LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

LEGEND
Concentration exceeds CCME Guideline
Concentration exceeds BC MOE AW 30-d avg. Standard
Concentration exceeds BC MOE AW Max. Standard
Concentration exceeds BC MOE DW Standard

Note: The British Columbia drinking water (BC MOE DW) and protection of aquatic life (BC MOE AW) standards as well as the Canadian Council of Ministers of the Environment (CCME) are shown in Table 10.

For CCME the results are compared to the long term max. concentrations

APPENDIX F
LABORATORY REPORTS AND CERTIFICATES

BGC ENGINEERING INC.
ATTN: Katherine Johnston
500 - 1045 Howe Street
Vancouver BC V6Z 2A9

Date Received: 13-OCT-11
Report Date: 27-OCT-11 15:46 (MT)
Version: FINAL

Client Phone: 604-684-5900

Certificate of Analysis

Lab Work Order #: L1071509

Project P.O. #: BRUCE JACK
Job Reference: 1008-004-30
C of C Numbers: 4, 10-170928, 10-170929, 10-170930
Legal Site Desc:

Comments: Cyanide analysis was not performed for L1071509-8 as no appropriate sample with correct preservation was submitted.

Dean Watt
Account Manager

Reference Information

Qualifiers for Sample Submission Listed:

Qualifier	Description
SPL	Sample was Preserved at the laboratory - samples # 1-3 - Total Metals

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Sulfate (SO4)	MS-B	L1071509-1, -2, -3, -4, -5, -6, -7, -8

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit Adjusted For required dilution
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRV	Reported Result Verified By Repeat Analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 "Alkalinity"

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

Reference Information

CN-T-MID-HH-COL-VA	Water	Total Cyanide by HH Distillation	APHA 4500-CN Cyanide

This analysis is carried out using procedures adapted from APHA Method 4500-CN "Cyanide". Total or strong acid dissociable (SAD) cyanide are determined by sample distillation and analysis using the chloramine-T colourimetric method.

CN-WAD-MID-COL-VA	Water	Weak Acid Dissociable Cyanide by Dist.	APHA 4500-CN Cyanide

This analysis is carried out using procedures adapted from APHA Method 4500-CN "Cyanide". Weak acid dissociable (WAD) cyanide are determined by sample distillation and analysis using the chloramine-T colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-DIS-CCME-MS-VA	Water	Diss. Metals in Water by ICPMS (CCME)	EPA SW-846 3005A/6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-TOT-CCME-MS-VA	Water	Total Metals in Water by ICPMS (CCME)	EPA SW-846 3005A/6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

Reference Information

It is recommended that this analysis be conducted in the field.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-COL-VA	Water	TKN in Water by Colour	APHA 4500-NORG (TKN)

This analysis is carried out using procedures adapted from APHA Method 4500-Norg "Nitrogen (Organic)". Total Kjeldahl Nitrogen is determined using automated colourimetry.

TN-CALC-VA	Water	Total Nitrogen (Calculation)	BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

10-170928	10-170929	10-170930	4

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Antimony (Sb)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Beryllium (Be)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Cadmium (Cd)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Copper (Cu)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Lead (Pb)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Lithium (Li)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Molybdenum (Mo)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Selenium (Se)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Silver (Ag)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Thallium (Tl)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Tin (Sn)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Uranium (U)-Total	DLA	L1129695-1, -2, -3, -4
Duplicate	Bromide (Br)	DLM	L1129695-1, -2, -3, -4
Duplicate	Nitrite (as N)	DLM	L1129695-1, -2, -3, -4
Matrix Spike	Chloride (Cl)	MS-B	L1129695-1, -2, -3, -4
Matrix Spike	Fluoride (F)	MS-B	L1129695-1, -2, -3, -4
Matrix Spike	Sulfate (SO4)	MS-B	L1129695-1, -2, -3, -4
Matrix Spike	Sulfate (SO4)	MS-B	L1129695-1, -2, -3, -4
Matrix Spike	Nitrate (as N)	MS-B	L1129695-1, -2, -3, -4
Matrix Spike	Sulfate (SO4)	MS-B	L1129695-1, -2, -3, -4
Matrix Spike	Ammonia, Total (as N)	MS-B	L1129695-1, -2, -3

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit Adjusted For required dilution
DLM	Detection Limit Adjusted For Sample Matrix Effects
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

Reference Information

ANIONS-NO3-IC-VA Water Nitrate in Water by Ion Chromatography EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA Water Sulfate by Ion Chromatography APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA Water Dissolved organic carbon by combustion APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA Water Total organic carbon by combustion APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-MID-HH-COL-VA Water Total Cyanide by HH Distillation APHA 4500-CN Cyanide

This analysis is carried out using procedures adapted from APHA Method 4500-CN "Cyanide". Total or strong acid dissociable (SAD) cyanide are determined by sample distillation and analysis using the chloramine-T colourimetric method.

CN-WAD-MID-COL-VA Water Weak Acid Dissociable Cyanide by Dist. APHA 4500-CN Cyanide

This analysis is carried out using procedures adapted from APHA Method 4500-CN "Cyanide". Weak acid dissociable (WAD) cyanide are determined by sample distillation and analysis using the chloramine-T colourimetric method.

COLOUR-TRUE-VA Water Colour (True) by Spectrometer BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA Water Dissolved Mercury in Water by CVAFS(Low) EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA Water Total Mercury in Water by CVAFS(Low) EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-DIS-CCME-MS-VA Water Diss. Metals in Water by ICPMS (CCME) EPA SW-846 3005A/6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

MET-DIS-ICP-VA Water Dissolved Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-TOT-CCME-MS-VA Water Total Metals in Water by ICPMS (CCME) EPA SW-846 3005A/6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

MET-TOT-ICP-VA Water Total Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or

Reference Information

microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA	Water	Total Nitrogen (Calculation)	BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

10-196181

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Nitrate (as N)	DLM	L1130044-1, -2, -3, -4, -5
Matrix Spike	Sulfate (SO4)	MS-B	L1130044-1, -2, -3, -4, -5
Matrix Spike	Total Organic Carbon	MS-B	L1130044-1, -2, -3, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit Adjusted For required dilution
DLM	Detection Limit Adjusted For Sample Matrix Effects
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-MID-HH-COL-VA	Water	Total Cyanide by HH Distillation	APHA 4500-CN Cyanide

This analysis is carried out using procedures adapted from APHA Method 4500-CN "Cyanide". Total or strong acid dissociable (SAD) cyanide are determined by sample distillation and analysis using the chloramine-T colourimetric method.

CN-WAD-MID-COL-VA	Water	Weak Acid Dissociable Cyanide by Dist.	APHA 4500-CN Cyanide

This analysis is carried out using procedures adapted from APHA Method 4500-CN "Cyanide". Weak acid dissociable (WAD) cyanide are determined by sample distillation and analysis using the chloramine-T colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

Reference Information

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-DIS-CCME-MS-VA	Water	Diss. Metals in Water by ICPMS (CCME)	EPA SW-846 3005A/6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-TOT-CCME-MS-VA	Water	Total Metals in Water by ICPMS (CCME)	EPA SW-846 3005A/6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven, or filtration (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - mass spectrometry (EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA	Water	Total Nitrogen (Calculation)	BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

10-174709

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

10-174709

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Barium (Ba)-Dissolved	MB-LOR	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Method Blank	Barium (Ba)-Dissolved	MB-LOR	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sulfate (SO4)	MS-B	L1171422-1, -10, -11, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Phosphorus (P)-Total	MS-B	L1171422-2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Phosphorus (P)-Total	MS-B	L1171422-1
Matrix Spike	Phosphorus (P)-Total	MS-B	L1171422-1
Matrix Spike	Arsenic (As)-Total	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Calcium (Ca)-Total	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Magnesium (Mg)-Total	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Manganese (Mn)-Total	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Strontium (Sr)-Total	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Uranium (U)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Zinc (Zn)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Molybdenum (Mo)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Uranium (U)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1171422-1, -10, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit Adjusted For required dilution
DLM	Detection Limit Adjusted For Sample Matrix Effects
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MB-LOR	Method Blank exceeds ALS DQO. LORs adjusted for samples with positive hits below 5 times blank level. Please contact ALS if re-analysis is required.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-COL-VA	Water	Alkalinity by Colourimetric (Automated)	EPA 310.2

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent

Reference Information

Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the

Reference Information

American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA	Water	Total Nitrogen (Calculation)	BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

Reference Information

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

10-252137

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Bromide (Br)	DLM	L1174115-1, -2
Duplicate	Chloride (Cl)	DLM	L1174115-1, -2
Duplicate	Fluoride (F)	DLM	L1174115-1, -2
Duplicate	Nitrite (as N)	DLM	L1174115-1, -2
Matrix Spike	Nitrate (as N)	MS-B	L1174115-1, -2
Matrix Spike	Phosphorus (P)-Total	MS-B	L1174115-1, -2
Matrix Spike	Aluminum (Al)-Total	MS-B	L1174115-1
Matrix Spike	Arsenic (As)-Total	MS-B	L1174115-1
Matrix Spike	Barium (Ba)-Total	MS-B	L1174115-1
Matrix Spike	Calcium (Ca)-Total	MS-B	L1174115-1
Matrix Spike	Magnesium (Mg)-Total	MS-B	L1174115-1
Matrix Spike	Manganese (Mn)-Total	MS-B	L1174115-1
Matrix Spike	Strontium (Sr)-Total	MS-B	L1174115-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted For Sample Matrix Effects
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 "Alkalinity"

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

Reference Information

ANIONS-SO4-IC-VA Water Sulfate by Ion Chromatography APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-TOC-VA Water Total organic carbon by combustion APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA Water Low Level Total Cyanide in water by CFA ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA Water Low level WAD Cyanide in water by CFA APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA Water Chemical Oxygen Demand by Colorimetric APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA Water Colour (True) by Spectrometer BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA Water Dissolved Mercury in Water by CVAFS(Low) EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA Water Total Mercury in Water by CVAFS(Low) EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).

MET-DIS-ICP-VA Water Dissolved Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).

MET-TOT-ICP-VA Water Total Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or

Reference Information

microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA	Water	Total Nitrogen (Calculation)	BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BC, CANADA

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Arsenic (As)-Dissolved	DLA	L1205274-1, -2, -3, -4, -5
Duplicate	Beryllium (Be)-Dissolved	DLA	L1205274-1, -2, -3, -4, -5
Duplicate	Bismuth (Bi)-Dissolved	DLA	L1205274-1, -2, -3, -4, -5
Duplicate	Lead (Pb)-Dissolved	DLA	L1205274-1, -2, -3, -4, -5
Duplicate	Silver (Ag)-Dissolved	DLA	L1205274-1, -2, -3, -4, -5
Duplicate	Tin (Sn)-Dissolved	DLA	L1205274-1, -2, -3, -4, -5
Duplicate	Vanadium (V)-Dissolved	DLA	L1205274-1, -2, -3, -4, -5
Matrix Spike	Phosphorus (P)-Total	MS-B	L1205274-2, -3, -4, -5
Matrix Spike	Phosphorus (P)-Total	MS-B	L1205274-2, -3, -4, -5
Matrix Spike	Total Organic Carbon	MS-B	L1205274-1, -2, -3, -4, -5
Matrix Spike	Phosphorus (P)-Total	MS-B	L1205274-1
Matrix Spike	Sulfate (SO4)	MS-B	L1205274-1, -2, -3, -4, -5
Matrix Spike	Mercury (Hg)-Total	MS-B	L1205274-4
Matrix Spike	Mercury (Hg)-Total	MS-B	L1205274-4

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit Adjusted For required dilution
DTC	Dissolved concentration exceeds total. Results were confirmed by re-analysis.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
TMV	Turbidity exceeded upper limit of the nephelometric method. Minimum value reported.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 "Alkalinity"

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

Reference Information

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or

Reference Information

filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).

MET-TOT-ICP-VA Water Total Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA Water Total P in Water by Colour APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA Water Diss. Orthophosphate in Water by Colour APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA Water TKN in Water by Fluorescence APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA Water Total Nitrogen (Calculation) BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-239827

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Bromide (Br)	DLM	L1206550-1, -2
Duplicate	Fluoride (F)	DLM	L1206550-1, -2
Duplicate	Nitrite (as N)	DLM	L1206550-1, -2
Duplicate	Nitrate (as N)	DLM	L1206550-1, -2
Duplicate	Bromide (Br)	DLM	L1206550-1, -2
Duplicate	Bromide (Br)	DLM	L1206550-1, -2
Duplicate	Fluoride (F)	DLM	L1206550-1, -2
Matrix Spike	Phosphorus (P)-Total	MS-B	L1206550-1, -2

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted For Sample Matrix Effects
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there

Reference Information

could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modifed from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

N-TOT-COMBUST-VA	Water	Total Nitrogen in Water by Combustion	BC: TN by Combustion/Chemiluminescence

This analysis is carried out, on hydrochloric acid preserved samples, following Method BC MOE "Total and Dissolved Nitrogen (TN) by Combustion with Chemiluminescence Detection". Total Nitrogen is determined directly by pyrolysis with chemiluminescence detection using automated instrumentation.

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et

Reference Information

al.

P-T-COL-VA Water Total P in Water by Colour APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-MAN-VA Water pH by Manual Meter APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-MAN-VA Water pH by Manual Meter APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA Water Diss. Orthophosphate in Water by Colour APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA Water TKN in Water by Fluorescence APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA Water Total Nitrogen (Calculation) BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-239823

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Duplicate	Bromide (Br)	DLM	L1263921-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Duplicate	Nitrite (as N)	DLM	L1263921-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L1263921-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L1263921-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1263921-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L1263921-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L1263921-1, -10, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1263921-1, -10, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit Adjusted For required dilution
DLM	Detection Limit Adjusted For Sample Matrix Effects
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
TMV	Turbidity exceeded upper limit of the nephelometric method. Minimum value reported.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 "Alkalinity"

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

Reference Information

ANIONS-NO2-IC-VA Water Nitrite in Water by Ion Chromatography EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA Water Nitrate in Water by Ion Chromatography EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA Water Sulfate by Ion Chromatography APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA Water Dissolved organic carbon by combustion APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA Water Total organic carbon by combustion APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA Water Low Level Total Cyanide in water by CFA ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA Water Low level WAD Cyanide in water by CFA APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA Water Chemical Oxygen Demand by Colorimetric APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA Water Colour (True) by Spectrometer BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA Water Dissolved Mercury in Water by CVAFS(Low) EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA Water Total Mercury in Water by CVAFS(Low) EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA Water Dissolved Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

Reference Information

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Bromide (Br)	DLM	L1264492-1, -2
Duplicate	Fluoride (F)	DLM	L1264492-1
Matrix Spike	Phosphorus (P)-Total	MS-B	L1264492-1, -2

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted For Sample Matrix Effects
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

Reference Information

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H pH Value

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-296699

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Alkalinity, Bicarbonate (as CaCO3)	B	L1287525-3, -4
Method Blank	Alkalinity, Total (as CaCO3)	B	L1287525-3, -4
Method Blank	Alkalinity, Bicarbonate (as CaCO3)	B	L1287525-3, -4
Method Blank	Alkalinity, Total (as CaCO3)	B	L1287525-3, -4
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L1287525-1, -2, -3, -4, -5
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1287525-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L1287525-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1287525-1, -2, -3, -4, -5
Matrix Spike	Ammonia, Total (as N)	MS-B	L1287525-3, -4, -6
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1287525-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L1287525-1, -2, -3, -4, -5
Matrix Spike	Selenium (Se)-Dissolved	MS-B	L1287525-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1287525-1, -2, -3, -4, -5
Matrix Spike	Uranium (U)-Dissolved	MS-B	L1287525-1, -2, -3, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. All associated sample results are at least 5 times greater than blank levels and are considered reliable.
DLA	Detection Limit Adjusted For required dilution
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 "Alkalinity"

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

Reference Information

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or

Reference Information

filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA Water Total Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA Water Ammonia in Water by Fluorescence J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA Water Total P in Water by Colour APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-MAN-VA Water pH by Manual Meter APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-MAN-VA Water pH by Manual Meter APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA Water Diss. Orthophosphate in Water by Colour APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA Water TKN in Water by Fluorescence APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Reference Information

Chain of Custody Numbers:

10-293380

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

10-293880

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Method Blank	Calcium (Ca)-Total	MB-LOR	L1288325-1, -2, -3, -4, -5
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L1288325-1, -2, -3, -4, -5
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1288325-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L1288325-1, -2, -3, -4, -5
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L1288325-1, -2, -3, -4, -5
Matrix Spike	Potassium (K)-Dissolved	MS-B	L1288325-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1288325-1, -2, -3, -4, -5
Matrix Spike	Uranium (U)-Dissolved	MS-B	L1288325-1, -2, -3, -4, -5
Matrix Spike	Ammonia, Total (as N)	MS-B	L1288325-1, -2, -3, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MB-LOR	Method Blank exceeds ALS DQO. LORs adjusted for samples with positive hits below 5 times blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 "Alkalinity"

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are

Reference Information

determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method

Reference Information

6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA	Water	Total Nitrogen (Calculation)	BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1331947-1, -2, -3, -4, -5
Matrix Spike	Barium (Ba)-Total	MS-B	L1331947-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Total	MS-B	L1331947-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Total	MS-B	L1331947-1, -2, -3, -4
Matrix Spike	Strontium (Sr)-Total	MS-B	L1331947-1, -2, -3, -4

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted For Sample Matrix Effects
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 "Alkalinity"

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

Reference Information

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United

Reference Information

States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-MAN-VA	Water	pH by Manual Meter	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode.

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location

Reference Information

VA ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-268554

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Bromide (Br)	DLM	L1333226-1, -2, -3, -4, -5
Duplicate	Chloride (Cl)	DLM	L1333226-1, -2, -3, -4, -5
Duplicate	Nitrite (as N)	DLM	L1333226-1, -2, -3, -4, -5
Matrix Spike	Phosphorus (P)-Total	MS-B	L1333226-1, -2, -4, -5
Matrix Spike	Barium (Ba)-Dissolved	MS-B	L1333226-1, -2, -3, -4, -5
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1333226-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L1333226-1, -2, -3, -4, -5
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L1333226-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1333226-1, -2, -3, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted For Sample Matrix Effects
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by

Reference Information

colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-268555

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Matrix Spike	Strontium (Sr)-Total	MS-B	L1335562-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted For Sample Matrix Effects
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or

Reference Information

filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA	Water	Total Nitrogen (Calculation)	BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

Reference Information

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-297711

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

* Please refer to the Reference Information section for an explanation of any qualifiers detected.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Nitrite (as N)	DLM	L1370058-1, -2, -3, -4, -5, -6
Duplicate	Nitrate (as N)	DLM	L1370058-1, -2, -3, -4, -5, -6
Method Blank	Chromium (Cr)-Total	MB-LOR	L1370058-1, -2, -3, -4, -6
Matrix Spike	Total Organic Carbon	MS-B	L1370058-1, -2, -3, -4, -5, -6
Matrix Spike	Phosphorus (P)-Total	MS-B	L1370058-1, -2, -3, -4, -5, -6
Matrix Spike	Total Kjeldahl Nitrogen	MSTN	L1370058-1, -2, -3, -4, -5, -6

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLA	Detection Limit Adjusted For required dilution
DLM	Detection Limit Adjusted For Sample Matrix Effects
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
MSTN	TKN Matrix Spike recovery was low due to interference from high nitrate, which causes negative bias on TKN.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 "Alkalinity"

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-PCT-VA	Water	Alkalinity by Auto. Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are

Reference Information

determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA Water Total organic carbon by combustion APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA Water Low Level Total Cyanide in water by CFA ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA Water Low level WAD Cyanide in water by CFA APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA Water Chemical Oxygen Demand by Colorimetric APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA Water Colour (True) by Spectrometer BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA Water Conductivity (Automated) APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA Water Hardness APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA Water Dissolved Mercury in Water by CVAFS(Low) EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA Water Total Mercury in Water by CVAFS(Low) EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA Water Dissolved Metals in Water by CRC ICPMS APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA Water Dissolved Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA Water Total Metals in Water by CRC ICPMS APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA Water Total Metals in Water by ICPOES EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or

Reference Information

microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA	Water	Total Nitrogen (Calculation)	BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-334654

Reference Information

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Total Organic Carbon	MS-B	L1370207-1, -2, -3, -4, -5
Matrix Spike	Dissolved Organic Carbon	MS-B	L1370207-3, -4, -5
Matrix Spike	Phosphorus (P)-Total	MS-B	L1370207-1, -2, -3, -4, -5
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1370207-1, -2, -3, -4, -5
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L1370207-1, -2, -3, -4, -5
Matrix Spike	Strontium (Sr)-Dissolved	MS-B	L1370207-1, -2, -3, -4, -5
Matrix Spike	Sodium (Na)-Total	MS-B	L1370207-1, -2, -3, -4, -5

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA	Water	Diss. Orthophosphate in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA	Water	Total Dissolved Solids by Gravimetric	APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA	Water	TKN in Water by Fluorescence	APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA	Water	Total Nitrogen (Calculation)	BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA	Water	Total Suspended Solids by Gravimetric	APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA	Water	Turbidity by Meter	APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-334653

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Duplicate	Bromide (Br)	DLM	L1372080-1
Duplicate	Fluoride (F)	DLM	L1372080-1
Duplicate	Nitrite (as N)	DLM	L1372080-1
Matrix Spike	Phosphorus (P)-Total	MS-B	L1372080-1
Matrix Spike	Phosphorus (P)-Total	MS-B	L1372080-1
Matrix Spike	Phosphorus (P)-Total	MS-B	L1372080-1
Matrix Spike	Dissolved Organic Carbon	MS-B	L1372080-1

Qualifiers for Individual Parameters Listed:

Qualifier	Description
DLM	Detection Limit Adjusted For Sample Matrix Effects
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 "Acidity"

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ACY-PCT-VA	Water	Acidity by Automatic Titration	APHA 2310 Acidity

This analysis is carried out using procedures adapted from APHA Method 2310 "Acidity". Acidity is determined by potentiometric titration to a specified endpoint.

ALK-SCR-VA	Water	Alkalinity by colour or titration	EPA 310.2 OR APHA 2320

This analysis is carried out using procedures adapted from EPA Method 310.2 "Alkalinity". Total Alkalinity is determined using the methyl orange colourimetric method.
OR
This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

ANIONS-BR-IC-VA	Water	Bromide by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-CL-IC-VA	Water	Chloride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-F-IC-VA	Water	Fluoride by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

ANIONS-NO2-IC-VA	Water	Nitrite in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrite is detected by UV absorbance.

ANIONS-NO3-IC-VA	Water	Nitrate in Water by Ion Chromatography	EPA 300.0

This analysis is carried out using procedures adapted from EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography". Nitrate is detected by UV absorbance.

ANIONS-SO4-IC-VA	Water	Sulfate by Ion Chromatography	APHA 4110 B.

This analysis is carried out using procedures adapted from APHA Method 4110 B. "Ion Chromatography with Chemical Suppression of Eluent Conductivity" and EPA Method 300.0 "Determination of Inorganic Anions by Ion Chromatography".

CARBONS-DOC-VA	Water	Dissolved organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)". Dissolved carbon (DOC) fractions are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis.

CARBONS-TOC-VA	Water	Total organic carbon by combustion	APHA 5310 TOTAL ORGANIC CARBON (TOC)

This analysis is carried out using procedures adapted from APHA Method 5310 "Total Organic Carbon (TOC)".

CN-T-L-CFA-VA	Water	Low Level Total Cyanide in water by CFA	ISO 14403:2002

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis. Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

Reference Information

CN-WAD-L-CFA-VA	Water	Low level WAD Cyanide in water by CFA	APHA 4500-CN CYANIDE

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

COD-COL-VA	Water	Chemical Oxygen Demand by Colorimetric	APHA 5220 D. CHEMICAL OXYGEN DEMAND

This analysis is carried out using procedures adapted from APHA Method 5220 "Chemical Oxygen Demand (COD)". Chemical oxygen demand is determined using the closed reflux colourimetric method.

COLOUR-TRUE-VA	Water	Colour (True) by Spectrometer	BCMOE Colour Single Wavelength

This analysis is carried out using procedures adapted from British Columbia Environmental Manual "Colour- Single Wavelength." Colour (True Colour) is determined by filtering a sample through a 0.45 micron membrane filter followed by analysis of the filtrate using the platinum-cobalt colourimetric method. Aparent Colour is determined without prior sample filtration. Colour is pH dependent. Unless otherwise indicated, reported colour results pertain to the pH of the sample as received, to within +/- 1 pH unit.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

HG-DIS-LOW-CVAFS-VA	Water	Dissolved Mercury in Water by CVAFS(Low)	EPA SW-846 3005A & EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by filtration (EPA Method 3005A) and involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

HG-TOT-LOW-CVAFS-VA	Water	Total Mercury in Water by CVAFS(Low)	EPA 245.7

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves a cold-oxidation of the acidified sample using bromine monochloride prior to reduction of the sample with stannous chloride. Instrumental analysis is by cold vapour atomic fluorescence spectrophotometry or atomic absorption spectrophotometry (EPA Method 245.7).

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-DIS-ICP-VA	Water	Dissolved Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedure involves filtration (EPA Method 3005A) and analysis by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	APHA 3030 B&E / EPA SW-846 6020A

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using hotblock, or filtration (APHA 3030B&E). Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

MET-TOT-ICP-VA	Water	Total Metals in Water by ICPOES	EPA SW-846 3005A/6010B

This analysis is carried out using procedures adapted from "Standard Methods for the Examination of Water and Wastewater" published by the American Public Health Association, and with procedures adapted from "Test Methods for Evaluating Solid Waste" SW-846 published by the United States Environmental Protection Agency (EPA). The procedures may involve preliminary sample treatment by acid digestion, using either hotblock or microwave oven (EPA Method 3005A). Instrumental analysis is by inductively coupled plasma - optical emission spectrophotometry (EPA Method 6010B).

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

P-T-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorous is determined colourimetrically after persulphate digestion of the sample.

PH-PCT-VA	Water	pH by Meter (Automated)	APHA 4500-H "pH Value"

Reference Information

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PH-PCT-VA Water pH by Meter (Automated) APHA 4500-H pH Value

This analysis is carried out using procedures adapted from APHA Method 4500-H "pH Value". The pH is determined in the laboratory using a pH electrode

It is recommended that this analysis be conducted in the field.

PO4-DO-COL-VA Water Diss. Orthophosphate in Water by Colour APHA 4500-P Phosphorous

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Dissolved Orthophosphate is determined colourimetrically on a sample that has been lab or field filtered through a 0.45 micron membrane filter.

TDS-VA Water Total Dissolved Solids by Gravimetric APHA 2540 C - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, TDS is determined by evaporating the filtrate to dryness at 180 degrees celsius.

TKN-F-VA Water TKN in Water by Fluorescence APHA 4500-NORG D.

This analysis is carried out using procedures adapted from APHA Method 4500-Norg D. "Block Digestion and Flow Injection Analysis". Total Kjeldahl Nitrogen is determined using block digestion followed by Flow-injection analysis with fluorescence detection.

TN-CALC-VA Water Total Nitrogen (Calculation) BC MOE LABORATORY MANUAL (2005)

Total Nitrogen is a calculated parameter. Total Nitrogen = Total Kjeldahl Nitrogen + [Nitrate and Nitrite (as N)]

TSS-VA Water Total Suspended Solids by Gravimetric APHA 2540 D - GRAVIMETRIC

This analysis is carried out using procedures adapted from APHA Method 2540 "Solids". Solids are determined gravimetrically. Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, TSS is determined by drying the filter at 104 degrees celsius.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 "Turbidity"

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

TURBIDITY-VA Water Turbidity by Meter APHA 2130 Turbidity

This analysis is carried out using procedures adapted from APHA Method 2130 "Turbidity". Turbidity is determined by the nephelometric method.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

10-334376

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

10- 334376

VOK	Valley of the Kings
VSF	Brucejack geologic unit; volcanic sedimentary facies
WRTSF	Waste Rock and Tailings Storage Facility
WTP	Water Treatment Plant

1. Introduction

1. Introduction

1.1 Mine Description and Background

The Brucejack Mine (the mine), located in northwest British Columbia (BC), is a high-grade underground gold and silver mine operated by Pretium Resources Inc. (Pretium), a member of the Newcrest Mining Ltd. (Newcrest) group of companies. The mine is centered approximately at 56°28′20″N Latitude by 130°11′31″W Longitude, a position approximately 950 kilometers (km) northwest of Vancouver, 65 km north-northwest of Stewart, and 21 km south-southeast of the Eskay Creek Mine in BC (Figure 1-1 inset). The mine is accessed via a 73 km access road linking the Brucejack Camp to Highway 37 at km 215.

The underground development is located southwest of the waste rock and tailings storage facility (WRTSF), and the mill, used for primary processing of the ore, is located adjacent to the WRTSF (Figure 1-1). Thickened tailings from the mill are deposited into the WRTSF together with a component of waste rock from the underground mine. Waste rock and paste-thickened tailings are used to backfill portions of the underground mine.

The mine received its Environmental Certificate (#M15-01) in March 2015 and received a Mines Act Permit (M-243) and Effluent Permit (PE-107835) in July and August of 2015, respectively. Construction-related activity ramped up in September 2015 and the mine achieved commercial production in July 2017.

Mines Act Permit M-243 has been amended several times to accommodate mine plan changes, most recently in December 2021 to update the project boundaries and authorize the use of remote equipment. The Environmental Management Act discharge permits for waste discharges to water and air have been amended four times. The December 2018 amendment to PE-107835 included revision of the groundwater monitoring program to include monitoring wells installed in 2018 with selected wells sampled under reduced frequency. In December 2020, Pretium provided an update on timing of a future groundwater monitoring installation which was subsequently added to the PE-107835 file (Lorax 2020c).

1.2 Scope of Work

Pretium retained Lorax Environmental Services Ltd. (Lorax) in June 2019 to provide hydrogeological consulting services for the mine. All site groundwater monitoring activities are undertaken by Brucejack Environmental Department staff. Lorax provides in-office support to site staff, offering feedback on sampling methodology and well

development activities. Lorax and Brucejack Environmental Department staff have prepared this 2021 Annual Groundwater Monitoring Report.

1.3 Objectives

The purpose of this 2021 Annual Groundwater Monitoring Report is to summarize the most recent groundwater monitoring data to allow for interpretation of mining impacts on the groundwater system.

This report fulfils both general annual reporting guidance provided in BC MOE (2016a) and specific reporting requirements given in M-243 and PE-107835 which include:

- A description of groundwater monitoring stations, methods and monitoring frequency demonstrating that the groundwater monitoring program fulfils the requirements of permits M-243 and PE-107835.
- An assessment of the groundwater quality control/quality assurance (QA/QC) program demonstrating that groundwater quality data are representative.
- An assessment of the temporal, seasonal and/or operational groundwater quantity (water levels and dewatering rates) and groundwater quality trends using tabular and graphical formats.
- A discussion of impacts to baseline water quality that may suggest the onset of Metal Leaching and/or Acid Rock Drainage.
- Inclusion of results from any additional hydrogeological investigation and assessment work and updates to the groundwater model for the site.

The data presented in this report is used to validate the recently updated site-wide groundwater model presented in 2020 Mine Plan and Reclamation Update (Pretium 2020c). The most recent comparison of simulated and observed groundwater data has been presented in Lorax (2022).

FIGURE: 1-1

P:\@Drafting\Brucejack\Drafting Figures\MXD\2021 Groundwater Report\Fig 1-1_General Arrangement.mxd

2. Mine Setting

2. Mine Setting

2.1 Physiography

The Brucejack Property is located in the Boundary Range of the Coast Mountain Physiographic Belt. Mine infrastructure is located at 1,360 to 1,415 metres above sea level (m asl) along Brucejack Creek (Figure 1-1). The mine site is devoid of trees with only sparse mosses along drainage pathways. The mine site lies in a transition zone between the very wet coastal and drier interior regions of BC. This part of northwestern BC is dominated by weather systems generated from the Pacific Ocean but is also strongly influenced by orographic effects caused by the local mountain topography that produces high spatial variability in snowfall, precipitation, temperatures and snowmelt. In addition, the extensive glacial areas around the mine site can impact snowmelt rates and produce high runoff volumes during the summer months. The humid climate and physical characteristics of the region result in dynamic streams and rivers with high annual runoff rates and high average stream flows.

2.2 Climate and Meteorology

Annual precipitation in the region ranges from approximately 1,500 to >2,200 mm, with approximately 70% of annual precipitation typically falling between October-April as snow. The months of October through to January typically have the highest monthly precipitation amounts, while late spring or early summer months see comparatively lower precipitation. Snowpack typically ranges from 1 to 2 m deep, but high winds can create snowdrifts up to 15 m deep. Mountainous terrain and permanent icefields are present in the upper reaches of the Brucejack Creek watershed. Precipitation in such terrain is spatially variable and subject to change with elevation owing to orographic cooling.

Site-specific weather data have been collected at a number of locations near the property since October 2009 which include measurement of the following climate information: wind speed and direction, air temperature and pressure, rainfall, snowfall, relative humidity, solar radiation, net radiation, and snow depth. With respect to collection of climate data near the mine, a key weather station was relocated from the WRTSF to its current position in the Valley of the Kings (VOK) valley (elevation 1,500 m asl) in September 2014 (Figure 1-1).

The reader is referred to the 2021 Annual Meteorological Monitoring Report (Pretium 2022a) for an in-depth analysis of current climate data. A brief analysis of recent site precipitation data is provided in this report for context when viewing water level hydrographs and underground dewatering data. Monthly precipitation from the VOK

weather station, corrected for gauge undercatch, is provided in Table 2-1 for the 2015 to 2021 time period. 2021 was on average 10% wetter than 2020, with wetter conditions being more prevalent during the winter, spring, and fall months. Between May and September, 2021 experienced slightly less rainfall than 2020. Compared to the 2015-2020 average VOK record, September and March 2021 precipitation were more than double, or nearly double, the average (Table 2-1).

Table 2-1:
Precipitation (mm) measured at VOK climate station.

Year	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Total
2015	241	96	177	152	19	105	143	213	201	392	190	139	2,069
2016	122	188	75	161	118	48	83	63	230	82	212	144	1,527
2017	161	97	143	44	107	117	64	176	180	231	108	130	1,556

2021	214	169	204	99	95	86	53	156	378	296	308	86	2,143
2015-2020 Avg.	158	111	110	108	73	93	111	198	169	224	207	143	1,704

2.3 Hydrology

The Brucejack Creek catchment (drainage area 6.5 km^2 at station BJ-3.10) is a small headwater sub-basin within the larger Sulphurets Creek watershed (drainage area 300 km^2 at the confluence with the Unuk River). It is located in a glaciated, alpine environment, with the uppermost part of the catchment flowing into the WRTSF (drainage area 6.7 km^2). About 17 km downstream of Sulphurets Lake, Sulphurets Creek forms a confluence with the larger Unuk River which ultimately flows into the Pacific Ocean, northeast of Ketchikan, Alaska.

In accordance with PE-107835, flow rates are measured at Station BJ-3.10 (approximately 250 m downstream of the WRTSF outlet, shown in Figure 1-1) and Station BJ-1.74 (1.74 km upstream of the Sulphurets Glacier). The hydrological regime of the mine area is snowmelt-dominated and supplemented by glacier meltwaters in the late summer. Peak flow conditions typically occur in mid-summer and low flow conditions occur during the winter months of January through March (Rescan 2013). The reader is referred to the 2021 Annual Hydrometric Monitoring Report (Pretium 2022b) for a discussion of hydrometric data collected in 2021.

2.4 Geology

The geology of the Brucejack Project area is described in detail in Shaw *et al.* (2020). The Brucejack Project area is largely underlain by volcano-sedimentary rocks of the Lower Jurassic Hazelton Group. These rocks unconformably overlie volcanic arc sedimentary rocks of the Upper Triassic Stuhini Group along the western-most part of the Brucejack Project area. The rocks are variably altered and deformed, with zones of intense quartz-sericite-pyrite (phyllic) alteration. The main lithologies encountered in boreholes advanced for groundwater monitoring well installations (Appendix A) include the following:

- P1 [Office]: Hornblende, feldspar phyric latite flows.
- P1 [Bridge]: As per Office P1 but with a different age and geochemical signature.
- P2: Megacrystic, plagioclase, potassium-feldspar, and hornblende phyric flow.
- V12 [Fragmental volcanics]: Hornblende and/or feldspar phyric latite to andesite fragmental volcanic rocks and subordinate flows with minor ash and lapilli tuff.
    - V6B: Mafic dykes
- S3-Poly [Polymictic conglomerate]: Heterolithic boulder to coarse cobble conglomerate with sandstone.
- Silicified Cap: Silicified rocks; typically, poorly sorted heterolithic conglomerate, lesser sandstone, and local mudstone; commonly includes rhyolite fragments.
- VSF [Volcanic Sedimentary Facies]: Volcanically derived siltstone and sandstone with minor arenite and pebble conglomerate.
    - S4-VSF: Sandstone/arenite.

These units may contain sulphide present as pyrite with trace to minor sphalerite and chalcopyrite. In the time since many of the hydrogeological holes have been advanced, Pretium geologists have amalgamated the P1 unit and no longer differentiate between Office and Bridge sub-units.

The surficial materials within the Brucejack Project area consist of a sparse veneer of well-graded glacial till overlying bedrock. Grain size varies from sand to gravel, with some silt and clay, and variable quantities of cobbles and boulders. The thickness of unconsolidated deposits varies at the site but is generally less than 5 m and commonly less than 1 m (BGC 2014).

The fault model developed by Pretium indicates four large (*i.e.,* mine-scale) fault zones intersecting the Brucejack Project area: the Brucejack Fault Zone, the Rainy Fault, the Valley of the Kings Main Thrust Fault, and the Upper Thrust Fault (Figure 1-1).

The Brucejack Fault Zone is a long lived northerly striking anastomosing vertical fault zone with predominantly left lateral strike slip movement showing a net displacement varying between 500 and 800 m (ERSi 2010). It is comprised of a core of highly fractured rock with a zone of less fractured, fault-disturbed rock mass on either side. The width of the fault zone varies with depth and along strike from approximately 5 to 40 m. It is considered to be continuous along strike.

The Rainy Fault, Valley of the Kings Main Thrust Fault and Upper Thrust Fault are three gently dipping south-southwest striking faults. The Rainy Fault has an average thickness of 2 m, with the thickness appearing to increase with depth. Often the Rainy Fault zone is comprised of multiple gouge zones separated by more competent zones of very blocky rock mass. Seepage conditions within the zone vary significantly, from dry to dripping.

Pretium staff indicate that the Rainy Fault is the most encountered fault within the mine workings and is typically shotcreted when encountered in the mine workings for geotechnical purposes. The Rainy Fault intersects a significant amount of mine workings between the 1200 m elevation to the 1350 m elevation, while the VOK Main Thrust intersects workings only on the 1440 m elevation and the 1470 m elevation. The Upper Thrust lies above the current mine workings, does not intersect any workings and is only identified through diamond drill core. Most current diamond drillholes are grouted upon completion except for select locations to facilitate controlled dewatering of areas of the Brucejack Fault in advance of mine workings development. Once completed, these remaining holes will also be grouted (Travis Murphy P.Geo, Chief Mine Geologist, pers. Communication). The Brucejack Fault and Rainy Fault are inferred to influence the hydrogeological conditions based on observations during mining, well yields near these features and contoured groundwater levels (Section 4.3).

2.5 Hydraulic Conductivity

The site hydraulic conductivity database has been updated to include results from the 2018 monitoring well installation program (BGC 2019a). Figure 2-1 plots hydraulic conductivity versus depth with starred symbols indicating tests where faults and/or fracture zones were identified in the core. Overall, the data suggest bedrock hydraulic conductivity decreases with depth but at any given depth, the hydraulic conductivity is highly variable. For example, between 0 m and 100 m depth, hydraulic conductivity ranges from 3E-09 m/s to 1.5E-05 m/s; between 400 m and 500 m, the hydraulic conductivity ranges from 2E-08 m/s to 1E-06 m/s. The data do not indicate a strong correlation between hydraulic conductivity and lithology and faulted rock intervals are not universally highly conductive.

Figure 2-1: Hydraulic conductivity versus depth at Brucejack Mine from packer and slug tests.

3. Methodology

NEWCREST

3. Methodology

3.1 Monitoring Well Installations

Brucejack monitoring wells currently monitored under PE-107835 are listed in Table 3-1 and shown in Figure 1-1. Groundwater quality sampling on a quarterly or biannual basis is prescribed at 28 monitoring wells along with continuous water level monitoring. Four additional locations are prescribed for continuous water level monitoring only. The mine collects continuous groundwater levels from four monitoring wells outside of PE-107835; two of these wells are also sampled on a quarterly basis (Table 3-2). Locations formerly monitored under PE-107835 and since decommissioned are listed in Table 3-3.

Borehole logs for monitoring wells listed in Table 3-1 through Table 3-3 are provided in Appendix A. All monitoring wells are conventional monitoring wells consisting of a polyvinyl chloride (PVC) standpipe with slotted screen interval, backfilled with filter sand across the screened interval, sealed with bentonite above the filter pack, and then backfilled to surface with grout, bentonite, and/or sand. Construction details for 2011, 2014, 2016, and 2018 era monitoring wells are provided in BGC (2014, 2015b, 2017, 2019a).

3.2 Monitoring Procedures

Hydraulic head and groundwater quality sampling are undertaken on a shifted quarter (sQ) or biannual basis, as specified by PE-107835. The shifted quarters are defined as follows:

- sQ1: February 1st to April 30th
- sQ2: May 1st to July 31st
- sQ3: August 1st to October 31st
- sQ4: November 1st to January 31st

Shifted quarters are off-set from calendar quarters by one month. This offset allows for evaluation of groundwater quality that coincides with seasonal controls (*e.g.,* freshet, first snowfall). Table 3-4 provides a record of groundwater sample collection at all groundwater monitoring wells installed at the site.

Table 3-1:
Monitoring wells currently monitored under PE-107835

Monitoring Site Identifier (PE-107835 Dec. 14, 2018)		Current Permit-Required Monitoring[1]		Install Date	Easting[2] (m)	Northing[2] (m)	Ground Surface Elevation[2] (m)	Top of Casing (m)	Sand Pack Interval (m bgs)		Lithological Unit

3.2.2 Hydraulic Head Measurements

Groundwater levels are manually measured at all wells on a quarterly basis using Heron Instruments Dipper-T2 water level meters. Starting in sQ3 a trial of the Solinst Sonic Water Level Meter was commenced to determine the viability of switching quarterly water level measurements from a manual water level meter to a sonic water level meter. The benefits of the Solinst Sonic Water Level meter are that it increases efficiency, reduces bias between different samplers that exists with the Dipper-T2 meters and reduces disruption to the logger cable. Thus far the Sonic Water Level Meter shows excellent correlation to the manual Dipper-T2 water level measurements (Figure 3-1).

Figure 3-1: Correlation between manual water level and sonic water level readings.

Continuous groundwater level data are also measured at six-hour intervals (12AM, 6AM, 12PM and 6PM) by pressure transducers. Two brands of pressure transducers have been utilized at Brucejack, namely Onset HOBO dataloggers and Van Essen Instruments TD-Diver dataloggers. Additional HOBO and TD-Diver dataloggers record the atmospheric pressure at the same time intervals as the pressure transducers installed in the monitoring wells. As of sQ3 2020, all wells were transitioned to TD-Diver dataloggers to improve measurement consistency. Water level pressures recorded by the well transducers are corrected for barometric pressure and converted into water level elevations (m asl) using the manual groundwater level measurements. Van Essen Instruments direct read cables are in the process of being installed at 17 wells on site as a trial. These direct read cables allow data logger downloads from surface and reduce the need to raise and lower

data loggers for data downloads. By negating the need to remove the data logger from the well for data downloads, the potential for error in redeployment is eliminated, allowing an accurate understanding of the data logger depth so that manual groundwater level measurements can be used as a check instead of as a calibration point.

Quarterly manual groundwater level measurements and datalogger downloads were completed on all wells except for BJ-GW11-1A/B (sQ1), BJ-GW11-3B (sQ4), BJ-GW11-6A/B (sQ4), BJ-GW14-13A/B (sQ1 and sQ4) and BJ-GW14-14A/B (sQ1, sQ2 and sQ4) due to faulty equipment, frozen wells, or inaccessibility during the winter months.

3.2.3 Groundwater Quality

3.2.3.1 Monitoring Well Sampling

Groundwater sample collection at the mine transitioned from sampling methods that utilized inertial pumping (high purge) to low-flow sampling methods in mid-2019. Prior to mid-2019, groundwater sampling followed a traditional multiple volume purge method utilizing Waterra tubing and weighted polyethylene bailers, combined with field parameter stabilization. These sampling methods often resulted in the collection of groundwater samples containing elevated turbidity (>50 NTU). The low-flow sampling protocol continues to be implemented to minimize the turbidity and sediment load and to collect samples that better represent formation water.

The low-flow sampling protocol is implemented as follows:

- A Geotech Geopump peristaltic pump is used for wells less than 11 m in depth, namely BJ-GW11-3B, BJ-GW14-14B, BJ-GW16-5B and BJ-GW18-23B.
- A Grundfos Redi-flo 2 submersible pump is used for wells with depths ranging from 11 m to 91 m (most pre-2018 groundwater wells along with BJ-GW18-18B and BJ-GW18-23A).
- A Bennett Sample pump is used for wells with depths exceeding 91 m depth, namely BJ-GW18-17A and BJ-GW18-19B.

Table 3-5 provides details regarding the sampling method and equipment employed during each quarterly sampling event. The site groundwater sampling protocol (Appendix B) includes detailed SOPs for all low-flow sampling methods deployed at the mine. The low-flow sampling protocol has not been adopted at well BJ-GW12-11A where samples are collected with a bailer due to slow groundwater recharge rates. Bailers are occasionally deployed at wells with seasonally low water levels and slow recharge, or if there are functional difficulties with sampling equipment (BJ-GW11-1B (sQ3), BJ-GW12-9B (sQ2), BJ-GW18-17A (sQ4) and BJ-GW18-17B (sQ1, sQ4)).

Notes
1. NS = not sampled, LF = low flow, HP = high purge
2. Sub = Redi Flo2 submersible pump, Ben = Bennett Pump (piston flow), PP = peristaltic pump, B = Bailer
3. SWL = static water level prior to sampling
4. Well volume = volume of water column occupying PVC and screened interval (assume 30% filter pack porosity)
5. IV = insufficient volume and/or lack of recovery, ART = artesian. FRZN = frozen

The discharge line from the pump is coupled to a flow-through cell allowing field parameters to be measured using a YSI Pro-DSS meter. A sample is collected once field parameters and water levels stabilize. If the well cannot be pumped continuously, or if a bailer is used, the sample is collected after field parameters stabilize and three well volumes have been extracted. If a bailer is used, a portion of the bailer volume is decanted into the YSI housing where field parameters are measured. Records of field data are compiled in Appendix C. The YSI Pro-DSS is calibrated within 24 hours of use, and can measure temperature, pH, specific conductivity, oxidation reduction potential (ORP), dissolved oxygen (DO) and turbidity Probe calibration data are reported in Appendix D.

3.2.3.2 Sampling Equipment Trial (Snap Sampler)

Historically, groundwater monitoring wells at the mine have elevated turbidity and TSS results, likely resulting from sampling with inertial pumps and/or bailers. While transitioning to low-flow techniques (peristaltic and submersible pumps) has reduced the observed turbidity and TSS results, mobilizing the necessary equipment to each well remains a challenge. Additionally, some deep and low-yield wells at the mine require prohibitively slow sampling rates (<0.1 L/min) and have significant annual water level fluctuations that complicate design for conventional dedicated systems such as bladder pumps. To help manage these constraints, a sampling trial using HydraSleeves, a no-purge sampling technique, was undertaken in 2019. Following a review of the HydraSleeve results, the trial was expanded to include Snap Samplers, a more robust no-purge sampling system, in sQ4 2020. Details of the HydraSleeve trial were presented in the 2019 Annual Monitoring Report (Lorax 2020a). The sQ4 2020 Snap Sampler trial results were presented the 2020 Annual Monitoring Report (Lorax 2021).

Snap Samplers provide a no-purge/passive groundwater sampling technique that allows for rapid sample collection with minimal equipment. These methods are particularly useful at remote field sites where logistical issues, adverse/unpredictable weather, difficult access, and low-yield wells make groundwater sampling challenging (ASTM 2014).

Both low-flow sampling and no-purge/passive methods are predicated on ambient flow from the formation through the well screen, a condition that is present in most properly constructed and developed wells (ASTM 2018). Under these conditions, water within the well screen is considered to be in equilibrium with the surrounding formation (Robin and Gillham 1987). These conditions may not be present in wells that recharge very slowly, with potential data quality issues arising from aeration, dewatering, and/or turbidity, regardless of the sampling method. In these instances, no-purge/passive sampling techniques, such as the Snap Sampler, may be the preferred sampling method provided there is sufficient equilibration time within the screen (ITRC 2007). As with other no-purge/passive techniques, the Snap Sampler is deployed within the well screen for a pre-determined period (at least two weeks at Brucejack Mine) prior to sample collection, allowing for equilibration with formation water following deployment.

A single Snap Sampler apparatus includes six replaceable 125 mL sample bottles aligned vertically in the well screen, for a total sample volume of 0.75 litres (Figure 3-2). The bottles are held open at both ends by a spring-loaded trigger mechanism operated by a pneumatic plunger at the top of the bottle array. A single HDPE tube is connected to the plunger, allowing for pressurization from surface, as well as deployment and withdrawal of the Snap Sampler. When the plunger is triggered, the recoiling springs seal the bottles, thereby capturing an in-situ, undisturbed sample from within the well screen. New bottles are installed following sample collection. Technical guidance and descriptive documents for the Snap Sampler are provided in Appendix E.

A total of seven Snap Samplers were deployed and eighteen samples collected from sQ1-sQ3 2021 on top of the six samples collected in sQ4 2020 (Table 3-6). Candidate wells were selected for a range of depths, yields, recharge, access and availability of historical data sets. After a minimum two-week equilibration period, the Snap Sampler was withdrawn from the well and sampled immediately prior to collecting the routine low-flow sample.

Figure 3-2: Snap Sampler assembled at surface.

Notes:
1. Sub = Redi Flo2 submersible pump, Ben = Bennett Pump (piston flow), B = Bailer
2. Low-flow comparison samples were collected immediately after the Snap Sampler, except for: BJ-GW18-17A (sQ1), where the comparison sample was collected on April 27, 2021; BJ-GW18-17B (sQ1), where comparison sample was collected April 5, 2021; BJ-GW18-17B (sQ2), where comparison sample was collected on July 29, 2021; BJ-GW12-3A (sQ3) where comparison sample was collected on September 23, 2021; BJ-GW18-17B where comparison sample was collected on September 15, 2021
3. Snap failure related to freezing of line/pressurization failure.
4. Snap failure related to hole in line or failure of seal.

3.2.3.3 Monitoring Well Development and Monitoring Network Evaluation

In 2021, Lorax advised Pretium staff to suspend development and prioritize water level monitoring at seven of the 2018 series monitoring wells due to persistent elevated pH, likely resulting from water contact with cement grout (Pohlmann and Alduino, 1992). Table 3-7 summarizes purge volumes and pH measurements current to the end of sQ3 2019 and additional discussion is provided in the 2020 Groundwater Monitoring Report (Lorax, 2021).

Subsequently, Lorax developed an updated numerical groundwater model in support of the 2020 Mine Plan and Reclamation Program Update (Lorax 2020b in Pretium 2020c). The updated model featured higher resolution discretization of the model domain and benefitted from a longer calibration period which included groundwater level and mine dewatering data collected until the end of 2018. With an improved conceptualization of mine developments at closure, the 2020 groundwater model predicts a narrower trajectory of contact water flowpaths from the flooded mine towards Brucejack Creek. The broader trajectory of contact water flowpaths west of the Brucejack Fault simulated by the 2015 groundwater model (BGC, 2015a), and the basis for the water quality monitoring requirements in many of the 2018-series wells, is not supported by the 2020 model. Eight of the groundwater wells installed in 2018 are not correctly located to intercept mine contact water at closure, the purpose for which they were installed.

In light of the model findings, Pretium has applied for an amendment to PE-107835 to revise the scope of groundwater quality monitoring at the 2018-series monitoring wells. This amendment was submitted to BC MECCS on February 10th, 2022, and includes a technical report outlining rationale for a streamlined groundwater quality monitoring scope (Lorax 2022).

3.3 Well Decommissioning and Maintenance

No groundwater wells were decommissioned or repaired in 2021.

Table 3-7: Well development status

Red text indicates well is not suitable for groundwater quality monitoring.
1. PE-107835 groundwater quality monitoring requirement; Q = quarterly; B = biannual; NR = not required (water level monitoring only).
2. *Italicised* numbers indicate full seasonal range in water levels not yet captured, seasonal range in borehole volumes (and range in purged volumes) may be larger. Volumes computed based on water levels collected until the end of December 2020.
3. Includes volume of water column inside casing and sand pack porosity.

4. Groundwater Quantity

4. Groundwater Quantity

4.1 Mining Operations and Water Management

A total of 1,415 kt of ore was produced at the Brucejack Mine during 2021. The base of the VOK zone workings was extended from 1038 m asl to 1015.5 m asl over the course of the year, with a maximum depth of 528.5 m bgs (Table 4-1). In the West Zone, approximately 150 m was mined at the 1320 ramp, while approximately 50 m was mined at the 1350 ramp in 2021. The 2021 West Zone development extends to 1278 m asl (150 m bgs); historical workings remain deeper than new developments (Table 4-1). Recently mined areas in the West Zone lie above the water level maintained in the workings (1,185 m asl) and are unlikely to have created water.

Mine dewatering is conducted to allow excavation of new workings, with water directed to the water treatment plant (WTP). The water level in the previously developed West Zone workings was maintained between 1,275 and 1,290 m asl in 2021. In the VOK, water is pumped from a series of sumps above and below the VOK 1300 m sump from where it is directed to the WTP.

Table 4-1:
Extent of Brucejack mine underground workings.

Mine Area	End of 2020	End of 2021	Projected End of Mine
VOK			
Max Elevation (m asl)	1,480	1,480	1,535
Min Elevation (m asl)	1,038	1,015.5	990
Max Depth (m bgs)	506	528.5	550
West Zone			
Max Elevation (m asl)	1,369	1,369	1,385
Min Elevation (m asl)	1,154	1,154	1,040
Max Depth (m bgs)	263	263	355

4.2 Underground Mine Dewatering

Underground dewatering rates attributed solely to groundwater are derived from daily measurements of underground influent to the WTP. These values are adjusted to account for water recirculated to the underground for drilling, dust suppression and washing. The recirculated water is reported as flow to the underground waterbox and is also recorded daily. For reporting purposes, it is assumed that all flow to the underground waterbox eventually reports back to the WTP, however Pretium staff indicate some of this water is lost to the mill (with ore) or to the WRTSF (with waste rock). Accordingly, calculated dewatering rates attributed solely to groundwater may be slightly underestimated.

Daily underground dewatering rates for 2021 are presented in conjunction with precipitation data in Figure 4-1. Annually, underground flow rates are higher during the open water season when precipitation reports as rainfall. Underground low flows fluctuated around 500 m^3/d in April 2021 with a few days reporting net negative flows (*i.e.*, more water sent underground for drilling than pumped back to surface). Underground dewatering rates remained low through May and rose sharply in response to a large (72 mm) rainfall event that occurred May 31st through June 2nd. Underground dewatering rates peaked on June 2nd at 4,200 m^3/d. A second peak of similar magnitude was experienced on June 29th following several days of warm weather (daily average temperature exceeding 10ºC) which melted the remaining snowpack. Dewatering rates stabilized around 2,500 m^3/d in August and September and declined through the fourth quarter to sub 1,000 m^3/d in December 2021.

The daily underground dewatering record indicates flashiness that is partly attributed to precipitation and is inferred to also be influenced by mining rate, mining elevation, ground conditions and/or other operational artefacts. Similar rapid upticks in dewatering rates in response to heavy rainfall events have been noted previously (Lorax 2020a, 2021), suggesting a component of fracture driven flow to the underground.

Figure 4-1: 2021 daily underground dewatering rates and daily rainfall and snow water equivalent.

Figure 4-2 shows monthly underground dewatering rates since 2013. A repeating series of monthly average underground dewatering over the 2013 to 2020 period is shown for

reference. Monthly average low flow dewatering rates measured in April 2021 (446 m^3/d) were slightly below low flow rates from prior years which ranged from 550 to 750 m^3/d. Peak monthly dewatering rates in June 2021 reached an all-time high of 2,800 m^3/d. Despite the large rainfall event which caused the June 2nd dewatering peak (Figure 4-1), total precipitation in June 2021 was slightly below average (Table 2-1). Further, May to September 2021 rainfall was about 10% less than the equivalent period in 2020. This supports the assertion that increased open water season dewatering rates are being influenced by the expanding mine development as much, if not more, than by climate.

Figure 4-2: Monthly underground dewatering rates between 2013 and 2021.

4.3 Groundwater Elevations

4.3.1 Overview

Groundwater level data have been collected at the mine on a nearly continuous basis since the end of 2012. Water level hydrographs for all current groundwater monitoring wells are provided in Appendix F. Contoured water level data from high flow (June 15th, 2021) and low flow (April 15th, 2021) periods are presented in Figure 4-3 and Figure 4-4, respectively. The groundwater level contours were constructed with emphasis given to water levels measured at the shallow well of the nested pair, noting that all Brucejack wells are completed in bedrock (Table 3-1, Appendix A). A cross-section along A-A', populated with June 2021 water levels, is provided in Figure 4-5. The discussion below provides a brief overview of baseline conditions, an interpretation of the 2021 groundwater head distribution followed by an analysis of trends by mine area.

4.3.2 Baseline

A description of the baseline groundwater system is provided in BGC (2014). Prior to mine dewatering, groundwater levels in the mine area were observed to follow topography, becoming deeper at higher elevations. Strong seasonal variations in groundwater levels were observed, particularly at higher elevations, indicating a snowmelt/precipitation-driven groundwater level hydrograph. Peak groundwater levels were observed in response to freshet and summer/fall storm events. Recharge beneath glaciers and in response to seasonal glacial melt was also identified as an unquantified contributor to groundwater recharge. Groundwater discharge zones are pervasive in the high-topography landscape, and include lakes, creeks, gullies, seeps, and breaks in slope.

4.3.3 Operations

4.3.3.1 Groundwater Level Surface

Continuous dewatering of the historical and current underground mine has occurred since August 2012. This has resulted in a depression of the water table in West Zone and VOK footprint areas and farther afield. The June and April 2021 water level contour plots reveal a similar groundwater level configuration, with June 2021 water levels 25 m to 50 m higher than April 2021 (Figure 4-3, Figure 4-4).

For wells where 2012 baseline data exist, annual drawdown based on June water levels has been computed (Table 4-2). Wells completed adjacent to the VOK (BJ-GW11-5A/B, BJ-GW12-12A) have experienced the most drawdown, with screens becoming desaturated during or before 2018. Water level data collected at nearby 2018-series monitoring wells (BJ-GW18-19A/B, BJ-GW18-21A/B) suggest that drawdown in the area of BJ-GW11-5A/B and BJ-GW12-12A exceeds 100 m; this is also supported by results from the 2020 model update (Lorax, 2020b).

A steep drawdown curve is expected within the footprint of the VOK workings itself, as the groundwater level is likely approaching the maximum depth of the workings (1,015.5 m asl). Slightly north of the VOK, shallow well BJ-GW12-9B (46 m deep) appears to screen a perched water table (*ca.* 1480 m asl) with the corresponding deeper well BJ-GW12-9A (76 m deep) essentially dry for the last several years (Figure 4-3, Appendix F).

Table 4-2:
Drawdown in selected monitoring wells since 2012.

Well ID	Ground Surface	Screen Top	Screen Bottom	Jun-12 (Baseline WLE)	Drawdown[2,3] (m)								
	(m asl)	(m asl)	(m bgs)	(m asl)	Jun-13	Jun-14	Jun-15	Jun-16	Jun-17	Jun-18	Jun-19	Jun-20	Jun-21[3]

Notes:
*Water level from July, ** Water level from August
***Water level from May
1. WLE = water level elevation, ND = no data
2. Positive values indicate drawdown, water levels preceded by ">" indicate well is dry. Negative values indicate water levels are above baseline levels.
3. Drawdown computed from water levels recorded on June 1 for years 2013 to 2020 (except where noted) and from June 15 for 2021.

The 2021 water level data indicate that groundwater is flowing towards the VOK from all directions. Both April and June water level contour interpretations depict a shallower groundwater divide between the West Zone and VOK (Figure 4-3 to Figure 4-5). At significant depth (*ca*. 500 m bgs), it is inferred that the strong depression in water levels at the VOK is causing groundwater flowpaths originating north of Brucejack Creek to bypass Brucejack Creek and deflect towards the VOK (Figure 4-5). This is supported by the findings of the groundwater model (Lorax 2020b).

Groundwater levels west of Brucejack Fault at BJ-GW18-20A/B are significantly higher than at BJ-GW18-19A/B, a well pair immediately northwest of the VOK and east of the Brucejack Fault. Water level differences between the deep (A) wells are on the order of 87 to 120 m in April and June, respectively (Figure 4-3, Figure 4-4). Water level differences between the shallow (B) wells is on the order of 87 m in June (Figure 4-3). The Brucejack Fault is inferred to be a permeable feature which is limiting the extent of drawdown west of the fault. The assumption of high permeability of the Brucejack Fault is supported by high airlift yield observed in the mine's water supply well (D3, Figure 1-1) and is supported by model findings (Lorax 2020b). The Brucejack Fault zone was intersected by mine workings in 2020 and 2021. The timing of the fault crossings and influence on mine water is currently being assessed by Pretium Environmental staff.

Water levels in the West Zone have been maintained between 1275 m asl and 1290 m asl for the last several years. Groundwater levels have declined on the order of 40 m at BJ-GW12-11B, about 170 m southwest of the West Zone, although this more likely due to the advancement of a development from the VOK towards the West Zone in 2021 (Figure 4-3). Water levels west of the West Zone at BJ-GW11-1A markedly declined by tens of meters through 2016 but have more recently recovered to baseline levels (Table 4-2). A similar trend is observed at BJ-GW11-3A, however, water levels are still depressed by several meters compared to baseline (Table 4-2,Figure 4-9). The deflection of water level contours towards BJ-GW18-17A/B suggests that this area may have an enhanced hydraulic connection to the West Zone (Figure 4-3, Figure 4-4). Water levels at BJ-GW18-17A/B are lower than the elevation of the WRTSF (1364.5 m) which suggests that the WRTSF is recharging the groundwater system. This is consistent with findings from the 2015 and 2020 groundwater models which predicted a small contribution of WRTSF water reporting to the underground workings during operations (BGC 2015a, Lorax 2020b).

4.3.3.2 Groundwater level time trends

Water level hydrographs for all monitoring wells are provided in Appendix F with selected hydrographs presented in the following sections. Underground dewatering rates and precipitation data are plotted for reference. Many hydrographs display seasonal peaks

consistent with freshet and summer precipitation events with annual minima experienced in April/May.

VOK Zone

Table 4-3 summarizes the water level and vertical gradient ranges measured at Brucejack monitoring wells in 2021. Historic monitoring wells located adjacent to the VOK (GW11-5A/B, BJ-GW12-12A/B, BJ-GW12-9A) have been essentially dry over the last two years or longer (Table 4-2). More consistent water level data from deeper monitoring wells established in 2018 are now available.

Similar to observations from historic wells, seasonal water level fluctuations at 2018-series wells completed near the VOK are on the order of tens to over 40 metres (BJ-GW18-20A,21A) (Table 4-3). On account of depressurization of the underground, a strong downward hydraulic gradient approaching unity is observed at BJ-GW18-21A/B and BJ-GW18-19A/B. Strong downward gradients were also observed in 2011-2012 era monitoring wells prior to the wells going dry (Lorax 2021, 2020a).

Water level hydrographs for selected shallow wells south (BJ-GW18-21B) and west (BJ-GW18-19B, BJ-GW18-20A) of the VOK are shown in Figure 4-6. The water level at BJ-GW18-21B is punctuated by a sharp spike near the beginning of June 2021 which coincides with a period of flooding at the wellhead, similar to that experienced in June 2020. This spike is also present in the deep well (Appendix F). Casing stickups at BJ-GW18-21A/B were extended in 2020 to prevent future ingress of surface water runoff. The stickup at BJ-GW18-21A/B will be inspected and further modified in 2022 to reduce the likelihood of future flooding events. Otherwise, the water level record at BJ-GW11-21B seems to indicate a declining trend which would be attributed to continued development of the VOK.

BJ-GW18-19B is northwest of the workings and shows water levels that were trending towards a maximum in August 2021, however, the water level did not recover after sampling in August so the full maximum may not have been captured. The incomplete record appears to suggest that water levels are declining. The seasonal minimum was not captured with the logger dry between December 2020 and June 2021 (Figure 4-6). For the period of overlap for the shallow and deep well logger data (Appendix F), a downward gradient approaching 100% is present (Table 4-3).

Nearby, the water level trend at BJ-GW12-9B shows some recovery of the shallower water table over the last three years (Figure 4-7) which is likely a result of higher precipitation from 2019-2021 compared to below average precipitation in 2016 to 2018 (Table 2-1).

Table 4-3: 2021 water level and vertical hydraulic gradient ranges in Brucejack monitoring wells

Well ID	Ground Surface (m asl)	Water Level Range (m bgs)		Water Level Range (m asl)		Range in Water Levels (m)	Range in Vertical Hydraulic Gradient[1,2] (%)

Notes:
n/a – not applicable. Well dry for entire year.
* Maximum derived from a manual reading rather than a continuous WL record.
**Logger became over pressurized during period of seasonal maximum.
***Water level artificially increased due to ponding and ingress of meltwater at well head.
1. Hydraulic vertical gradient ranges are provided where a nearly complete WL record is available.
2. Upward gradients are positive.
3. Wells are artesian and pressurized prior to WL measurement; WL elevations and gradient may be inaccurate.

Figure 4-6: Water level hydrographs at BJ-GW18-21B, BJ-GW18-19B and BJ-GW18-20B.

Figure 4-7: Water level hydrograph at BJ-GW12-9B.

The water level data record at BJ-GW18-20B demonstrates a minimum water level at the beginning of May and peak water levels in September/October 2021. The data record for the deeper well is of similar shape (Appendix F). Vertical hydraulic gradients at this well pair range from slightly downward (6%) to moderately upward (8%). This well pair has not shown an obvious water level response to crossing of the Brucejack fault by underground workings in 2020 and 2021. The relatively modest vertical gradients at this well pair suggest that the Brucejack fault is limiting the extent of groundwater depressurization west of the fault.

East of the VOK, well pair BJ-GW18-18A/B report upward gradients (26%) during the winter low flow period, which then switches to a downward gradient, starting in May, and persists through September (Table 4-3, Appendix F).

West Zone

The West Zone workings have been dewatered to an elevation ranging between 1,275 and 1,290 m asl for several years. Prior to 2019, monitoring of the West Zone was accomplished through several historic monitoring well pairs with maximum well depths of up to 80 m. New monitoring wells BJ-GW18-17A/B and BJ-GW18-22A/B provide water level information up to 370 m depth (Table 3-1). BJ-GW18-22A/B lies south of the West Zone along the decline to the VOK. The water level data indicate a modest downward hydraulic gradient (12-18%) and seasonal fluctuations on the order of 10 m to 20 m in the deep and shallow wells, respectively (Table 4-3).

2021 water levels measured at BJ-GW12-11A, west of the West Zone, are consistent with previous years' data. Water levels in the deeper well, BJ-GW12-11B, dropped significantly in 2021 after three years of reasonably consistent values with the water level maximum over 15 m lower than previous years (Figure 4-8). Downward vertical gradients have increased as a result and exceed 140%. Note that at this location, the "B" well is the deeper well. At this time, the downward trend in BJ-GW12-11B is thought to arise from a new development advanced from the VOK southwards towards the West Zone (Figure 4-3).

Water levels in nearby monitoring wells BJ-GW11-1A/B and BJ-GW11-3A/B started to diverge from 2018-2020 measurements, with some influence from annual precipitation trends. Water levels from BJ-GW11-1A/B, west of the West Zone portal, remain generally consistent from previous years, though peak water levels in BJ-GW11-1A were over 10 m higher than previous years on account of heavy precipitation in September/October (Appendix F, Table 2-1). A similar increase (6 m) was experienced east of the West Zone portal at BJ-GW11-3A (Figure 4-9). Water levels in the shallow well (BJ-GW11-3B) were above ground surface more consistently in 2021 than in 2019 and 2020, with the well maintaining artesian conditions late into the fall and freezing solid to the top of casing at the onset of winter. Downward hydraulic gradients at BJ-GW11-3A/B peaked in 2016 at 20% and are now in the range of 2% to 12% (Figure 4-9, Table 4-3).

Water level data from BJ-GW18-17A/B are shown in Figure 4-10. Both shallow and deep water levels are responsive to freshet and summer/fall rainfall, with similar trends to 2019 and 2020 observed. The well pair demonstrated a downward hydraulic gradient in the range of 40% to 73% over 2021 (Table 4-3).

BJ-GW12-8A/B, located west of the Brucejack Fault, responded to mine dewatering with peak water levels at the shallower well (BJ-GW11-8B) declining by ~10 m between 2013 and 2017 (Appendix F). Since then, water levels in the shallow well have remained reasonably consistent. Water levels at the deeper well (BJ-GW11-8A) have remained consistent since inception. Upward vertical gradients have generally increased since 2013, reaching a maximum of 25% in 2021 (Table 4-3).

Contact Water Pond

Nearly three years of water level data have been collected at BJ-GW18-23A/B, located directly downgradient of the Contact Water Pond (CWP). As expected, water levels at this well are strongly influenced by the controlled water level in the CWP and thus vary on the order of one meter throughout the year (Figure 4-11). Vertical gradients at this well pair are subtle and were more frequently downward (<2%) in 2021.

Background

Hydrographs from background monitoring wells BJ-GW11-6A/12-6B, BJ-GW14-13A/B and BJ-GW14-14A/B are provided in Appendix F. Continuous data from BJ-GW11-6A/12-6B indicate water levels are commensurate with previous years' data with exception to the deep well (BJ-GW11-6B) reaching a water level maximum two metres higher than previous years. Data from BJ-GW14-13A/B and BJ-GW14-14A/B are also commensurate with previous years' data. Vertical gradients and BJ-GW14-14A/B are modestly upward (<10%) for most of the year. The vertical gradient at BJ-GW14-13A/B is difficult to interpret since both wells are artesian when the loggers are downloaded and register pressures higher than the top of casing prior to the j-plug being removed. The gradient appears to be relatively constant and downward throughout the year, but the magnitude is not completely certain (Table 4-3, Appendix F).

Figure 4-11: Groundwater levels and vertical hydraulic gradient at BJ-GW18-23A/B.

5. Groundwater Quality

5. Groundwater Quality

5.1 Quality Assurance and Quality Control

An extensive quality assurance/quality control (QA/QC) program was implemented for the groundwater quality monitoring program. Samples were collected, preserved, stored, transported and tested in accordance with the requirements set forth in the British Columbia Environmental Laboratory Manual (Austin, 2015) and the British Columbia Field Sampling Manual (Clark 2013). All groundwater quality samples were analysed by ALS Environmental (ALS) in Burnaby, BC. The 2021 QA/QC data is tabulated in Appendix D.

5.1.1 Field Blanks

Field blanks are used to detect potential contamination resulting from the sample collection method, handling, filtration, preservation, and exposure to the environment. Blank samples were collected by pouring de-ionized (DI) water into clean sample bottles at a well site and then processing the blank at the laboratory in the same manner as other samples.

One field blank was collected in sQ1 and sQ4 of 2021, with two field blanks collected in sQ3 of 2021. Field blanks were analyzed for general parameters, anions, nutrients, total and dissolved metals. Overall, most analytes in field blank samples reported below method detection limit (MDL) with the exception of parameters listed in Table 5-1. The field blank sample from sQ1, sQ3 and sQ4 had four, three and one detection(s) above the MDL, respectively, with four being less than double the lowest detection limit. All dissolved metals detected were notably lower than the co-located samples collected and as such, do not represent concerns for sample contamination.

Table 5-1:
Analyte detections in 2021 field blank samples

Sampling Period	Parameter	Unit	MDL (mg/L)	Result
sQ1	Hardness (as CaCO3), dissolved	mg/L	0.50	1.6
	Aluminum, dissolved	mg/L	0.0010	0.0011
	Calcium, dissolved	mg/L	0.050	0.641
	Strontium, dissolved	mg/L	0.00020	0.00036
sQ3 (1)	Acidity (as CaCO3)	mg/L	2.0	2.1
	Barium, dissolved	mg/L	0.00010	0.001
	Copper, dissolved	mg/L	0.00020	0.00063
sQ4	Acidity (as CaCO3)	mg/L	2.0	2.3

5.1.2 Travel Blanks

Travel blanks are used to assess the likelihood of sample contamination occurring during handling of the samples, or from the sample containers. Three travel blank samples were submitted in 2021; one each in sQ1, sQ2 and sQ4, respectively. Analyte detections are noted in Table 5-2, with none representing concerns to sample integrity.

Table 5-2:
Analyte detections in 2021 travel blank samples

Sampling Period	Parameter	Unit	MDL (mg/L)	Result
sQ1	Acidity (as CaCO3)	mg/L	2.0	2.3
sQ4	Acidity (as CaCO3)	mg/L	2.0	2.7
	Alkalinity, total (as CaCO3)	mg/L	1.0	1.1

5.1.3 Equipment Blanks

An equipment blank was collected from the Bennett sample pump in sQ1 immediately prior to collecting a sample from BJ-GW18-17A. Approximately 40 litres of dilute Alconox solution was pumped through the tubing, followed by 60 litres of Brucejack potable tap water and 40 litres (the approximate total volume of the tubing length) of DI water. The equipment blank sample was collected after approximately 20 litres of DI water discharge, when the water appeared clear. Several analytes were measured above MDL in the equipment blank and these detects are compared to the lowest concentrations measured in a groundwater sample collected with the Bennett pump since 2018 in Table 5-3.

A total of 16 samples have been collected with the Bennett sample pump between BJ-GW18-17A (10) and BJ-GW18-19B (6) since 2018. The lowest measured concentrations in the 16 samples are typically one to two orders of magnitude greater than those measured in the equipment blank. Some parameters measured above detection in the equipment blank have been reported below detection limit in groundwater samples collected with the Bennett pump (Table 5-3). The data suggest that potential cross-contamination from the Bennett sample pump has minimal, if any, impact on the interpretation of groundwater quality samples collected with the Bennett pump.

Additionally, equipment blanks were collected from the Grundfos Redi-Flo2 submersible pump in sQ1 and sQ2. After the pump was cleaned, approximately 10 litres of dilute Alconox solution was pumped through the pump, followed by approximately 12 litres of DI water, at which point a sample was collected. In sQ1, an intermediate sample was collected after the pump was cleaned and before flushing with Alconox and DI water. Several analytes were measured above MDL in the equipment blank and these detects are compared against the corresponding groundwater sample collected at the well in Table 5-4.

For the sQ1 sample, the intermediate sample yielded higher parameter concentrations than the primary equipment blank (Table 5-5). This suggests that continued flushing of the pumping (either with DI water when collecting an equipment blank, or with well water when collecting a groundwater sample) results in more representative samples. While the data indicate that there is the potential for cross-contamination from the submersible pump, the purging process reduces the impact of this effect and should not significantly impact the interpretation of groundwater samples collected with the submersible pump.

Table 5-3:
Analyte detections in the 2021 Bennett pump equipment blank sample

Parameter	MDL (mg/L)	Equipment Blank Result (mg/L)	Lowest Concentration Measured in Well Sampled with Bennett Pump

5.1.4 Field Duplicate Samples

Field duplicates are independent samples collected as close as possible from the same location and at the same time as the primary sample to characterize environmental variability and the precision of the entire sampling and analytical process (Clark 2013).

For analytes measured above five times the detection limit (5xMDL), a relative percent difference (RPD) exceeding 20% between primary and duplicate sample results could indicate potential integrity issues, while an RPD exceeding 50% suggests a definite integrity issue such as contamination or lack of sample representativeness (Clark 2013). For analytes measured at lower concentrations (*i.e.,* within 5xMDL), a generally accepted guidance is that the difference between primary and duplicate results be within twice the detection limit (2xMDL).

One field duplicate was collected per shifted quarter in 2021. The analytes from sample/duplicate pairs exceeding data quality objectives (DQOs) of 20% or >2xMDL are listed in Table 5-6. Duplicates taken in sQ1 (BJ-GW18-23A), sQ2 (BJ-GW12-8B), sQ3 (BJ-GW14-14A) and sQ4 (BJ-GW11-3A) had 1, 3, 0 and 3 exceedances of DQOs, respectively, largely related to the total metals suite and differences in TSS/Turbidity. Overall, the field duplicate analysis indicates adequate sampling precision in 2021, with large improvements over 2020 which saw 30 DQO exceedances, compared to 7 in 2021.

Table 5-6:
Differences between primary and field duplicate samples (sQ1 to sQ4)

Sampling Period and Well ID	Analyte	MDL (mg/L)	Sample (mg/L)	Duplicate (mg/L)	RPD
sQ1: BJ-GW18-23B	Zinc-D	0.0010	0.0065	0.0025	>2MDL
sQ2: BJ-GW12-8B	Phosphorus-T	0.0020	0.0079	0.0168	>2MDL
sQ2: BJ-GW12-8B	Chromium-T	0.00050	0.00913	0.0124	30%
sQ2: BJ-GW12-8B	Nickel-T	0.00050	0.00496	0.007	34%
sQ4: BJ-GW11-3A	TSS	3.0	20.9	<3	>2MDL
sQ4: BJ-GW11-3A	Turbidity	0.10	5.8	3.96	38%
sQ4: BJ-GW11-3A	Aluminum-T	0.0030	0.0279	0.0176	45%

Notes:
MDL = method detection limit, RPD = relative percent difference

5.1.5 Transport Temperature

Coolers containing groundwater samples were packed with icepacks and dispatched from site typically within one day of sample collection. Cooler temperature was measured at the laboratory upon receipt. Clark (2013) recommends that water samples are maintained

below 10ºC during transit. All but nine out of 38 cooler submissions arrived at ALS with an internal temperature below 10ºC. Of these nine coolers, four had temperatures between 10ºC and 12.5ºC and five had temperatures between 15ºC and 18ºC. These temperature exceedances are generally associated with long transport times between the mine site and ALS in Burnaby and are typically outside the control of site field personnel. The analytical results for the samples contained within these coolers were consistent with historical analytical results at the respective monitoring well locations. Hence, the warmer transport temperatures do not appear to have impacted analytical results for the affected samples.

5.1.6 Hold Times

Groundwater samples collected at Brucejack groundwater wells were received/analysed within recommended hold times for all tested parameters, except for the samples listed in Table 5-7, which exceeded some or all of the laboratory hold times for turbidity, nitrite, nitrate, orthophosphate-D, total sulfides, TDS and TSS. The hold time exceedance for these samples were due to delays with the cargo carrier or having to hold samples over the weekend before shipment.

The analytical results from these samples were consistent with historical nitrite, nitrate, turbidity, orthophosphate-D, total sulfides, TDS and TSS concentrations; hence these results are considered to be representative of the groundwater quality from these monitoring wells.

Table 5-7:
Hold Time Exceedances for 2021 (sQ1 to sQ4)

5.1.7 Charge-Balance Error

The accuracy of groundwater quality analytical results was assessed by calculating the charge-balance error (CBE) according to the following formula:

$$\text{CBE} = \frac{\sum cations - |\sum anions|}{\sum cations + |\sum anions|} \; x \; 100\%$$

where cations include Na^+, K^+, Ca^{2+}, Mg^{2+} and Fe^{2+}, and anions include HCO_3^-, SO_4^{2-}, Cl^- and NO_3^-. Cation and anion concentrations in the CBE equation are expressed in milliequivalents per litre (meq/L). Seven of the 53 groundwater samples had a CBE greater than or equal to ± 5% as presented in Table 5-8. It should be noted that the non-permit wells BJ-GW16-5A/B were included within this section as they accounted for a significant number of the charge-balance errors.

Table 5-8:
Summary of Results for CBE (All Quarters)

Groundwater Well	sQ1 CBE (%)	sQ2 CBE (%)	sQ3 CBE (%)	sQ4 CBE (%)
BJ-GW11-1A	-	-1%	-2%	-3%

5.1.8 Total versus Dissolved Metals

In samples where both dissolved and total fractions of analytes are measured above 5xMDL, the dissolved metal concentration is flagged as a potential QA/QC issue if the ratio of dissolved to total concentration exceeds 120%. Parameters exceeding the DQO are listed in Table 5-9. Most exceedances are associated with selenium. ALS has indicated that results for dissolved selenium can be biased high on account of volatile organic selenium interfering with the ICP-MS. Digestion of the total metals sample prior to analysis allows the volatile selenium to off-gas and prevents this type of interference. Since selenium has not been identified as a parameter of concern for the Brucejack Mine, Pretium has not sought alternative sampling/analytical methodologies for dissolved selenium. Rather, dissolved versus total exceedances are flagged in summary tables (Appendix G).

Table 5-9:
Parameters where dissolved fraction exceeds total fraction (sQ1-sQ4)

Groundwater Well	Sampling Period	Parameter	Ratio of Dissolved/Total Metals (%)
BJ-GW18-17B SNAP	sQ1	Selenium-D	1971%
BJ-GW18-17A SNAP	sQ2	Potassium-D	130%
BJ-GW18-23A	sQ4	Selenium-D	201%
BJ-GW16-5A		Molybdenum-D	123%
BJ-GW16-5B		Zinc-D	129%
BJ-GW12-8B		Copper-D	124%
BJ-GW18-17A		Selenium-D	630%

5.1.9 Turbidity

The Water and Air Baseline Monitoring Guidance Document for Mine Proponents and Operators (BC MOE 2016b) (the Guidance) highlights concerns regarding high turbidity values measured in groundwater quality datasets. These concerns are related to the representativeness of dissolved metal concentrations as bioavailable metal concentrations. The Guidance recommends that low flow sampling techniques should be employed if sample turbidity exceeds 50 NTU. Where turbidity is naturally elevated, the Guidance indicates that sample turbidity of up to 200 NTU may be acceptable.

Table 5-10 provides a breakdown of wells sampled in 2021 that had turbidity results greater than 50 NTU and 200 NTU, with samples >50 NTU including samples >200 NTU. Table 5-11 provides a comparison of pre-2021 and 2021 turbidity values at all the wells, with samples >50 NTU including samples >200 NTU. Upon implementation of the low-flow protocol in mid-2019 (Section 3.2.3.1), the number of locations with turbidity in

excess of 50 NTU and 200 NTU declined. One location, BJ-GW18-17B, presented more persistent turbidity issues in 2021.

BJ-GW18-17B was sampled via submersible pump in sQ2 and sQ3 and via bailer in sQ1 and sQ4. The high turbidity values reported at this well are largely attributed to a fine suspended sediment load in the well purge water. With well recharge rates extremely low, multiple bore volumes need to be purged in order to achieve parameter stabilization. In addition, the well screens anoxic groundwater that may be prone to oxidation in the unpreserved anions/physical parameters bottle, leading to formation of suspended hydroxides. This may also contribute to the high turbidity reported for this well. Similarly, wells BJ-GW11-1A and BJ-GW18-17A were sampled with a bailer in sQ3 and sQ4, respectively, which likely played a role in their elevated turbidity readings. Overall, the transition to low-flow sampling methodologies continues to improve in turbidity levels in groundwater samples in 2021.

Table 5-10:
Summary of high turbidity occurrence in Brucejack groundwater samples by date

Well ID	Total Sample Count	Samples >50 NTU	Samples >200 NTU

5.2 Groundwater Quality Interpretation

5.2.1 Overview

Complete groundwater quality data for all wells currently sampled under PE-107835 is tabulated in Appendix G. Appendix H tabulates groundwater quality statistics for each monitoring well (minimum, maximum, median, mean) for the baseline period (2011-2014) and annually from 2015-2021. Bar graphs of baseline and annual mean groundwater quality are presented in Appendix I, along with piper plots and times series graphs of selected parameters. Appendix J contains laboratory reports of analysis. Selected data from these appendices are presented below.

As identified in the groundwater level discussion (Section 4.3), groundwater flow patterns at site are dominated by the drawdown created from dewatering of the West Zone and VOK Zone. Declining water levels in wells may introduce more oxygenated water at depth or draw water in from areas different from baseline. Monitoring wells at lower elevations are more prone to impacts from surface activities such as construction and operation of surface infrastructure, such as the CWP. The mine undertook a hydrogeological study of the CWP in 2016 (BGC 2017) and it was determined that seepage losses to groundwater CWP would occur when the elevation of the pond was above 1369.2 m asl.

Table 5-12 summarizes average 2021 concentrations measured in Brucejack monitoring wells for selected parameters. Parameters excluded from this table were infrequently to rarely measured above baseline concentrations. Formatting in Table 5-12 indicates where 2021 average concentrations are higher than the baseline period (2011-2014). More notable trends are highlighted in the discussion below.

5.2.2 Major Ion Chemistry

As indicated in Table 5-12, several wells indicate elevated major ions (Ca-D, Mg-D, SO_4) compared to baseline. Both temporal and spatial trends in major ion chemistry are explored through piper plots and time series presented in this section and in Appendix I. Table 5-13 summarizes groundwater quality types across the Brucejack site and associated trends. Several historic wells (BJ-GW11-5A/B, BJGW12-12A) demonstrate trends in major ion chemistry arising from mine dewatering. Wells downgradient of the CWP (BJ-GW18-23A/B) and other site infrastructure (BJ-GW11-3B) show influence from mining activities manifested as elevated sulphate and chloride. All Brucejack monitoring wells screen groundwater that is neutral to slightly alkaline (pH 7 to 8.5).

Table 5-12:
Average 2021 concentrations of selected parameters in Brucejack groundwater

Notes:
1. Not sampled in 2021. Reported concentrations presented for 2016 (-12A/B, -5B), 2017 (-5A) and 2020 (-11B) (most recent samples)

Concentration exceeding mean 2011-2014 concentration by 20% is shaded, *e.g.* 5.4 mg/L. Concentration exceeding mean 2011-2014 concentration by 100% is shaded and bold, *e.g.* **5.4** mg/L
Underlined values are the highest average concentrations measured across the mine site in 2021
Italicized values include some data in 2021 with sample dilution due to high dissolved solid/electrical conductivity
* values indicate some data in 2021 may not be representative due to elevated dissolved/total metals ratios

Table 5-13:
Summary of Brucejack groundwater quality types

Well ID	Current Water Type	Trend (Mine Influence)
Periphery of VOK		
BJ-GW12-12A[1]	Ca-SO_4	increasing SO_4 influence (dewatering)
BJ-GW11-5A[1]	Ca-HCO_3,SO_4	increasing Ca influence (dewatering)
BJ-GW11-5B[1]	Ca-HCO_3,SO_4	increasing Ca, SO_4 influence (dewatering)
BJ-GW12-9B	Ca-HCO_3,SO_4	none
BJ-GW18-18B	Ca,Na-HCO_3,SO_4	none
BJ-GW18-19B	Ca,Na-HCO_3,SO_4	none
West of West Zone		
BJ-GW12-11A	Ca,Mg-HCO_3,SO_4	none
BJ-GW12-11B	Ca,Mg-HCO_3,SO_4	none
BJ-GW11-1A	Ca,Na-HCO_3	none but variable
BJ-GW11-1B	Ca-HCO_3	none
East of West Zone		
BJ-GW11-3A	Ca-HCO_3,SO_4	variable chloride (wash bay)
BJ-GW11-3B	Ca-HCO_3,SO_4	variable chloride (wash bay)
BJ-GW18-17A	(Ca),Na,-HCO_3,SO_4	potential seasonal trend to more Ca influence
BJ-GW18-17B	Ca,Na-HCO_3,SO_4	none
West of Brucejack Fault		
BJ-GW12-8A	Ca,Mg-HCO_3	none
BJ-GW12-8B	Ca,Mg-HCO_3	none
BJ-GW14-14A	Ca,Na-HCO_3,	none
BJ-GW14-14B	Ca,Mg-HCO_3,SO_4	none
Downgradient of CWP		
BJ-GW18-23A	Ca,Na-SO_4	None (CWP influence)
BJ-GW18-23B	Ca,Na-SO_4	None (CWP influence)

Historic wells upgradient of the VOK zone experienced increasing proportions of dissolved calcium (Ca-D) (BJ-GW11-5A/B) and sulfate (SO_4) (BJ-GW11-5A/B, BJ-GW12-12A) prior to going dry (Figure 5-1**,** Table 5-13). The water quality types at these wells prior to going dry was predominantly Ca-SO_4 with varying influence of HCO_3. The trends suggest that mine dewatering did influence surrounding chemistry, either by creating more oxic conditions (hence higher SO_4) or drawing in a younger (less sodic) water type. BJ-GW18-18B and BJ-GW18-19B continue to yield Ca,Na-HCO_3,SO_4 type water, which is not unlike baseline water quality at BJ-GW11-5A.

Figure 5-1: Trilinear plot of major ion chemistry in wells surrounding the VOK zone.

Major ion chemistry at BJ-GW11-3A, near the West Zone portal, originally had higher sodium content during the baseline period, however since 2015, the sodium content has remained low (<10 mg/L), rendering a Ca-HCO_3,SO_4 water type (Figure 5-2, Figure 5-3, Table 5-13). The shallow well BJ-GW11-3B shows water chemistry that is variable Ca-HCO_3,SO_4 type with elevated chloride through to 2020, though chloride levels in 2021 returned to low levels similar to baseline (Figure 5-2). Chloride in BJ-GW11-3B is believed to originate from salt application on pathways leading towards the nearby wash bay, which could have been diluted by precipitation that was higher in 2021 than recent years, leading to extended periods of artesian flow within the well. Ca-D and Mg-D are observed to follow similar trends as chloride with Na-D to a lesser extent (noting log scale for Na-D on Figure 5-2).

Wells BJ-GW18-17A/B are located near BJ-GW11-3A/B and show distinctly different water types (Figure 5-3). BJ-GW18-17B is installed at a similar depth to BJ-GW11-3A (Table 3-1), but shows a stronger influence of sodium (Na,Ca-HCO_3,SO_4). BJ-GW18-17A is screened 50 m to 75 m deeper than both wells. BJ-GW18-17A data from 2018/2019 (all events), and sQ1 and sQ4 of 2020 and 2021 are Na-HCO_3,SO_4 type (Figure 5-3). Samples collected in sQ2 and sQ3 of 2020 and 2021 reported a slight shift towards a more intermediate Na,Ca-HCO_3,SO_4 type water. All pH values for BJ-GW18-17A in 2021 were between 8.2 and 8.4.

The strong sodium signature at the BJ-GW18-17A/B well pair, in conjunction with strongly reducing conditions (evidenced by presence of sulphide), suggests that these wells screen older groundwater. Sulfate concentrations measured at BJ-GW18-17A/B ranged from 169 to 395 mg/L in 2021 and are some of the highest concentrations measured in groundwater outside of the CWP area (Table 5-12). Future sampling efforts at this well will focus on resolving seasonal differences in water quality and/or identifying potential artefacts of well installation.

BJ-GW18-23A/B, a shallow nest installation located adjacent to the CWP, continues to have the highest SO_4 concentrations on site ranging from 181 to 465 mg/L. Both wells have similar Na-D concentrations to BJ-GW18-17A/B, while BJ-GW18-23B shows variably increasing Cl (Figure 5-2). BJ-GW18-23A/B are generally Ca,Na-SO_4 type, though BJ-GW18-23B demonstrates intermittent mixing with increasing HCO_3 (Figure 5-3). The major ion chemistry of this well pair closely resembles that of the CWP (Figure 5-3).

Figure 5-2: Time trends in Ca-D, Mg-D, Na-D and Cl at monitoring wells completed east of the West Zone portal. Note log axis for D-Na, D-Cl.

Figure 5-3: Trilinear plot of major ion chemistry in wells east of the West Zone

Major ion chemistry is largely stable in wells located between the West Zone portal and the Brucejack fault with samples from different years showing significant overlap in piper diagrams (Appendix I). Most samples are Ca,Mg-SO_4 type with varying influence of HCO_3. BJ-GW11-1A demonstrates seasonal peaks in D-Na that coincides with January/ February samples, shifting the water type to Ca,Na-HCO_3. Piper plots of groundwater quality west of the Brucejack Fault (BJ-GW12-8A/B and BJ-GW14-14A/B) do not indicate any trends in major ion composition (Appendix I).

5.2.3 Nitrate/Nitrite

Nitrogen species can occur naturally in groundwater through atmospheric deposition, nitrogen rich minerals, and through plant and microbial activities (Madison and Brunett 1985). In mining environments, blasting residues are responsible for elevated concentrations of nitrogen species in the receiving environment. Nitrite (NO_2) is less stable than nitrate (NO_3) and is accordingly found at much lower concentrations. In 2021, NO_3 was measured above detection limit (0.005 mg/L) in one or more sampling events at most Brucejack monitoring wells except BJ-GW11-3B and BJ-GW14-14A/B (Table 5-12).

As expected, the highest NO_3 and NO_2 concentrations measured in 2021 were encountered downgradient of the CWP at BJ-GW18-23A/B (Figure 5-4, Table 5-12). NO_3 and NO_2 concentrations are typically one to two orders of magnitude higher at BJ-GW18-23A/B relative to the other well sites. Nitrate is reasonably stable throughout the year at BJ-GW18-23A (Figure 5-6) with average 2021 concentrations about 30% higher than the previous two years (Figure 5-4). Nitrate concentrations at BJ-GW18-23B show strong seasonality, with maximum concentrations *ca.* 40 mg/L experienced in the winter (sQ1/sQ4) (Figure 5-6). The maxima coincide with concentration maxima observed in the CWP, which climb through winter. The high winter NO_3 concentrations are presumably due to lack of dilution by runoff to the CWP. Average NO_3 concentrations in BJ-GW18-23B declined slightly in 2021. Nitrite concentrations in BJ-GW18-23A/B are also the highest on site but declined in 2021 (Table 5-12, Figure 5-5).

East of the West Zone portal, average NO_3 concentrations at BJ-GW18-17A/B were similar in 2021 compared to 2020, and NO_2 concentrations at BJ-GW18-17A/B were lower in 2021 compared to 2020. Average NO_3 and NO_2 concentrations at BJ-GW18-17A/B remain higher relative to nearby well BJ-GW11-3A/B (Figure 5-4, Figure 5-5).

West of the West Zone portal, average NO_3 and NO_2 concentrations remained stable at BJ-GW12-11A in 2021 (Figure 5-4, Figure 5-5). Both NO_3 and NO_2 rose in BJ-GW11-1A in 2021 while equivalent parameter concentrations in BJ-GW11-1B remained stable.

West of the Brucejack Fault at BJ-GW12-8A/B, average NO_3 concentrations had been increasing since 2011 while remaining low (<0.035 mg/L) but have since shown a decreasing trend from 2019-2021 (Figure 5-4). Average NO_2 remained below detection limit (<0.001 mg/L) at BJ-GW12-8A/B and BJ-GW14-14A/B (Figure 5-5).

Within the VOK, average NO_3 are measured near or at detection limit at BJ-GW18-18B and BJ-GW18-19B in 2021 (Figure 5-4). Average 2021 NO_2 concentrations at these two wells are also low, near detection At BJ-GW18-18B and within 5xMDL at BJ-GW18-19B (Figure 5-5).

Figure 5-4: Annual average NO_3 in Brucejack monitoring wells. 2021 detection limit for NO_3 is 0.005 mg/L.

Figure 5-5: Annual average NO_2 in Brucejack monitoring wells. 2021 detection limit for NO_2 is 0.001 mg/L.

Figure 5-6: Nitrate time trends in CWP water (as influent to the WTP) and groundwater stations downgradient of the CWP (BJ-GW18-23A/B).

5.2.4 Trace Metals

Average annual concentrations of As-D at Brucejack wells are provided in Figure 5-7. Dissolved arsenic is mobile in reducing, circum-neutral environments as it tends to sorb to iron oxy-hydroxides in lower pH and more oxygenated waters. BJ-GW18-17A reported the highest annual average As-D concentration across the site in 2021 (0.0418 mg/L) (Table 5-12) however average concentrations have shown a sharp decline since 2019 (Figure 5-7). Dissolved arsenic concentrations are lower in sQ2 and sQ3 at this well, possibly reflecting increased sorption as pH decreases slightly (Appendix G). Elevated average arsenic concentrations are also measured at BJ-GW11-3A (0.012 mg/L), BJ-GW12-8B (0.013 mg/L), BJ-GW18-17B (0.03 mg/L), BJ-GW18-23A (0.0349 mg/L) and BJ-GW18-19B (0.015 mg/L) (Table 5-12). These arsenic concentrations are typically one to two orders of magnitude higher than groundwater screened at other locations. Prior to going dry, wells upgradient of the VOK zone also displayed elevated As-D in the range of 0.02 mg/L. High concentrations of As-D at BJ-GW12-12A measured during the baseline period (Figure 5-7) suggest that elevated As-D is naturally occurring in the groundwater environment.

Average Cu-D trends are shown for selected wells in Figure 5-8. The highest average concentration of Cu-D observed in 2021 is measured at BJ-GW11-1A (0.00118 mg/L) and has been gradually increasing since 2017. Increasing Cu-D trends have been observed at BJ-GW12-8B since 2017 but are barely exceeding 5xMDL.

Dissolved chromium (Cr-D) is generally measured at low concentrations in Brucejack groundwater but has been consistently increasing in several wells, namely BJ-GW18-23B,

BJ-GW11-1A/B, BJ-GW11-3B and BJ-GW12-8B (Figure 5-9). Other wells experienced increases in average Cr-D concentrations between 2020 and 2021. The highest concentrations of Cr-D in 2021 were in wells BJ-GW11-1A, BJ-GW11-1B, BJ-GW12-8B and BJ-GW18-17B, all being between 0.0010 mg/L and 0.0012 mg/L. It is uncertain if the high Cr-D results in conventional samples are representative or are an artefact of sampling with the submersible pump, with equipment blank samples collected in 2021 both having hits of Cr-D above the MDL. Cr-D is not considered a parameter of concern in groundwater at this time but is actively being investigated.

Dissolved selenium (Se-D) has been measured at several locations above 5xMDL (0.000050 mg/L) (Table 5-12). The QA/QC analysis on dissolved versus total metals (Section 5.1.8, Table 5-9) revealed that dissolved selenium can be biased high in the dissolved metals analysis due to the presence of volatile organic selenium species. With suspect wells removed, the highest average concentration in 2021 were reported at BJ-GW18-23B (0.00037 mg/L), with three other wells showing concentrations greater than 5xMDL. Most remaining wells continued to report low 2021 average concentrations (*i.e.*, below or near 5xMDL).

Figure 5-7: Average annual As-D in Brucejack monitoring wells. 2021 detection limit for As is 0.0001 mg/L.

Figure 5-8: Annual average Cu-D in Brucejack monitoring wells. 2021 detection limit (0.0002 mg/L) shown as dashed line.

Figure 5-9: Annual average Cr-D in Brucejack monitoring wells. 2021 detection limit (0.0001 mg/L) shown as dashed line.

5.3 Snap-Sampler Trial

Snap samples (Snap) were compared to primary samples collected with traditional methods, immediately after the Snap, or in some cases, as close as possible to the Snap collection date. The preliminary analysis below reports the RPD's between parameters, with DQO's of >20% RPD where both samples are greater than x5MDL, as per the BC Field Sampling Manual QA/QC objectives for field duplicate samples (Clark 2013). Given that field duplicates are defined as samples collected by the same method, the DQO's selected for this preliminary analysis serve as guidelines only. When comparing sampling methods, observed differences between comparison samples may reflect the nature of the sample method, not necessarily the water quality (ITRC 2007).

In most wells, Snap samples compare well with primary samples for physical parameters, anions, nutrients and dissolved metals (Table 5-14, Table 5-15, Table 5-16, Table 5-17). Detailed RPD results are presented in Appendix K. Charge balance errors in excess of 5% were present in one sample throughout the trial period (BJ-GW18-18B-SNAP at -15% in sQ4 2020). This sample had notably higher alkalinity and TSS when compared to the corresponding primary low-flow sample (Table 5-14), suggesting suspended hydroxides may have contributed to the charge balance error. The Snap samples generally have elevated TSS and turbidity when compared to wells with lower TSS and turbidity from low-flow sampling methodologies (BJ-GW11-3A, BJ-GW12-8A/B) and lower TSS and turbidity when compared to wells with historically higher TSS and Turbidity from low-flow and high-flow sampling methodologies (BJ-GW18-17A/B).

Data quality objectives were most frequently exceeded in the total metals suite (Table 5-14, Table 5-15, Table 5-16, Table 5-17, Appendix K), where elevated turbidity and TSS are the likely cause. Where DQOs were exceeded with respect to dissolved metals, concentrations were consistently lower in Snap samples, with some exceptions mainly associated with BJ-GW18-17A/B (Table 5-18). Parameters exceeding DQOs in the anions/nutrients and dissolved metals suites occur most frequently in BJ-GW18-17A/B (Table 5-18).

The Snap Sampler trial was completed in sQ3 2021, and data processing and analysis are ongoing to assess reproducibility between traditional sampling methods, the influence of seasonal variation on water quality (*i.e.*, increased water level) and the effect of increased sampling proficiency with the Snap Samplers. No transition to no-purge/passive sampling will occur at the Brucejack Mine without regulator review and approval.

6. Conclusions

6. Conclusions

6.1 Groundwater Quantity

Monthly underground dewatering rates during the open water season were appreciably higher in 2021 than previous years, reaching an all-time high of 2,800 m^3/d in June. Previous monthly averages peaked at 2,500 m^3/d in 2020. Low flow dewatering rates in 2021, however, were similar if not lower than previous years' averages. Overall, 2021 had ~10% more precipitation that 2021, however, over the May to September period, rainfall was actually 10% lower than 2021. This supports the assertion that increased open water season dewatering rates are being influence by the expanding mine development as much, if not more, than by climate.

Continued dewatering of the VOK and West Zone workings has sustained a substantial cone of depression in the groundwater table in the footprint of the workings and farther afield. Water levels collected at wells near the VOK suggest that drawdown at historic wells exceeds 100 m and that a groundwater divide exists between the VOK and West Zone. East of the West Zone, water levels at BJ-GW11-3A and BJ-GW18-17A/B are lower than the elevation of the WRTSF (1364.5 m) which suggests that the WRTSF is recharging groundwater at its outlet. The low water level at BJ-GW18-17A/B appears to suggest an enhanced connection to the West Zone.

The data record at 2018 series wells indicates that seasonal water level fluctuations are on the order of tens of meters and hydraulic gradients at well pairs are moderately to strongly downward. This is consistent with observations at older monitoring wells. Several well pairs do experience upward hydraulic gradients for at least part of the year: BJ-GW18-20A/B, BJ-GW18-18B, BJ-GW18-23A/B, BJ-GW11-1A/B, BJ-GW14-14A/B and BJ-GW12-8A/B.

Notable water level time trends include increasing water levels trends at several wells (BJ-GW12-9B, BJ-GW11-1A, BJ-GW11-3A/B and BJ-GW11-6B) on account of higher precipitation in 2021 than in previous years. A few wells experienced notable drops in peak water levels including BJ-GW12-11B, BJ-GW18-19B and BJ-GW18-21B, presumably due to expansion and deepening of the VOK. Water levels at BJ-GW18-20A/B do not appear to be responding to mining. This supports the conceptualization of the Brucejack Fault as a highly permeable feature that is limiting the extent of groundwater system depressurization west of the fault.

6.2 Groundwater Quality

Groundwater sampling at the Brucejack Mine has been conducted in accordance with procedures outlined in the BC Groundwater Field Sampling Manual (Clark 2013). Groundwater sampling methods transitioned towards low-flow methodologies in 2019, resulting in fewer occurrences of high turbidity samples (>200 NTU) in 2021. The mine is currently experimenting with the Snap Sampler passive sampling system to determine if this sampling method is viable for select wells.

Overall, the quality assurance program indicates good contamination control, precision and sample homogeneity in field sampling. Samples are routinely transported to the laboratory at recommended temperatures and within recommended holding times. As in 2020, dissolved selenium may be biased high in select samples on account of volatile organic selenium complexes interfering with laboratory equipment. Since selenium has not been identified as a parameter of concern for the Brucejack Mine, Pretium has not sought alternative sampling/analytical methodologies. The 2021 monitoring results are considered to be representative of groundwater water quality at the time of sampling.

In 2021, NO_3 was measured above detection limit (0.005 mg/L) in one or more sampling events at most Brucejack monitoring wells except BJ-GW11-3B and BJ-GW14-14A/B. The highest average concentrations of NO_3 and NO_2 are measured downgradient of the CWP at BJ-GW18-23A/B (17.6 mg/L NO_3 at BJ-GW18-23B and 0.1 mg/L NO_2 at BJ-GW18-23A). Average NO_3 concentrations remain stable while average NO_2 continue to decline at the well pair. Average NO_3 and NO_2 are typically one to two orders of magnitude higher at BJ-GW18-23A/B than other wells across the mine. Sulphate is also highest in well nests downgradient of the CWP, with averages ranging from 181 mg/L to 465 mg/L at BJ-GW18-23A/B in 2021.

Dewatering of the underground caused slight shifts in major ion chemistry at historic wells prior to the wells going dry (BJ-GW11-5A/B and BJ-GW12-12A). This manifested as higher proportions of sulphate and/or calcium at these wells. BJ-GW11-3A/B show seasonally variable chloride which has been attributed to winter salt application near the wash bay. The only other wells showing clear influence of the mine in major ion chemistry are BJ-GW18-23A/B which intercept groundwater flowpaths from the CWP. All Brucejack monitoring wells screen groundwater that is neutral to slightly alkaline (pH 7 to 8.5).

Average concentrations of some dissolved trace metals (Al, As, Cu, Cr, Se) measure above detection in most wells, however in many cases concentrations of dissolved metals remain within 5xMDL. BJ-GW18-17A reported the highest annual average As-D concentration across the site in 2021 (0.0418 mg/L) and has dropped from 2020 average (0.11 mg/L).

Annual average concentrations of As-D at BJ-GW11-3A (0.012 mg/L), BJ-GW12-8B (0.013 mg/L), BJ-GW18-17B (0.03 mg/L), BJ-GW18-23A (0.0349 mg/L) and BJ-GW18-19B (0.0315 mg/L) are approximately one to two orders of magnitude greater than the mine's other monitoring wells. Cr-D is generally measured at low concentrations in Brucejack groundwater but has been consistently increasing in several wells, namely BJ-GW18-23B, BJ-GW11-1A/B, BJ-GW11-3B and BJ-GW12-8B (Figure 5 10). Other wells experienced increases in average Cr-D concentrations between 2020 and 2021. The mine is investigating whether this trend can be attributed to the sampling methodology.

Impacts from mining on Brucejack groundwater are limited to subtle shifts in major ion chemistry in wells dewatered by VOK development and isolated influences of surface features (CWP seepage, wash bay salting) on shallower wells. Groundwater at the Brucejack mine site is not displaying a signature that could be attributed to mine-induced ARD. This is not surprising given that the mine is currently acting as a groundwater sink.

7. Closure

7. Closure

The Brucejack Project 2021 Annual Groundwater Monitoring Report is a collaboration of Lorax and Pretium authors. This report has been prepared in fulfilment of annual reporting requirements for the Brucejack Mine. The material in it reflects the professional judgment of Lorax in light of the information available to Lorax at the time of document preparation. Reliance upon this document by third parties outside of its intended use is at the responsibility of the third party.

Yours sincerely,

LORAX ENVIRONMENTAL SERVICES LTD.

Lithologic Description

GRAVEL (GP)
Coarse, some cobbles, some boulders, grey to white, iron staining.

PLAGIOCLASE-HORNBLENDE PORPHYRY (P1)
Contains pervasive sericite-chlorite alteration with phenocryst replacement. Multiple veinlets. Medium strong to strong (R3-R3.5). Faint to slight alteration (A1.5-A2).
2.8 m: Fault, 60 mm thick, broken rock.

7.3 m: Fault, 110 mm thick, broken rock.

8.1 m: Fault, 70 mm thick, broken rock.

12.9 - 23.5 m: Stockwork (H7) with minimal mineralization. Steep wall rock veinlets (oriented 50-90 degrees TCA).

23.5 - 53.8 m: Some sections of conglomerated porphyry.

28.4 m: Fault, 300 mm thick, broken rock.
28.8 m: Fault, 200 mm thick.

SYMBOLS AND TERMS

FOR SOIL/ROCK DESCRIPTIONS ON BOREHOLE LOGS

Project: Brucejack 2018 Groundwater Monitoring Well Installation and Site Investigation

Project Number: 1008029

SOIL/ROCK SYMBOLS		
Overburden	Fill	Till
Fragmental volcanics [V12]	Porphyry [P1]	Conglomerate [S3-Poly]
Silicified con-glomerate [H8]	Sandstone/ arenite [S4-Vsf]	Mafic dyke [V6]

INSTRUMENT DETAILS SYMBOLS		
Grout	Cuttings / slough	Bentonite chips
Bentonite pellets	Sand	Standpipe screen in sand
Standpipe in bentonite	Standpipe in grout	

NOTES

1. Depths are along hole and relative to ground surface.

LIST OF ACRONYMS	
A	Alteration
K	Hydraulic conductivity
R	Strength grade
W	Weathering
RMR	Rock mass rating
RQD	Rock quality designation

SYMBOLS AND TERMS

FOR SOIL/ROCK DESCRIPTIONS ON BOREHOLE LOGS

Project: Brucejack 2018 Groundwater Monitoring Well Installation and Site Investigation Project Number: 1008029

WEATHERING/ALTERATION [1]		
GRADE	**Description**	**Field Identification**
A/W 1	Fresh and Unweathered	No visible sign of rock material weathering
A/W 1.5	Faintly Weathered	Discolouration on major discontinuity surfaces
A/W 2	Slightly Weathered or Altered	Discolouration indicated weathering of rock material and discontinuity surfaces. All rock material may be discoloured by weathering and may be weaker than in its fresh condition.
A/W 3	Moderately Weathered or Altered	Less than 50% of rock material decomposed and/or disintegrated to soil. Fresh/ discoloured rock present as a continuous framework or corestones.
A/W 4	Highly Weathered or Altered	More than 50% rock material is decomposed or disintegrated to soil. Fresh/Discoloured rock present as discontinuous framework or corestones.
A/W 5	Completely Weathered or Altered	All rock material decomposed and/or disintegrated to soil. Original mass structure still largely intact
A/W 6	Residual Soil	All rock material converted to soil; mass structure and material fabric destroyed.

Note: Weathering/alteration half grades can be assigned to indicate a transition zone.

STRENGTH/HARDNESS CLASSIFICATION FOR ROCK [1]		
GRADE	**Description**	**Field Identification**
R6	Extremely Strong	Specimen can only be chipped with flat end of geological hammer
R5	Very Strong	Specimen requires many blows of flat end of geological hammer to fracture
R4	Strong	Specimen requires more than one blow of flat end of geological hammer to fracture
R3	Medium Strong	Cannot be scraped or peeled with pocket knife; can be fractured with single firm blow of flat end of the geologic hammer
R2	Weak	Can be peeled with pocket knife with difficulty; shallow indentation made by firm blow with point of geological hammer
R1	Very Weak	Crumbles under firm blow with point of geological hammer; can be peeled by a pocket knife
R0	Extremely Weak	Indented by thumbnail

Note: Strength/hardness half grades can be assigned to indicate a transition zone.

JOINT CONDITION [2]	
Condition of Joints	**Rating**
Very rough surfaces. Not continuous. No separation. Hard joint wall rock.	25
Slightly rough surfaces. Separation <1mm. Hard joint wall rock.	20
Slightly rough surfaces. Separation <1mm. Soft joint wall rock.	12
Slickensided surfaces or gouge <5mm thick or joints open 1-5mm. Continuous joints.	6
Soft gouge >5mm thick or joints open >5mm. Continuous joints.	0

Core recovery $= \frac{1.40}{1.50} = 93\%$

Solid core recovery $= \frac{1.06}{1.50} = 71\%$

R Q D $= \frac{0.95}{1.50} = 63\%$

Fracture index $= \frac{8}{1.50} = 5.3$ /m run

If strength grade ≤ R1, do not include in RQD.

SYMBOLS AND TERMS

FOR SOIL/ROCK DESCRIPTIONS ON BOREHOLE LOGS

Project: Brucejack 2018 Groundwater Monitoring Well Installation and Site Investigation Project Number: 1008029

Texture [3]		
Term	**Particle Size**	**Examples**
Very Coarse	> 60 mm	Porphyritic
Coarse	2 - 60 mm	Breccia, Gneiss (measurable grains)
Medium	0.06 - 2 mm	Sandstone, Gabbro, Granite, Schist (visible grains)
Fine	0.002 - 0.06 mm	Tuff, Siltstone, Claystone, Mudstone, Basalt
Very Fine	< 0.002 mm	

Fabric	
Term	**Description**
Homogeneous/ Uniform	Equigranular or homogeneous grains
Bedded	Deposited in layers, can be sedimentary or volcaniclastic rocks
Foliated	Minerals are aligned due to shearing or metamorphism
Gneissic	Alternating layers of different colour or texture with mineral alignment and typically parts along layers
Porphyritic	Crystalline texture with bimodal grain size distribution, fine to medium grained groundmass with coarse to very coarse phenocrysts
Stockwork	Veins (typically quartz, calcite, or gypsum/anhydrite) make up greater than 10% of the rock mass, they may be aligned with foliation or irregularly oriented
Microfractured	Hairline fractures are the primary fabric of the rock, typically oriented in all directions and intersecting one another
Brecciated	Healed or welded angular clasts with matrix, may be matrix – or clast-supported

Depth (m)	GEOTECHNICAL DESCRIPTION, MAJOR DISCONTINUITIES, AND ADDITIONAL NOTES
0	FILL and OVERBURDEN (0.00 m to 1.12 m)
1.12	MAFIC DYKE [V6a] (1.12 m to 6.00 m) Green, aphanitic mafic dyke. Closely spaced discontinuities, slightly rough joint surfaces with moderately to highly weathered walls, very strong to extremely strong, slightly weathered. Jointing sometimes along quartz veins, with apertures 1-20 mm, commonly with red-brown-black oxidized joint surfaces and broken/crushed rock infill. Two joint sets, at approximately 30° and 70° to core axis. At 6.00 m: Contact between mafic dyke and fragmental volcanics has weak chill margins, is oxidized, and is at 25° to core axis.
6.00	FRAGMENTAL VOLCANICS [V12] (6.00 m to 75.00 m) Medium grey fragmental intermediate volcanic. Matrix is composed of ash to fine-grained volcanic groundmass with 2-5 mm sub-blocky plagioclase phenocrysts ranging from 2-10% throughout. Angular lapilli fragments of aphanitic to porphyritic volcanics 10-150 mm are prevalent. Moderate alignment of fragments and phenocrysts are observed. Weak pervasive quartz-sericite-pyrite alteration with weak calcite replacement of plagioclase phenocrysts. Rare quartz-calcite [Vn3] veins throughout as planar to undulatory vein sets. Widely to extremely widely spaced discontinuities, very rough joint surfaces with unweathered walls, very strong to extremely strong, fresh. Joints occasionally along veins, with apertures typically < 1 mm, often with calcite coatings, generally 20-30° to core axis. From 6.00 m to 10.72 m: Red-brown-black iron oxide staining on joint surfaces.

From 65.00 m to 76.76 m: Joint apertures 1-5 mm and infilled with silt and/or clay.

At 75.00 m: Contact between fragmental volcanics and porphyry is ambiguous.

PLAGIOCLASE-HORNBLENDE PORPHYRY [P1] (75.00 m to 142.68 m)
Medium grey porphyritic volcanics/intrusives. Predominantly composed of euhedral, clay-altered mafic (hornblende?) phenocrysts and subhedral, calcite-altered plagioclase phenocrysts ranging from 5-25% throughout a grey, fine-grained matrix. Weak alignment of phenocrysts. Occasional intermediate fragments. Weak, pervasive, quartz-sericite-pyrite alteration with weak calcite replacement of plagioclase phenocrysts. Rare quartz-calcite [Vn3] veins throughout as planar to undulatory vein sets.

Widely to extremely widely spaced discontinuities, slightly rough to very rough joint surfaces with unweathered walls, very strong to extremely strong, fresh.

Joints with apertures typically < 1 mm, sometimes with calcite or chlorite coatings.

Weathering grade: FRESH, SLIGHTLY, MODERATELY, HIGHLY, COMPLETELY, SOIL
Strength grade: EXT. WEAK, V. WEAK, WEAK, MED. STRONG, STRONG, V. STRONG, EXT. STRONG
RQD: V. POOR, POOR, FAIR, GOOD, EXT. GOOD
Fracture intercept: V. CLOSE, CLOSE, MODERATE, WIDE

At 142.68 m: Contact between porphyry and fragmental volcanics is weak to moderately sharp.

FRAGMENTAL VOLCANICS [V12] intruded by MAFIC DYKES [V6b] (142.68 m to 148.12 m)
Fragmental volcanics are medium grey and intermediate. Matrix is composed of ash to fine-grained volcanic groundmass with 2-5 mm sub-blocky plagioclase phenocrysts ranging from 2-10% throughout. Angular lapilli fragments of aphanitic to porphyritic volcanics 10-150 mm are prevalent. Weak pervasive quartz-sericite-pyrite alteration with weak calcite replacement of plagioclase phenocrysts. Mafic dykes are green, aphanitic, and intruded by strong quartz-calcite-chlorite [Vn4b] veining.

Moderately wide to wide discontinuity spacing, slightly rough to very rough joint surfaces with moderately weathered to unweathered walls, very strong to extremely strong, fresh to slightly weathered.

Packer Test 2: 145.12 m to 148.12 m, K ≥ 10^{-6} m/s.

At 146.62 m: Lost drilling fluid circulation.

From 146.62 m to 147.40 m: White quartz vein, coarse-grained, vuggy, closely to moderately spaced discontinuities, slightly weathered.

END OF HOLE at 148.12 m.

NOTES
1) Installed 60.3 mm outer diameter schedule 80 polyvinyl chloride standpipe piezometer with 0.020 in slot size screen from 147.72 m to 144.67 m.
2) Filter sand (10-20 mesh size) placed around screen zone from 148.12 m to 142.07 m.
3) Bentonite pellet seal (coated, 1/4") placed above screen zone from 142.07 m to 140.67 m.
4) Bottom of piezometer is capped with an 0.20 m polyvinyl chloride sump with a slip cap glued to the lower end of the sump.
5) Water level measured after piezometer installation on 4 July 2018 at 108.30 m bgs.

FILL and OVERBURDEN (0.00 m to 1.19 m)

FRAGMENTAL VOLCANICS [V12] (1.19 m to 69.28 m)
Medium grey fragmental intermediate volcanic. Matrix is comprised of ash to fine-grained volcanic groundmass with 2-5 mm sub-blocky plagioclase phenocrysts ranging from 2-10% throughout. Angular lapilli fragments of aphanitic to porphyritic volcanics 10-150 mm are prevalent. Weak pervasive quartz-sericite-pyrite alteration with weak calcite replacement of plagioclase phenocrysts. Veining is negligible <1% throughout. Rare quartz-calcite [Vn3] generations are observed throughout as planar to undulatory vein sets.

Widely to extremely widely spaced discontinuities, slightly to very rough joint surfaces with slightly weathered to unweathered walls, very strong to extremely strong, fresh.

Joints apertures typically < 1 mm, often with calcite coatings, sometimes with sand, silt, and/or clay infill, variable joint orientations.

From 1.19 m to 1.69 m: Green, aphanitic, mafic dyke [V6] that intrudes the fragmental volcanics.

From 1.19 m to 3.49 m: Moderately spaced discontinuities, slightly rough joint surfaces with highly weathered walls and separation 0-5 mm, strong to very strong, slightly weathered.

From 1.27 m to 14.30 m: Joint surfaces have iron oxide stainings.

At 2.53 m: Broken rock zone, 150 mm length, rock fragments are medium strong.

END OF HOLE at 110.10 m.

NOTES
1) Bottom of borehole backfilled with alternating layers of filter sand (10-20 mesh size) and coated bentonite pellets (1/4").
2) Installed 60.3 mm outer diameter schedule 80 polyvinyl chloride standpipe piezometer with 0.020 in slot size screen from 101.00 m to 97.95 m.
3) Filter sand (10-20 mesh size) placed around screen zone from 101.27 m to 95.53 m.
4) Bentonite pellet seal (coated, 1/4") placed above screen zone from 95.93 m to 92.80 m.
5) Water level measured after piezometer installation on 4 July 2018 at 13.62 m bgs.

0		FILL (0.00 m to 1.03 m)
1.03		PLAGIOCLASE-HORNBLENDE PORPHYRY [P1] (1.03 m to 66.51 m) Green porphyritic volcanic/intrusive. Predominantly comprised of subhedral, calcite-altered plagioclase phenocrysts ranging from 5-25%, with minor specks of dark mafic phenocrysts throughout a green, fine-grained matrix. Occasional mafic fragments. Weak to strong pervasive quartz-sericite-pyrite alteration with moderate pervasive chlorite replacement. Interval of minor 2% quartz-calcite veining. Dominantly comprised of cuspate-lobate [Vn1a] and planar to brecciate grey-pink calcite [Vn3] veins. Lesser crosscutting [Vn4b] tension gash style veins and pyrite-rich [Vn0] veins. Moderately to widely spaced discontinuities, variably slightly to very rough joint surfaces with highly weathered to unweathered walls, strong to very strong, slightly weathered to fresh. Joint apertures typically < 1 mm, often with oxide staining on joint surfaces, sometimes with calcite or chlorite coatings, mostly oriented approximately 30° or 70° to core axis. From 1.03 m to 8.22 m: Slightly weathered, moderately spaced discontinuities, slightly rough joint surfaces with highly weathered walls and separation 0-5 mm.

PLAGIOCLASE-HORNBLENDE PORPHYRY [P1] (0.00 m to 196.89 m)
Light to dark green porphyritic volcanic/intrusive. Predominantly comprised of subhedral, sericite-altered plagioclase phenocrysts ranging from 5-25%, with minor specks of dark mafic phenocrysts throughout a green, fine-grained matrix. Weak alignment of phenocrysts. Rare mafic fragments. Moderate pervasive chlorite replacement with isolated intervals of strong pervasive quartz-sericite-pyrite alteration. Variable veining structures.

Variable rock mass and discontinuity properties detailed in specific intervals.

From 0.00 m to 7.00 m: Trace veining consisting of [Vn3] veinlets.

From 0.00 m to 13.88 m: Very close to moderately spaced discontinuities, slightly rough joint surfaces with slightly to highly weathered walls, medium strong to strong, slightly to moderately weathered. Discontinuities with variable apertures generally 1-5 mm with some larger broken rock zones, frequent iron oxide staining on joint surfaces, sometimes with calcite or chlorite coatings, primary joint orientation is approximately 30° to core axis.

From 7.00 m to 22.89 m: 3-5% veining consisting of predominantly mm and cm scale [Vn3] and [Vn1a]/[Vn1b] (some strong ankerite replacement in [Vn1]). Few [Vn4]. Common discontinuous [Vn1].

From 13.88 m to 47.92 m: Moderately to widely spaced discontinuities, slightly rough to very rough joint surfaces with slightly weathered to unweathered walls, very strong, fresh. Discontinuity apertures generally < 1 mm, commonly with calcite coatings, sometimes with iron oxide staining on joint surfaces, variable joint orientations.

From 18.43 m to 18.72 m: Zone of decreased discontinuity spacing, iron oxide staining, some crushed rock infill.

PLAGIOCLASE-HORNBLENDE PORPHYRY [P1] (0.00 m to 159.54 m)
Grey-green porphyritic unit with 2 mm feldspar laths. Both phenocrysts and groundmass have been altered to sericite. Chlorite and sericite alteration. Variable veining structures.

Widely to very widely spaced discontinuities, slightly to very rough joint surfaces with moderately weathered to unweathered walls, strong to extremely strong, fresh to slightly weathered.

Discontinuity apertures generally < 1 mm, sometimes with calcite and/or chlorite coatings, occasional trace sand or clay infill, primary joint orientations are 20-30° and 60-70° to core axis.

From 0.00 m to 8.29 m: Very close to close discontinuity spacing, slightly rough joint surfaces with slightly to highly weathered walls, medium strong to strong, slightly to moderately weathered. Discontinuities with apertures generally 1-5 mm, iron oxide staining on joint surfaces, sometimes with disintegrated rock (clay) infill, primary joint orientations are 30-40° to core axis.

From 0.00 m to 43.00 m: 1% planar [Vn1a] veins.

From 8.29 m to 18.95 m: Moderately spaced discontinuities, slightly rough joint surfaces with slightly weathered walls, medium strong to strong, slightly weathered to fresh. Discontinuities with apertures < 1 mm, iron oxide staining on joint surfaces, primary joint orientations are approximately 30° and 70° to core axis.

OVERBURDEN (0.00 m to 1.16 m)

PLAGIOCLASE-HORNBLENDE PORPHYRY [P1] (1.16 m to 100.00 m)
Light green volcanic intrusive. Quartz-feldspar phenocrysts less than 20 mm. Upper 18 m show oxidation with limonite along fracture surface. Mostly sericite-chlorite alteration. Galena-sphalerite-sulfide veins linked to oxidation zones in top of hole and strong sericite-chlorite alteration at approximately 63 and 84 m in moderate-high angle quartz-calcite veins. 5-7% quartz and quartz-calcite veining. Mostly comprised of high and shallow angle [Vn1a] veining and shallow-moderate [Vn3] veining. Late stage [Vn4] tension veining.

Widely to extremely widely spaced discontinuities, slightly to very rough joint surfaces with slightly to highly weathered walls, strong to very strong, fresh.

Discontinuity apertures generally < 1 mm, jointing often occurring along quartz-calcite veins, frequent calcite and chlorite coatings, primary joint orientation 60-70° to core axis.

From 1.16 m to 19.73 m: Mostly oxidized [Vn3] quartz-calcite veining at high angle to core axis. Minimal [Vn2] veining with galena and sphalerite at low angle to core axis.
Fracture-controlled quartz veining. Close to moderately spaced discontinuities, slightly rough joint surfaces with highly weathered walls and separation typically 1-5 mm, medium strong to strong, slightly to moderately weathered. Discontinuities commonly with iron oxide staining on joint surfaces, sometimes with crushed rock (sandy or clayey) infill, primary joint orientations approximately 30° and 60° to core axis.

At 7.08 m: Crushed/disintegrated rock zone, 60 mm length.

PLAGIOCLASE-HORNBLENDE PORPHYRY [P1] (100.00 m to 177.34 m)
Dark green matrix-supported porphyritic intermediate-mafic volcanic. Contains 2-3% chlorite-altered hornblende phenocrysts 1-5 mm wide and largely sub-angular. Beige-white sericite-altered feldspars make up 5-10% of phenocrysts, are 1-2 mm wide and rounded to sub-rounded. Phenocrysts sit in green chlorite-altered matrix but are distinct in colour. Rare 10-20 mm chlorite- and sericite-altered phenocrysts visible. Weak-moderate chlorite alteration throughout matrix and within hornblende phenocrysts. Sericite-replaced feldspars make up small percentage of interval. Epidote replacement of plagioclase phenocrysts. Weak veining (2-3%) containing mostly thin, planar to rarely disarticulated [Vn3] (2%), thicker (50-150 mm) [Vn4] containing chlorite along selvages and within vein, and rare [Vn1a] (10-20 mm thick and planar).

Widely to very widely spaced discontinuities, slightly to very rough joint surfaces with slightly to highly weathered walls, strong to very strong, fresh.

Discontinuity apertures < 1 mm, jointing sometimes along quartz-calcite veins, frequent calcite and chlorite coatings, variable joint orientations.

From 115.12 m to 118.90 m: Increased fracture frequency zone, joints cross-cutting quartz-calcite veins, with chlorite coatings on joint surfaces.

Packer Test 2: 115.84m to 118.54 m, K ~ 8×10^{-8} m/s.

Depth (m)	Instrumentation & Hole Completion Details	Geotechnical Description, Major Discontinuities, and Additional Notes
0		OVERBURDEN (0.00 m to 0.61 m)
0.61 – 20		PLAGIOCLASE-HORNBLENDE PORPHYRY [P1] (0.61 m to 120.34 m) Green porphyritic volcanic/intrusive. Predominantly comprised of subhedral, sericite-altered plagioclase phenocrysts ranging from 5-25%, with minor specks of dark mafic phenocrysts throughout a green, fine-grained matrix. Weak alignment of phenocrysts. Rare mafic fragments. Moderate pervasive chlorite replacement with isolated intervals of strong pervasive quartz-sericite-pyrite alteration. Moderate pervasive chlorite alteration throughout with strong sericite replacement of phenocrysts. Interval of moderate 4-5% quartz-calcite veining. Dominantly comprised of planar to undulatory [Vn1a] and grey-calcite [Vn3] veins typically oriented at a shallow angle to the core axis. Moderate [Vn4] tension gash style veins crosscut these veins and are oriented at a high angle to the core axis. Widely to very widely spaced discontinuities, slightly rough to very rough joint surfaces with variably highly weathered to unweathered walls, generally strong to very strong, fresh. Discontinuity apertures typically < 1 mm, frequently with calcite and/or chlorite coatings, primary joint orientation approximately 40° to core axis. From 0.61 m to 17.25 m: Strong fracture-controlled orange oxidation and earthy orange goethite/limonite replacement in veins. Strong pervasive quartz-sericite-pyrite alteration. Interval of strong 10% quartz-base metal sulfide veining in highly fractured and oxidized zone. Dominantly comprised of strongly mineralized and sheeted [Vn2] base metal sulfide veins that are marginal to faults. [Vn1a] and overprinting [Vn3] grey-calcite networks/stockworks that are often fracture controlled. Veins often display vuggy textures that are replaced by orange earthy iron oxides (goethite/limonite). Lesser [Vn4] veins. Close to moderately spaced discontinuities, slightly rough joint surfaces with slightly to highly weathered wall rock, strong, slightly weathered. Discontinuity apertures typically 1-10 mm, common iron oxide staining on joint surfaces, some broken and crushed rock infill in larger aperture discontinuities, some chlorite coatings, variable joint orientations. From 5.09 m to 6.22 m: Strongly developed fault zone characterized by strongly oxidized surfaces, iron oxide replacement and quartz-base metal sulfide veining. Subsidiary fracture networks are common. Sections 10-60 mm length of fault gouge (broken/crushed rock, clayey), oriented approximately 30° to core axis. From 17.25 m to 40.51 m: Moderately spaced discontinuities, slightly rough joint surfaces with slightly to highly weathered walls, strong, fresh. Discontinuity apertures approximately < 2 mm, frequent calcite and occasional chlorite coatings, occasional iron oxide staining on joint surfaces, variable joint orientations.

Depth (m)	GEOTECHNICAL DESCRIPTION, MAJOR DISCONTINUITIES, AND ADDITIONAL NOTES
0	TILL (0.00 m to 2.78 m) Silt and gravel, trace sand, trace clay, cobbles.
3	INTENSELY-SILICIFIED CONGLOMERATE [H8] (2.78 m to 9.06 m) Grey, strongly silicified interval. Ghosted textures suggest original rock type was [S3]. Closely spaced discontinuities, slightly rough joint surfaces with slightly to highly weathered walls, some larger apertures joints with gougey infills, extremely strong, slightly weathered. Discontinuity apertures generally 1-5 mm, some broken rock zones up to 200 mm long, iron oxide staining on joint surfaces, frequent crushed rock infill, primary joint orientations approximately 30° and 60° to core axis. From 2.78 m to 41.22 m: Overall 1-3% veining with local 1-2 m sections with elevated veining to 3-5%. Veining is predominantly 10-30 mm [Vn1a] veins with lesser [Vn1c] veins that are up to 200 mm, and rare brecciated [Vn1b] veins. Rare base metal sulfide [Vn2] veins. Weak base metal sulfide mineralization in select [Vn1] generation veins. Veins range from planar to weakly deformed with cuspate-lobate margins. At 3.28 m: Gougey fault with fairly planar contacts. At 4.89 m: Gougey (clayey) to rubbly (crushed rock) fault with irregular contacts, 170 mm length.
9.06	CONGLOMERATE [S3-Poly] (9.06 m to 29.55 m) Grey-green, matrix-supported conglomerate with sub-rounded to rounded coarse, granular to pebble sized clasts. Clasts are commonly strongly sericite altered. Moderately spaced discontinuities, slightly rough joint surfaces with slightly to highly weathered walls, very strong to extremely strong, fresh. Discontinuity apertures generally < 1 mm, frequent crushed rock (clayey) infill, primary joint orientation approximately 20-30° to core axis.

SANDSTONE/ARENITE [S4-Vsf] (41.22 m to 255.28 m)
Medium greenish-grey, massive, silty to coarse sand [S4-Vsf]. Rare < 1 m interbeds of [S3] as observed above. Occasional calcite-pyrite concretions. Some patches of high-temperature sericite alteration. Overall 1-3% veining with local 1-2 m sections with elevated veining to 3-5%. Veining is predominantly 10-30 mm [Vn1a] veins with lesser [Vn1c] veins that are up to 200 mm, and rare brecciated [Vn1b] veins. Occasional 20-50 mm grey, calcite-rich [Vn3] veins. Rare base metal sulfide [Vn2] veins. Weak base metal sulfide mineralization in select [Vn1] generation veins. Veins range from planar to weakly deformed with cuspate-lobate margins.

Widely to very widely spaced discontinuities, typically slightly rough to very rough joint surfaces with slightly to unweathered walls, very strong to extremely strong, fresh to sometimes slightly weathered.

Discontinuity apertures generally < 1 mm with occasional 1-5 mm, some crushed rock (clayey or sandy) infill, some calcite coatings, primary joint orientations approximately 20-30° and 60-70° to core axis.

From 48.28 m to 50.12 m: Light grey, strongly silicified silica cap [H8] interval. Most of original texture overprinted.

At 57.87 m: Weakly-healed (breccia) planar fault, 30-40 mm length.

From 57.91 m to 95.68 m: Very widely to extremely widely spaced discontinuities.

Packer Test 2: 151.78 m to 156.28 m, K ~ 2×10^{-8} m/s.

From 152.83 m to 154.30 m: Closely spaced discontinuities, 1-5 mm apertures, crushed rock (clayey) infills, one weakly to moderately healed planar fault.

Below 153.30 m: Sericite alteration is the dominant phase of quartz-sericite-pyrite alteration with quartz and pyrite being weaker.

Packer Test 3: 159.08 m to 163.78 m, K ~ 3×10^{-7} m/s.

Below 182.00 m: Relatively weak veining with 0-1.5% veining overall. Locally slightly stronger short [Vn1a] networks and larger [Vn1] veins. Veining consists predominantly of [Vn1a] veins with lesser [Vn3] and rare [Vn1b] and [Vn1c] veins. Veins are planar to weakly deformed and occasionally have cuspate-lobate margins.

From 187.43 m to 203.36 m: Decreased discontinuity spacing (moderate to widely spaced), joint apertures 1-2 mm, several minor 3-15 mm aperture faults with gougey or brecciated infills.

Packer Test 6: 187.74 m to 190.80 m, K ≤ 10^{-8} m/s.

Packer Test 4: 196.58 m to 201.28 m, K ~ 5×10^{-8} m/s.

END OF HOLE at 255.28 m.

NOTES
1) Bottom of borehole backfilled with cement-bentonite grout and Van Ruth plug installed at 205.94 m.
2) Installed 60.3 mm outer diameter schedule 80 polyvinyl chloride standpipe piezometer with 0.020 in slot size screen from 204.45 m to 195.30 m.
3) Filter sand (10-20 mesh size) placed around screen zone from 204.83 m to 193.49 m.
4) Bentonite pellet seal (coated, 1/4") placed above screen zone from 193.49 m to 189.66 m.
5) Water level measured after piezometer installation on 4 July 2018 at 112.60 m bgs.

OVERBURDEN (0.00 m to 2.77 m)

INTENSELY-SILICIFIED CONGLOMERATE [H8] (2.77 m to 8.20 m)
Grey, strongly silicified interval. Ghosted textures suggest original rock type was [S3]. Approximately 5% quartz veins as disarticulated [Vn1a] veins. Strong silicification of host and most fragments, minor sericite alteration of clasts.

Close to moderately spaced discontinuities, slightly rough joint surfaces with slightly to highly weathered walls, very strong to extremely strong, slightly weathered.

Discontinuity apertures generally < 1 mm, commonly with iron oxide staining on joint surfaces, some sand infill, primary joint orientations approximately 30° and 60° to core axis.

At 3.75 m: Weakly developed fault zone with minor fault gouge, 20 mm length.

At 6.17 m: Moderately developed fault zone with minor fault gouge, 170 mm length.

CONGLOMERATE [S3] (8.20 m to 29.80 m)
Grey-green, matrix-supported conglomerate with sub-rounded to rounded coarse, granular to pebble sized clasts. Clasts range from 2-100 mm and are commonly strongly sericite altered. Quartz veining, mostly disarticulated [Vn1a] veins and disarticulated and deformed [Vn1c]/[Vn1b] vein networks. Moderate vein associated silicification, with sericite alteration of fragments/clasts and chlorite alteration that is patchy throughout host matrix.

Moderately spaced discontinuities, slightly rough joint surfaces with variable but mostly highly weathered walls, very strong to extremely strong, slightly weathered to fresh.

Discontinuity apertures generally 0.5-5 mm, some iron oxide staining on joint surfaces in shallower part of unit, some crushed/disintegrated rock (clayey or sandy) infill, minor calcite coatings, variable joint orientations.

From 11.40 m to 19.14 m: Four minor to moderately developed fault zones with some fault gouge, 15-140 mm length.

WEATHERING GRADE: FRESH, SLIGHTLY, MODERATELY, HIGHLY, COMPLETELY, SOIL
STRENGTH GRADE: EXT. WEAK, V. WEAK, WEAK, MED. STRONG, STRONG, V. STRONG, EXT. STRONG
RQD: V. POOR, POOR, FAIR, GOOD, EXT. GOOD
FRACTURE INTERCEPT: V. CLOSE, CLOSE, MODERATE, WIDE

INTENSELY-SILICIFIED CONGLOMERATE [H8] (29.80 m to 42.20 m)
Grey, strongly silicified interval. Ghosted textures in the top portion of the interval suggest original rock type was [S3]. Mostly [Vn1c]/[Vn1b] vein networks. Moderate brecciation of host in [Vn1b]. Minor pyrite mineralization along vein selvages. Strong silicification of host matrix and clasts, minor sericite alteration is localized to few clasts/phenocrysts.

Moderate to widely spaced discontinuities, slightly to very rough joint surfaces with slightly weathered to unweathered walls, extremely strong, fresh to slightly weathered.

Discontinuity apertures generally < 1 mm, some sandy or clayey infill, minor calcite coatings, variable joint orientations.

SANDSTONE/ARENITE [S4-Vsf] (42.20 m to 159.45 m)
Medium greenish-grey, massive, silty to coarse sand [S4-Vsf]. Rare < 1 m interbeds of [S3] as observed above. Occasional calcite-pyrite concretions. Weak to moderate chlorite alteration of host matrix, with stronger chlorite alteration of clasts. Weak pervasive silicification of host matrix, with stronger alteration related to veining (high-fluid pathways). Pyrite appears as large clotty replacement of clasts and weakly disseminated throughout.

Widely to very widely spaced discontinuities, slightly rough to very rough joint surfaces with mostly slightly weathered to unweathered walls, very strong to extremely strong, fresh.

Discontinuity apertures generally < 1 mm, occasional crushed rock (clayey) or sand/silt infill, primary joint orientations approximately 30° and 60° to core axis.

From 42.20 m to 61.10 m: Moderately spaced discontinuities, mostly slightly rough joint surfaces with slightly to moderately weathered walls, extremely strong, slightly weathered. Discontinuity apertures generally < 1 mm, occasional crushed rock infill, primary joint orientation approximately 30° to core axis.

From 53.53 m to 55.20 m: Zone of discontinuities with crushed rock infill, aperture range 1-80 mm.

FILL and OVERBURDEN (0.00 m to 3.10 m)

CONGLOMERATE [S3-Poly] (3.10 m to 160.00 m)
Grey-green polymictic conglomerate. Clasts are dominantly subrounded with some subangular, 60% mafic and 40% lighter coloured. Possible [S4] clasts. Weak, shallow-angled imbrication of clasts (5-10°). Trace concretions with dark grey centres surrounded by a pale green rim. Concretions range from 10-100 mm. Phyllic alteration. Minimal veining, localized 10-30 mm vein structures. Trace [Vn2] with galena, sphalerite, acanthite.

Widely to extremely widely spaced discontinuities, slightly to very rough joint surfaces with typically slightly weathered walls, very strong to extremely strong, fresh.

Discontinuity apertures generally < 1 mm, some crushed rock infill, some calcite coatings, primary joint orientation approximately 40° to core axis.

From 3.10 m to 49.34 m: Close to widely spaced discontinuities, slightly rough joints with variably weathered variably slightly to highly weathered walls, very strong, slightly weathered to fresh. Discontinuity apertures generally < 1 mm with some 1-5 mm at shallower depths, common iron oxide staining on joint surfaces, some clay infill, some calcite coatings, highly variable joint orientations.

At 15.60 m: Fault zone 1.5 m long, sub-parallel to core axis, some fault gouge.

FILL and OVERBURDEN (0.00 m to 3.80 m)

CONGLOMERATE [S3-Poly] (3.80 m to 91.92 m)
Grey-green polymictic conglomerate. Clasts are dominantly subrounded with some subangular, 60% mafic and 40% lighter coloured. Possible [S4] clasts. Weak, shallow-angled imbrication of the clasts (5-10°). Trace concretions with dark grey centres surrounded by a pale green rim. Concretions range from 10-100 mm. Phyllic alteration. Overall hole has weak veining with 0-1% veining consisting of 10-30 mm [Vn1a] and [Vn3] veinlets/veins. Veins are weakly deformed and occasionally have cuspate-lobate margins.

Widely to very widely spaced discontinuities, slightly rough to very rough joint surfaces with moderately weathered to unweathered walls, very strong to extremely strong, fresh.

Discontinuity apertures generally < 1 mm, some crushed rock infill, some calcite coatings, primary joint orientation approximately 60-70° to core axis.

From 3.80 m to 20.97 m: Closely to widely spaced discontinuities, slightly rough joint surfaces with slightly to highly weathered walls, very strong, slightly weathered.

From 3.80 m to 48.54 m: Iron oxide staining on joint surfaces.

At approximately 17 m: Minor loss of drilling fluid circulation.

OVERBURDEN (0.00 m to 2.96 m)

SANDSTONE/ARENITE [S4-Vsf] (2.96 m to 35.20 m)
Light grey, fine-grained sandstone. Silicification is pervasive as well as areas of patchy sericite and oxide alteration along fracture surfaces. Large fault zone areas containing gouge. Primarily [Vn0] and [Vn3] veining ~2-5%. [Vn0] veins have coarse grained pyrite mineralization. Pyrite also disseminated coarsely throughout the matrix. Trace ankerite within [Vn3] veins.

Widely spaced discontinuities, variable joint condition, extremely strong, fresh to slightly weathered.

Discontinuity apertures generally < 1 mm, some sand/silt infill, variable joint orientations.

From 2.96 m to 11.97 m: Moderately spaced discontinuities, strong to very strong, slightly weathered, some iron oxide staining on joint surfaces.

At 13.33 m: Fault, 10 mm aperture, gouge infill, sub-parallel to core axis.

Groundwater Monitoring and Sampling Field Protocol

NEWCREST

GROUNDWATER MONITORING AND SAMPLING PROTOCOL – BRUCEJACK MINE

VERSION CONTROL

Revision #	Date Released	Approved By	Amendment
1	14 April 2015 - internal		DRAFT for Pretium Review and Comment
2	24 April 2015 - internal		Incorporated M. Holtby and L. Tate review comments; added version tracking sheet
3	June 2015		Revised to include MA and EMA Permit Review comments and recommendations
4	August 2015		Revised to include the wells to be added to the program during Operations and Closure
5	February 2017		Revised to include updated monitoring program details
6	January 2019		Revised to include updates to monitoring program details and CWP Monitoring Wells, update well purge methods.
7	February 2020		Revised to match the low-flow field sampling protocol employed in 2019
8	March 2022		Revised to add direct read cable and sonic water level measurement SOPs

1. INTRODUCTION

The following document describes the procedures and equipment associated with groundwater level monitoring, groundwater sampling, field documentation and quality assurance/quality control (QA/QC) protocols for the Brucejack Mine Site.

This document is strictly a guideline and procedures may vary when in the field to suit field conditions at the time of sampling.

1.1 Brucejack Groundwater Monitoring Program

The wells included in the current groundwater monitoring program at Brucejack are listed in Table 1 along with screening information. Table 2 provides a list of monitoring wells to be constructed later in Operations or prior to Closure, to satisfy requirements outlined in the *Mines Act* and *Environmental Management Act* Permits (i.e., M-243 and PE-107835, respectively). A map showing current and proposed well locations is provided in Appendix A, while detailed well construction information for existing wells is provided in Appendix B.

Table 1. Monitoring Well Locations and Sampling Method.

BJ-GW18-23B	CWP	7.8	10.8	C	Peristaltic	<250	Q

Notes:
C = Continuous (automatically recorded on a 6-hr interval) monitoring using pressure transducer; Q = Quarterly sampling; B = Biannual sampling
WZ – West Zone; VOK – Valley of Kings; PV – Pilsner Valley; OVB – Overburden; CWP – Contact Water Pond
[a]Pumping rate ranges are listed. The lower rate should be used if turbidity readings are elevated.
[b]Monitoring wells where flowing artesian conditions are observed.
[c]If well access is improved, otherwise bailer can be used
[d]At high water levels a submersible pump is feasible, at low water levels a bailer may have to be used.

Table 2. Additional Compliance Monitoring Wells.

New Well @ P5	-	-	Install timing to be assessed during 2020 Five Year Mine Plan update

2. FIELD EQUIPMENT AND CALIBRATION

2.1. Equipment Check List

The equipment needed for sampling of the wells is listed in Table 3.

Table 3. Groundwater Sampling Equipment

Equipment	Purpose	Equipment Source
Personal Protective Equipment (PPE) – Safety glasses, vinyl gloves, hard hat, safety boots, high-visibility safety vest, hearing protection, as required	Health and safety concerns, limit exposure to noise and chemical preservatives	On-site stock
Water level meter and spare battery	To manually measure the groundwater level	On-site stock
Alconox soap and distilled water	To rinse the monitoring equipment between wells	On-site stock
YSI multi-probe (with a flow cell) capable of measuring pH, Temperature, Specific Conductivity (SC), Dissolved Oxygen (DO), Oxidation Reduction Potential (ORP), and Turbidity.	To measure field temperature, pH, SC, DO, ORP and turbidity.	On-site stock
Calibration solutions for pH 4, 7 and 10; 1413 µS/cm conductivity solution, Zobell solution for ORP, 0 FNU and 124 FNU Turbidity standards).	To evaluate and adjust the precision and accuracy of the YSI meter and probes.	On-site stock, Hoskin Environmental
HACH Digital Titrator Model 16900 with sulfuric acid (1.6 and 0.16 N) cartridges, Phenolphthalein and Bromcresol Green-Methyl Red powder pillow packets	To measure field alkalinity	On-site, HACH Sales and Services
Poly-weighted bailers	To sample groundwater wells with poor recovery or deep wells with short water columns.	On-site stock, Pine Environmental
Geotech peristaltic pump, 12V battery, 5/8" Silicone Tubing, 1/4" polyethylene tubing, power cable	To sample shallow (<10 m deep) groundwater wells	On-site stock, Pine Environmental
Grundfos Redi-Flo2 submersible pump, Redi-Flo variable frequency drive controller, 3000W	To sample groundwater wells with depths ranging from 10m to 90m.	On-site stock, Pine Environmental

Equipment	Purpose	Equipment Source
generator, hose clamps, 1/2" polyethylene tubing, extension cord (generator), power cord (VFD to pump), jerry can of gasoline for generator		
Bennett sample pump, propane tanks (seacan heat source), jerry can of gasoline for generators, three 20L pails of water (to prime the pump)	To sample groundwater wells with depths greater than 100m	On-site Bennett Sample Pump seacan.
QED bladder pump, QED pump controller, disposable bladders, Makita portable air compressor, polyethylene tubing, generator, power cord, jerry can of gasoline for generator.	Back-up pump capable of sampling wells that utilize the Bennett sample pump and the Grundfos submersible pump	On-site stock, Pine Environmental
45 micron filter and syringes or High Capacity Waterra inline filters	To field filter the groundwater samples	Pine Environmental or on-site stock
String/ 100 m nylon cable reel	Attach to Poly-weighted bailer to collect groundwater sample	On-site stock
Graduated 20 litre pail	To measure flowrate, and clean water level tape and pump	On-site stock
Laboratory supplied sample bottles	To collect groundwater samples	ALS Laboratories
Preservatives (if any)	To preserve various samples	ALS Laboratories
Cooler(s) with bubble wrap	To protect samples and provide a temperature controlled environment for transport	On-site stock or ALS laboratories
Frozen ice-pack(s)	To provide a temperature controlled environment for transport of groundwater samples to laboratory	ALS Laboratories
Chain of custody (COC)	To track samples and ensure integrity/provide a record of samples from collection to reporting	ALS Laboratories
Stopwatch, graduated cylinder	To determine purge rate	On-site stock
Field Forms	To record field measurements	Field laptop or printed on Rite in Rain Paper
Computer with HOBOware and Diver-Office software and optical reading cables	To download and reset dataloggers and barologgers	Free software download available at Onsetcomp.com and vanessen.com

2.2. Calibrations and Equipment Checks

Prior to heading to the field ensure that all equipment is working properly and complete with required accessories (power cables, flow cell, etc) as outlined in Table 3.

- Test the water level meter function by pushing the test button and listening for the tone or observing the flashing light which indicates that the water level tape is functioning correctly.
- Ensure that battery for peristaltic pump is fully charged and/or bring a spare.
- The YSI calibration should be checked every day, prior to its use in the field and recalibrated if required.

- Record the calibration data on the Brucejack master calibration tracking spreadsheet (Appendix C).
- Check the YSI multi-probe calibration for pH, specific conductance (SC), Oxidation Reduction Potential (ORP), Dissolved Oxygen (DO) and turbidity using the appropriate calibration solutions (i.e., pH 4, 7 and 10; 1413 µS/cm conductivity solution at reference temperature 25 ºC; Zobell solution for ORP, and 0 FNU and 124 FNU solutions for turbidity). If parameters report outside of range, the probe should be re-calibrated. Calibration procedures should follow instrument manual instructions.
- The YSI should be stored covered and protected from freezing conditions while not in use. The sonde should be stored in the calibration cup with a damp sponge to ensure pH and DO sensors do not dry out.

3. METHODOLOGY

3.1. Groundwater Level Monitoring Procedures

- Remove well cap and check the PVC stick-up for damage; repair if necessary.
- Wait five minutes before lowering the clean water level meter into the well until the tone is heard or the light illuminates. This delay allows the water level to equilibrate with barometric pressure. Wells that have vented pipe (holes drilled on the side) do not require the five minute delay for water level measurement.
- Measure depth-to-water (using the water level meter) below the notch on the PVC pipe prior to sampling (i.e., static level). Water levels should be recorded on the *Groundwater Monitoring Well Field Sampling Form* (Appendix C) in meters to the nearest mm, which will provide a groundwater level in meters below top of PVC casing (m bTOC). Include the well ID, date and time.
    - Note: The notch on the PVC pipe is the standard survey point from which all water levels in the well are measured.
- Measure the height of the PVC pipe (at the notch level) above ground (stickup) using a measuring tape. Record this value on the *Groundwater Monitoring Well Field Sampling Form* (Appendix D) and compare to the well record (provided in Appendix B) to identify changes in these values. Document any changes in stickup on the *Groundwater Monitoring Well Field Sampling Form*.
- Clean the submerged portion of the water level meter between locations with a phosphate free detergent like Alconox and rinse with distilled water.
- The elevation of the water level can be calculated by subtracting the depth to water from the top of the PVC (m bTOC) from the surveyed elevation of the top of the PVC (found in Appendix B).

3.2. Datalogger and Barologger Download and Reset

All monitoring wells at Brucejack are equipped with Onset Industries HOBO dataloggers or Van Essen Instruments TD-Diver dataloggers to remotely record the groundwater level and temperature on a 6-hr interval (i.e., at 12 AM, 6 AM, 12 PM, and 6 PM). A barometric logger is also used and placed in a safe and dry location on site to record barometric pressure at the same time intervals. The barometric logger data is used for barometric compensation of the groundwater level data.

Prior to deploying tubing or equipment in a well:

- Measure and record water level below the top of the PVC pipe utilizing a water level meter. Note date and time.
- Retrieve cable with datalogger from the well.
- Download the datalogger using the optical reader connected to a computer with a USB plug-in. The computer will need the HOBOware software for Onset HOBO dataloggers and Diver-Office for Van Essen TD-Diver dataloggers
- Review the status of the logger by confirming logger function, battery life and available internal memory. Ensure the logger internal clocks are synchronized with the computer clock. If the battery level is less than 20%, remove the logger from service. If the memory level is greater than 80%, download the data and reset the logger. Do NOT reset the dataloggers, unless a setup issue (e.g. off-set internal clock, logging frequency error, internal memory almost at full capacity) is identified.
- Save the downloaded data to the appropriate subfolder within the master Groundwater folder on the server. Save the raw data file and export (and save) the data as a .csv file.
- Ensure the dataloggers are stored in a safe place while they are not in the wells.
- Once groundwater sampling is complete, redeploy the datalogger in the well to the same depth using the well-specific attached cable.
- Measure and record water level below the PVC pipe utilizing a water level meter after the logger has been redeployed. Note date and time.
- Download the barometric datalogger at the end of the sampling quarter.

3.3. Sampling

Low-Flow Sampling

Groundwater samples will be collected from wells using the sampling equipment listed in Table 1. Low-flow sampling protocols will be followed for all wells where the peristaltic pump, submersible pump, Bennett sample pump or bladder pump are utilized. Standard Operating Procedures for the submersible pump, Bennett Sample Pump and bladder pump are presented in Appendix E, Appendix F, and Appendix G, respectively. General low-flow sampling procedures are as follows:

- Deploy pump and/or tubing using clean gloves. The intakes for the pump/tubing should be within the screened area of the well (Table 1)
- Initiate pumping. Connect pump discharge line to flow through cell of YSI. Allow outlet of YSI to drain into graduated bucket.
- Throttle pump settings to recommended ranges provided in Table 1. Typical low flow sampling rates range between 0.1 and 0.5 L/min, although some wells can support higher rates. In slower recharging wells, it may be advantageous to pump the well at a slightly higher rate to obtain some drawdown (i.e. forcing higher gradients towards the well) and then throttling the pump rates back to recommended levels to achieve stable water levels.
- Measure and record groundwater level, sampling flow rate and field parameters (pH, ORP, SC, Turbidity, DO) at regular intervals on the well sampling form provided in Appendix C. Suggested time intervals are on the order of 5 to 10 minutes, more frequent for faster pump rates and less frequent for slower pumping rates.
- As monitoring progresses, prepare sample bottles with waterproof labels provided by the laboratory. Use indelible ink or pencil to fill in the information.

- Observed trends in water levels and field parameters to determine if the well discharge has stabilized. Stabilization of parameters is considered achieved when turbidity is minimal (<50 NTU) and three consecutive readings change within the following limits:
    - Water level (within ± 2 mm)
    - pH ± 0.1
    - Specific Conductance ±3%
    - Dissolved Oxygen ±10% for values >0.5 mg/L (three values less than 0.5 mg/L are considered stabilized);
    - Oxidation Reduction Potential ±10 mV
    - Turbidity ±10%
- Collection of groundwater sample can occur when the above criteria are met. Disconnect the YSI flow- through cell and measure the flow rate. Sometimes flow rates increase when the flow-through cell is disconnected, which will cause the water level to drop, introducing stagnant well water into the sample stream. Adjust flow rate downwards so that it matches or is lower than the stabilized flow rate when the flow-through cell was attached.
- A clean set of vinyl gloves must be used during sample collection. Care should be taken to avoid touching the inside of the sample bottle and cap with sampling tubing, filters, syringes or gloves.
- Samples bottles are taken for the analyses outlined in Table 4. Bottles that do not require field filtering can be filled in sequence with appropriate laboratory supplied preservatives added as the bottles are filled.
- For dissolved parameters, the groundwater sample should be field-filtered using a 0.45 micron filter. Typically, a syringe is filled with groundwater and a filter is attached to the end of the syringe. Alternatively, an inline high-capacity filter may be used. The filtered groundwater should be dispensed directly into the appropriate laboratory bottle and preserved with prescribed preservative.
- Prior to turning off the pump, review Appendix H to select the appropriate sample volume and titration cartridge based on the expected alkalinity range of the well water. Alkalinity can be done in the field if conditions permit, or inside the site environmental office promptly after sampling. More detailed instructions on how to measure field alkalinity are found in Appendix H.
    - Transfer the sample into a clean 250-mL Erlenmeyer flask and dilute with DI water to the 100 mL mark if necessary.
    - Add one packet of Phenolphthalein and swirl the flask. If the solution turns pink, titrate to a colorless end point while recording the number of digits required. Calculate the $CaCa_3$ P alkalinity and record the value on the well data sheet.
    - Add one Bromcresol Green-Methyl Red packet and swirl to mix. Continue titrating while recording the digits to either a light green-blue-gray, a light violet-gray, or a light pink (the color depends on the sample composition). Calculate the total alkalinity and record it on the field sheet.
- Place filled sample bottles in a cooler with ice-packs and fill out the chain-of-custody (COC) for each cooler. Ensure samples are tightly capped. Sample cooler temperature should be maintained between 4 °C and 10 °C.
- If samples are not shipped immediately, refrigerate samples immediately and maintain refrigerated conditions until the cooler is ready for shipment to the analytical laboratory.
- When ready to ship the samples to the selected laboratory:

- Put sample bottles in coolers with (fresh or newly frozen) ice-packs located above and below samples.
- Place enough bubble wrap in the cooler to protect the samples from impact.
- Include COC form for each cooler in ZipLoc bag.

Table 4: Groundwater Analytes and Preservatives

Bottle	Volume/Material	Parameters	Filtered	Preservative
1	500 mL HDPE	General Parameters + Anions: pH, conductivity, total dissolved solids (TDS), total suspended solids (TSS), turbidity, hardness, total alkalinity, acidity, sulphate, chloride, fluoride, nitrate, nitrite	No	None
2	120 mL Amber Glass	Nutrients: Total Kjeldahl Nitrogen (TKN), ammonia, orthophosphate – dissolved, phosphorous - total, total nitrogen	No	H_2SO_4
3	60 mL HDPE	Total Metals: Aluminum (Al), Antimony (Sb), Arsenic (As), Barium (Ba), Beryllium (Be), Bismuth (Bi), Cadmium (Cd), Calcium (Ca), Chromium (Cr), Cobalt (Co), Copper (Cu), Iron (Fe), Lead(Pb), Lithium (Li), Manganese (Mn), Magnesium (Mg), Molybdenum (Mo), Nickel (Ni), Phosphorous (P), Potassium (K), Selenium (Se), Silver (Ag), Sodium (Na), Strontium (Sr), Thallium (Tl), Tin (Sn), Uranium (U), Vanadium (V), Zinc (Zn).	No	HNO_3
4	60 mL HDPE	Dissolved Metals: (as per total metals suite)	Yes	HNO_3
5	40 mL glass vial	Mercury (Total)	No	HCl
6	40 mL glass vial	Mercury (Dissolved)	Yes	HCl
7	145 mL HDPE	Sulfide (Total)	No	Zn Acetate; NaOH

Grab Sampling (Bailers)

Poly-weighted bailers (i.e., 1.6” x 36”) are used in deep wells with short water columns (insufficient head pressure to operate the submersible pump or Bennett sample pump) and wells with very poor recovery. General procedures for sampling with bailers are as follows:

- The poly-weighted bailer is lowered down the well using a cable until the bailer is submerged.
- Bailers are raised to the surface as smoothly as possible, which allows the ball valves to seal, trapping water in the bailers on the way up.
- The cumulative volume withdrawn by the bailers is tracked by emptying the bailer into an appropriate receptacle (e.g., 20-litre bucket) to record purge volumes and measure field parameters (temperature, pH, SC, DO, ORP and turbidity). Field parameters and water levels should be measured over 5L increments to monitor the stabilization of parameters and water level. Once three consecutive stable readings are obtained, a groundwater sample can be collected.
- For sampling, use the pourer (supplied with the poly-weighted bailer), by inserting into the bottom of the poly-weighted bailer to dislodge the ball valve and allow the water to flow either directly into the sampling bottles for unfiltered parameters or into a syringe for filtering prior to filling the dissolved parameter bottle (Table 4).

Equipment Decontamination

Any portable pumps (submersible or Bennett pump) must be decontaminated between monitoring wells using an Alconox solution or similar followed by a rinse with de-ionized water. Any pump motor leads that are submerged must also be wiped prior to re-deployment. When not in use, the submersible pump shall be stored in a dust free environment (or bagged). The seacan containing the Bennett pump should have its doors closed while not in use to inhibit dust incursion.

3.4. Artesian Conditions

Artesian (or "flowing") conditions occur when a confined aquifer is under positive pressure, which causes the water level in a monitoring well to rise above ground surface to achieve hydrostatic equilibrium. The monitoring wells BJ-GW14-13A/B and BJ-GW14-14A present artesian conditions and are fitted with packer plugs to control the artesian flow and satisfy Part 8 of BC's Groundwater Protection Regulation under the *Water Sustainability Act.*

All three monitoring wells contain dataloggers that are deployed below the packer plugs to record pressure. The packers will have to be removed prior to downloading the dataloggers at BJ-GW14-13A/B and prior to the monitoring, sampling and data logger download at BJ-GW14-14A. The packers will be reinstalled in the wells upon completing of the monitoring and/or sampling tasks. To prevent water from freezing in the well above the packer, any standing water above the packer seal should be expelled (using a peristaltic pump).

BJ-GW14-14A is seasonally artesian which can impact the sampling procedure:

- If the water level in the well resides within the casing upon removal of the packer plug, then the well should be sampled via low flow methods outlined in Section 3.3.
- If the well flows upon removal of the packer plug, the flow rate should be estimated and the well allowed to 'self-purge' one to three bore volumes prior to collection of the sample. One bore volume is approximately 88 L. Upon purging of this water, the well can be sampled using a peristaltic pump, the sample tubing need not be deployed to the bottom of the well. The sampler should connect the YSI flow through cell and record three readings (every 5 minutes) prior to collecting the sample as per the procedures outline in Section 3.3.

3.5. Quality Assurance/Quality Control (QA/QC) Procedures

Quality Assurance/Quality Control (QA/QC) procedures are important to ensure that representative data are obtained.

- Collect field duplicate samples for analyses for the same analytical parameters as the primary samples:
    - The field duplicate sample provides an indication of the precision of the analytical methodology as well as sampling methodology and sample matrix variability.
    - Collect one duplicate per ten primary samples in a quarterly sampling event. If more than one duplicate is collected in a quarterly sampling event (i.e. primary samples exceed ten), then duplicates should be collected at wells using different sampling methods. Ideally, a duplicate for each sampling method (peristaltic pump, submersible pump, Bennett sample pump, bailer and bladder pump) should be collected over the course of one year.
    - The duplicate should be taken for all parameters listed in Table 4.
    - The field duplicate is given the name of the primary sample, followed by the suffix "-98" (for example, BJ-GW18-23B-98).

- At least one field blank should be collected during each quarterly sampling event.
    - The field blank will be collected by directly pouring recently prepared (within one month) deionized water (DI) supplied from the laboratory into the same sample bottles as a typical groundwater sample set (Table 4).
    - DI water will be field-filtered using a syringe and disc filter for the dissolved metals and dissolved mercury samples.
    - All field blank bottles should be preserved in the field.
    - The field blank is given the name of the well site where the sample was collected, followed by the suffix "-99" (for example, BJ-GW18-23B-99).
- One equipment blank should be collected during each quarterly sampling event. This sample should be collected using one of the main sampling methods used during the sampling rounds.
    - The DI water should be field-filtered using an inline filter for the dissolved metals and dissolved mercury samples.
    - The field blank is given the name of the well site where the sample was collected, followed by the suffix "-99" (for example, BJ-GW18-23B-99).
- Record QA/QC samples on COC submissions.

4. FIELD DOCUMENTATION

Complete required field documentation for each monitoring well/sample. These field data include (but are not limited to) the following, as appropriate:

- Date and time of groundwater monitoring, data logger withdrawal/deployment and sample collection.
- Sampling equipment used.
- Specific notes regarding the sample collection and QA/QC samples.
- References, such as maps or photographs, of the sampling site.
- Field measurements, such as color/clarity, temperature, pH, SC, DO, ORP, turbidity and alkalinity (starting in sQ1 2020).

5. SITE SPECIFIC CONSIDERATIONS

In the winter, keep the YSI meter and probes warm to avoid damage from freezing. Prevent groundwater samples from freezing, as sample bottles could crack with the change in volume.

5.1. Wells with Slow Recovery

Some wells experience slow recovery during purging and sampling necessitating multiple trips to purge the required well volumes prior to sampling. For wells where the water level is within the screened interval, purging should be conducted such that the water level does not reach the bottom of the screen. The well should be allowed to recover, then purging may resume.

Submersible Pump Standard Operating Procedure

NEWCREST		BJ-ENV-SOP-XXX Groundwater Sampling with Submersible Pump	
Owner:	**Approver**:	**Revision Number**: 1	**Creation Date**: June 13 2019
			Revision Date: Dec 14, 2019

Objective

Safe and effective operation of the Grundfos Redioflo 2 submersible pump for collection of groundwater samples from standpipe monitoring wells.

Scope

Installing the pump in a well, operating the pump, recovering the pump from a well, storage and maintenance. Other aspects of groundwater sampling and working at Brucejack more generally are discussed in other SOPs.

Health, Safety & Reclamation Code of BC

- 1.11.1 – Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 – Personal Protective Equipment
- 4.9.01, 4.9.1, 4.9.3 – Heavy Equipment

Training

Personnel should be familiar with the safe operation and limitations of the equipment before using it. When using the submersible pump system for the first time, personnel with previous experience using the equipment should be leading the work and providing hands-on guidance on the risks.

Preparation

Hazards

- Electric shock
- Back and muscle strain (forearms, shoulders)
- Property damage (Loss of well and pump)

Tools

- Vinyl gloves
- ½ inch inner diameter (ID) tubing (high-density polyethylene or low-density polyethylene)
- Submersible pump and 300 ft cable reel
- Pump variable frequency drive (VFD) controller
- Tubing cutters
- Hose clamps (1 x ¾ or 1 inch, 1 x 2½ or 3 inch)
- 2 ft Cord, 2 mm diameter or greater
- Water level tape
- Multi-parameter probe with flow-through cell
- PVC tape
- Zip ties
- Medium or large vice grips
- Nut drive fitted to the hose clamps
- Flathead screw driver
- Graduated bucket (1 or 2 L graduations, 1 or 2 buckets)

DRAFT

Job Step

1. **Measure groundwater level in the well and remove pressure transducer**
    - Well should be clear of all obstructions before lowering the pump
2. **Prepare to lower pump**
    - Stage pump, cable reel, and tubing next to the well collar'
    - Pump motor chamber should be filled with water. This should be inspected and topped up as required before each use of the pump
    - Connect tubing to barb fitting at top of pump. Use hose clamp to tighten tubing onto fitting
3. **Lower the pump**
    - Fix the tubing and cable together approximately 1 m above the pump using PVC tape or zip ties. Continue to fix the cable and tubing together at approximately 10 m intervals as the pump is lowered. The cable should be kept under light tension while lowering, particularly when fixing it to the tubing. This task step serves to prevent the cable from bunching up during recovery of the assembly. **Bunching up cable presents a risk of considerable property damage, the worst case being loss of both the pump and monitoring well.**
    - If an obstruction is encountered before reaching the bottom of the well, do not apply force to advance the pump past it. **Applying force against an obstruction may result in the pump becoming stuck at or below it, presenting a risk of considerable property damage, the worst case being loss of both the pump and monitoring well.**
    - This is a two person task. One person is positioned at the collar, guiding the tubing and cable into the well. The second person unspools the tubing. The cable reel is allowed to unspool cable with light resistance applied by the mechanical break (preventing free-wheeling).
    - Vice grips may be used to suspect the assembly part-way down the well temporarily, providing personnel with the opportunity to take breaks to minimize muscle fatigue and prevent strain. Set the vice grips to an appropriate size to grip the tubing without damaging it before starting to lower the pump, so that they are available with minimal disruption when needed.
    - Vinyl gloves should be worn to lower tubing to minimize cross-contamination of the water in the monitoring well and to maximize dexterity for holding the tubing.
4. **Set the pump at the center of the well screen**
    - The center of the well screen is most easily identified by lowering the pump to the bottom of the well (where the weight of the assembly is supported), then raising by a distance equal to half the length of the well screen. Most well screens are 3 m long (verify for each specific well by reviewing well construction details table).
5. **Prepare to start the pump**
    - Cut the tubing to length, if required, using tubing cutters. Connect the flow cell with multi-parameter probe to the end of the tubing, use a short additional length of tubing to direct flow into a graduated bucket.
    - Plug the pump cable lead into the VFD controller.
    - Plug the controller into the generator.
    - Prepare to start the generator: fuel up (using standard protocol with gloves, spill kit, containment), turn breather valve on fuel filler cap to On position, open fuel valve, turn power to on position, turn choke on. Start the generator, turn choke off.
    - The controller will immediately power up once the generator starts to produce power. Wait around one minute before starting pump to verify power supplied to the controller is appropriate (an error message will display if not).
6. **Start the Pump**
    - Slowly turn the VFD knob on the controller clockwise to increase the pump motor frequency (increase controller output voltage).

DRAFT

- The motor frequency required to sustain flow to the well depends on the depth to water in the well, and may need to be adjusted depending how rapidly the water level drops in response to pumping. Determining the optimal motor frequency and adjustments will require familiarity with both the pump and the recharge and sediment load characteristics of the specific well.
- VFD controllers are sometimes not compatible with the ground fault circuit interrupters on some generators.

7. Purge and sample

- Conduct groundwater sampling in accordance with the groundwater sampling SOP. Purging should be conducted until groundwater level stabilization can be demonstrated followed by hydrochemical parameter stabilization. Additionally, the flow rate should be maintained adequately low to minimize entrainment of suspended sediments (as assessed by turbidity measurements).
- The practical lower threshold flow rate for the Redi Flo 2 submerisble pump is around 200 mL/min. Lower flow rates may be achieved but may not be consistent, particularly in the presence of higher sediment loads and as pump impeller and motor wear progresses.
- Sediment load should be minimized with use of a submersible pump. A slug of suspended sediment shortly after starting to pump and enduring less than one well volume is common and should not cause undue wear on the pump. Sustained elevated sediment loads will reduce pump lifespan due to the abrasion on components contacting the water.
- Water level measurements should be recorded at regular intervals while purging. Care should be taken to avoid the water level dropping to the pump (e.g. maintain a water column at least a couple meters above the pump).
- Flow should remain continuous at a consistent flow rate while sampling with the submersible pump. This pump is not equipped with a check valve, and as such when the pump is stopped all water in the tubing will return to the standpipe column.

8. Stop the pump and remove the assembly from the well

- The pump may be stopped either using the stop button on the controller or by turning off the generator.
- Disconnect the materials used to suspend the pump at the well collar.
- Raise the tubing and cable using a hand-over-hand motion, cutting the PVC tape or zip ties as they daylight from the well.
- Raising the tubing and cable is a two person task.

9. Tubing will not be re-used. Dispose the tubing in the General Waste bin at the Waste Sorting Facility. Return equipment to storage

- Controller box should be left open to allow any moisture accumulation to dry. Care should be taken to avoid any direct water contact with the controller itself at all times.

Appendix F

Bennett Sample Pump Standard Operating Procedure

Objective

To provide operational guidance when using the Bennett Sample Pump (BSP) during groundwater sampling at the Brucejack mine.

Scope

The document covers the transport of the BSP along with instructions on start-up, operation and shut-down. Troubleshooting, safety tips and decontamination procedures are also provided.

Health, Safety & Reclamation Code of BC

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5, 1.8.7 Personal Protective Equipment
- 2.13 WHMIS

Definitions

- BSP – Bennett Sample Pump
- PPE – Personal Protective Equipment (hard hat, steel toed boots, high visibility vest, hearing protection, cut resistant gloves and safety glasses)
- PSI – Pounds per square inch

Preparation

Hazards

- Work near heavy equipment (loaders and snowcat)
- Gasoline exhaust fumes
- Pressurized air compressor tank and pressurized air lines
- Propane lines and tanks
- Gasoline tanks and generators
- Slips, trips and falls
- Tight working space
- Noise
- Excessive vibration
- Work in a remote field environment
- Avalanche hazards
- Deep snow
- Wildlife

Training Requirements

- Avalanche training.
- Bear aware training.

Tools

- BSP seacan:
  - Ingersoll Rand gasoline powered air compressor (Photograph 1),

    - BE 9000W gasoline generator (Photograph 2),
    - BSP motorized tubing reel and detachable tube reel arm (Photograph 3),
    - Super-Dry air dryer unit (Photograph 4),
    - Detachable airline (Photograph 5), and;
    - Propane heater (Photograph 6).
- Toolkit (adjustable pipe wrench, small wrenches for reel tubing and screwdrivers).
- Super-dry desiccant
- Three 20 L pails full of clean water (to prime the BSP and tubing)
- Electrical tape
- Rubber bungie cables
- Two twenty pound propane tanks (cold weather conditions)
- Gasoline jerry can
- Large spill tray
- Hydrocarbon spill pads
- Wildlife deterrent (bear bangers and bear spray)
- Snow shovels

Job Step

1. Pump Movement/Relocation

- Coordinate with the Surface Operations department in advance to plan the transport of the BSP seacan. A loader will be required in the summer. In the winter, the seacan must be loaded and fastened onto a snowcat trailer.
- Personnel familiar with the safe operation of the BSP should lead the pre-operational check of the seacan. Inspect the exterior and interior of the seacan for any visible damage to the structure of the seacan (including interior insulation) and its contents, including the propane heater and exhaust, propane lines, air compressor, generator and tubing reel.
- Ensure that any loose equipment (tools, pails, spill kits, snow shovels, etc.) are secured to minimize any movement during transport of the seacan.
- Propane tanks must be disconnected, and along with gasoline jerry cans, must be transported separately to prevent any spills and minimize safety risks.
- Close and lock the man-door and the roll up door.
- In the summer, provide guidance to the loader operator regarding the transport of the seacan, and accompany the loader (and seacan) to the well site. In the winter, provide guidance to the snowcat operator regarding the transport of the seacan to the well site. Environmental team members should accompany the loader/snowcat operators to serve as a spotter and to confirm the correct placement of the seacan.
- At the well site, direct the heavy equipment operator to position the seacan approximately 1 to 2 m away from the well/well shack, with the reel lined up with the well stickup being sampled(Photograph 7).

NOTE: Positioning the pump in the winter can be significantly more challenging. Depending on the thickness of the snow, there may be a considerable amount of shoveling around the well shack doors. This should be completed prior to mobilizing the seacan to minimize the snowcat operator's down time. Additionally, the trailer should be placed as flat as possible. The trailer MAY ROLL if left on a slope. If necessary, dunnage/wooden blocks can be placed under the tracks before the trailer is detached from the snowcat. DO NOT rely on the dunnage to prevent a roll.

2. Assembling and priming the pump

- Using a small adjustable wrench, attach the Bennett pump head to the pump reel tubing. First, attach the steel wire to the centre of the Bennett pump head. Next, the three tubes within the tubing reel (Air Inlet, Air Exhaust, and Water) will have to be attached to the labelled ports on the pump head. The Air Inlet and Exhaust are similar in size and are located on either side of and

below the Water line, which is located in the centre of three lines. The lines create a triangle. Finally, ensure the pressure transducer line is fitted into the associated slot on the Bennett pump head.

- Remove the generator from the seacan, and orient the generator exhaust downwind and/or away from the work area. Turn the generator on and run for about two minutes to allow the generator to warm up. Plug in the electrical cable from the tubing reel motor into the generator.
- Advance the reel forward using the reel toggle switch, allowing enough slack in the tubing to place the pump in a 20L pail full of clean water. The pump and entire reel of tubing needs to be primed prior to advancing the pump downhole.
- Check to ensure that the air compressor outlet valve is closed (perpendicular to the air line). Close the air compressor drain valve located at the base of the air compressor tank. Check the engine oil and fuel tank level. DO NOT operate the air compressor if the engine oil level is low. Start the air compressor by turning the key to the ON position. Turn the fuel lever to the open position and open the choke. Toggle the grey metal wire below the choke so that the small metal plate is parallel to the floor (horizontal). This will aid in helping the air compressor to turn over (Photograph 8). Start the air compressor engine with the pull cord. Slowly close the choke.
- Once the air compressor tank is full, the engine will switch to idle mode. To minimize noise, it is preferable to turn the engine off. Monitor the pressure gauge on top of the tank every 3 to 5 minutes. Close the moisture filter valve, located behind the tubing reel flow controller and close the drain valve located below the air dryer unit.
- Slowly open the air compressor outlet valve to allow air flow into the Super-dry air dryer unit. There are two pressure gauges, one at the inlet and one at the outlet of the Super-dry air dryer unit. The inlet (bottom) pressure gauge and the outlet (top) pressure gauge should read the same pressure during operation. If there is a discrepancy in the readings between the inlet and outlet pressure gauges, the internal desiccant will need to be replaced. The air dryer unit is rated to handle a maximum air pressure of 150 psi. Monitor the pressure gauges and ensure that the pressure does not exceed 130 psi (this allows a 20 psi buffer).
- Open the air dryer outlet air valve and open the flow controller on the front face of the tubing reel (Photograph 9) to allow air to flow through the tubing and the pump. As the air pressure increases, the pump will engage (identified by a clicking sound) and will begin pumping water from the 20L pail. Approximately 40L of water will be required to completely fill the tubing reel and pump. Monitor the discharge, noting the frequency of air bubbles. Once the discharge of air bubbles ceases, the pump is ready for deployment into the well. While priming the pump on surface, 40 psi of air pressure will be adequate to pump water out of a 20L pail. Ideally, pump three 20L pails of water through the tubing to ensure the pump is primed and flushed. After one and a half pails (~30L), the pump outlet should start to produce water, which should be discharged into an empty pail.
- The air pressure in the air compressor tank will gradually reduce. In order to fill up the compressor tanks, close the outlet valve on the air compressor tank, turn on the engine, allow the tank to fill up, and then open the outlet valve on the air compressor tank. Alternatively, the outlet valve can be adjusted and left open such that the air compressor fills the compressor tank and the desiccator to the desired psi.
- Once the pump is primed, close the outlet air valve on the air dryer unit and allow the pump to slow down the pumping rate. Once the pump stops cycling, turn off the flow controller. Allowing the pump to slow down reduces the air pressure within the tubing, thus applying less pressure on pump fittings and connections. Ideally, no air should be pumped while lowering the tubing down the well. By releasing pressure in the system, it reduces the likelihood of pumping or water loss during deployment.

3. Deploying the pump in the monitoring well. TWO PERSON TASK.

- Advance the tubing reel forward using the toggle switch, and gently guide the pump into the well. One person will control the reel toggle switch, while the other person guides the tubing into the well. Ensure the pump head enters the well directly so that it is not damaged and does not damage the well.
- Place the detachable reel arm between the monitoring well and the reel, using the arm to support the weight of the tubing. The reel arm will reduce the load on the well stick-up and will minimize

surface abrasion to the tubing (Photograph 10). At the start of the tubing deployment, the tubing will likely have to be pushed down the well.

- While lowering the tubing, complete repairs to the tubing bundle by applying thick electrical tape on exposed areas of the tubing bundle and/or removing brittle tape.
- Lower the pump to the bottom of the well and then withdraw it up to the desired target depth for the pump head. The pump should be deployed midway into the well screen (confirm screen length from well fact sheets).
- Turn off the generator and unplug the electrical cable.
- Wait 5-10 mins to allow disturbed silt to settle.

4. Purging and sampling the monitoring well

- Pressurize the system again to begin pumping. The air compressor can remain turned off while pumping. Re-engage the air compressor only when the pressure drops below the minimum pressure needed to pump the well. This will minimize unnecessary noise and vibration.
- The air pressure as measured by the air dryer pressure gauges should be maintained below 130 psi. Initially, the air compressor outlet valve may need to be adjusted each time it is turned on to adjust to a steady pressure of ~80-120 psi, however, after repeated adjustments the air compressor should pressurize to the set pressure before dropping to idle automatically.
- Follow the low flow sampling guidelines provided in the Groundwater Sampling Protocol document. Generally, a flow rate of 1000 mL/min or less should be maintained, filling one 20L pail in 20 minutes.
- Once field parameters have stabilized, the sample can be collected following standard sampling procedures outlined in the groundwater sampling SOP.

5. Removing the pump from the monitoring well. TWO PERSON TASK.

- Close the valve at the air compressor outlet, thus slowing the pumping rate and eventually stopping the pump from cycling. Turn off the flow controller.
- Connect the electrical cable from the BSP reel motor to the generator.
- Retrieve the pump and tubing by using the toggle switch and by gently guiding the tubing onto the reel by spreading it in an even manner. One person will control the toggle switch, while the other person will direct the tubing onto the reel. Proper communication and eye contact is vital to complete this task safely. Use the detachable reel arm to aid in guiding the tubing out of the well and onto the reel.
- When the pump head is close to the top of the well, lower the rate of tubing withdrawal, to prevent the pump head from getting wedged at the top of the well stickup.
- Repair any damage to the tubing bundle with thick electrical tape, as the pump is raised out of the well.
- Turn off the generator and unplug the electrical cable once the tubing and pump head are at surface.

6. Draining water from the BSP tubing and pump.

- Turn off the air compressor and shut the air compressor outlet valve.
- Open the air dryer inlet valve, air dryer outlet valve and air dryer drain valve, which will drain the air pressure in the tubing bundle. **HEARING PROTECTION** is mandatory due to the high pitch of the air exiting the tubing.
- Once the BSP air line is drained, detach the pump screen using small a small adjustable wrench. Disconnect the BSP air line (black hose) from the outlet end of the air dryer.
- Close the inlet, outlet and drain valves of the air dryer. Attach the snap fitting of the detachable air line (yellow hose) to the outlet end of the air dryer and attach the threaded end to the base of the Bennett pump head (the screen will have to be removed as mentioned above).
- Open the inlet and outlet valves of the air dryer. Gently crack the air compressor outlet valve, thus allowing a slow stream of air into the pump head. This air stream will displace all the water in the BSP tubing. Approximately 30L of water will drain from the tubing, equivalent to the volume required to prime the pump and tubing.

- Once all the water has been drained from the tubing, close the air compressor outlet valve. Open the air dryer inlet, outlet and drain valves, thus allowing all the air in the yellow detachable air line to drain. Unscrew the yellow detachable air line from the base of the pump head.

7. Shutdown and equipment storage

- Open the drain valve located at the base of the air compressor. This will drain the air pressure and will drain any accumulated moisture in the compressor tank.
- Open all air line valves to drain them completely.
- Drain the Speedaire water filter located behind the BSP flow controller panel (Photograph 11)
- Close the inlet, outlet and drain valves for the air dryer.
- Turn the propane tank off, turn the propane heater off, unhook the propane tank, and allow propane lines to drain. **Propane heater has been broken for several seasons and a portable heater is currently being used, or a FrostFighter.*
- Secure the generator in the seacan using bungee straps.
- Secure the man door and roll up door of the seacan.
- Transport gasoline jerry cans and propane tanks separately.
- Contact the Surface Operations department regarding the transport of the seacan, if required.

8. Cold weather considerations

The pump head must be removed during above zero temperatures to prevent water from freezing within the pump head. The pump seals and piston will get damaged by water freezing within the pump chambers. During the winter, the BSP seacan should be heated (using the internal propane heater) prior to use. The heater should be run for at least 24 hours to allow residual water in the tubing to thaw, and to melt any frost/ice on the seacan floor. **Propane heater has been broken for several seasons and a portable heater is currently being used, or a FrostFighter.*

Troubleshooting

If the BSP is operational but no water is discharging, there could be an air lock in the system. To rectify this issue:

- Adjust the air pressure into the pump, but do not exceed 140 psi.
- Close the flow controller, thus allowing the system to pressurize.
- Try lowering and raising the pump within the water column.

If these steps do not rectify the issue, withdraw the pump, re-prime at surface and reinstate the pump down the well.

Bladder Pump Standard Operating Procedure

NEWCREST		BJ-ENV-SOP-XXX Groundwater Sampling with High-Pressure Bladder Pumps	
Owner:	**Approver**:	**Revision Number**:	**Creation Date**: June 15 2019
			Revision Date:

Objective

Safe and effective operation of a bladder pump system for collection of groundwater samples from standpipe monitoring wells.

Scope

Installing the pump in a well, operating the pump, recovering the pump from a well, storage and maintenance. Other aspects of groundwater sampling and working at Brucejack more generally are discussed in other SOPs.

Health, Safety & Reclamation Code of BC

- 1.11.1 – Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 – Personal Protective Equipment
- 4.9.01, 4.9.1, 4.9.3 – Heavy Equipment

Training

Personnel should be familiar with the safe operation and limitations of the equipment before using it. When using the bladder pump system for the first time, personnel with previous experience using the equipment should be leading the work and providing hands-on guidance on the safety risks, particularly in relation to the high air pressure that is not involved in the day-to-day work of the environment department. There is also a low-probability high-magnitude risk of property damage associated with using down-well pumps. These risks can be controlled with the information included in this SOP.

Preparation

Hazards

- Energized equipment (compressed air) – fitting or tubing failures causing energized release
- Hearing trauma (compressed air)
- Property damage – loss of pump and use of monitoring well

Tools

- Vinyl gloves
- PVC Tape
- Tubing cutters
- 3/8 inch outer diameter tubing – bladder pump water discharge tube
- ¼ inch outer diameter tubing – bladder pump air tube
- Polyethylene bladder (disposable or dedicated)
- Bladder pump – QED model no. ST1102PM
- Bladder pump controller – QED model no. MP10UH
- Support cable (e.g., motorized winch with 1/8 inch PTFE-coated cable) – stainless steel (refer to cable winch SOP for equipment needed to operate the cable winch)
- ¼ inch and 3/8 inch stainless steel nut and ferule compression fitting unions
- Air compressor (oil-less, 400 psi max pressure)
- Appropriately-rated fittings adapting air compressor outlet to controller, and controller to ¼ inch HDPE air tubing
- Various crescent wrenches

DRAFT

- Teflon thread tape
- Multi-parameter probe with flow through cell
- Graduated bucket (1 or 2 L graduations, 1 or 2 buckets)
- Generator with 15 amp power supply
- Whip-checks for all couplings at surface

Job Step

1. **Assemble equipment, prepare to go to the field**
    - Required equipment is listed under tools above
    - Use of a stainless steel support cable is required for pump depths greater than 50 m.
    - Polyethylene bladders are disposable and should not be used between wells.
    - Install a new bladder in the pump before going to the field. Wear new, clean vinyl gloves when handling the bladder. Use the task-specific clamp plyers to remove the bladder retainer clamps. Practice installing and removing bladders using a waste bladder.
    - Ensure the Teflon thread tape is applied to all threaded couplings in the bladder pump when re-assembling.
    - Select the appropriate tubing for the expected water levels (Table 1). Be sure to obtain specifications for tubing when ordering to **confirm working pressures are adequate for the expected pressures.** Some common tubing working pressures are included in Table 1.

Table 1. Common tubing working pressures (confirm manufacturer specifications when ordering)

Tubing	Maximum working pressure	Maximum depth to water
¼” OD x 0.17” ID HDPE	250 psi	150 m
3/8” OD x ¼” ID HDPE	250 psi	150 m
5/16 OD Teflon bonded with 3/8” OD (QED # DW5000)	500 psi	300 m

2. **Measure groundwater level, remove pressure transducer from the well**
    - All equipment should be removed from the well before lowering the pump
3. **Prepare to lower the pump in the well**
    - Couple air (1/4 inch) and water (3/8 inch) tubing into the top of the pump (Photo X). These are nut and ferule stainless steel Swagelok compression fittings. Review Swagelok tubing installation videos to familiarize with correct installation methods.
    - Connect support cable to eye loop at top of pump (Photo X).
    - Ensure all couplings are tight.
4. **Lower the pump down the well**
    - Fix the tubing (air and water lines) and cable together at intervals of around 10 m using PVC tape or zip ties.
    - Maintain tension on the cable to avoid it bunching up down the well.
    - Control the lowering rate using the cable winch – this will be especially helpful for deep wells where the weight of the pump, cable, and tubing down the well may exceed 50 lbs.

DRAFT

- Tip! This is a two person task. One person unspools the tubing, while the second controls the cable winch. The mechanical brake on the cable winch may be used to take micro breaks and switch tasks
- If an obstruction is encountered before reaching the bottom of the well, do not apply force to advance the pump past it. **Applying force against an obstruction may result in the pump becoming stuck at or below it, presenting a risk of considerable property damage, the worst case being loss of both the pump and monitoring well.**
- Vinyl gloves should be worn to lower tubing to minimize cross-contamination of the water in the monitoring well and to maximize dexterity for holding the tubing.
- For deep wells multiple lengths of tubing will need to be coupled together to reach the bottom of the well. Couple the tubing using stainless steel nut and ferule compression fittings. Review the online materials from Swagelok to familiarize with the appropriate manufacturer-recommended methods for coupling tubing together in a manner that ensures maximum fitting strength.

5. Set the pump at the center of the well screen

- The center of the well screen is most easily identified by lowering the pump to the bottom of the well (where the weight of the assembly is supported), then raising by a distance equal to half the length of the well screen. Most well screens are 3 m long (verify for each specific well by reviewing well construction details table).
- Support the pump assembly down the well. If using the cable winch, the mechanical break would provide the simplest means of securing the assembly. If not using cable, the tubing may be secured to the standpipe collar using hose clamps and cord.

6. Prepare to Start the Pump

- Cut the tubing to the appropriate lengths using tubing cutters.
- Couple the air line from the pump into the controller “Air Out” port using an adaptor with one end consisting of a 3/8 inch stainless steel nut and ferule compression fitting and the other end standard NPT threading connected to the quick coupler.
- Connect the controller “Air In” port to the air compressor using the hosing and fittings assembly.
- **All airline couplings at surface are secured with appropriately sized whip checks.**
- Couple the water line into the flow cell and use an additional short length of tubing to direct flow into a graduated bucket.
- Plug the air compressor into the generator
- Start up the generator and wait for the air compressor to pressurize the tank.
- Slowly pressurize the controller by turning the pressure knob clockwise to the required pressure (minimum pressure is the head pressure from static water level to top of pipe plus at least 10 psi).
- Set the recharge/discharge cycling parameters to the desired setting. A common start point for an unfamiliar well is 45 seconds recharge / 15 seconds discharge. The optimal setting depends on the rate required to attain a stable water level, minimizing turbidity, and minimizing the time required to purge volume. Higher pressure and a greater pump submergence depth maximize the achievable flow rate. Lower pressure and, shorter discharge time (not completely emptying the bladder), and longer refill time (time for complete bladder refill plus additional stationary time to allow for water level recovery) reduces the flow rate. The optimal settings will be different for each well, and operators will become familiar with the specifications required for each well following initial use of the pump at the well. This topic is discussed further in the pump user manual.

7. Start the pump

- Recharge/discharge cycling will begin on pressing the start button on the controller.
- It may take several minutes to achieve flow at surface in wells with deeper water levels after starting the pump. Proper function of the pump can be confirmed by submerging the water line outlet in water and observing bubbling during the discharge cycle.
- If flow does not reach surface within a few minutes and there is no bubbling from the water line outlet, double check the pressure gauge readings on the air compressor and controller, and ensure the pressure is high enough to overcome static pressure. Check for leaks in the air line at

surface (listen for hissing). If the air compressor is running continuously this is a good indicator of a leak in the air supply. A leak in the water line may also prevent flow. It may be necessary to remove the assembly from the well and re-inspect the couplings, tubing, and pump for leaks.

8. Purge and sample

- Conduct groundwater sampling in accordance with the Ground Water Monitoring and Sampling Protocol.
- Bladder pumps are effective low-flow sampling tools that minimize entrainment of suspended sediments. A slug of suspended sediment shortly after starting to pump and enduring less than one well volume is common and may clear up. Bladder pumps are well-suited to elevated sediment loads, however the check valve that prevents water backflow may lose effectiveness at high sediment loads and low flow rates.
- Water level measurements and field parameters should be recorded at regular intervals (approximately 5 to 10 minutes) while purging. Air pressure may need to be increased as the water level drops.
- Collect a sample once field parameters have stabilized and water level is constant.
- Disconnect the flow cell prior to collecting a sample. Measure the flow rate and ensure that it hasn't increased. Disconnecting the flow cell may cause the water level to drop during sampling, invalidating the low flow method.
- After collecting the sample, take a final water level measurement prior to stopping the pump.

9. Stop the pump and remove the assembly from the well

- Press the stop button on the controller, turn off the generator, and bleed the pressure from the air compressor. Hearing and eye protection should be worn while bleeding the pressure, and personnel should be positioned outside the line of fire should any debris be energized by the air flow.
- Confirm pressure in the airline has been relieved before beginning to raise the assembly – check gauge pressures on the air compressor and controller read zero.
- Raise the tubing, cable and pump from the well. The cable winch is used to coil in the cable and lift the weight of the assembly. One person coils up the tubing as it raises, removing the zip ties or tape connecting the tubing to the cable.
- Following recovery of the pump, loosen the compression fittings at the top to remove the tubing – the nut and ferule stay with the tubing if it is dedicated (not being discarded).
- The bladder should be changed prior to using the pump on another well location or going into storage.
- The pump housing should be cleaned with an Alconox solution prior to being used in another well or going into storage

10. Return the equipment to storage

- Dedicated tubing should be stored in labelled plastic bags to prevent cross-contamination.
- The pump should be cleaned with Alcanox and the bladder replaced with a new bladder. The pump should be stored in the PVC sleeve between uses.
- Controller box should be left open to allow any moisture accumulation to dry. Care should be taken to avoid any direct water contact with the controller itself at all times.

Field Alkalinity Measurement Procedure

GENERAL DESCRIPTION

1.1 Introduction

Hach's Digital Titrator is a new concept in titrimetric analysis. It is a precision dispensing device fitted with compact cartridges that contain concentrated titrants. Accurate titrations are made without the bulk and fragility of conventional burets.

A main drive screw in the Digital Titrator controls a plunger which forces the concentrated titrant from a titration cartridge in a carefully regulated flow. The titrator body is constructed of precision-molded, heavy-duty, chemical- and impact-resistant acetal plastic. Accuracy is rated at ± 1% or better for a titration of more than 100 digits. For titrations less than 100, accuracy is ± 1 digit.

Titration solutions (titrants) are packaged in disposable polypropylene or Kynar® containers with Teflon-covered neoprene seals and polyethylene resealable closures to cover the cartridge tips. Each cartridge contains approximately 13 mL of titrating solution, enough for 50–100 average titrations. Titrant solutions are typically controlled to ± 0.5% concentration with normality and tolerances listed on the label. Titrant concentrations are designed for titrations of 10 to 40 turns
(100 to 400 digits) of the delivery knob. For the most commonly used concentration ranges, the digits appearing in the counter window correspond to the sample concentration.

Figure 1 Hach Digital Titrator

Both portable and fixed-position titrations are possible with the Digital Titrator. The instrument has a grip for hand-held operation or it can be clamped to a TitraStir® Stir Plate or laboratory stand for stationary setups. See *Figure 1*.

Each Digital Titrator comes with five delivery tubes and a methods manual, which covers the most commonly tested parameters and the corresponding titrant cartridges. Right-angle (ninety-degree) delivery tubes for stationary setups are available as an optional accessory.

1.1.1 Following a Procedure for the First Time

Each method is divided into five sections: Procedure, Accuracy Check, Interferences, Summary of Method, and Reagents and Apparatus. For more information about how to select a procedure or for answers to chemical questions, see Hach's *Water Analysis Handbook* (literature 8376). For more information about chlorine measurement, also see the technical booklet titled, *Current Technology of Chlorine Analysis for Water and Wastewater* (literature 7019).

The **Procedure** details how to perform the method step-by-step. To select the appropriate sample volume and titration cartridge based on expected sample concentration, use the

tables provided in each procedure. If the expected sample concentration is not known, start with one of the smaller sample volumes and determine its approximate concentration. Retest with the appropriate sample size.

The ranges in the table overlap to offer more flexibility. In most procedures, the number of digits used for each concentration range will be 100 to 400 digits.

To determine the actual concentration of the sample, use the correct digit multiplier for the sample volume and titration cartridge used.

Throughout the procedure, the notes will provide additional information.

The **Accuracy Check** provides a way to verify the results and determine if interferences are present. It also provides a method for checking the performance of reagents, the Digital Titrator and the operator's technique. Further information is provided in *Appendix A, Accuracy Check and Standard Additions*.

The **Interferences** section identifies common interferences causing inaccurate results and describes how to eliminate their effects. The interference levels are based on the sample volume that has 1.0 as the digit multiplier. Higher interference levels may be tolerated if a smaller sample is used.

The **Summary of Method** section discusses the chemical reaction taking place and information that applies to the entire procedure.

The **Reagents and Apparatus** list concludes the procedure. All the items required to perform the test are listed first and are available from Hach. The items listed in the notes or interferences sections are included in the optional listings.

1.2 Step-By-Step

1. Select a sample volume and titration cartridge corresponding to the expected sample concentration from the table given in each procedure.

If the expected sample concentration is not known, start with one of the smaller sample volumes and determine

its approximate concentration. Retest with the appropriate sample size.

2. Slide the cartridge into the titrator receptacle and lock in position with a slight turn. See *Figure 2.*

Figure 2 Sliding the Cartridge into Place

3. Remove the polyethylene cap and insert a clean delivery tube into the end of the cartridge until it is tight. See *Figure 3.* Use a straight tube with a hook at the end for hand-held titrations; use a 90° tube with a hook at the end for stationary setups.

   Do not insert tube past cartridge extension; see illustration below. In some instances, it might be necessary to remove a small burr on the leading edge of the tube before insertion.

Figure 3 Inserting the Delivery Tube

4. For stationary titrations, use a TitraStir Stir Plate or a clamp holder and clamp to attach the titrator to a laboratory stand. See *Figure 4* and *Figure 5.*

   The TitraStir Stir Plate holds the Digital Titrator during the titration and also stirs the sample at a constant speed, leaving the analyst free to detect the end point.

When a TitraStir Stir Plate is used, substitute or add the following Optional Apparatus.

APPARATUS

Description	Quantity Required Per Test	Unit	Cat. No.
Delivery Tubes, 90° with hook for TitraStir® Stir Plate	1	5/pkg	41578-00
Flask, Erlenmeyer, 125 mL	1	each	505-43
Flask, Erlenmeyer, 250 mL	1	each	505-46
Stir Bar, 28.6 x 7.9 mm	1	each	20953-52
TitraStir® Stir Plate, 115 Vac	1	each	19400-00
TitraStir® Stir Plate, 230 Vac	1	each	19400-10

5. To start titrant flowing and flush the delivery tube, hold the tip of the cartridge up. Advance the plunger release button to engage the piston with the cartridge (push the button in and toward the cartridge). Do not expel solution when pushing the piston toward the cartridge. Turn the delivery knob until air is expelled and several drops of solution flow from the tip. As you turn the knob a drive screw pushes a piston against the cartridge seal and forces liquid out through the delivery tube. Then use the counter reset knob to turn the digital counter back to zero and wipe the tip. The tip can be rinsed with deionized water rather than wiped, if desired.

Figure 4 Using the TitraStir® Stir Plate

Figure 5 Using a Laboratory Stand

Figure 6 Titrating the Sample

6. Use the smallest appropriate graduated cylinder or pipet to measure the sample volume from the given table. Transfer the sample into a 125-mL or 250-mL Erlenmeyer flask. Dilute to the appropriate total volume with deionized water if necessary.

Note: *Sample volume measurements and dilutions (if required) must be made accurately. However, final total volume of titrated solution is not critical.*

7. Add the necessary reagents to the sample and swirl to mix.

8. Immerse the delivery tube tip in the solution and swirl the flask while titrating. Titrate by turning the delivery knob. Keep turning the knob and swirling the sample until the end point is reached. Record the number of

digits that appear in the digital counter window. See *Figure 6*.

Note: *The number of digits required will usually range from 100 to 400. In nearly all of the procedures if the digits required is less than 100 or more than 400, an alternate sample volume or titrant cartridge should be used.*

Note: *Inaccurate results will occur if the delivery tube tip is held out of the solution rather than under the solution surface.*

9. Calculate the concentration of your sample by using the following formula:

Digits Required × Digit Multiplier = Sample Concentration

Where:

Digits Required = the number that appeared in the digital counter window in Step 8.

Digit Multiplier = the number from the table given in the procedure. It takes into account the sample dilution and titrant strength.

10. After completing testing for the day, press the plunger release button and manually retract the plunger into the body of the titrator. Remove the cartridge. Remove the delivery tube and reseal the cartridge with the polyethylene cap. See *Figure 7.*

Figure 7 **Retracting the Plunger**

11. Discard or clean the delivery tube immediately after use. To clean, force water, then air, into the tube opening with a syringe or wash bottle.

1.3 Helpful Hints

1.3.1 To Reuse a Partially Emptied Cartridge

1. With the plunger fully retracted, attach cartridge to the titrator.
2. Press the plunger release; then manually push the plunger against the cartridge seal.
3. Attach a delivery tube. Hold the tip of the cartridge up. Eject air and a few drops of titrant, zero the counter, and wipe the tip.
4. Titrate as usual.

1.3.2 To Calculate Titrant Volume Used

Normalities of many Hach titration cartridge solutions have been designed so that the number of digits used in a titration corresponds to the sample concentration in mg/L. To determine the volume used in mL, divide the Digital Titrator reading by 800.

1.3.3 To Fill Your Own Titration Cartridges

Cartridges may be cleaned and refilled, or new empty cartridges, Cat. No. 14495-01, can be purchased from Hach Company. See *Figure 8*. When preparing to refill old cartridges, push the cartridge seal out of the cartridge with air pressure applied through the tip. Cap the tip, fill with solution and reinsert the cartridge seal using care to avoid wrinkling the Teflon sheath. Filling also can be accomplished at the tip with a syringe.

Figure 8 Digital Titrator Cartridges

1.3.4 Verifying Technique

Whenever procedures are changed or new equipment is used, it is helpful to run a sample of known concentration. This technique will confirm the operator is following the procedure correctly and the new equipment is working properly. One objective important to Hach Company is making our tests self-verifying. This means Hach makes the tools available so the operator can check their own work for accurate results without relying on an outside lab or chemist.

For most of the tests in this manual, *Table 1* on page *21* lists each procedure, the suggested standard, the volume of standard needed, the titration cartridge used, and the number of expected digits when the test is performed correctly. The suggested standards are Voluette® or PourRite™ Ampules whenever possible because of their superior accuracy and stability.

To use titration standards follow these steps:

1. Select the procedure of interest and order the appropriate standard. Use the given catalog numbers.
2. Measure the volume of standard to be used as the sample in the procedure using a TenSette® Pipet or Class A pipet.
3. Perform the procedure as written, adding deionized water as necessary.

4. After titrating, the required number of digits should approximately equal the expected digits.

Call Hach Technical and Customer Service (1-800-227-4224) for additional help.

.

Table 1 Titration Standards

Procedure (Parameter)	Standard Description (Cat. No.)	Volume of Standard (mL)	Titration Cartridge (Cat. No.)	Expected Digits
Acid-Base: Acid	0.500 N H_2SO_4 (2121-26)	1.0 5.0	1.600 N NaOH (14379-01) 8.00 N NaOH (14381-01)	250 250
Base	0.500 N Na_2CO_3 (14278-10)	1.0 5.0	1.600 N H_2SO_4 (14389-01) 8.00 N H_2SO_4 (14391-01)	250 250
Acidity	0.500 N H_2SO_4 (2121-26)	0.1 1.0	0.1600 N NaOH (14377-01) 1.600 N NaOH (14379-01)	250 250
Alkalinity	0.500 N Na_2CO_3 (14278-10)	0.1 1.0	0.1600 N H_2SO_4 (14388-01) 1.600 N H_2SO_4 (14389-01)	250 250
Calcium*: mg/L $CaCO_3$	10,000 mg/L $CaCO_3$ (2187-10)	0.1 1.0	0.0800 M EDTA (14364-01) 0.800 M EDTA (14399-01)	100 100
G.d.h.	10,000 mg/L $CaCO_3$ (2187-10)	0.2 1.0	0.1428 M EDTA (14960-01) 0.714 M EDTA (14959-01)	112 112

Table 1 Titration Standards (Continued)

Procedure (Parameter)	Standard Description (Cat. No.)	Volume of Standard (mL)	Titration Cartridge (Cat. No.)	Expected Digits
Chloride	12,500 mg/L Cl (14250-10)	0.1	0.2256 N $Hg(NO_3)_2$ (14393-01)	125
		0.1	0.2256 N $AgNO_3$ (14396-01)	125
		1.0	1.128 N $AgNO_3$ (14397-01)	250
		1.0	2.256 N $Hg(NO_3)_2$ (921-01)	125
Chlorine	~50 mg/L Cl_2 (14268-20) (see certificate)	2.0	0.02256 N $Na_2S_2O_3$ (24091-01)	varies**
	~25 mg/L Cl_2 (26300-20)	0.5	0.00564 N FEAS (22923-01)	varies***
Chromate	1000 mg/L Cr (2231 mg/L CrO_4) (14664-42)	1.0	0.2068 N $Na_2S_2O_3$ (22676-01)	223
Hardness: mg/L $CaCO_3$	10,000 mg/L $CaCO_3$ (2187-10)	0.1	0.0800 M EDTA (14364-01)	100
		0.1	0.0800 M CDTA (14402-01)	100
		1.0	0.800 M EDTA (14399-01)	100
		1.0	0.800 M CDTA (14403-01)	100
G.d.h.	10,000 mg/L $CaCO_3$ (2187-10)	0.2	0.1428 M EDTA (14960-01)	112
		1.0	0.714 M EDTA (14959-01)	112
Iron	50 mg/L Fe (14254-10)	10.0	0.0716 M TitraVer (20817-01)	200
	1000 mg/L Fe (2271-42)	10.0	0.716 M TitraVer (20818-01)	100
Oxygen, Dissolved****	10 mg/L as DO (401-11)	100	0.2000 N $Na_2S_2O_3$ (22675-01)	500
		200	2.00 N $Na_2S_2O_3$ (14401-01)	100
Sulfite	5000 mg/L SO_3 (22674-10)	1.0	0.3998 N KIO_3–KI (14961-01)	250

* One to two drops of Magnesium Standard Solution (10 g/L as $CaCO_3$) must be added to get a sharp end point. These added drops will not change the results.

** The expected digits equal the volume of standard times the concentration on the certificate (e.g., 2 mL x 50 mg/L = 100 digits).
*** The expected digits equals the volume of standard times the concentration on the certificate times the constant, 4. (Example: 0.5 mL x 50 mg/L x 4 = 100 digits)
**** Add one Sulfamic Acid Powder Pillow to the volume of standard and follow Steps 10 to 12 in the Dissolved Oxygen Procedure. It is not necessary to add the first two reagents.

1.4 Adapting a Buret Titration to the Digital Titrator

Adapt any standard titration procedure using a buret to the Digital Titrator by using the following procedure.

1. Determine the approximate number of digits required. The Digital Titrator dispenses 1 mL per 800 digits on the counter. Using the following equation, determine the digits required for your buret method.

$$\text{Digits Required} = \frac{N_t \times mL_t \times 800}{N_c}$$

Where:

N_t = Normality of buret titrant
mL_t = milliliters of buret titrant required for an average titration
N_c = Normality of Digital Titrator cartridge

2. If the number of digits required is within the range of 70 to 350, you can use the procedure as written, substituting the Digital Titrator directly for the buret. Or, if the number of digits is outside of this range, make the following modifications:

a. If the number of digits required is more than 350, reduce the sample size to save titrant.

b. If the number of digits required is less than 70, increase the sample size to increase precision.

c. If the sample size is altered, adjust the amount of buffering or indicating reagents by the same proportion.

3. When using the Digital Titrator for your buret method, note the number of digits required for a sample titration.

To convert the digits required to the equivalent number of milliliters if the buret method was used, calculate:

$$\text{Equivalent Buret Milliliters} = \text{Digits Required} \times \frac{N_c}{800 \times N_t}$$

If the sample size was changed, adjust the equivalent buret milliliters accordingly. If the sample size was increased, reduce the equivalent buret milliliters; if the sample size was reduced increase the equivalent buret milliliters. Multiply the equivalent buret milliliters by any normally used factors to calculate concentration in oz/gal, g/L, etc.

Example: Adapt a buret procedure, which normally requires about 20 mL of a 0.4 N titrant, to the Digital Titrator. Try an 8.0 N titration cartridge. The first equation above gives:

$$\text{Digits Required} = \frac{0.4 \times 20 \times 800}{8.0} = 800 \text{ digits}$$

Because this would use excessive titrant, reduce the sample size to one fourth its normal size to reduce the digits required to 200, well within the recommended range.

Upon completion of the titration using the smaller sample size, calculate the equivalent buret milliliters by the second equation above. If 205 were the digits required:

$$\text{Equivalent Buret Milliliters} = \frac{205 \times 8.0}{800 \times 0.4} = 5.13 \text{ mL}$$

Multiply the 5.13 mL by 4 to account for the reduction in sample size to give the true equivalent buret milliliters of 20.5 mL. If the buret method called for multiplying the number of milliliters of titrant by a factor to calculate the concentration of a sample component, then multiply 20.5 by that factor.

1.5 Using PermaChem® Powder Pillows

1. **Tap** the PermaChem on a hard surface to collect the powdered reagent in the bottom.

2. **Tear** across on the dotted pillow line marked “TEAR” holding the pillow away from your face.

3. Using two hands, **Push** both sides toward each other until thumbs and forefingers form a diamond. Make sure to **Crease** the foil pack, so that it forms a spout.

4. **Pour** the pillow contents into the sample. The polyfilm lining is specially formulated to deliver all the powder necessary for accurate results (no tapping on the vessel edge is necessary).

1.6 Safety

Safety is the responsibility of each individual when performing analysis procedures, and the analyst must develop and maintain good safety habits. Because many of the procedures in this methods handbook use potentially hazardous chemicals and apparatus, it is important that the analyst practice good laboratory techniques to minimize accidents. The following paragraphs present several techniques applicable to water analysis in the laboratory and in the field. They are not all inclusive, of course, nor do

they apply only to the procedures provided in this handbook. They are general in nature but emphasize practices that are often key factors in personal injury incidents.

- Read labels carefully. Never remove the label from a reagent container. When preparing a reagent or standard solution, be sure to label the container clearly and date it.
- A Material Safety Data Sheet (MSDS) comes with each reagent. This sheet contains helpful information on first aid, spill and disposal procedures, and precautionary measures and should be read before using the product.
- Warning labels also appear on some of the apparatus used with the test procedures.
- Wear protective clothing when handling chemicals that cause irritation or burns. Eye protection in particular is important to guard against spattering and splashes from accidental spills when caustic materials are being used.
- Use tongs or finger cots when transferring apparatus that is hot.
- Use mechanical pipetters: Mouth pipetting could result in accidentally ingesting dangerous chemicals. Make a habit of using mechanical pipet fillers for all pipetting. This will avoid mistakes that could cause serious injury.
- Use special care with dangerous chemicals and apparatus.
- Follow the test procedure steps carefully and observe all precautionary measures. It is good practice to read the entire procedure carefully before beginning the procedure. Use safety equipment, such as pipet fillers, protective clothing, and ventilating hoods, appropriate for the test being conducted. Wipe up all spills promptly. Do not smoke or eat in an area where toxic or irritating chemicals are used. Use reagents and apparatus only as they were meant to be used and use them only as

directed in the test procedure. Do not use damaged labware and malfunctioning equipment.

TITRATION PROCEDURES

ALKALINITY (10 to 4000 mg/L as $CaCO_3$)

Phenolphthalein and Total Method

1. Select the sample volume and Sulfuric Acid (H_2SO_4) Titration Cartridge corresponding to the expected alkalinity concentration as mg/L calcium carbonate ($CaCO_3$) from *Table 1*.

Note: *See Sampling and Storage following these steps.*

2. Insert a clean delivery tube into the titration cartridge. Attach the cartridge to the titrator body. See *General Description, Step-by-Step* for assembly instructions, if necessary.

3. Turn the delivery knob to eject a few drops of titrant. Reset the counter to zero and wipe the tip.

Note: *For added convenience use the TitraStir® Stir Plate. See General Description, Step 3 in Step-by-Step.*

4. Use a graduated cylinder or pipet to measure the sample volume from *Table 1*. Transfer the sample into a clean 250-mL Erlenmeyer flask. Dilute to about the 100-mL mark with deionized water, if necessary.

Table 1

Range (mg/L as $CaCO_3$)	Sample Volume (mL)	Titration Cartridge (H_2SO_4)	Catalog Number	Digit Multiplier
10-40	100	0.1600	14388-01	0.1
40-160	25	0.1600	14388-01	0.4
100-400	100	1.600	14389-01	1.0
200-800	50	1.600	14389-01	2.0
500-2000	20	1.600	14389-01	5.0
1000-4000	10	1.600	14389-01	10.0

5. Add the contents of one Phenolphthalein Indicator Powder Pillow and swirl to mix.

Note: *A solution of one pH 8.3 Buffer Powder Pillow and one Phenolphthalein Powder Pillow in 50 mL of deionized water is recommended as a comparison for determining the proper end point color.*

Note: *Four drops of Phenolphthalein Indicator Solution may be substituted for the Phenolphthalein Indicator Powder Pillow.*

6. If the solution turns pink, titrate to a colorless end point. Place the delivery tube tip into the solution and swirl the flask while titrating with sulfuric acid. Record the number of digits required.

Note: *If the solution is colorless before titrating with sulfuric acid, the Phenolphthalein (P) Alkalinity is zero; proceed with step 8.*

7. Calculate:

Digits Required x Digit Multiplier = mg/L $CaCO_3$ P Alkalinity

8. Add the contents of one Bromcresol Green-Methyl Red Indicator Powder Pillow to the flask and swirl to mix.

Note: *Four drops of Methyl Purple Indicator Solution may be substituted for the Bromcresol Green-Methyl Red Indicator Powder Pillow. Titrate from green to a gray end point (pH 5.1).*

Note: *Four drops of Bromcresol Green-Methyl Red Indicator Solution may be substituted for the Bromcresol Green-Methyl Red Indicator Powder Pillow.*

9. Continue the titration with sulfuric acid to a light greenish blue-gray (pH 5.1), a light violet-gray (pH 4.8), or a light pink (pH 4.5) color, as required by the sample composition; see *Table 2.* Record the number of digits required.

Note: *A solution of one Bromcresol Green-Methyl Red Powder Pillow and one pillow of the appropriate pH buffer in 50 mL of deionized water is recommended as a comparison for judging the proper end point color. If the pH 3.7 end point is used, use a Bromphenol Blue Powder Pillow instead of a Bromcresol Green-Methyl Red and titrate to a green end point.*

10. Calculate:

Total Digits Required x Digit Multiplier = mg/L as CaCO3 Total (T or M) Alkalinity

Note: *Carbonate, bicarbonate and hydroxide concentrations may be expressed individually using the relationships shown in Table 3.*

Note: *meq/L Alkalinity = mg/L as $CaCO_3$ ÷ 50.*

Table 2

Sample Composition	End Point
Alkalinity about 30 mg/L	pH 4.9
Alkalinity about 150 mg/L	pH 4.6
Alkalinity about 500 mg/L	pH 4.3
Silicates or Phosphates present	pH 4.5
Industrial waste or complex system	pH 4.5

Sampling and Storage

Collect samples in clean plastic or glass bottles. Fill completely and cap tightly. Avoid excessive agitation or prolonged exposure to air. Samples should be analyzed as soon as possible after collection but can be stored at least 24 hours by cooling to 4 °C (39 °F) or below. Warm to room temperature before analyzing.

Alkalinity Relationship Table

Total alkalinity primarily includes hydroxide, carbonate and bicarbonate alkalinities. The concentration of these alkalinities in a sample may be determined when the phenolphthalein and total alkalinities are known (see *Table 3*).

Table 3 Alkalinity Relationship

Row	Result of Titration	Hydroxide Alkalinity is equal to:	Carbonate Alkalinity is equal to:	Bicarbonate Alkalinity is equal to:
1	Phenolphthalein Alkalinity = 0	0	0	Total Alkalinity
2	Phenolphthalein Alkalinity equal to Total Alkalinity	Total Alkalinity	0	0
3	Phenolphthalein Alkalinity less than one half of Total Alkalinity	0	2 times the Phenolphthalein Alkalinity	Total Alkalinity minus two times Phenolphthalein Alkalinity
4	Phenolphthalein Alkalinity equal to one half of Total Alkalinity	0	Total Alkalinity	0

Table 3 Alkalinity Relationship

Row	Result of Titration	Hydroxide Alkalinity is equal to:	Carbonate Alkalinity is equal to:	Bicarbonate Alkalinity is equal to:
5	Phenolphthalein Alkalinity greater than one half of Total Alkalinity	2 times the Phenolphthalein minus Total Alkalinity	2 times the difference between Total and Phenolphthalein Alkalinity	0

To use the table follow these steps:

a. Does the phenolphthalein alkalinity equal zero? If yes, use Row 1.

b. Does the phenolphthalein alkalinity equal total alkalinity? If yes, use Row 2.

c. Multiply the phenolphthalein alkalinity by 2.

d. Select Row 3, 4, or 5 based on comparing the result of *step c* with the total alkalinity.

e. Perform the required calculations in the appropriate row, if any.

f. Check your results. The sum of the three alkalinity types will equal the total alkalinity.

For example:
A sample has 170 mg/L as $CaCO_3$ phenolphthalein alkalinity and 250 mg/L as $CaCO_3$ total alkalinity. What is the concentration of hydroxide, carbonate and bicarbonate alkalinities?

The phenolphthalein alkalinity does not equal 0 (it is 170 mg/L), see *step a*.

The phenolphthalein alkalinity does not equal total alkalinity (170 mg/L vs. 250 mg/L), see *step b*.

The phenolphthalein alkalinity multiplied by 2 = 340 mg/L, see *step c*.

Because 340 mg/L is greater than 250 mg/L, select Row 5, see *step d*.

The hydroxide alkalinity is equal to: (see *step e*).

340 – 250 = 90 mg/L hydroxide alkalinity

The carbonate alkalinity is equal to:

250 – 170 = 80
80 x 2 = 160 mg/L carbonate alkalinity

The bicarbonate alkalinity equals 0 mg/L.

Check: (see *step f*).

90 mg/L hydroxide alkalinity + 160 mg/L carbonate alkalinity +
0 mg/L bicarbonate alkalinity = 250 mg/L

The above answer is correct; the sum of each type equals the total alkalinity.

Accuracy Check

Standard Additions Method
This accuracy check should be performed when interferences are suspected or to verify analytical technique.

1. Snap the neck off an Alkalinity Standard Solution Voluette® Ampule, 0.500 N.
2. Use a TenSette® Pipet to add 0.1 mL of standard to the sample titrated in Steps 6 or 9. Resume titration back to the same end point. Record the number of digits needed.
3. Repeat, using two more additions of 0.1 mL. Titrate to the end point after each addition.
4. Each 0.1 mL addition of standard should require 25 additional digits of 1.600 N titrant or 250 digits of 0.1600 N titrant. If these uniform increases do not occur, refer to *Appendix A, Accuracy Check and Standard Additions*.

Interferences

- Highly colored or turbid samples may mask the color change at the end point. Use a pH meter for these samples.
- Chlorine may interfere with the indicators. Add one drop of 0.1 N Sodium Thiosulfate to eliminate this interference.

Summary of Method

The sample is titrated with sulfuric acid to a colorimetric end point corresponding to a specific pH. Phenolphthalein alkalinity is determined by titration to a pH of 8.3, as evidenced by the color change of phenolphthalein indicator, and indicates the total hydroxide and one half the carbonate present. M (methyl orange) or T (total) alkalinity is determined by titration to a pH between 3.7 and 5.1, and includes all carbonate, bicarbonate and hydroxide.

REQUIRED REAGENTS
(varies with sample characteristics)

Description	Unit	Cat. No
Alkalinity Reagent Set (about 100 tests)		22719-00
Includes: (1) 942-99, (1) 943-99, (1) 14388-01, (1) 14389-01		
Bromcresol Green-Methyl Red Powder Pillows	100/pkg	943-99
Phenolphthalein Powder Pillows	100/pkg	942-99
Sulfuric Acid Titration Cartridge, 1.600 N	each	14389-01
Sulfuric Acid Titration Cartridge, 0.1600 N	each	14388-01
Water, deionized	4 L	272-56

REQUIRED APPARATUS

Digital Titrator	each	16900-01
Flask, Erlenmeyer, 250-mL	each	505-46
Select one or more based on sample concentration:		
Cylinder, graduated, 10-mL	each	508-38
Cylinder, graduated, 25-mL	each	508-40
Cylinder, graduated, 50-mL	each	508-41
Cylinder, graduated, 100-mL	each	508-42

OPTIONAL REAGENTS

Alkalinity Standard Solution Voluette® Ampules, 0.500 N Na_2CO_3, 10-mL	16/pkg	14278-10
Bromcresol Green-Methyl Red Indicator Solution	100 mL MDB	23292-32
Bromphenol Blue Indicator Solution	100 mL MDB	14552-32
Bromphenol Blue Powder Pillows	100/pkg	14550-99
Buffer Powder Pillows, pH 3.7	25/pkg	14551-68

TitraStir® Stir Plate, 230 Vac	each	19400-10
Voluette® Ampule Breaker Kit	each	21968-00

APPENDIX A
ACCURACY CHECK AND STANDARD ADDITIONS

Most of the procedures in this manual have an accuracy check based on the standard additions method. Standard additions is a widely accepted technique for checking the validity of test results. Also known as “spiking” and “known additions,” the technique adds a small amount of the component (parameter) being measured to an analyzed sample and the analysis is repeated. The increase in the test results should equal the amount of the standard added. The results can be used to check the performance of the reagents, the apparatus, and the procedure.

First Step - The Accuracy Check

Perform the procedure and accuracy check as described in this manual. In each accuracy check the number of digits expected for each increment is given. If the actual number of digits required is within 1% of the expected number of digits, the analyst can conclude the answer for the sample is accurate and the reagents, apparatus, and method used are working properly.

Second Step - The Decision Tree

If the actual number of digits varies noticeably, then it must be concluded the problem was caused by either the reagents, the apparatus, the procedure or an interfering substance. By following a logical troubleshooting approach, the source of the problem can be systematically determined. Using the step-by-step decision tree in *Figure 1* will greatly ease identifying the problem. An explanation of each step in the decision tree follows.

Third Step - The Branches

Branch A

Suppose the first, or all three standard additions to the sample did not give the correct incremental digit increase. A possible cause for this could be the presence of interferences. Other causes could be defective reagents, an incorrect procedure, defective apparatus or a defective standard used for standard addition. If interferences are

Figure 1
Decision Tree

either absent or assumed to be absent, proceed to Branch B. If interferences are present, proceed to Branch C. The Chloride Procedure, Silver Nitrate Method, is used as an example throughout these steps.

Branch B

Repeat the Accuracy Check given in the procedure substituting the same volume of deionized water for the sample. For example, using the Chloride Procedure, Silver Nitrate Method:

1. Take a 50.0-mL sample of deionized water and follow the Chloride Procedure, Silver Nitrate Method. Record the number of digits required for the titration.

2. Add 0.10 mL of Chloride Standard Solution, 12,500 mg/L, and titrate to the end point. Record the number of digits required for the titration.

3. Repeat, using two more additions of 0.1 mL of 12,500 chloride standard, titrating to the end point after each addition. Record the number of digits required.

4. Tabulate the date as shown below:

Table 1

Total Standard Added (mL)	Total Number of Digits Used	Total Standard Added (mg/L)	Total Parameter Found (mg/L)
0	_____	0	_____
0.1	_____	_____	_____
0.2	_____	_____	_____
0.3	_____	_____	_____

The **Total Standard Added (mL)** will vary depending on the procedure used.

The **Total Number of Digits Used** are the total digits recorded after each titration.

The **Total Standard Added (mg/L)** is determined for each addition by the following equation:

$$\frac{\text{Total Standard Added (mL)}}{\text{Sample Volume (mL)}} \times \text{Standard Concentration (mg/L)}$$

$$= \text{Total Standard Added (mg/L)}$$

The **Total Parameter Found (mg/L)** is determined by following the calculation step of the procedure used. Use the same volume of deionized water as used for the sample. The addition of standard will not change the digit multiplier.

Performing the above procedure, the completed table would look like this:

Table 2

Total Standard Added (mL)	Total Number of Digits Used	Total Standard Added (mg/L)	Total Parameter Found (mg/L)
0	0	0	0
0.1	25	25	25
0.2	50	50	50
0.3	75	75	75

To complete the table the following calculations were made based on the above formula:

First Addition

$$\frac{0.1}{50} \times 12{,}500 = \text{Total Standard Added (mg/L)} = 25 \text{ mg/L}$$

Second Addition

$$0.1 + 0.1 = 0.2 \text{ mL} = \text{Total Standard Added (mL)}$$

0.2 mL in the above formula gives 50 mg/L total standard added.

Third Addition

$$0.1 + 0.1 + 0.1 = 0.3 \text{ mL} = \text{Total Standard Added (mL)}$$

0.3 mL in the above formula gives 75 mg/L total standard added.

The data shown above reveals several points:

- The chemicals, apparatus, procedures and standards are in good working condition. This conclusion is made because chloride added to the deionized water sample

was recovered entirely in the same uniform steps of addition.

- Because chloride added to deionized water was recovered, but was not recovered during the Accuracy Check, one may conclude the sample contains interferences which prevent the test reagents from operating properly.
- The first analysis of the water sample gave an incorrect result.

If the above results gave the expected increments between additions, proceed to Branch C. If the results did not give the expected increments, proceed to Branch D.

Branch C

If interfering ions are present, it may be concluded the analysis is incorrect. However, with the completed accuracy check it may be possible to arrive at an approximation of the correct result. Tabulate the results as follows:

Table 3

Total Standard Added (mL)	Total Number of Digits Used	Total Standard Added (mg/L)	Total Parameter Found (mg/L)
0	_____	0	_____
_____	_____	_____	_____
_____	_____	_____	_____
_____	_____	_____	_____

The **Total Standard Added (mL)** will vary depending on the procedure used.

The **Total Number of Digits Used** are the total digits recorded after each addition of standard as specified in the accuracy check.

The **Total Standard Added (mg/L)** is determined for each addition by the following equation:

$$\frac{\text{Total Standard Added (mL)}}{\text{Sample Volume (mL)}} \times \text{Standard Concentration (mg/L)} = \text{Total Standard Added (mg/L)}$$

The **Total Parameter Found (mg/L)** is determined by following the calculation step of the procedure used. Use the same volume of deionized water as used for the sample. The addition of standard will not change the digit multiplier.

If steps between each addition are roughly uniform (i.e., 25 digits or 25 mg/L difference between each addition), proceed to Branch G. If the results are not uniform (i.e., 13, 10, and 6 mg/L), proceed to Branch F.

For example, a sample of water was analyzed for chloride with the result being 100 mg/L. The analyst, suspecting interferences, made one standard addition of 0.10 mL of 12,500-mg/L chloride standard to 50.0 mL of sample. Rather than an increase of 25 mg/L as expected, the analyst found an increase of 13 mg/L.

The analyst added a second and third addition of 0.1 mL of standard. The titrations were made and the results tabulated. The increments were 10 (123 minus 113) and 6 (129 minus 123) mg/L, respectively. The analyst proceeded to Branch F.

Table 4

Total Standard Added (mL)	Total Number of Digits Used	Total Standard Added (mg/L)	Total Parameter Found (mg/L
0	100	0	100
0.1	113	25	113
0.2	123	50	123
0.3	129	75	129

To complete the table the following calculations were made based on the above formula:

First Addition

$$\frac{0.1}{50} \times 12{,}500 = \text{Total Standard Added (mg/L)} = 25 \text{ mg/L}$$

Second Addition

$$0.1 + 0.1 = 0.2 \text{ mL} = \text{Total Standard Added (mL)}$$

0.2 mL in the above formula gives 50 mg/L Total Standard Added.

Third Addition

0.1 + 0.1 + 0.1 = 0.3 mL = Total Standard Added (mL)

0.3 mL in the above formula gives 75 mg/L Total Standard Added.

Branch D
Carefully check the instructions or directions for use of the procedure, making sure the proper techniques, reagents, titrant, sample volume, and digit multiplier were used. Verify there is no air or liquid, other than the titrant being used, in the delivery tube by ejecting several drops of solution. If the procedure in use is found to be in error, repeat Branch B using the correct procedure. If the procedure is found to be correct, proceed to Branch E.

Branch E
Check the performance of the reagents. This may be done easily by using a known standard solution to run the test or by obtaining a new fresh lot of the reagent. A list of known standard solutions is given in *Table 1* on page *21*. If it is determined reagents are defective, repeat Branch B with new reagents. If the reagents are proven in good condition, proceed with Branch H.

Branch F
Examples of non-uniform increments between standard additions on a sample are shown below in *Table 5*, *Table 6* and *Figure 2* on page 201. These plots illustrate the effect of interferences upon the standard addition and upon substances in the sample. The plots were made by graphing the Total Standard Added (mg/L) on the X axis and the Total Parameter Found (mg/L) on the Y axis as shown in *Figure 2* on page 201.

Table 5 Plot A

Total Standard Added (mL)	Total Number of Digits Used	Total Standard Added (mg/L)	Total Parameter Found (mg/L)
0	100	0	100
0.1	113	25	113
0.2	123	50	123
0.3	129	75	129

Table 6 Plot B

Total Standard Added (mL)	Total Number of Digits Used	Total Standard Added (mg/L)	Total Parameter Found (mg/L)
0	0	0	0
0.1	25	25	0
0.2	50	50	25
0.3	75	75	50

Both of these plots show that the four data points do not lie on a straight line. Plot A illustrates an interference which becomes progressively worse as the concentration of the standard increases. This type of interference is not common and may be caused by an error or malfunction of the procedure, reagents or apparatus. Perform Branch B to ensure that the supposed interference is present.

Plot B illustrates a common chemical interference which becomes less or even zero as the concentration of the standard increases. The plot shows the first standard addition was consumed by the interference and the remaining additions gave the correct increase of 25 mg/L for each additional 0.1 mL of standard added. The apparent interference in Plot B could be the result of an error made in the standard addition, and the analysis should be repeated with a fresh portion of sample.

The two examples illustrate chemical interferences which most certainly mean the result of the first analysis of the water sample was incorrect. When this type of interference is encountered, review the Interference section for the procedure for corrective steps. If this fails, the analyst should attempt to analyze the sample with an alternate method which, if possible, uses a different type of chemistry.

Branch G

Examples of uniform increments between standard additions on a sample are shown below in *Table 7* and *Table 8* on page 200. These plots illustrate the effect of interferences upon the standard addition and upon substances in the sample. The plots were made by graphing the Total Standard Added (mg/L) on the X axis

and the Total Parameter Found (mg/L) on the Y axis as shown in *Figure 2* on page 201.

Table 7 Plot C

Total Standard Added (mL)	Total Number of Digits Used	Total Standard Added (mg/L)	Total Parameter Found (mg/L)
0	50	0	50
0.1	63	25	63
0.2	75	50	75
0.3	88	75	88

Plot C illustrates a common interference with a uniform effect upon the standard and the substances in the sample. The four data points form a straight line, but the titration increments between the additions is not correct. The straight line between the additions may be extrapolated back through the horizontal axis. The point of intersect of the line with the horizontal axis gives a more accurate estimate of the concentration of the substance in question for the sample. In the example, the first analysis of the sample gave 50 mg/L. The result located graphically (100 mg/L) using the accuracy check should be much closer to the correct result. Other interference effects may also be present, or interferences may not be consistent in all samples. Use of another method not subject to the interference, or elimination of the interference is preferred over extrapolation or use of the percent recovery calculation.

Apparent interferences also may be caused by errors in the method, a defect in the apparatus or standards. Before assuming the interference is chemical in nature, perform Branch B.

Table 8 Plot D

Total Standard Added (mL)	Total Number of Digits Used	Total Standard Added (mg/L)	Total Parameter Found (mg/L)
0	0	0	0
0.1	25	25	25
0.2	50	50	50
0.3	75	75	75

Plot D illustrates correct results but may hide a problem for the analyst. The increments found are uniform and the recovery of the standard was complete. The result of the first analysis was 0 mg/L and the plot graphs back through 0 mg/L. If interfering species are present, the interference may be sufficient to change the sample result but not sufficient to prevent the analyst from finding uniform increments and complete recovery of the additions. This would be an uncommon situation and results are probably correct unless unusual interferences are possible. Refer to the Interferences section in the specific procedure.

Figure 2
Multiple Standard Additions Graph

Branch H
Check operation of the apparatus used in the performance of the test. Verify the correct volumes of sample and standard were used. Check glassware used in the procedure, making sure that it is scrupulously cleaned. Dirty pipets and graduated cylinders are a source of

contamination and will not deliver the correct volume. If a defect is found in the apparatus, repeat Branch B after repair or replacement of apparatus. If the apparatus is found to be in good working order, proceed with Branch I.

Branch I

After demonstrating that the procedure, reagents, and apparatus are correct and operating properly, the only possible cause for standard additions not functioning properly in deionized water is the standard used in performing the standard additions. Prepare or obtain a new set of standards and repeat Branch B.

Branch J
If the standard addition gave the correct result, the analyst must then determine if interfering substances are present. If interfering substances are not present, the result of the analysis prior to the standard addition is correct. If interfering substances are present, proceed to Branch C.

One of the greatest aids to the analyst is knowledge of the water sample's composition. An analyst need not know the exact composition of each sample but should be aware of potential interferences in the method of analysis to be used. When performing a particular method, the analyst should know if those interferences are present or not in order to have confidence in the accuracy of the results. Once the interferences are known, the Interference section of each procedure describes how to correct for many common interferences.

If the correct result is obtained with one standard addition when no interfering species are present, the chance of an error in sample results is very small. Possible sources of error not revealed include: sample quality, sample quantity (unless the sample and standard volume used is equal), and inconsistent end point determinations.

Call Hach Technical and Customer Support (1-800-227-4224) for additional help.

Direct Read Cable Installation and Download

Objective

To outline a procedure to ensure proper installation of direct read cables in groundwater monitoring wells and associated data logger downloads.

Scope

Proper installation of and downloads from direct read cables.

Health, Safety & Reclamation Code for Mines in British Columbia

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

Definitions

-

Roles and Responsibilities

The General Manager or Designate shall ensure that:

- Ensuring this procedure is implemented and followed.
- Ensuring this procedure has been reviewed and the appropriate signatures acquired.

The Health and Safety Manager or Designate shall ensure that:

- Ensuring this procedure complies with H&S regulation.
- Ensuring this procedure has been reviewed and the appropriate signatures acquired.

The Area Manager or Designate shall ensure that:

- Ensuring this procedure is followed.
- Ensuring that the Worker(s) has read, understood, and signed off on this procedure prior to beginning the work.
- Ensuring that this procedure is reviewed and updated as necessary, at minimum annually.

The Worker(s) are responsible for:

- Following the methodology outlined in this SOP and reporting deficiencies in the procedure to Brett DeHay-Turner (Hydrogeochemist), Nathan Glas (Hydrogeologist), Richelle Sussbauer (Environmental Scientist) and/or Jason Gabora/Torence Sandhals (Environmental Coordinator/Environmental Superintendent).

Preparation

Hazards

- Repetitive motion from reeling data logger to surface
- Potential risk of hand injury when cutting notch in well casing

Tools

- Electrical tape
- Leatherman or designated cutting tool as required by site policy
- Tablet
- Direct read cable
- USB connector
- Data logger from well
- Groundwater field sheets

Requirements

- Personnel familiar with well location, typical water levels and well construction (see Well Fact Sheets)
- Functional knowledge of Diver Office software for downloading data loggers

Job Step

Direct Read Cable Installation and Data Downloads

1. Reel the data logger that is already installed in the well up to surface. Remove the end cap and store in the groundwater cupboard in the office for future use.
2. Unwrap the correct length reel with the direct read cable and screw the end onto the top of the data logger, ensuring the cable attachment and logger are dry and free of moisture (Photo 1).
3. Use electrical tape to seal the connection point between the direct read cable and logger to ensure no moisture or water can seep in and disrupt the optical sensor reading (Photo 2). The optical sensor is within the cable end and sends data up to surface, meaning it remains downhole at all times, making a firm connection and well taped seal important to prevent leakage and ensure proper data downloads.
4. Lower the logger down the well such that the entirety of the cable is down the well, the cable is 1 m off the bottom of the well, or the cable matches the previous depth within the well. The logger elevation within the well will vary between wells. Contact Nathan Glas, Richelle Sussbauer or Brett DeHay-Turner if unsure about the situation at a specific well. Additional cable can be kept at surface on the reel (Photo 3). If the entirety of the cable is down the well, the cap on the end of the direct read cable can be used as a well cap (Photo 4), though it is recommended that an additional seal is made (either using tape, a plastic cap, etc.) to ensure the well remains tightly sealed.
5. At the surface end of the direct read cable there is a port with a cap on it (Photo 4). This cap screws off and the port access is below (Photo 5).
6. Instead of an optical sensor, the data logger is downloaded using a USB cable that plugs into the surface port (Photo 6). The USB cable end has four pins (Photo 7) that plug into the port on the end of the direct read cable.
7. Once connected, plug the USB cable into the tablet and open Diver Office. Hit the Diver icon along the top toolbar to connect to the Diver (third from left) (Photo 8).
8. Once the status window opens (Photo 9), collect a screenshot for internal records. It is recommended to create a folder on the tablet desktop to save all relevant screenshots and exports from the well. Ensure the logger reads as 'started', that there is sufficient space and battery left and that the date and time shown under Actual Data are reading correctly. Hit the Data icon (second from left along the top toolbar) to download the logger data.
9. The logger data will be downloaded, and a window will open showing the pressure and temperature

fluctuation graphed over time (Photo 10). Ensure that the data graphed continues to the current date. Collect a screenshot of the graphs for internal records.

10. Next, on the left-hand side of the screen, select the relevant logger and date range and export the data by right clicking the selection (or holding it for a second) and hitting export. Ensure to save the data to the associated desktop folder and select Mon; CSV under export file types and uncompensated (Photo 11). Hit okay. Once exported, it is recommended to open the .csv file and ensure the last point collected corresponds to the current date and time (most recent six-hour interval).
11. If the status window reads incorrectly or the data graphs do not show current data, close and re-open Diver Office. If they persist, unplug the USB and try again. The USB cable has a diagnostic function (Photo 12) that will alert the user to potential issues with the cable or diver and detail when the logger is sending data or is ready.
12. Once the data download is complete, the USB can be unplugged from the tablet and detached from the cable port. Screw the cap back on to the port to ensure no debris or moisture enters the port (Photo 13). Properly stow and store the USB cable to ensure no debris or moisture enters the USB or cable attachment.
13. If the direct read cable is fully extended down the well, the logger cap can act as a well cap and be set into the well (Photo 13). It is recommended to further seal the well to ensure the cap does not become dislodged and provides a good seal over the well.
14. If there is still some cable on the reel, lower the direct read cable to the desired depth and leave a tape mark to record this depth for future field visits. Seal the well with a j-plug. A slot may need to be cut in the casing to ensure the direct read cable does not become pinched, crimped or damaged when inserting the j-plug. Cover any cut section of the well casing with electrical tape to ensure there are no sharp edges. It is recommended that the remaining direct read cable and reel be hung towards the well shack roof where possible to ensure that they do not become buried, damaged or lost due to excessive snow in the winter (Photo 14).
15. Pack up any remaining equipment and leave the well site. Back in the office, transfer the downloaded data to the proper folder (select proper year and quarter) within the Groundwater section of the Monitoring Programs folder. Pathway: J:\Environmental\03 Monitoring Programs\Groundwater.
16. For all future field visits after initial cable installation, follow steps 5-15.

Table 1 below outlines monitoring wells with direct read installations. This table should be updated as deployment depths are adjusted to account for seasonal fluctuations and mine dewatering influence on water levels.

Sonic Water Level Measurement SOP

Objective

Properly utilize the Solinst Sonic Water Level Meter for water level measurements within groundwater monitoring wells on site.

Scope

Provide details to properly use the Sonic Water Level Meter to obtain water levels on site.

Health, Safety & Reclamation Code for Mines in British Columbia

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

- Ensuring that the Worker(s) has read, understood, and signed off on this procedure prior to beginning the work.
- Ensuring that this procedure is reviewed and updated as necessary, at minimum annually.

The Worker are responsible for:

- Following the methodology outlined in this SOP and reporting deficiencies in the procedure to Brett DeHay-Turner (Hydrogeochemist), Nathan Glas (Hydrogeologist) and/or Jason Gabora/Torence Sandhals (Environmental Coordinator/Environmental Superintendent).

Preparation

Hazards

- Sonic pulse should be kept away from ears

Tools

- Sonic water level meter

- Well cover disc
- Field sheets/notebook
- Gloves or other material to seal well
- 6 spare AA batteries, preferably lithium for winter conditions

Requirements

- Trained and qualified to conduct water level sampling.
- Familiar with well location, typical water levels and well construction (see Well Fact Sheets)

Job Step

Operating Principles

1. The Solinst Sonic Water Level Meter (WLM) consists of a Control Unit (Photo 1) and Probe (Photo 2). The Control Unit has a display, keypad, and comes with 6 AA alkaline batteries. The Probe contains a sound/pulse generator, microphone and temperature sensor.
2. The Sonic Water Level Meter works by the Probe transmitting a sound wave into the pipe, tube, or well and measuring the time it takes for the pulse to return after making contact with water. The depth to water is calculated using the speed of sound and time. Since the speed of sound varies with temperature, the temperature sensor located in the Probe adjusts for variations.
3. View the attached link for additional details: https://www.solinst.com/products/level-measurement-devices/104-sonic-water-level-meter/instructions/instructions.php

Equipment Check and Setup

1. Connect the Probe to the Control Unit by plugging the Probe cable connector into the connection on the side of the Control Unit. Ensure the connector is completely pushed in, with the arrow facing inwards and towards the front of the control unit (Photo 3).
2. Press the ON button. The Sonic WLM Version number should briefly display and then show "Depth* Searching". There should be a popping sound from the Probe, if not, ensure the Probe is plugged in properly. Turn the Sonic Water Level Meter OFF by pressing the button.
3. Insert the Probe into the open well casing, and then cover any open area around the Probe to stop the sound pulse from leaving the well. For example, use the plastic disc that is supplied with the Solinst Sonic Water Level Meter (Photo 4). A glove also works to fill gaps where the plastic disc cannot be used to create a seal within the casing stickup.
    a. The seal around the probe does not need to be airtight, but the signal works better if there is a proper seal keeping the pulse inside the well. It also helps keep out external noise, including wind.
    b. If the top of the well or pipe is open, then it should be covered with a cap with a hole for the probe to access. The included plastic disc from Solinst is a good option.

Water Level Measurement

1. Press the ON button on the Control Unit. "Depth* Searching" will be displayed as it obtains a stable depth to water reading. The depth to water measurement will be displayed after a few seconds.
2. To ensure the accuracy of the reading, use the Control Unit to enter specific well details such as drop tube diameter (review Setting Measurement Parameters below) and the minimum and maximum water level measurement range (review Well Fact Sheets). See the following sections for setting up these, and other parameters. It should be noted that it is very tedious and inefficient to change the minimum and maximum depths – it is recommended to check these ranges but not adjust them if the general water level falls within them. If issues reading the signal are encountered, consider narrowing the range.

   a. Temperature is generally set at 4 degrees Celsius as an estimate, but can be adjusted seasonally if water level values seem incorrect.

3. Press the ON button (or the Read button if already on). During or after "Depth* Searching" is displayed, press the down arrow to show the battery voltage.
   a. Batteries should be replaced at 6.5 volts.

Setting Measurement Parameters

1. Press the Set button repeatedly to scroll through the various settings (see below for available set modes).
2. Use the up and down arrow buttons to change a setting.
3. When the desired setting is reached, press the Set button to save and advance to the next setting, or press Read to display the depth to water measurement.

Available Set Modes:

When the Set button is pressed, the Sonic WLM version number is displayed. Press the down arrow to read the Serial Number of the Sonic Water Level Meter.

WL Range Min (m): Sets the minimum range to start detecting. Setting a minimum range can also help ignore interferences at a specific depth. E.g. if the well casing ends at 10 m and your water level is below that at about 20 m, then the minimum range could be set to 15 m to ignore any reflection at 10 m. See "Well Obstruction" and "Depth to Water" considerations on Page 5.

WL Range Max (m): Sets the maximum depth from which the Probe will listen for a returning pulse. If the approximate depth to water is known, don't set the Meter to listen for the returning pulse longer/deeper than required. A longer range gives less frequent returning pulses and increases the possibility of interference. A shorter range means more frequent pulses returning to the probe. See "Depth to Water" considerations.

Water Temp (ºC): Manually set the estimated temperature of the water inside your well. With the air temperature automatically detected by the sensor in the Probe, the two temperatures are used to calculate the speed of sound and therefore, the distance. Note: The distance error is small for variations in temperature, about 1% for a 5.6 ºC temperature error.

Drop Tube Diameter (cm): Set the drop tube diameter. This compensates for a reduced sound speed in tubes smaller than 5 cm (2") in diameter. The options for this setting are: >5 cm, 5 cm, 4.4 cm, 3.8 cm, 3.2 cm, 2.5 cm, 1.9 cm and 1.3 cm (>2", 2", 1.75", 1.5", 1.25", 1", 0.75", 0.50"). The following are the recommended maximum depths for each drop tube diameter: 1.3 cm to 120 m, 1.9 cm to 180 m, 2.5 cm to 300 m, 5 cm to 600 m (0.50" to 400 ft, 0.75" to 600 ft, 1" to 1,000 ft, 2" to 2,000 ft). This setting should not be changed as all our wells are ~5 cm.

MP Offset (cm): Set the offset of the probe position from ground level – the zero point is the tip of the Probe. E.g. if the probe is inserted into a well cap that extends 75 cm above the ground. Then enter 75 cm for the offset. This will automatically be deducted from the depth reading. The value can be negative if the probe is installed on a casing below ground level. **We will not complete this step as our measurements are made from Top of Casing.*

Units: Select the measurement system for the data. The options are Metric for meters, centimeters, and degrees Celsius, or Eng ft for feet, inches, and degrees Fahrenheit. **Leave measurements in Metric.*

Power Mode: Set in Normal or Power save mode. When in Normal mode there is an auto off after 15 minutes. When in Power save mode, there is an auto off after 3 minutes.

Contrast: Set the contrast level on the LCD screen from 0 (brightest) to 10 (dimmest).

Factory Reset: Sets the Control Unit back to the factory default configuration. Press the up button to make the selection. All settings will be set to the default values in Metric.

Maintenance

Batteries and power: The 6 AA batteries should be replaced at 6.5 V. Old batteries should be removed as soon as possible to prevent damage from leaking. To access the batteries, undo the screw from the back of the Control Unit and remove the battery cover and batteries. Ensure the new batteries are installed in the correct polarity, as labeled. Do not kink or damage the ribbon cable inside the Control Unit and be careful when reinstalling the battery cover. If the Control Unit is going to be stored for longer than a two month period, the 6 alkaline batteries should be removed to avoid any potential leakage.

Factory Reset: It is good practice to perform a Factory Reset before starting a new application, or at a minimum, once a month. A Factory Reset will default measurements to Metric.

Troubleshooting

SYMPTOM	CAUSE	REMEDY
Will not power on / Display is blank	Contrast of the Control Unit is too low.	If the Probe makes the normal "popping" sound when powered on, but nothing is displayed, check the contrast of the Control Unit screen. You may be able to see the screen in a different lighting condition to adjust it. If this still does not work, a hard reset can be done by removing one of the AA batteries and waiting a few minutes before reinstalling.
	Control Unit needs a reset.	Remove the Probe connector, reconnect and try again.
	Batteries need replacing.	Replace the 6 AA batteries in the Control Unit.
Powers up, but no Probe "pop"	A bent connector pin, damaged cable or Probe.	Check the Probe cable connection first, then contact Solinst for more options.
Erratic depth, an asterisk beside the depth reading, or reads "Depth* Searching" for more than 15 seconds.	Probe not connected properly, a bent connector pin, damaged cable or Probe.	If there is no Probe "pop' heard, check the Probe cable connection first, then contact Solinst for more options.
	The well is not closed tightly enough.	Ensure the well is closed and that there is a good seal around the Probe.
	There is perforated casing, incomplete inner casing, excessive pump noise.	Try using a drop tube, or adjusting the parameter settings.
	The maximum or minimum range settings are not set properly.	Try resetting the parameters.
	Other parameters or settings are incorrect.	Try a Factory Reset.
The depth reading seems too small.	You set the minimum range too small.	Try adjusting the minimum range parameter.
	There is an obstruction or opening in the well.	Set a minimum range to ignore the obstruction or opening at that depth.
Display reads "no probe"	Probe not connected properly, a bent connector pin, damaged cable or Probe.	Check the Probe cable connection first, then contact Solinst for more options.

Other Operating Considerations

Well Openings

Well Obstructions

Depth to Water

Well Opening

The pulse generated by the Probe is an air pressure wave/low frequency sound wave. This is why there should be a good seal around the probe to prevent the air pressure from escaping an opening, which would result in not enough of the pulse going down the well. A good seal also prevents external noise, such as wind, from interfering with the signal.

Well Obstructions

The sound wave travels until it is disturbed. Each time it is disturbed by an imperfection in the well, some of the pulse is reflected, making the main pulse a little weaker. A complete imperfection, like the surface of the water, will reflect the entire remaining wave. Smaller obstructions, like tubing or wires, will not obstruct the pulse enough to affect the water level reading. However, larger interferences such as a small change in casing diameter, could reflect enough of the pulse to generate an erroneous reading. Setting a minimum detection range is helpful to ignore such interferences.

A drop tube should be used if there are more significant disturbances in the well, such as a large step-down in well casing diameter or perforated casing sections.

Depth to Water

The sound wave loses energy as it travels, and even more if the well casing is rough or porous. To compensate for this, the Probe increases its gain with time to listen for fainter signals. This can cause problems if the Probe listens for too long. The gain will get so high that pump noise or noise outside the well could outweigh the pulse. Therefore, the maximum range setting is available to tell the Probe how long to listen. E.g. if a pump is installed at 50 m, then set a maximum range of less than 50 m to avoid any interference from that depth.

In shallow wells, the sound wave bounces off the top and bottom of the well, so the pulse can bounce back and forth many times. E.g. in a well where the water level is at 2 m, the Probe would hear a reflection at 2 m, then again at 4 m, then 6 m etc., until the pulse gets weak enough to ignore. In this example, you would be able to see the multiple reflections by increasing the minimum range. When set to 3 m, the depth would read 4 m. When set to 5 m, it would read 6 m, etc. In this case, it may be helpful to leave a small leak at the probe to help dissipate the pulse.

Well Diameter

As well diameter increases, the strength of the sounds pulse weakens, therefore it is more susceptible to pump noise or interference from other imperfections. As such, wells larger than 8" in diameter should use a drop tube from top of well, to just below the depth to water for measurement.

Photo 1: Solinst Sonic Water Level Meter Control Unit.

Photo 2: Solinst Sonic Water Level Meter Probe with cable.

Photo 3: Cable connected to control unit, with arrow pointed inwards and facing the front of the control unit.

Photo 4: Solinst disc with hole for sealing well opening. If the disc does not create a tight seal, the probe can be inserted directly in the well, with a glove or other material acting to seal off the well opening.

DO:	+/- 10%		

Spent two hours with a shovel trying to dig out area but could not find the well or rock -> dug down ~3.5-4 m over a ~ 20m² area

tripping of bottles impossible - will purge line again before redeploy

WL after pulled out was 18.035 mbTOC @ 14:30

going to sample = SP now and do snaps later, not paired just to ensure sample is collected -> sulfur smell at start

purged sample line again after reset bottles and set it back down

QA/QC Sample (FB, TB, DUP):

Datalogger remove time (dd/mm/yr hr:mm): Mar 4 @ 13:05

Datalogger redeployment time (dd/mm/yr hr:mm): " " @ 15:55

Date multimeter (e.g., YSI) last calibrated:

WL (mbTOC): 66.555

WL (mbTOC):

Equipment Used (Model, SN):

SAMPLING CRITERIA

Record field parameters, including water elevation, until they have stabilized for three consecutive readings, three to five minutes apart.

Drawdown:	<10 cm	pH:	+/- 0.1
Temperature:	+/- 0.1°C	ORP:	+/- 10%
SPC:	+/- 3%	Turbidity:	<50 NTU
DO:	+/- 10%		

Snap pressure hit ~ 38psi & stabilized @ 24 psi -> @ 13:05 snap tripped closed

Sulfur smell from well

✱ Snap sampler parameters first line

Groundwater Sampling Field Form v3 BDT 2020

Slundfas dry @ 2:10 to ~74 mbTOC

↳ WL dropping too = slowest possible flow rate

@ 14:44 water level drop slowed to a crawl, almost stable but barely dripping from flow through cell - pH still stabilizing though

Ground.

Sulfur visible water was dark gray - got light brown over time but recharge too slow

Snap bottles had sulfur smell, some suspended particles and a slight yellow brown color to them

2/2

* after tapped YSI Turbidity dropped rapidly

pump is having a lot of issues pumping at end - would have to crank pump up to maintain pumping rate and then 10-30 seconds later would shoot out water at very high pressure so then could drop pump rate for a bit before having to slowly increase pumping rate to avoid water sputtering -> in end took sample as 3 volumes purged and max. becoming very unpredictable

NEWCREST

SNAP SAMPLER® ZERO
PASSIVE SAMPLING SYSTEM

STANDARD OPERATING PROCEDURE FOR THE SNAP SAMPLER® PASSIVE GROUNDWATER SAMPLING METHOD (NOVEMBER 2019)

2019 UPDATE

The 2019 update includes minor additions to reflect further technical validation of the Snap Sampler® method add and clarifications to some sample and equipment handling procedures, including the PFAS-Zero™ version of the Snap Sampler passive groundwater sampler. The update includes reference to the ASTM Standard Guide for Passive Sampling, D7929-14 (ASTM, 2014).

This Standard Operating Procedure (SOP) should be used to familiarize the user with the application and protocol for use the Snap Sampler® passive groundwater monitoring system. *The laminated picture instruction cards contain step-by-step field instructions. The picture instructions in the Appendices, rather than the SOP itself, should be the primary tool for Snap Sampler® operation in the field.* The SOP is designed for overall understanding and rationale for passive groundwater sampling with the Snap Sampler®, and for regulatory submittal with Sampling and Analysis Plans. Should the user require information beyond that included in this SOP, additional information can be found on the Snap Sampler® website **www.SnapSampler.com, www.qedenv.com/global** or by contacting your Snap Sampler representative at **QED Environmental Systems, Inc.**

FORWARD

This SOP was adapted from SOPs in USEPA's groundwater guidance for RCRA and Superfund project managers (U.S. Environmental Protection Agency 2002). Portions of the applicable text are included here. With this forward, the authors and USEPA are acknowledged in sincerest appreciation. Edited and supplemental text is added to detail application information and procedures for use and deployment of the Snap Sampler® passive groundwater sampling device and method.

INTRODUCTION

The goal of groundwater sampling is to collect samples that are representative of *in situ* groundwater conditions and to minimize changes in groundwater chemistry during sample collection and handling. Experience has shown that groundwater sample collection and handling procedures can be a source of variability in water quality concentrations due to differences in sampling personnel, sampling procedures, and equipment (U.S. Environmental Protection Agency 1995; McHugh *et al.* 2010; Parker and Britt, 2012).

Traditionally, the collection of representative water samples from wells is neither straightforward nor easily accomplished. Groundwater sample collection through pumping or bailing can be a source of variability through differences in sampling personnel and their individual sampling procedures, the equipment used, and ambient temporal variability in subsurface and environmental conditions. Many site inspections and remedial investigations require the sampling at groundwater monitoring wells within a defined criterion of data confidence or data quality, which necessitates that the personnel collecting the samples are trained and aware of proper sample collection procedures.

The purpose of this SOP is to provide a description of the Snap Sampler® passive groundwater sampling method. The method and specialized equipment is designed to minimize the impact the sampling process on groundwater chemistry. This is accomplished through deployment and passive re-equilibration of the monitoring well to ambient groundwater flow and/or diffusive contaminant flux within the well/aquifer system. The Snap Sampler® method eliminates well purging prior to sample collection.

As a passive groundwater sampling device, the Snap Sampler® is a proven, cost-effective alternative to well purge and low-flow sampling (Parker *et al*. 2011; Britt *et al*. 2010). Historical and recent research shows that most if not virtually all well screen zones exhibit ambient flow-through under natural groundwater gradients (Gillham

1982; Pankow *et al.* 1985; Robin and Gillham 1987; Powell and Puls 1993; Puls and Barcelona 1996; Vroblesky *et al.* 2001a; ASTM 2002; ITRC 2004, 2007, ASTM 2014). The screen sections of these wells naturally exchange formation water without pumping. Ongoing research suggests that natural ambient flow-through induces a contaminant redistribution effect within wells (Britt *et al.* 2011; Britt 2005, 2006; Martin-Hayden and Britt 2006; Vroblesky *et al.* 2006; Britt and Calabria 2008). This redistribution regularly results in a flow-weighted averaging effect in the well *without purging*. Though not all wells are thoroughly mixed, many wells show relatively narrow ranges of vertical concentrations when vertically profiled (Vroblesky *et al.* 2001b; Parsons 2003; Britt and Calabria 2008). These studies and others indicate flow-weighted contaminant concentration averaging within wells is common. The Snap Sampler® takes advantage of these "naturally purged" wells by capturing a whole water sample after a period of sampler deployment in the well.

Wells in poor yielding formations with slow recharge during pumping have always been problematic for pumping methods. Wells with short water columns are also problematic for some of the same reasons. Passive sampling of poorly yielding wells has been suggested as a better method than purging to dryness in VOC impacted wells (McAlary and Barker 1987; Puls and Powell 1993; Puls and Barcelona 1996). *The Snap Sampler® can be deployed in low yield and short water column wells to take advantage of this passive sampling approach*.

The Snap Sampler® (Figure 1) passive groundwater sampling method limits sample collection variables by sealing the sample while it is still in the well, at the same position in the well during each sampling event. Where appropriate, the sample is maintained in the same sample container that is transmitted to the laboratory rather than pouring into sample bottles at the ground surface. Using this approach, sampling personnel are essentially prevented from introducing error, variability, or bias during the sample collection process. Sample collection is virtually the same for any user because the sample is captured downhole the same way every event, without impact from user technique, and in many cases, not exposed to the ambient air from the well to the laboratory. Research shows that variability reduction may improve long-term data trend analysis (Britt *et al.* 2011; McHugh *et al.* 2010; Britt *et al.* 2010; Britt 2008).

SCOPE AND APPLICATION

This SOP should be used primarily for monitoring wells that have a screen or an open interval large enough to

FIGURE 1, example with 2 of the VOA-size Snap Sampler Modules. Up to 6 modules can be assembled in any combination of sizes.

accept a downhole device of 1.8 inches (46mm) in diameter or larger. Long screen interval sampling may be conducted, but stratification testing may be warranted if previous information about aquifer and/or well contaminant stratification is not available. Vertical profiling requirements depend on site-specific data quality objectives (DQO's) and site-specific requirements (ASTM 2014, Vroblesky 2001a; ITRC 2004, 2007).

Groundwater samples that are collected using this procedure are useable for the analyses of groundwater contaminants that may be found at Superfund and RCRA contamination sites, as well as sites with a variety of contamination types. The analytes may be volatile organic compounds, semi-volatile organic compounds, pesticides, PCBs, metals, and other inorganic compounds, including perchlorate and other emerging contaminants

such as explosive compounds, 1,4-dioxane, 1,2,3-TCP, NDMA and others. No analyte limitations have been found for the Snap Sampler® (Parker and Mulherin, 2007, Parker *et al*. 2008, 2009, 2011a and 2011b; Britt *et al*. 2010). Sufficient sample volume is the only practical analyte limiting factor for the method. When sampling for Per- and Polyfluoroalkonated compounds (PFAS), the user should choose the PFAS Zero™ versions of the Snap Sampler product line. These components contain no fluorinated compounds. The user should note that bottles and pneumatic actuator devices not specifically marked as "PFAS Zero™" items may contain fluoropolymers. Lot testing shows these tested items to be PFAS free, but some sampling plans prohibit use of any fluoropolymers regardless of testing status.

For contaminant plume monitoring, the sampler should be placed within the screened interval of the well. For consistency and comparability of results over time, the sampler should be placed in same location and depth for each subsequent sampling event. To accommodate this preference, dedicated sampling devices with dedicated trigger lines should be used whenever possible. The Snap Sampler® should not be placed resting on the bottom well to avoid disturbing any sediment at the bottom of the well during deployment or when the sampler is triggered.

The Snap Sampler® relies on natural flow-through and/or diffusion of contaminants from the aquifer to the well (Powell and Puls 1993; ASTM 2002; ITRC 2004, 2007). Well purging is not conducted before sampling, therefore, measurement of water-quality-indicator parameters is not a prerequisite to sample collection. If parameters are required for certain monitoring programs independent of sampling method (e.g. for monitored natural attenuation assessment), parameters can be collected by utilizing one of the deployed Snap Sampler® bottles or post-sampling by another method (*e.g.* a downhole probe).

Samples collected for metals, semi-volatile organic compounds, pesticides, and other analytes may be impacted by sample turbidity. They also may be subject to transport by colloidal flow in the natural groundwater regime (Kearl *et al.* 1992; Puls and Powell 1992). Deployment and re-equilibrium of the Snap Sampler® allows natural colloidal flow to be monitored within the well. This is a distinct advantage over sampling methods such as the polyethylene diffusion bag (PDB), where colloidal particles are excluded from the sample; and an advantage over purge methods where colloids may be artificially mobilized (Britt *et al.* 2010). Field filtering is not required for samples collected with the Snap Sampler® but can be conducted if required by the site Sampling and Analysis Plan.

Proper well construction, development, and maintenance are essential for any groundwater sampling procedure. Prior to conducting field work, information on the construction of the well and well development should be obtained and that information factored into the site specific sampling procedure. This SOP is not to be used where non-aqueous phase liquids (NAPL) (immiscible fluids) are present in the monitoring well.

MATERIALS AND EQUIPMENT

- Field Sampling and Quality Assurance Project Plan.
- Site Health and Safety Plan with specifications for personal protective equipment and air monitoring equipment.
- Personal protective equipment in good working order as specified in the site Health and Safety Plan.
- Air monitoring equipment in good working order as specified in the Site Health and Safety Plan.
- Site access/permission documentation for site entry.
- Well keys and map of well locations.
- Tool box - All needed tools for all site equipment used.
- Snap Sampler® Modules - Dedicated samplers are recommended in most applications.
- Snap Sampler® Trigger lines, – Dedicated trigger lines are recommended in most applications. Trigger lines may be manual, with a mechanical wire connection from surface to sampler; or pneumatic, with an airline from surface to sampler.
- Snap Sampler® Well Caps – Lockable well caps for Snap Sampler® -deployed wells—includes a support ring to hang Snap Sampler equipment.
- Sample bottles, sample preservation supplies, sample tags or labels, and chain-of-custody forms.
- Well construction, field, and water quality data from the previous sampling event.
- Field notebook, groundwater sampling logs, and calculator.
- Polyethylene sheeting placed on ground around the well head.
- Depth-to-water measuring device - An electronic water-level indicator or steel tape and chalk, with marked intervals of 0.01 foot. Interface probe for determination of liquid products (NAPL) presence, if needed.

- Steel tape and weight - Used for measuring total depth of well.

- Multi-parameter meter, if required. The water-quality-indicator parameters that may be monitored under common monitoring programs include pH, ORP/Eh, (ORP) dissolved oxygen (DO), turbidity, specific conductance, and temperature. Turbidity readings, if required, must be collected from a sacrificed Snap Sampler® bottle because retrieving the sampler may agitate the well, increasing turbidity values not present in the actual samples. Calibration fluids for all instruments should be traceable and there should be enough for daily calibration throughout the sampling event.

- Decontamination supplies, including a reliable and documented source of distilled water and any solvents (if used). Pressure sprayers, buckets or decontamination tubes for pumps, brushes and non-phosphate soap will be needed for non-dedicated equipment that is moved from well to well.

- A suitable container for excess sample and decontamination water, as needed or required.

Construction materials of non-dedicated sampling equipment (samplers, tubing, and other equipment that comes in contact with the sample) should be limited to inert materials. This will reduce the chance that sampling materials alter the groundwater where concentrations of the site contaminants are expected to be near the detection limits. The tendency of organics to sorb into and desorb out of plastic materials makes dedicated equipment preferable where possible.

It should be noted that plastic materials used in the Snap Sampler® are not usually problematic for sorption. Using methods described in this SOP, the sampler is deployed for one to two weeks (or more). This deployment period allows materials prone to sorption to achieve equilibrium with groundwater before the sample is collected (Parker, et al. 2007).

DEPLOYMENT/SAMPLING PROCEDURES

The following describes the deployment and sampling procedures for the Snap Sampler® passive groundwater sampling method. These procedures describe steps for dedicated and non-dedicated systems.

Pre-Sampling Activities

1. Well location maps, construction information, keys and sampling equipment should be assembled and transported to the site.

2. Water level monitoring and sampling must begin at the monitoring well with the least contamination, generally up-gradient or farthest from the site or suspected source. Then proceed systematically to the monitoring wells with the most contaminated ground water.

3. Check and record the condition of the monitoring well for damage or evidence of tampering. Lay out polyethylene sheeting around the well to minimize the likelihood of contamination of sampling equipment from the soil and exposure of soil to liquids dripping from the sampling equipment.

4. Unlock well head. Record location, time, date, and appropriate information in a field logbook or on the groundwater sampling log.

5. Remove inner casing cap.

6. If required, monitor the headspace of the monitoring well at the rim of the casing for volatile organic compounds (VOC) with a photo-ionization detector (PID) or flame ionization detector (FID) and record in the logbook. If the existing monitoring well currently has or has a history of positive headspace readings, then the sampling must be conducted in accordance with the Health and Safety Plan.

7. Measure the depth to water (water level must be measured to nearest 0.01 feet) relative to a reference measuring point on the well casing with an electronic water level indicator or other appropriate measuring device and record in logbook or groundwater sampling log. If no reference point is found, measure relative to the top of the inner casing, then mark that reference point and note that location in the field logbook. Record information on depth to ground water in the field logbook or groundwater sampling log. Measure the depth to water a second time to confirm initial measurement; measurement should agree within 0.01 feet or re-measure.

8. Check the available well information or field check for the total depth of the monitoring well.

FIGURE 2

Deployment Activities

Selection of the deployment depth within the screen interval is dependent on site specific DQO's. Normally, deployment depth is targeted at the center of the well screen. If depth-specific monitoring is desired, multiple samplers may be deployed at intervals appropriate for the sampling objective.

If multiple sample zones within a well, zone isolation using a packer or baffle device to limit in-well mixing can be used (Britt 2006; Britt and Calabria 2008). These can be attached to the Snap Sampler® trigger line or deployed separately. Installation of an upper baffle designed to isolate the unscreened well casing or well headspace may be desired. The upper baffle will limit mixing of "stagnant" casing water with screen-interval water, an/or gas exchange with the headspace air.

1. Remove the Snap Sampler bottle(s) from its packaging.

2. Turn the translucent "Snap Cap" on each end of the bottle slightly to release any sticking of the o-ring.

3. Insert the bottle into the upper end of the sampler as shown in Figure 2.

4. Place the sampler twist-on connector onto each end of the sampler; turn clockwise to align the set pins/screw (Figure 3); then gently tighten the set screw with the Snap Driver Tool (Figure 4).

FIGURE 3

FIGURE 4

5. Pivot the vial cap (Snap Cap) into its seat with the Snap driver. Push up the retainer pin through the lower hole in the vial cap. Repeat for all Snap Caps (Figure 5). If an o-ring should dislodge from its seat during setting, remove the sample bottle and carefully replace it in the o-ring groove; repeat setting procedure.

FIGURE 5

6. For the manual trigger, feed ball-fitting end of trigger cable through lower release pin groove; click tube fitting into connector (Figure 6).

FIGURE 6

7. Press in the ball fitting to attach to lower release pin (Figure 6).

FIGURE 7

8. For the pneumatic trigger system, attach the wireline from the plunger (Figure 7).

Figure 8

9. Deploy to selected depth with trigger cable/tubing and attach to well head docking station (Figure 8, Figure 9).

10. Additional Snap Samplers® can be deployed with separate trigger lines or in series with a single trigger. If separate triggers are used, the ID tags should be marked at the surface for later reference.

FIGURE 9

11. The recommended deployment period is one to two weeks. There may be hydrogeologic conditions where a shorter deployment is possible, but one to two weeks would generally assure a return of the well to its steady-state condition (Vroblesky, 2001a, 2001b). Parker et al (2009) found that a 72 hour submergence time was sufficient for most analytes tested, but this does not account for well disturbance or other-well-specific factors. The user may determine that shorter or longer deployment times than the standard 1-2 weeks are appropriate for a specific application.

12. The Snap Sampler® can be deployed for extended periods. No upper bound for sampler deployment has been found. Rather, conditions at individual wells seem to control the applicability of deployments lasting a year or longer.

Sample Collection Activities

When the deployment period is completed, the sampler should be triggered at the well head without disturbing the sampler position. For the manual trigger, the cable end should be pulled with sufficient force to move the cable up the tubing. Depending on the length of the cable, closure of the samplers usually can be felt through the trigger line when the samplers trip. For the pneumatic trigger system, pressure is added to the downhole air line to trigger the Snap Samplers to close. If more than one triggering line is present, closure should proceed from the deepest to the shallowest sampler position to limit capture of sediment potentially re-suspended by closure of the first sampler. Additional details on collection activities are included in the Appendices and "Quick Check" instructions.

After the sampler is triggered and retrieved, the upper connector should be removed by loosening the blue retainer screw and turning the white cover piece. The bottom connector piece does not need to be disassembled to remove the bottles.

While the bottles should not leak with reasonable handling, they should not be agitated (to check for headspace, for example) until after the screw caps are tightened. Under most circumstances there will be no air in the vials at retrieval. However, some field conditions—including deep groundwater, natural effervescence, or other causes—may cause some small air bubbles to be present in the bottle or on the spring when retrieved. This is not a concern if the air was entrained while deployed. Air adhering to the vial during deployment would be in equilibrium with the sample water upon sampler closure. Therefore it is not "headspace air" into which sample VOCs could volatilize. Deployment air could be attached to the spring or cap, and should not be larger than 1-2 mm upon retrieval. Pankow (1986) showed that small headspace gas from these or other causes do not substantially impact results for most

common volatiles. If gas bubbles are larger than 5 mm before placing the screw cap, or water is clearly leaking from the vial, the sample may not have sealed properly. There are three options for addressing bubbles: 1) the bottle can be submitted to the laboratory with the headspace bubble, noting the occurrence; 2) the cap can be opened slightly and sample water from another bottle added to fill the vial; or 3) the bottle can be discarded. The user can determine which approach is most appropriate depending on the size of the bubble. For a 1mm bubble, option #1 may be most appropriate; for a 5mm bubble, #2 may be appropriate, while #3 may be appropriate for a 50% full bottle.

There are no special laboratory preparation procedures for Snap Sample bottles. The bottles can be analyzed using common 40-ml autosamplers. The spring inside the VOAs is polymer-coated and will deflect away from the autosampler extraction needle during insertion.

The appendices include step-by-step instructions for deployment and bottle preparation procedures.

Appendix A contains step-by-step field procedures for deployment of both 40 ml Snap Sampler VOAs and 125 ml Snap Sampler POLY bottles.

Appendix B contains step-by-step procedures for preparation of both 40 ml Snap Sampler VOAs and 125 ml Snap Sampler POLY bottles.

DECONTAMINATION PROCEDURES

The electronic water level indicator probe/steel tape, the water-quality field parameter sensors and any *non-dedicated* Snap Sampler® groundwater sampling equipment should be decontaminated by the following procedures:

1. The water level meter will be hand washed with phosphate-free detergent and a scrubber, then thoroughly rinsed with distilled water.

2. Water quality field parameter sensors with distilled water between sampling locations where utilized. No other decontamination procedures are necessary or recommended for these probes since they are sensitive. After the sampling event, the sensors must be cleaned and maintained per the manufacturer's requirements.

3. For *non-dedicated* applications, the Snap Sampler® and trigger tubing must be pressure-sprayed or bristle-brush scrubbed with soapy water, tap water, and distilled water prior to use in a different well. Depending on the condition of the Snap Sampler®, the release pin mechanism may need to be disassembled to effectively clean the pins and grooves. Disassembly can be accomplished by removing the lever screw.

FIELD QUALITY CONTROL

Quality control (QC) samples must be collected to verify that sample collection and handling procedures were performed adequately and that they have not compromised the quality of the groundwater samples. The appropriate EPA or other appropriate program guidance must be consulted in preparing the field QC sample requirements for the site-specific Quality Assurance Project Plan (QAPP).

There are five primary areas of concern for quality assurance (QA) in the collection of representative groundwater samples:

1. Obtaining a groundwater sample that is representative of the aquifer or zone of interest in the aquifer. Verification is based on the field log documenting that the field procedures were followed appropriately during sample deployment and collection.

2. Ensuring that the sampling devices are made of materials, and utilized in a manner that will not interact with or alter the analyses.

3. Ensuring that results generated by these procedures are reproducible; therefore, the sampling scheme should incorporate co-located samples (duplicates).

4. Preventing cross-contamination. Sampling should proceed from least to most contaminated wells, if known. Field equipment blanks should be incorporated for all sampling, and decontamination of the equipment is therefore required.

5. Properly preserving, packaging, and shipping samples.

All field QC samples must be prepared the same as regular investigation samples with regard to sample volume, containers, and preservation. The chain-of custody procedures for the QC samples will be identical to the field groundwater samples. The following are QC samples that should be collected during the sampling event:

Field duplicates	See QAPP/SAP
Matrix spike	See QAPP/SAP
Matrix spike dup.	See QAPP/SAP
Equipment blank	See QAPP/SAP
Trip blank (VOCs)	See QAPP/SAP
Temperature blank	See QAPP/SAP

HEALTH AND SAFETY CONSIDERATIONS

Depending on the site-specific contaminants, various protective programs must be implemented prior to sampling the first well. The site Health and Safety Plan should be reviewed with specific emphasis placed on the protection program planned for the sampling tasks. Standard safe operating practices should be followed, such as minimizing contact with potential contaminants in both the liquid and vapor phase through the use of appropriate personal protective equipment.

Depending on the type of contaminants expected or determined in previous sampling efforts, the following safe work practices should be employed:

Particulate or metals contaminants

1. Avoid skin contact with, and incidental ingestion of sample water.

2. Use protective gloves and splash protection.

Volatile organic contaminants

1. Avoid breathing constituents venting from well.

2. Pre-survey the well head space with an appropriate device as specified in the site Health and Safety Plan.

3. If monitoring results indicate elevated organic constituents, sampling activities may be conducted in elevated protective equipment (e.g. level C protection). At a minimum, skin protection will be afforded by disposable protective clothing, such as Tyvek®, appropriate gloves and face protection.

General practices should include avoiding skin contact with water from preserved sample bottles, as this water will have pH less than 2 or greater than 10. Also, when field acidifying VOA bottles, hydrochloric acid fumes may be released and should not be inhaled. Acid should not contact skin, eyes, or unprotected clothing.

POST-SAMPLING ACTIVITIES

Several activities need to be completed and documented once groundwater sampling has been completed.

These activities include, but are not limited to the following:

1. Ensuring that all field equipment has been decontaminated and returned to proper storage location. Once the individual field equipment has been decontaminated, tag it with date of cleaning, site name, and name of individual responsible.

2. Processing all sample paperwork, including copies provided to the appropriate sample handling and tracking facility.

3. Compiling all field data for site records.

4. Verifying all analytical data processed by the analytical laboratory against field sheets to ensure all data has been returned to sampler.

THE SNAP SAMPLER

for Passive Groundwater Sampling

The Snap Sampler—a Passive Groundwater Sampling Technology for Any Analyte

What is a Snap Sampler and how does it work?

The Snap Sampler is a passive grab sampler. A passive sampler is any device that is left in place for an "equilibration" period that allows the analytes of concern to enter the sampling device and equilibrate with the surrounding sample environment. Unlike diffusion- or sorption-based passive samplers, Snap Sampler containers are simply open to the sampled environment. There is no diffusion through a membrane or sorption onto special media. Snap Sampler bottles have openings on both ends, allowing advective or diffusive analyte exchange with the surrounding environment.

The equilibration period for the Snap Sampler depends on the installation environment and the analytes of concern. For many inorganic analytes, Snap Samplers have been shown by the US Army Corps of Engineers to be in an equilibrium state within the shortest timeframe measured in their tests—24 hours. For organic analytes, including VOCs, equilibration periods could be longer—up to 72 hours or so. We recommend a deployment period of 1-2 weeks in many cases to allow extra time for the well to re-establish natural flow-through and water exchange after the disturbance of inserting the Snap Sampler into the well. For routine sampling, Snap Samplers are left in the sample position for the entire time between sampling events, so this equilibration period is not a concern. It is mainly a consideration for initial or one-time deployments.

To capture the sample, Snap Sampler bottles are activated to close mechanically from the surface, either through a manual pull trigger system for shallow applications (less than 40-50ft, 12-15m) or using a pneumatic triggering system that can be used an any depth (the current record is approximately 2500ft, 760m). Photos show the "Snap Caps" in the set position. Caps are left in the open position during the deployment period, then "snapped" shut immediately prior to retrieval and preparation for laboratory submittal. Typically, Snap Samplers are then redeployed into the well in preparation for the subsequent sampling event.

ASTM Standard D7929-14 includes the Snap Sampler as a "passive" sampling device by defining passive grab sampling differently from "active" grab sampling. "Active" grab sampling requires motion of the sampling device to "grab" the sample from the environment, while a "passive" grab sampler already contains the sample within the sampler. For the Snap Sampler, simple closure of the device retains the sample. A bailer, a bailer-type pull-filling device, or a pressure/vacuum-based sampler actively moves sample from the environment into the sampling device during collection. For these devices, there is no real equilibration. Sampler materials are not truly equilibrated with the surrounding environment as they may be exposed to that water for the first time at the time of collection. Further, there may be substantial disturbance of the water column during collection and the precise sample position may not be known. Some research suggests strong bias and data variability can occur when the sampling position is not known. Water may come from beyond the screen zone of the well in the case of a pull-filling device, causing such bias and variability.

Designation: D7929 – 14

Standard Guide for
Selection of Passive Techniques for Sampling Groundwater Monitoring Wells[1]

This standard is issued under the fixed designation D7929; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

1. Scope

1.1 This standard provides guidance and information on passive sampling techniques for collecting groundwater from monitoring wells. Passive groundwater samplers are able to

oping groundwater monitoring wells in granular aquifers, and D6452 provides a standard guide for purging methods used in groundwater quality investigations. Consult ASTM Standard D6724 for a guide on the installation of direct-push ground-

Snap Samplers can be configured to collect samples in 40ml VOA vials designed to be used directly in commercial laboratory testing equipment. Snap VOA vials allow the user to collect samples in the same container that is analyzed at the lab, never exposing the sample. These samples can be field-preserved after collection without exposing sample. This is just about the perfect sample—sealed downhole, never exposed, analyzed in the same container that was deployed in the well. Snap Samplers can also be configured with 125ml or 350ml HDPE bottles for larger volume requirements. Snap Sampler modules can be stacked in any combination up to 6 in a "string" of Snap Samplers. The 40ml VOA and 125ml Poly bottles will fit into 2-inch (50mm) or larger wells, while the 350ml bottle can fit into wells that are 4-inch (100mm) or larger. Samples collected in the Poly bottles can be prepared for direct submittal to the analytical laboratory, or samples can be transferred into appropriate lab-supplied containers as needed.

Why use a Snap Sampler?

Cost savings is usually the main reason users consider passive sampling generally. Snap Samplers are passive devices, which means you can avoid the time-consuming purge process and the associated waste generation, handing, paperwork and liability. If you generate no wastewater, you don't have to deal with it. It's smart

and it's sustainable. It also allows you to avoid equipment rentals, meter calibrations, and potential failures. Of course, if you need parameter readings for purposes other than purge "stability" measurements, you can use collected Snap Sampler water to take hand held meter measurements. Typical cost savings from Snap Sampling ranges widely, but a good rule of thumb is a 50% cost savings on physical sample collection. Savings results from reduced time in the field, avoidance of waste handling and disposal, and avoidance of equipment rentals.

Data Quality is another primary reason for choosing the Snap Sampler. The US Department of Defense funded a number of SERDP and ESTCP studies that show the Snap Sampler met data quality criteria for equivalence to low flow sampling for both concentration and data variability. The bottom line is that Snap Sampling is technically equivalent to low flow sampling. Sealed VOC samples mean that in addition to technical equivalence, the effect of field conditions and personnel is minimized or even eliminated. This can't be said for other no-purge devices that are highly reliant on user technique, or have analyte limitations. These key factors set the Snap Sampler apart from other approaches.

Discrete depth sampling is a common use for Snap Samplers. Because Snap Samplers are deployed in a fixed position, you can be as sure as you can be about where the sample comes from within a well. For multiple depth sampling, that is a key feature. Zone isolation devices can be inserted between Snap Samplers to improve vertical profile results. This approach allows a user to utilize existing infrastructure for characterization, or may allow dual purpose well construction.

Very deep wells are traditionally difficult to sample. With Snap Samplers, deep wells are much less of a problem. The Snap Sampler pneumatic trigger system operates on tire pump air pressure. There is no need to overcome submergence pressure, therefore you no longer need nitrogen bottles to sample from hundreds or even thousands of feet depth.

Notes:

Sample results in red indicate turbidity measured between 50 and 200 NTU

Sample results in **red bold** indicated turbidity measured above 200 NTU

Sample results highlighted yellow have pH values measured above 8.5

Chemical Oxygen Demand (COD)	mg/L	-	-	-	-	-	-	-	-	-	<20	22

Notes:
Sample results in red indicate turbidity measured between 50 and 200 NTU
Sample results in **red bold** indicated turbidity measured above 200 NTU
Sample results highlighted yellow have pH values measured above 8.5

Notes:
Sample results in red indicate turbidity measured between 50 and 200 NTU
Sample results in **red bold** indicated turbidity measured above 200 NTU
Sample results highlighted yellow have pH values measured above 8.5

Notes:
Sample results in red indicate turbidity measured between 50 and 200 NTU
Sample results in **red bold** indicated turbidity measured above 200 NTU
Sample results highlighted yellow have pH values measured above 8.5

Notes:
Sample results in red indicate turbidity measured between 50 and 200 NTU
Sample results in **red bold** indicated turbidity measured above 200 NTU
Sample results highlighted yellow have pH values measured above 8.5

Notes:
Sample results in red indicate turbidity measured between 50 and 200 NTU
Sample results in **red bold** indicated turbidity measured above 200 NTU
Sample results highlighted yellow have pH values measured above 8.5

Notes:
Sample results in red indicate turbidity measured between 50 and 200 NTU
Sample results in **red bold** indicated turbidity measured above 200 NTU
Sample results highlighted yellow have pH values measured above 8.5

Notes:
Sample results in red indicate turbidity measured between 50 and 200 NTU
Sample results in **red bold** indicated turbidity measured above 200 NTU
Sample results highlighted yellow have pH values measured above 8.5

Appendix G: Summary of Groundwater Quality Analytical Results

Notes:
Sample results in red indicate turbidity measured between 50 and 200 NTU
Sample results in **red bold** indicated turbidity measured above 200 NTU
Sample results highlighted yellow have pH values measured above 8.5

Notes:
Sample results in red indicate turbidity measured between 50 and 200 NTU
Sample results in **red bold** indicated turbidity measured above 200 NTU
Sample results highlighted yellow have pH values measured above 8.5

Notes:

Sample results in red indicated turbidity measured between 50 and 200 NTU

Sample results in **red bold** indicated turbidity measured above 200 NTU

Sample results highlighted yellow have pH values measured above 8.5
