CERTIFICATE OF ANALYSIS

Work Order	: **VA21C0111**	Page	: 1 of 6
Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 15-Sep-2021 16:00
PO	: 1025612	Date Analysis Commenced	: 16-Sep-2021
C-O-C number	: ----	Issue Date	: 23-Sep-2021 16:36
Sampler	: RS/BM		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Dion Chan	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculaton)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Dion Chan	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Annabelle Prasad	Analyst	Metals, Burnaby, British Columbia
Dion Chan	Lab Assistant	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Total Metals	QC-MRG3-298951001	----	arsenic, total	7440-38-2	E420	0.00011 mg/L MB-LOR	0.0001 mg/L	Blank result exceeds permitted value

Result Qualifiers

Qualifier	*Description*
MB-LOR	*Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculaton)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Qualifiers

Qualifier	Description
MB-LOR	Method Blank exceeds ALS DQO. Limits of Reporting have been adjusted for samples with positive hits below 5x blank level.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Woochan Song	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples received	: 1		
No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: ✗ = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395-H Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H_2S concentration based on the total sulfide concentration in the sample. The H_2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculaton)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Total Organic Carbon by Combustion	EP355 Vancouver - Environmental	Water		Preparation for Total Organic Carbon by Combustion

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

QUALITY CONTROL REPORT

Work Order	: **VA21C0574**	Page	: 1 of 17
Client	: Pretium Explorations Inc.	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9

Sampler	: C M, N G		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Woochan Song	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Ken Chan	Supervisor - Metals Prep & Mercury	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Workorder Comments

Sample "BJ-GW11-3A - Snap": 250mL plastic unpreserved bottle received approx. 2/5th full. All analyses still likely possible but if volume is insufficient, Account Manager will be in touch.

No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Alkalinity Species by Titration	E290	302368	1	17	5.8	5.0	✓
Ammonia by Fluorescence	E298	307780	1	6	16.6	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculaton)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 25-Sep-2021 12:05
PO	: 1025614	Date Analysis Commenced	: 26-Sep-2021
C-O-C number	: ----	Issue Date	: 13-Oct-2021 14:10
Sampler	: BM, NG		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Saron Kim	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DTC	*Dissolved concentration exceeds total. Results were confirmed by re-analysis.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA21C1212**	Page	: 1 of 14
Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 25-Sep-2021 12:05
PO	: 1025614	Issue Date	: 13-Oct-2021 14:10
C-O-C number	: ----		
Sampler	: BM, NG		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H_2S concentration based on the total sulfide concentration in the sample. The H_2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculaton)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Total Organic Carbon by Combustion	EP355 Vancouver - Environmental	Water		Preparation for Total Organic Carbon by Combustion

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 12-Oct-2021 21:30
PO	: 1025614	Date Analysis Commenced	: 13-Oct-2021
C-O-C number	: ----	Issue Date	: 26-Oct-2021 16:58
Sampler	: NG/RS		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 7		
No. of samples analysed	: 7		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Jay Jang	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Saron Kim	Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DTMF	*Dissolved concentration exceeds total for field-filtered metals sample. Metallic contaminants may have been introduced to dissolved sample during field filtration.*
DTSE	*Dissolved Se concentration exceeds total. Positive bias on D-Se suspected due to signal enhancement from volatile selenium species. Contact ALS if an alternative test to address this interference is needed.*
RRV	*Reported result verified by repeat analysis.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA21C2526**	Page	: 1 of 27
Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 12-Oct-2021 21:30
PO	: 1025614	Issue Date	: 26-Oct-2021 16:58
C-O-C number	: ----		
Sampler	: NG/RS		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 7		
No. of samples analysed	: 7		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTR: Exceeded ALS recommended hold time prior to sample receipt.

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

EHT: Exceeded ALS recommended hold time prior to analysis.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H_2S concentration based on the total sulfide concentration in the sample. The H_2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculaton)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Total Organic Carbon by Combustion	EP355 Vancouver - Environmental	Water		Preparation for Total Organic Carbon by Combustion

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Special Instructions / R... ...E-Freshwater Aquatic Life/BC CSR - Commercial/AB Tier 1 - Natural, etc) / Hazardous Details

Please report results with 5 business day turnaround, no surcharge. Dissolved Metals and Dissolved Mercury are filtered. TOC/DOC NOT required. Please CC report to Steven.Momeyer@lorax.ca, Laura.Findlater@lorax.ca and bjwq@lorax.ca. EMS Upload Required (for samples with EMS number)

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY.

By the use of this form the user acknowledges and agrees with the Terms and Conditions as provided on a separate Excel tab.

Also provided on another Excel tab are the ALS location addresses, phone numbers and sample container / preservation / holding time table for common analyses.

Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 18-Oct-2021 21:20
PO	: 1025614	Date Analysis Commenced	: 19-Oct-2021
C-O-C number	: ----	Issue Date	: 27-Oct-2021 14:50
Sampler	: NG/RS/LF		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Jay Jang	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers occur - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Total Metals	QC-MRG3-329001001	----	magnesium, total	7439-95-4	E420	0.0070 mg/L [B]	0.005 mg/L	Blank result exceeds permitted value

Result Qualifiers

Qualifier	*Description*
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

EHTL: Exceeded ALS recommended hold time prior to analysis. Sample was received less than 24 hours prior to expiry.

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: ✗ = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculaton)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Qualifiers

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

CERTIFICATE OF ANALYSIS

Work Order	: **VA21C3094**	Page	: 1 of 6
Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 18-Oct-2021 21:20
PO	: 1025614	Date Analysis Commenced	: 20-Oct-2021
C-O-C number	: ----	Issue Date	: 27-Oct-2021 14:49
Sampler	: LF/BM		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Jay Jang	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA21C3094**	Page	: 1 of 20
Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 18-Oct-2021 21:20
PO	: 1025614	Issue Date	: 27-Oct-2021 14:49
C-O-C number	: ----		
Sampler	: LF/BM		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Total Metals	QC-MRG3-329001001	----	magnesium, total	7439-95-4	E420	0.0070 mg/L [B]	0.005 mg/L	Blank result exceeds permitted value

Result Qualifiers

Qualifier	*Description*
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = QC frequency outside specification; ✓ = QC frequency within specification.

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	324161	1	14	7.1	5.0	✓
Alkalinity Species by Titration	E290	324154	1	18	5.5	5.0	✓
Ammonia by Fluorescence	E298	327017	1	20	5.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculaton)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

QUALITY CONTROL REPORT

Work Order	: **VA21C3094**	Page	: 1 of 17
Client	: Pretium Explorations Inc.	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 18-Oct-2021 21:20
PO	: 1025614	Date Analysis Commenced	: 20-Oct-2021
C-O-C number	: ----	Issue Date	: 27-Oct-2021 14:49
Sampler	: LF/BM		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 4		
No. of samples analysed	: 4		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Jay Jang	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Qualifiers

Qualifier	Description
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Courtney Cox	Analsyt	Inorganics, Burnaby, British Columbia
Jay Jang	Lab Assistant	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Physical Tests : TSS by Gravimetry										
HDPE BJ-GW11-1A - E303054	E160-H	31-Oct-2021	----	----	----		05-Nov-2021	7 days	5 days	✓
Physical Tests : Turbidity by Nephelometry										
HDPE BJ-GW11-1A - E303054	E121	31-Oct-2021	----	----	----		02-Nov-2021	3 days	2 days	✓
Total Metals : Total Mercury in Water by CVAAS										
Glass vial total (hydrochloric acid) BJ-GW11-1A - E303054	E508	31-Oct-2021	----	----	----		10-Nov-2021	28 days	10 days	✓
Total Metals : Total Metals in Water by CRC ICPMS										
HDPE total (nitric acid) BJ-GW11-1A - E303054	E420	31-Oct-2021	----	----	----		12-Nov-2021	180 days	12 days	✓
Total Sulfides : Total Sulfide by Colourimetry (Automated Flow)										
HDPE total (zinc acetate+sodium hydroxide) BJ-GW11-1A - E303054	E395	31-Oct-2021	----	----	----		02-Nov-2021	7 days	2 days	✓

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	335599	1	9	11.1	5.0	✓
Alkalinity Species by Titration	E290	335598	1	20	5.0	5.0	✓
Ammonia by Fluorescence	E298	341774	1	17	5.8	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H_2S concentration based on the total sulfide concentration in the sample. The H_2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculation)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Total Organic Carbon by Combustion	EP355 Vancouver - Environmental	Water		Preparation for Total Organic Carbon by Combustion

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 1		
No. of samples analysed	: 1		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Saron Kim	Analyst	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

No. of samples analysed	: 1		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- Method Blank value outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Method Blank (MB) Values								
Physical Tests	QC-MRG2-341505001	----	alkalinity, total (as CaCO3)	----	E290	1.8 mg/L [B]	1.5 mg/L	Blank result exceeds permitted value

Result Qualifiers

Qualifier	*Description*
B	*Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P E (mod)	Dissolved Orthophosphate is determined colourimetrically on a water sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395-H Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), dissolved" is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	"Hardness (as CaCO3), from total Ca/Mg" is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. "Total Hardness" refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculation)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Qualifiers

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Sampler	: NG/CM		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Saron Kim	Analyst	Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLA	*Detection Limit adjusted for required dilution.*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*
DTSE	*Dissolved Se concentration exceeds total. Positive bias on D-Se suspected due to signal enhancement from volatile selenium species. Contact ALS if an alternative test to address this interference is needed.*

Analytical Results

No. of samples received	: 2		
No. of samples analysed	: 2		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	345742	1	15	6.6	5.0	✓

Total Sulfide by Colourimetry (Automated Flow)	E395-H	346090	1	4	25.0	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a flow analyzer on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395-H Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculation)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

QUALITY CONTROL REPORT

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sampler	: N G		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Inorganics, Burnaby, British Columbia
Kelley Macdonald	Lab Assistant	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Tracy Harley	Supervisor - Water Quality Instrumentation	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLDS	*Detection Limit Raised: Dilution required due to high Dissolved Solids / Electrical Conductivity.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA21C5605**	Page	: 1 of 15
Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 16-Nov-2021 16:20
PO	: 1025614	Issue Date	: 24-Nov-2021 18:59
C-O-C number	: ----		
Sampler	: N G		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	347042	1	6	16.6	5.0	✓
Alkalinity Species by Titration	E290	347041	1	6	16.6	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Organic Carbon (Non-Purgeable) by Combustion (Low Level)	E355-L Vancouver - Environmental	Water	APHA 5310 B (mod)	Total Organic Carbon (Non-Purgeable), also known as NPOC (total), is a direct measurement of TOC after an acidified sample has been purged to remove inorganic carbon (IC). Analysis is by high temperature combustion with infrared detection of CO_2. NPOC does not include volatile organic species that are purged off with IC. For samples where the majority of total carbon (TC) is comprised of IC (which is common), this method is more accurate and more reliable than the TOC by subtraction method (i.e. TC minus TIC).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a flow analyzer on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395-H Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H_2S concentration based on the total sulfide concentration in the sample. The H_2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculation)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.
Preparation for Total Organic Carbon by Combustion	EP355 Vancouver - Environmental	Water		Preparation for Total Organic Carbon by Combustion
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Kim Jensen	Department Manager - Metals	Metals, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Woochan Song	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DTSE	*Dissolved Se concentration exceeds total. Positive bias on D-Se suspected due to signal enhancement from volatile selenium species. Contact ALS if an alternative test to address this interference is needed.*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA21C7213**	Page	: 1 of 14
Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 06-Dec-2021 21:50
PO	: 1025614	Issue Date	: 16-Dec-2021 17:59
C-O-C number	: ----		
Sampler	: NG/KE		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160-H Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a flow analyzer on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculation)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Cindy Tang	Team Leader - Inorganics	Inorganics, Burnaby, British Columbia
Dan Gebert	Laboratory Analyst	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Owen Cheng		Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Ruby Pham	Lab Assistant	Metals, Burnaby, British Columbia
Woochan Song	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA22A1683**	Page	: 1 of 15
Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 27-Jan-2022 21:20
PO	: 1025612	Issue Date	: 08-Feb-2022 16:58
C-O-C number	: ----		
Sampler	: ----		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Matrix Spike outliers occur.
- Laboratory Control Sample (LCS) outliers occur - please see following pages for full details.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **Water**

Analyte Group	Laboratory sample ID	Client/Ref Sample ID	Analyte	CAS Number	Method	Result	Limits	Comment
Laboratory Control Sample (LCS) Recoveries								
Total Metals	QC-MRG2-401095002	----	phosphorus, total	7723-14-0	E420	124 % MES	80.0-120%	Recovery greater than upper control limit

Result Qualifiers

Qualifier	*Description*
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160 Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a flow analyzer on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395-H Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculation)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Qualifiers

Qualifier	Description
MES	*Data Quality Objective was marginally exceeded (by < 10% absolute) for < 10% of analytes in a Multi-Element Scan / Multi-Parameter Scan (considered acceptable as per OMOE & CCME).*

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 28-Jan-2022 21:15
PO	: 1025612	Date Analysis Commenced	: 30-Jan-2022
C-O-C number	: ----	Issue Date	: 09-Feb-2022 17:14
Sampler	: K U, N G		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Woochan Song	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DLM	*Detection Limit Adjusted due to sample matrix effects (e.g. chemical interference, colour, turbidity).*

QUALITY CONTROL INTERPRETIVE REPORT

Work Order	: **VA22A1795**	Page	: 1 of 17
Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 28-Jan-2022 21:15
PO	: 1025612	Issue Date	: 09-Feb-2022 17:14
C-O-C number	: ----		
Sampler	: K U, N G		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160 Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a flow analyzer on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395 Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculation)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

QUALITY CONTROL REPORT

Work Order	: **VA22A1795**	Page	: 1 of 18
Client	: Pretium Explorations Inc.	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby, British Columbia Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 28-Jan-2022 21:15
PO	: 1025612	Date Analysis Commenced	: 30-Jan-2022
C-O-C number	: ----	Issue Date	: 09-Feb-2022 17:14
Sampler	: K U, N G		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 3		
No. of samples analysed	: 3		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits
- Reference Material (RM) Report; Recovery and Acceptance Limits
- Method Blank (MB) Report; Recovery and Acceptance Limits
- Laboratory Control Sample (LCS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Monica Ko	Lab Assistant	Metals, Burnaby, British Columbia
Robin Weeks	Team Leader - Metals	Metals, Burnaby, British Columbia
Woochan Song	Lab Analyst	Metals, Burnaby, British Columbia

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Sub-Matrix: **Water**

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Sub-Matrix: **Water**

Client	: **Pretium Explorations Inc.**	Laboratory	: Vancouver - Environmental
Contact	: Robin McCall	Account Manager	: Dean Watt
Address	: Suite 2300, Four Bentall Centre 1055 Dunsmuir Street Vancouver BC Canada V7X1L4	Address	: 8081 Lougheed Highway Burnaby BC Canada V5A 1W9
Telephone	: 604 558 1784	Telephone	: +1 604 253 4188
Project	: Brucejack Groundwater	Date Samples Received	: 31-Jan-2022 21:00
PO	: 1025614	Date Analysis Commenced	: 01-Feb-2022
C-O-C number	: ----	Issue Date	: 11-Feb-2022 16:45
Sampler	: NG/RS/KU		
Site	: ----		
Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QC Interpretive report to assist with Quality Review and Sample Receipt Notification (SRN).

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is conducted in accordance with US FDA 21 CFR Part 11.

Signatories	*Position*	*Laboratory Department*
Angela Ren	Team Leader - Metals	Metals, Burnaby, British Columbia
Angelo Salandanan	Lab Assistant	Metals, Burnaby, British Columbia
Caleb Deroche	Lab Analyst	Metals, Burnaby, British Columbia
Dee Lee	Analyst	Metals, Burnaby, British Columbia
Kevin Duarte	Supervisor - Metals ICP Instrumentation	Metals, Burnaby, British Columbia
Lindsay Gung	Supervisor - Water Chemistry	Inorganics, Burnaby, British Columbia
Miles Gropen	Department Manager - Inorganics	Inorganics, Burnaby, British Columbia

General Comments

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Refer to the ALS Quality Control Interpretive report (QCI) for applicable references and methodology summaries. Reference methods may incorporate modifications to improve performance.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Please refer to Quality Control Interpretive report (QCI) for information regarding Holding Time compliance.

Key : CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances
LOR: Limit of Reporting (detection limit).

Unit	*Description*
-	No Unit
µS/cm	Microsiemens per centimetre
mg/L	milligrams per litre
NTU	nephelometric turbidity units
pH units	pH units

<: less than.

>: greater than.

Surrogate: An analyte that is similar in behavior to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.

Test results reported relate only to the samples as received by the laboratory.

UNLESS OTHERWISE STATED on SRN or QCI Report, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.

Qualifiers

Qualifier	*Description*
DTSE	*Dissolved Se concentration exceeds total. Positive bias on D-Se suspected due to signal enhancement from volatile selenium species. Contact ALS if an alternative test to address this interference is needed.*

Quote number	: Standing Offer BC & Yukon 2021-2022		
No. of samples received	: 2		
No. of samples analysed	: 2		

This report is automatically generated by the ALS LIMS (Laboratory Information Management System) through evaluation of Quality Control (QC) results and other QA parameters associated with this submission, and is intended to facilitate rapid data validation by auditors or reviewers. The report highlights any exceptions and outliers to ALS Data Quality Objectives, provides holding time details and exceptions, summarizes QC sample frequencies, and lists applicable methodology references and summaries.

Key

Anonymous: Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number: Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO: Data Quality Objective.
LOR: Limit of Reporting (detection limit).
RPD: Relative Percent Difference.

Summary of Outliers

Outliers : Quality Control Samples

- No Method Blank value outliers occur.
- No Duplicate outliers occur.
- No Laboratory Control Sample (LCS) outliers occur
- No Matrix Spike outliers occur.
- No Test sample Surrogate recovery outliers exist.

Outliers: Reference Material (RM) Samples

- No Reference Material (RM) Sample outliers occur.

Outliers : Analysis Holding Time Compliance (Breaches)

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- No Quality Control Sample Frequency Outliers occur.

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times, which are selected to meet known provincial and /or federal requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by organizations such as CCME, US EPA, APHA Standard Methods, ASTM, or Environment Canada (where available). Dates and holding times reported below represent the first dates of extraction or analysis. If subsequent tests or dilutions exceeded holding times, qualifiers are added (refer to COA).

If samples are identified below as having been analyzed or extracted outside of recommended holding times, measurement uncertainties may be increased, and this should be taken into consideration when interpreting results.

Where actual sampling date is not provided on the chain of custody, the date of receipt with time at 00:00 is used for calculation purposes.

Where only the sample date without time is provided on the chain of custody, the sampling date at 00:00 is used for calculation purposes.

Matrix: **Water**

Evaluation: × = Holding time exceedance ; ✓ = Within Holding Time

Legend & Qualifier Definitions

EHTR-FM: Exceeded ALS recommended hold time prior to sample receipt. Field Measurement recommended

Rec. HT: ALS recommended hold time (see units).

Quality Control Parameter Frequency Compliance

The following report summarizes the frequency of laboratory QC samples analyzed within the analytical batches (QC lots) in which the submitted samples were processed. The actual frequency should be greater than or equal to the expected frequency.

Matrix: **Water**

Evaluation: × = *QC frequency outside specification*; ✓ = *QC frequency within specification.*

Quality Control Sample Type			Count		Frequency (%)		
Analytical Methods	*Method*	*QC Lot #*	*QC*	*Regular*	*Actual*	*Expected*	*Evaluation*
Laboratory Duplicates (DUP)							
Acidity by Titration	E283	399727	1	2	50.0	5.0	✓
Alkalinity Species by Titration	E290	399726	1	17	5.8	5.0	✓
Ammonia by Fluorescence	E298	403819	1	13	7.6	5.0	✓

Methodology References and Summaries

The analytical methods used by ALS are developed using internationally recognized reference methods (where available), such as those published by US EPA, APHA Standard Methods, ASTM, ISO, Environment Canada, BC MOE, and Ontario MOE. Reference methods may incorporate modifications to improve performance (indicated by "mod").

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Conductivity in Water	E100 Vancouver - Environmental	Water	APHA 2510 (mod)	Conductivity, also known as Electrical Conductivity (EC) or Specific Conductance, is measured by immersion of a conductivity cell with platinum electrodes into a water sample. Conductivity measurements are temperature-compensated to 25°C.
pH by Meter	E108 Vancouver - Environmental	Water	APHA 4500-H (mod)	pH is determined by potentiometric measurement with a pH electrode, and is conducted at ambient laboratory temperature (normally 20 ± 5°C). For high accuracy test results, pH should be measured in the field within the recommended 15 minute hold time.
Turbidity by Nephelometry	E121 Vancouver - Environmental	Water	APHA 2130 B (mod)	Turbidity is measured by the nephelometric method, by measuring the intensity of light scatter under defined conditions.
TSS by Gravimetry	E160 Vancouver - Environmental	Water	APHA 2540 D (mod)	Total Suspended Solids (TSS) are determined by filtering a sample through a glass fibre filter, following by drying of the filter at 104 ± 1°C, with gravimetric measurement of the filtered solids. Samples containing very high dissolved solid content (i.e. seawaters, brackish waters) may produce a positive bias by this method. Alternate analysis methods are available for these types of samples.
TDS by Gravimetry	E162 Vancouver - Environmental	Water	APHA 2540 C (mod)	Total Dissolved Solids (TDS) are determined by filtering a sample through a glass fibre filter, with evaporation of the filtrate at 180 ± 2°C for 16 hours or to constant weight, with gravimetric measurement of the residue.
Bromide in Water by IC (Low Level)	E235.Br-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Chloride in Water by IC	E235.Cl Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Fluoride in Water by IC	E235.F Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrite in Water by IC (Low Level)	E235.NO2-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Nitrate in Water by IC (Low Level)	E235.NO3-L Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Sulfate in Water by IC	E235.SO4 Vancouver - Environmental	Water	EPA 300.1 (mod)	Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.
Acidity by Titration	E283 Vancouver - Environmental	Water	APHA 2310 B (mod)	Acidity is determined by potentiometric titration to pH 8.3
Alkalinity Species by Titration	E290 Vancouver - Environmental	Water	APHA 2320 B (mod)	Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.
Ammonia by Fluorescence	E298 Vancouver - Environmental	Water	J. Environ. Monit., 2005, 7, 37-42 (mod)	Ammonia in water is analyzed by flow-injection analysis with fluorescence detection after reaction with orthophthaldialdehyde (OPA).
Total Nitrogen by Colourimetry	E366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Total Nitrogen is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Total Phosphorus by Colourimetry (Ultra Trace)	E372-U Vancouver - Environmental	Water	APHA 4500-P E (mod).	Total Phosphorus is determined colourimetrically using a discrete analyzer after heated persulfate digestion of the sample.
Dissolved Orthophosphate by Colourimetry (Ultra Trace Level)	E378-U Vancouver - Environmental	Water	APHA 4500-P F (mod)	Dissolved Orthophosphate is determined colourimetrically on a flow analyzer on a sample that has been lab or field filtered through a 0.45 micron membrane filter. Field filtration is recommended to ensure test results represent conditions at time of sampling.
Total Sulfide by Colourimetry (Automated Flow)	E395-H Vancouver - Environmental	Water	APHA 4500 -S E-Auto-Colorimetry	Sulfide is determined using the gas dialysis automated methlyene blue colourimetric method. Results expressed "as H2S" if reported represent the maximum possible H2S concentration based on the total sulfide concentration in the sample. The H2S calculation converts Total Sulphide as (S2-) and reports it as Total Sulphide as (H2S)
Total Metals in Water by CRC ICPMS	E420 Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Total Chromium in Water by CRC ICPMS (Low Level)	E420.Cr-L Vancouver - Environmental	Water	EPA 200.2/6020B (mod)	Water samples are digested with nitric and hydrochloric acids, and analyzed by Collision/Reaction Cell ICPMS.

Analytical Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Dissolved Metals in Water by CRC ICPMS	E421 Vancouver - Environmental	Water	APHA 3030B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS. Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.
Dissolved Chromium in Water by CRC ICPMS (Low Level)	E421.Cr-L Vancouver - Environmental	Water	APHA 3030 B/EPA 6020B (mod)	Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by Collision/Reaction Cell ICPMS
Total Mercury in Water by CVAAS	E508 Vancouver - Environmental	Water	EPA 1631E (mod)	Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS
Dissolved Mercury in Water by CVAAS	E509 Vancouver - Environmental	Water	APHA 3030B/EPA 1631E (mod)	Water samples are filtered (0.45 um), preserved with HCl, then undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAAS.
Chemical Oxygen Demand by Colourimetry	E559 Vancouver - Environmental	Water	APHA 5220 D (mod)	Samples are analyzed using the closed reflux colourimetric method.
Dissolved Hardness (Calculated)	EC100 Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), dissolved” is calculated from the sum of dissolved Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations.
Hardness (Calculated) from Total Ca/Mg	EC100A Vancouver - Environmental	Water	APHA 2340B	“Hardness (as CaCO3), from total Ca/Mg” is calculated from the sum of total Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. “Total Hardness” refers to the sum of Calcium and Magnesium Hardness. Hardness is normally or preferentially calculated from dissolved Calcium and Magnesium concentrations, because it is a property of water due to dissolved divalent cations. Hardness from total Ca/Mg is normally comparable to Dissolved Hardness in non-turbid waters.
Nitrate and Nitrite (as N) (Calculation)	EC235.N+N Vancouver - Environmental	Water	EPA 300.0	Nitrate and Nitrite (as N) is a calculated parameter. Nitrate and Nitrite (as N) = Nitrite (as N) + Nitrate (as N).
Total Kjeldahl Nitrogen (Calculation)	EC318 Vancouver - Environmental	Water	BC MOE LABORATORY MANUAL (2005)	Total Kjeldahl Nitrogen is a calculated parameter. Total Kjeldahl Nitrogen (calc) = Total Nitrogen - [Nitrite (as N) + Nitrate (as N)].

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Preparation for Ammonia	EP298 Vancouver - Environmental	Water		Sample preparation for Preserved Nutrients Water Quality Analysis.

Preparation Methods	Method / Lab	Matrix	Method Reference	Method Descriptions
Digestion for Total Nitrogen in water	EP366 Vancouver - Environmental	Water	APHA 4500-P J (mod)	Samples are heated with a persulfate digestion reagent.
Digestion for Total Phosphorus in water	EP372 Vancouver - Environmental	Water	APHA 4500-P E (mod).	Samples are heated with a persulfate digestion reagent.
Dissolved Metals Water Filtration	EP421 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HNO3.
Dissolved Mercury Water Filtration	EP509 Vancouver - Environmental	Water	APHA 3030B	Water samples are filtered (0.45 um), and preserved with HCl.

QUALITY CONTROL REPORT

General Comments

The ALS Quality Control (QC) report is optionally provided to ALS clients upon request. ALS test methods include comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against predetermined Data Quality Objectives (DQOs) to provide confidence in the accuracy of associated test results. This report contains detailed results for all QC results applicable to this sample submission. Please refer to the ALS Quality Control Interpretation report (QCI) for applicable method references and methodology summaries.

Key :

Anonymous = Refers to samples which are not part of this work order, but which formed part of the QC process lot.
CAS Number = Chemical Abstracts Services number is a unique identifier assigned to discrete substances.
DQO = Data Quality Objective.
LOR = Limit of Reporting (detection limit).
RPD = Relative Percentage Difference
# = Indicates a QC result that did not meet the ALS DQO.

Laboratory Duplicate (DUP) Report

A Laboratory Duplicate (DUP) is a randomly selected intralaboratory replicate sample. Laboratory Duplicates provide information regarding method precision and sample heterogeneity. ALS DQOs for Laboratory Duplicates are expressed as test-specific limits for Relative Percent Difference (RPD), or as an absolute difference limit of 2 times the LOR for low concentration duplicates within ~ 4-10 times the LOR (cut-off is test specific).

Sub-Matrix: **Water**

Method Blank (MB) Report

A Method Blank is an analyte-free matrix that undergoes sample processing identical to that carried out for test samples. Method Blank results are used to monitor and control for potential contamination from the laboratory environment and reagents. For most tests, the DQO for Method Blanks is for the result to be < LOR.

Laboratory Control Sample (LCS) Report

A Laboratory Control Sample (LCS) is an analyte-free matrix that has been fortified (spiked) with test analytes at known concentration and processed in an identical manner to test samples. LCS results are expressed as percent recovery, and are used to monitor and control test method accuracy and precision, independent of test sample matrix.

Sub-Matrix: **Water**

Matrix Spike (MS) Report

A Matrix Spike (MS) is a randomly selected intra-laboratory replicate sample that has been fortified (spiked) with test analytes at known concentration, and processed in an identical manner to test samples. Matrix Spikes provide information regarding analyte recovery and potential matrix effects. MS DQO exceedances due to sample matrix may sometimes be unavoidable; in such cases, test results for the associated sample (or similar samples) may be subject to bias. ND – Recovery not determined, background level >= 1x spike level.

Special Instructions / Regulations with water or land use (CCME-Freshwater Aquatic Life/BC CSR - Commercial/AB Tier 1 - Natural, etc) / Hazardous Details

Please report results with 5 business day turnaround, no surcharge. Dissolved Metals and Dissolved Mercury are filtered. ~~TOC/DOC NOT required. Please CC report to Steven.Momeyer@lorax.ca,~~ Laura.Findlater@lorax.ca and bjwq@lorax.ca. EMS Upload Required (for samples with EMS number)

Failure to complete all portions of this form may delay analysis. Please fill in this form LEGIBLY.

By the use of this form the user acknowledges and agrees with the Terms and Conditions as provided on a separate Excel tab.

Also provided on another Excel tab are the ALS location addresses, phone numbers and sample container / preservation / holding time table for common analyses.

Notes:
1." - " indicates that analyses were not performed, or RPD was not calculated for parameters where one or both of the concentrations were less than 5x the RDL.
2. Bolded values indicate that the sample and duplicate values are > 5x the RDL and the RPD is greater than 10%.
3. White text on black fill indicates that the sample and duplicate values are > 5x the RDL and the RPD is greater than 20%.
4. Yellow highlighting indicated Se-D>Se-T

Notes:
1." - " indicates that analyses were not performed, or RPD was not calculated for parameters where one or both of the concentrations were less than 5x the RDL.
2. Bolded values indicate that the sample and duplicate values are > 5x the RDL and the RPD is greater than 10%.
3. White text on black fill indicates that the sample and duplicate values are > 5x the RDL and the RPD is greater than 20%.
4. Yellow highlighting indicated Se-D>Se-T

Notes:
1." - " indicates that analyses were not performed, or RPD was not calculated for parameters where one or both of the concentrations were less than 5x the RDL.
2. Bolded values indicate that the sample and duplicate values are > 5x the RDL and the RPD is greater than 10%.
3. White text on black fill indicates that the sample and duplicate values are > 5x the RDL and the RPD is greater than 20%.
4. Yellow highlighting indicated Se-D>Se-T

Notes:
1." - " indicates that analyses were not performed, or RPD was not calculated for parameters where one or both of the concentrations were less than 5x the RDL.
2. Bolded values indicate that the sample and duplicate values are > 5x the RDL and the RPD is greater than 10%.
3. White text on black fill indicates that the sample and duplicate values are > 5x the RDL and the RPD is greater than 20%.
4. Yellow highlighting indicated Se-D>Se-T

Appendix 3-1: WRTSF Deposition Model for 4950 tpd Permit Amendment

TECHNICAL MEMORANDUM

DATE 31 January 2023 **Reference No.** 21507844-026-TM-Rev1-6000

TO Sylvia Van Zalingen
Newcrest Mining Ltd.

CC Cam MacKay-Stotesbury and Brett DeHay-Turner

FROM Caitlyn Cartwright and Jeffrey Kwok **EMAIL Caitlyn.Cartwright@wsp.com; Jeffrey.Kwok2@wsp.com**

DETAILED DEPOSITION MODEL FOR 4,950 TPD PERMIT AMENDMENT IN THE WASTE ROCK AND TAILINGS STORAGE FACILITY, BRUCEJACK MINE, BRITISH COLUMBIA

1.0 INTRODUCTION

Newcrest Mining Ltd. (Newcrest; formerly Pretium Resources Ltd.) retained Golder Associates Ltd. (Golder), now known as WSP Canada Inc. (WSP), to provide tailings and waste rock deposition planning and modelling for the waste rock and tailings storage facility (WRTSF) at Brucejack Mine. Deposition modelling was conducted for the proposed production rate of 4,950 tonnes per day (tpd) life of mine (LOM) material balance.

This technical memorandum presents the tailings and waste rock deposition planning and modelling work that has been completed to support the 4,950 tpd permit amendment and presents the predicted WRTSF configuration at various stages through the LOM. This revision 1 includes minor updates in scheduling taking into consideration input from Newcrest based on access road planned development schedule, mine plan update for years 2028 and 2029 and fully supersedes the revision 0 of this document.

2.0 BACKGROUND AND EXISTING CONDITIONS

The Brucejack mine site is an active underground mine that extracts gold and silver resources. The process concentrate is dewatered and transported to Stewart, British Columbia, for shipment to smelters.

Tailings are either discharged to the WRTSF or transported to the paste plant for backfilling the underground mine. Waste rock is either deposited in the Waste Rock Dump (WRD) within the WRTSF or is used to backfill the underground mine (not comingled with the tailings). Figure 1 includes the configuration of the WRTSF at the end of 2022.

2.1 Tailings Deposition

The tailings deposition system has evolved since the start of deposition in May 2017. Per the mine's effluent discharge permit issued by the BC Ministry of Environment and Climate Change Strategy, the tailings outfall to the WRTSF must never be positioned more than 7.5 m above the top of the natural lake bottom or deposited tailings, whichever is higher (Permit 107835, Section 1.3.2).

The full history and description of the tailings deposition lines are documented in the pipeline design and tailings deposition design basis (Golder 2022a).

The following are the tailings deposition lines currently in the water:

- Tails Line 1 was installed in 2017 at start-up, from a cable suspension line, and is currently inoperable.
- Tails Line 2 was installed in 2018, from a cable suspension line. Tails Line 2 was operated following the failure to deposit from Tails Line 4 in July 2021. In July 2022, following planned shutdown, Tails Line 2 appeared to be plugged and potentially may have reached end of operability as the current discharge elevation appears to be within the tailings beach mound. Tails Line 2 is planned to be decommissioned and removed in the future.
- Tails Line 3 was installed in 2017 at start-up, anchored to the lake bottom, and is operable but not used due to total suspended solids generation from lake bottom sediments and occasional observed plumes when the line was used. This line was used as an emergency discharge line following the failure of Tails Line 4 (Chong 2021).
- Tails Line 4 was installed in October 2020, anchored to the lake bottom until it was plugged and inoperable in July 2021.
- Tails Line 5 and 6 were installed in September 2021 and are anchored to the lake bottom.

A total of 3.56 million dry tonnes of tailings have been deposited in the WRTSF between the start of operations and the end of 2021 (summation of reported dry tonnages of tailings deposited in the WRTSF in the Annual Construction Reports [Pretium 2018a, 2019a, 2020a, 2021b] and MacKay-Stotesbury [2022a]). In 2022, a total of 0.44 million dry tonnes of tailings were deposited between January and mid-July (MacKay-Stotesbury 2022a).

2.2 Waste Rock Deposition

The waste rock deposition method has also undergone several changes since the start of deposition in 2015. An active mechanical screening system, used until 2021, separated materials passing through a 200 mm screen. Coarse rock is defined as screened material greater than 200 mm in diameter and temporarily stockpiled at the WRD. Fine material is defined as material nominally less than 200 mm in diameter.

2.2.1 Historical and Current Deposition Methods

The following main methods have been used to deposit waste rock into the WRTSF:

- **Remote-operated dozer push (as of May 2021 to date)**—A remote-operated dozer (no operator on board the equipment) is used to directly push run-of-mine waste muck into the WRTSF.
- **Telestacker conveyance (to May 2021)**—A telescoping radial conveyor stacker (Telestacker) was used to deposit 200 mm minus waste rock into the WRTSF from July 2017 until May 2021. The Telestacker was inoperable in May 2021 and has been removed from the immediate WRTSF area. There is no plan to resume Telestacker conveyance in the future.
- **Excavator bailing (to May 2021)**—A hydraulic excavator was used to place the coarse-size fraction from active screening and/or run-of-mine waste muck from October 2015 until May 2021. This method has ceased due to safety concerns.

- **Dozer push (start of Operations to October 2015)**—Dozer to directly push run-of-mine muck into the WRTSF, used until WRD partial crest sloughing failure on 11 October 2015.

The *Mines Act* Permit M-243 (recently amended 14 November 2022) includes the following conditions related to waste rock deposition:

- Condition D.3.(c)(iv)—all potentially acid generating (PAG) waste rock deposition in WRTSF is covered with a minimum 1 m water cover.
- Condition D.3.(c)(v)—waste rock stored temporarily on surface, within the mine contact water collection system for no longer than two years.

A total of approximately 5.6 million tonnes of waste rock (from both underground and surface development) have been deposited in the WRD between the start of operation and the end of 2021 (DeHay-Turner 2022a). In 2022, a total of 0.38 million tonnes of waste rock were deposited between January and mid-July (MacKay-Stotesbury 2022b).

Currently, there is additional waste rock stored in a temporary surface stockpile (WP1) on the crest of the WRD. The temporarily stockpiled material along with approximately 30,000 m^3 of the WRD crest above water (from elevation 1364.5 m to 1365 m) is to be subcut and replaced with fresh PAG to comply with condition D.3.(c)(v).

2.2.2 East Waste Rock Dump Historical *Mines Act* and *Environmental Management Act*

An east waste rock dump (EWRD) was initially part of the 2015 *Mines Act* and *Environmental Management Act* presented in Pretium (2015), as a contingency deposition site (Contingency Plan C), in case unacceptable water quality was detected at the outlet of the WRTSF. The EWRD was conceptually sized up to 2.18 million cubic metres (Mm^3) of waste rock. To date, no waste rock deposition has occurred at this location.

2.3 Bathymetry

The original base bathymetry was taken in 2013 prior to any waste rock or tailings deposition. The WRTSF deposition progress has been captured by annual bathymetry since 2017:

- August 2013 (Pretium 2013)
- 28 September 2017 (Pretium 2017b)
- 17 July 2018 (Pretium 2018c)
- 14 August 2019 (Pretium 2019c)
- 8 July 2020 (Pretium 2020b)
- 22, 25, and 26 July 2021 (Pretium 2021c)
- 23 August 2021 (Pretium 2021d), partial surface focusing on the WRD and tailings deposition lines
- 22 July 2022 (Newcrest 2022a)

This historical bathymetry is used to estimate the waste rock and tailings properties for deposition planning.

2.4 July 2022 Waste Rock Dump Failure

A circular failure (~150 m long and up to 40 m deep from the crest) occurred from the WRD crest around 10:00 a.m. on 16 July 2022. The failure mobilized approximately 236,100 m^3 of waste rock from the WRD into the WRTSF. The WRD was shut down and barricaded at the time of failure since 11 July 2022, as settlement exceeding the quantifiable performance objectives were observed, and settlement rates were accelerating. The failure was reported to the Ministry of Energy, Mines and Low Carbon Innovation (EMLI) (Newcrest 2022c).

As a result of the failure and subsequent deposition shutdown, gradual ramp-up to normal deposition, and operational limitations during the winter season, the temporary waste rock storage stockpile (WP1) was expanded from mid-July to mid-September and the volume of waste rock stored in WP1 is only predicted to be substantially reduced starting in May 2023.

2.5 2022 Geotechnical Investigation

WSP conducted a geotechnical investigation of the WRTSF with Gregg Drilling and Testing Canada (Gregg) from 13 September 2022 to 20 September 2022 (excluding mobilization and de-mobilization). The initial proposed investigation included seven cone penetration test (CPT) soundings to be carried out on a barge through 50 m to 60 m of water into tailings and lakebed sediments. Sampling was intended to be conducted in a targeted fashion using a MOSTAP sampler, which did not require drilling to the sample depth.

Due to the WRD partial crest failure on 16 July 2022 (Newcrest 2022c), it was recognized that the lakebed sediments at three of the sounding locations would be covered in at least 7 m of waste rock (per comparison between 2021 and 2022 bathymetry). Therefore, Gregg proposed bringing a sonic drill rig, instead of mud rotary, to allow for pre-drilling through waste rock and collection of samples. Furthermore, four of the planned CPT soundings were re-aligned to match with the back-analysis sections.

Due to difficult conditions (waste rock run-out in the WRTSF from the failure, subsequent loss of equipment, budget, and schedule constraints), only the following investigation locations were attempted:

- CPT22-01 (completed to refusal, part of the east back-analysis section)
- CPT22-02 (completed to refusal, part of the west back-analysis section)
- CPT22-04 (attempted, lost optical cone at ~4.9 m below mudline, part of the west back-analysis section)
- SCPT22-05 (completed to refusal, part of potential future WRD analysis section / tailings properties)
- CPT22-06 (completed to refusal, part of potential future WRD analysis section / tailings properties)
- BH22-06 (samples collected every ~10 ft [3 m], adjacent to CPT22-06)

3.0 DESIGN BASIS

Some key components of the mine production design basis and material properties are presented in the following sections.

3.1 Mine Waste Production Plan

The proposed 4,950 tpd mine waste production plan was provided by Newcrest and is summarized in Table 1.

Table 1: 4,950 tpd Mine Waste Schedule – Deposited in Waste Rock and Tailings Storage Facility

Year	Planned Tailings to WRTSF[(a)] (dry tonnes)	Planned Waste Rock to WRTSF[(a,b)] (tonnes)
2022[(c)]	389,000	265,000
2023	826,000	571,000
2024	1,076,000	630,000
2025	1,144,000	183,000
2026	1,144,000	33,000
2027	1,123,000	19,000
2028	940,000	3,000
2029	391,000	2,000
Total	**7,033,000**	**1,706,000**

(a) Values provided were rounded to the nearest thousand (DeHay-Turner 2022b).
(b) The waste rock quantity does not include waste rock currently stockpiled on surface.
(c) Tonnages for 2022 are for the period from mid-July to end of December.
WRTSF = waste rock and tailings storage facility; tpd = tonnes per day.

3.2 Allowable Waste Rock Deposition Rate

The preliminary WRD failure stability back-analysis (Golder 2022b) interpreted that a key control in managing the stability of the WRD going forward is the rate of loading (i.e., deposition of waste rock).

It is inferred that in the month prior to the failure, the average deposition rate from the crest was approximately 8 m^3/d/m of lineal crest frontage based on estimated daily volumes and deposition area tracking by Newcrest (2022b). Post-failure, the deposition (from post-July 2022 to Dec 2022) occurred over a limited front (~150 m) and was limited to approximately 9.5 m^3/d/m of lineal crest frontage. A higher deposition rate can be considered acceptable as the failure flattened the WRD slope slightly, runout waste rock had a small pre-loading effect on lakebed sediments, and settlement data does not show accelerating settlements.

An average rate of deposition of 7 m^3/d/m of lineal crest frontage is used to account for equipment downtime. Based on historical site experience, it is also assumed that no deposition would occur from 15 December to 1 May due to WRTSF surface freeze-up (MacKay-Stotesbury 2022d). Efforts would be made to deposit as late into the winter season as practical; but for the purposes of modelling, it would be assumed that deposition would only occur during 228 days of each year, which results in an average deposition rate of 1,596 m^3/yr/m of lineal crest frontage.

Waste rock produced between 15 December and 1 May is expected to be stockpiled at WP1. Throughout the remainder of the year, material depletion from WP1 occurs when waste rock production is less than the average rate of deposition. Waste rock that cannot be deposited at the WRD would be transported to a secondary stockpile, WP2, and deposited at the EWRD.

3.3 Existing Temporary Surface Stockpile (WP1)

At the time of the WRD failure (16 July 2022), the estimated amount of waste rock stored in WP1 was ~162,800 m^3 based on survey information as reported by Newcrest in daily WRD reports.

Newcrest developed two WP1 conceptual design options considering current constraints on the WRD and used as the basis for reconfiguration layout of WP1 in (Golder 2022c). The first option allows for an approximate additional storage capacity of 104,000 m^3, in addition to the volume estimated to be stored as of end of December 2022, providing an estimated maximum storage capacity of 332,225 m^3 within WP1. In preparation for an expected reduction in subaqueous waste rock deposition during winter operations of 2022/2023, a second contingency option with southern extension was developed to provide additional temporary storage capacity. The southern extension option allows for an additional 148,400 m^3 of storage over the volume estimated to be stored, as of end of December 2022, providing an estimated maximum storage capacity of 376,625 m^3 (MacKay- Stotesbury 2022c).

This 4,950 tpd deposition plan does not provide design concepts for WP1 beyond predicting the storage capacity of WP1 over time. A geotechnical assessment for WP1 temporary stockpile and the reconfiguration layout of WP1 is presented under separate cover (Golder 2022c).

3.4 Proposed East Temporary Surface Stockpile (WP2)

A second temporary surface stockpile (WP2) is expected to be developed at a separate location to the east of the WRTSF for the following reasons:

- requirement to completely subaqueously deposit the existing PAG waste rock stored above water in WP1 and replace the PAG waste rock beneath the footprint of WP1 to comply with Condition D.3.(c)(v)
- limited area to expand WP1 laterally
- stability concerns related to expanding WP1 vertically

WP2 is to be developed regardless of whether the production increase of 4950 tpd is granted. Notice of Departure from Approvals submission is anticipated to be provided to EMLI by Newcrest.

This document does not provide a specific location or design details for WP2 beyond predicting the required storage capacity of WP2 over time. It is assumed that this facility would be approved and developed by mid-September 2023.

3.5 Proposed East Waste Rock Dump

Waste rock stored at WP2 is proposed to be deposited in an EWRD. The EWRD would also be used to subaqueously deposit produced waste rock as an alternative to the existing WRD if monitoring shows increased settlement requiring a temporary halt to deposition at the existing WRD.

At the time of this report, it is assumed that the deposition into the EWRD is limited to 5,000 m^3/d due to equipment handling capacity. Estimate is expected to be further refined during detailed design of the facility.

The EWRD is to be developed regardless of whether the production increase of 4,950 tpd is granted. Notice of Departure from Approvals submission is anticipated to be provided to EMLI by Newcrest.

This document provides a conceptual location for the EWRD based on the 2015 *Mines Act* and *Environmental Management Act* application (Pretium 2015). The conceptual configuration is assumed based on maximizing the available deposition front. The final design configuration of the EWRD may be different than that shown in this document and will be approved by a qualified person. It is assumed this facility would be approved and developed by May 2024. The final design will be influenced by further geotechnical CPTs of the lakebed sediments and approved by a qualified person.

3.6 Waste Rock Properties

The waste rock properties used for deposition modelling are summarized in Table 2. It is noted that the properties are unchanged from 2021 due to the failure of the WRD on 16 July 2022 rendering it impracticable to re-assess densities and dump slopes.

Table 2: Waste Rock Properties

Criteria	Unit	Planning Value	Comment/Reference
Subaqueous waste rock in situ density	t/m^3	2.06[(a)]	Scarcelli-Casciola 2022
Subaqueous WRD slope	1.43H:1V[(a)]		average of five cross-sections from 2021 bathymetry (Pretium 2021c)

(a) Parameters are unchanged from 2021 waste rock properties for post failure of WRD slope on 16 July 2022.
H:V = horizontal distance to vertical rise; WRD = waste rock dump.

Density

The deposited (in situ) density of the waste rock was determined by comparing the reported waste rock quantities deposited in the WRTSF, between start of deposition in 2015 to mid-2019, to the 2013 bathymetric survey (Pretium 2013), and a composite surface generated from the 2019 LiDAR and bathymetric survey (Pretium 2019b,c). The waste rock quantities were obtained between 2015 and 2018 from the Annual Reclamation Reports for Ministry of Energy, Mines and Petroleum Resources (now EMLI; Pretium 2017a, 2018b, 2021a) and data to 19 August 2019 from the 2019 Annual Construction Reports (Pretium 2020a). The waste rock in situ density was calculated to be 2.08 t/m^3, which validates the assumed density of 2.06 t/m^3 used by Pretium for regulatory reporting and SRK Consulting Ltd. (SRK) for analysis and design works. The in situ density may be further validated with updated LiDAR information for the ground surface contours.

Slope

The WRD downstream slope was calculated by taking the average of five cross-sections around the existing WRD from the 2021 bathymetry. Only the 2021 bathymetry was implemented due to the change in waste rock deposition method in 2021 using the remote dozer push. Bathymetry from previous years generally showed a slightly flatter WRD downstream slope, likely due to the subsurface terrain and the stacker and bail method for deposition.

3.7 Tailings Properties

The tailings properties used for deposition modelling are summarized in Table 3.

Table 3: Tailings Properties

Criteria	Unit	Planning Value	Comment/Reference
Tailings in situ dry density	t/m^3	1.15	Estimated based on analysis of existing conditions and reported quantities.
Tailings beach slope (lakebed pipeline)	3% for 8 m; 10.5% for 90 m; 7% for 50 m; 3% for 35 m; 0.1% to the end		Determined through approximation and calibration of 2022 bathymetry surface compound slope with preliminary 2022 geotechnical investigation findings (slightly steeper than values in 2021 deposition model).
Tailings beach slope (suspended pipeline)	8% for 15 m; 11.5% for 60 m; 2% for 55 m; 0.1% to the end		Determined through approximation and calibration of 2022 bathymetry surface compound slope with preliminary 2022 geotechnical investigation findings (slightly steeper than values in 2021 deposition model).

Density

Previously, WSP estimated the in situ tailings dry density from bathymetry review and reported dry tonnages of tailings deposited in the WRTSF; the values typically increased from year to year ranging from 0.8 to 1.28 t/m^3. An in situ dry tailings density of 1.0 t/m^3 was used for the 2021 deposition model (Golder 2022a) as a conservative estimate.

This assumption was re-assessed based on the 2022 bathymetry and the reported dry tonnages of tailings deposited in the WRTSF between July 2021 and 2022 (MacKay-Stotesbury 2022a).

The deposited (in situ) dry density of the tailings was calculated using a method that involved creating a capacity-based volumetric deposition model. The model was created for lakebed and suspended deposition for 2022 over the 2021 bathymetric surface, using the beach slope parameters estimated from the bathymetry surface. The total volume generated by this model was then compared with the reported in situ dry tailings tonnages to estimate an approximate in situ tailings dry density of 1.18 t/m^3.

A secondary approach, which involved modifying the 2022 bathymetric surface to the approximate encountered mudline elevation at three locations to calculate a tailings volume, resulted in a slightly higher in situ dry density of 1.25 t/m^3.

Both of these methods relied on interpretation and approximation; therefore, an in situ dry density of 1.15 t/m^3 was determined to be a conservative estimate based on the analysis and would be used for this deposition model.

Slope

It is observed that in all of the bathymetry, there is a relatively steep slope (5% to 15%) for a distance (up to ~100 m) below the discharge point, followed by a relatively flat slope (~2%) for a short distance (~20 m) before flattening completely and appearing to fill the basin relatively uniformly. The uniform tailings surface was identified as a key uncertainty that may affect future tailings deposition modelling and planning. It was considered

that that the appearance of the long, flat run-out of the tailings surface may have been a factor of high turbidity impeding bathymetric measurements at the lake bottom, which did not accurately reflect actual conditions.

The results of the 2022 geotechnical investigation indicated that the mudline elevation at the lake bottom is approximately 1 to 1.5 m lower than the lake bottom visible in the 2022 bathymetry. The mudline elevation was fairly consistent across three CPT geotechnical investigation locations despite varying distances to the nearest deposition point. The greatest distance between the three CPT geotechnical investigation locations and a deposition point was 385 m. Therefore, it was assumed that bathymetry generally represents a relatively flat distribution of tailings across the bottom of the basin. The discrepancy between the mudline elevation and the bathymetry surface was considered when assessing the tailings beach slopes and the slopes were developed to match the mudline elevation instead of the bathymetry surface.

Future geotechnical investigations would confirm the beach slope assumptions as it remains a key parameter that may affect future tailings deposition modelling and planning.

The lakebed pipeline beach slope was assessed from 2022, when Tails Lines 5 and 6 were in operation. The measured mudline elevations at lake bottom obtained from the 2022 geotechnical investigation were used when approximating the tailings beach slopes. This was done to account for the discrepancy in lake bottom elevation between the 2022 bathymetry surface and the 2022 CPT geotechnical investigation measurements. The main beach slope estimated from the 2022 bathymetry was approximately 10.5% (plus flatter compound run-out slopes). This is the same as the slope that was previously approximated from the 2021 bathymetry (Golder 2022a). The 2022 bathymetry beach slope was therefore selected for the deposition model calibration as it is the most recent information and was assumed to best represent conditions at this time. The difference between the 10.5% subaqueous beach slope approximated for 2022 and the 5.5% beach slope that was previously approximated from the 2017 bathymetry (Golder 2022a) indicates there is a high level of uncertainty in beach slopes.

The suspended pipeline slope was assessed from the 2022 bathymetry surface. The measured mudline elevations at lake bottom obtained from the 2022 geotechnical investigation were used when approximating the tailings beach slopes. The suspended pipeline beach slope estimated from 2022 bathymetry was approximately 11.5% (plus flatter compound run-out slopes). This is slightly steeper than the 10% beach slope that was previously approximated from the 2021 bathymetry (Golder 2022a). The 2022 bathymetry beach slope was selected for the deposition model calibration as it is the most recent information and was assumed to best represent conditions at this time.

4.0 DEPOSITION MODEL

4.1 Approach

The Muk3D software application developed by MineBridge Software was used to model the tailings and waste rock deposition.

Detailed modelling was carried out in annual time steps except in 2022 when the modelling commenced from mid-July 2022 using the recent 2022 bathymetry (Newcrest 2022a) taken on 22 July 2022.

Waste rock was modelled in annual timesteps, starting in January and ending in December, based on the mine waste production plan and drawdown of temporary surface storage stockpiles. The WRD was modelled at the beginning of each timestep for the quantity expected to be deposited in that timestep. The existing temporarily stored surface waste rock and the planned produced waste rock to be deposited was tracked via spreadsheet to

account for required temporary storage in WP1 and WP2 due to deposition limits. The annual timesteps were subdivided to track growth of temporary storage due to winter conditions starting annually on 15 December and depletion of temporary storage during the summer season starting the following 1 May.

Tailings deposition was also modelled in annual timesteps, starting in January and ending in December, based on the mine waste production plan. As an approximation, the tailings deposition for the year was modelled overlying the waste rock deposition for the year.

The deposition model shows the tailings deposition and waste rock placement in annual increments until end of 2029 (LOM).

The model was developed with the design basis assumptions documented in Section 3.0.

The tailings deposition model and plan should be reviewed and updated periodically, with at minimum, annual bathymetry to determine whether tailings deposition and WRD development is occurring as expected.

4.2 Perimeter Tailings Pipelines

The tailings pipeline discharge outlet elevation is set to 7.5 m above the natural lakebed or tailings surface below the outlet (per PE-107835 Section 1.3.2). The perimeter tailings pipelines are located between the WRD and the snow dump located at the eastern extent of the plant site.

The discharge outlet is located 7.5 m above the natural lakebed slope just prior to meeting the tailings surface. Due to concerns regarding the potential for excess total suspended solids if the discharge outlets were located too close to the water surface, the discharge outlets were located at the lowest elevation providing a reasonable discharge capacity.

Pretium installed two new tailings pipelines, Lines 5 and 6, along the lakebed in September 2021 (Table 4). The design locations of the two recently installed pipelines are presented in the design drawings (Golder 2021) and the historical pipelines are shown in Figure 1.

Table 4: Newly Installed Perimeter Tailings Pipelines

ID	Northing (m)	Easting (m)	Discharge Elevation (m)
5	427712.87	6258838.04	1318.21
6	427791.05	6258801.20	1322.26

Table 5 outlines the locations of the future planned tailings pipelines. These are located based on the same deposition concept and assumptions. The locations of these pipelines are shown in Figure 1.

Table 5: Future Planned Tailings Pipelines

ID	Northing (m)	Easting (m)	Discharge Elevation (m)
A	427730.45	6258818.47	1329.49
B	427833.56	6258786.00	1334.95
C	427723.47	6258807.98	1341.95
D	427834.13	6258767.00	1345.60

4.3 Results

Figure 1 shows plan view snapshots of the projected WRTSF conditions at the end of 2022, end of 2024, end of 2026, and end of 2029 LOM. Figure 2 shows cross-sections for the tailings deposition, existing WRD, and proposed EWRD to show annual progress until the end of LOM.

Key results are highlighted:

- WP1 is expected to be depleted by end of year 2023.
- Waste rock stockpiling reoccurs in WP1 (to a significantly smaller size) when deposition into the WRTSF is halted due to winter conditions. WP1 is then fully depleted every year during the summer season (i.e., surface waste rock storage does not exceed two years).
- Waste rock stockpiling starts in WP2 in 2023 and is expected to be fully depleted by end of 2024 (i.e., surface waste rock storage does not exceed two years).
- The existing WRTSF has sufficient capacity for the predicted tailings and waste rock storage and will have excess additional capacity at the end of LOM.

Detailed results are presented in the following subsections.

4.3.1 Tailings

Table 6 presents the modelled tailings deposition volumes in comparison to the planned volumes.

Table 6: Tailings Deposition Model by Volume

Year	Maximum Tailings Elevation (m)	Minimum Tailings Elevation (m)	Modelled Deposited Volume[(a)] (m^3)	Cumulative Error (%)	Planned Incremental Tailings[(a,b)] (m^3)	Planned Cumulative Tailings[(a,b)] (m^3)
2022	1,321.92	1,307.32	338,000	0.0%	339,000	339,000
2023	1,324.73	1,310.13	718,000	0.0%	718,000	1,057,000
2024	1,328.09	1,313.43	935,000	0.0%	935,000	1,992,000
2025	1,331.21	1,316.41	995,000	0.0%	995,000	2,987,000
2026	1,334.36	1,319.58	994,000	0.0%	994,000	3,981,000
2027	1,337.17	1,322.45	977,000	0.0%	977,000	4,958,000
2028	1,339.52	1,324.74	817,000	0.0%	817,000	5,775,000
2029	1,340.45	1,325.66	337,000	-0.1%	340,000	6,115,000
Total	**N/A**	**N/A**	**6,111,000**	**N/A**	**6,115,000**	**N/A**

(a) Values rounded to the nearest thousand.
(b) The model begins in mid-July 2022 when the bathymetry was collected (DeHay-Turner 2022b).
N/A = not applicable.

The deposition model was completed by alternating deposition between two perimeter pipelines. The model was tested for sensitivity to alternating single versus multiple simultaneous deposition points, and the use of alternating single point was not found to significantly impact the resulting capacity or maximum tailings elevation. In some years, the deposition was split between two perimeter pipelines when one of the pipelines had reached maximum capacity. Table 7 summarizes the required tailings pipeline operation and construction schedule.

Table 7: Tailings Pipeline Operation and Construction Timeline

Year	Operating Line ID	Operating Line ID	Contingency Line ID
2022	5	6 (active)	A[(a)]
2023	A (active)	6 (active)	B
2024	A (active)	B	C
2025	A (active)	B (active)	C
2026	C	B (active)	D
2027	C (active)	B (active, minimal capacity remaining)	D
2028	C (active)	D	N/A[(b)]
2029	C (active)	D	N/A[(b)]

(a) Tails Line 5 and 6 are sized such that they cannot each independently pass the maximum flow rate; therefore, a contingency line is recommended. Currently, Newcrest has planned to construct Tails Line A in 2023 and would serve as contingency.

(b) A contingency Line E may not be required if Lines C and D are each sized to be able to independently pass the maximum flow rate. In which case, Line D can act as the contingency for Line C. A contingency Line E was not modelled.

N/A = not applicable.

4.3.2 Existing Waste Rock Dump

Advancement of the existing WRD is limited on the west and east sides to avoid blocking the outlet of the WRTSF and to avoid impacting the space available for the tailings deposition pipelines, respectively. Therefore, the majority of advancement is northward.

The model does not consider consolidation of the lakebed sediments or waste rock settlement into the tailings.

Table 8 presents the modelled WRD volumes in comparison to the planned volumes showing general verification and alignment of the model to the planned production.

4.3.3 Proposed East Waste Rock Dump

The proposed EWRD is conceptually located at the eastern end of the WRTSF (Figure 1). The original location and plan is provided in (Pretium 2015), which includes the Tertiary Waste Rock Contingency Plan in Appendix E-1 by SRK (2015). The waste rock would be advanced from one or two access points and deposition would occur following the shoreline before advancing into deeper parts of the WRTSF. It is possible the toe of the EWRD would interact with the subaqueous tailings deposit. The model does not consider consolidation of the lakebed sediments or waste rock settlement into the tailings.

Table 9 presents the modelled EWRD volumes compared to planned volumes showing general verification and alignment of the model to the planned production.

It is expected the final design for the EWRD may be produced for a higher storage capacity for contingency purposes.

Table 8: Existing Waste Rock Dump Model

Year	Modelled Waste Rock[a] (m^3)	Cumulative Error (%)	Available Deposition Front (m)	Deposited Rehandle from WP1[a,b,c] (m^3)	Deposited from Production (no rehandle)[a,c] (m^3)	Planned Deposited Waste Rock[a,b,c] (m^3)	Cumulative Planned Deposited Waste Rock[a,b,c] (m^3)
2022[d]	86,000	0.3%	142 to 207	15,000	71,000	86,000	86,000
2023	439,000	0.1%	290	346,000	93,000	439,000	525,000
2024	178,000	0.1%	350	0	178,000	178,000	703,000
2025	88,000	0.0%	280	37,000	51,000	89,000	791,000
2026	16,000	0.0%	190	7,000	9,000	16,000	807,000
2027	9,000	0.0%	190	4,000	5,000	9,000	816,000
2028	1,000	0.0%	90	1,000	0	1,000	817,000
2029	1,000	0.0%	50	0	1,000	1,000	818,000
Total	**819,000**	**N/A**	**N/A**	**410,000**	**408,000**	**819,000**	**N/A**

(a) Values rounded to the nearest thousand.

(b) Re-handle includes the ~162,800 m3 of WP1 stockpiled waste rock as of mid-July 2022.

(c) Planned waste rock deposited in the existing WRD does not track exactly with planned waste rock production as: 1) planned production is diverted to WP2 in 2023, and 2) deposition into the WRD is managed with an allowable deposition rate and excess is stored temporarily in WP1 then subsequently drawn down at a later time.

(d) Values provided are actual waste rock in the WRTSF occurring from mid-July to December 2022. The model begins in mid-July 2022 when the bathymetry was collected (Scarcelli-Casciola 2022).

WRTSF = waste rock and tailings storage facility; WRD = waste rock dump; N/A = not applicable.

Table 9: East Waste Rock Dump Model

Year	Modelled Waste Rock[a] (m^3)	Cumulative Error (%)	Available Deposition Front (m)	Deposited Rehandle from WP2[a,b] (m^3)	Deposited from Production (no rehandle)[a,b] (m^3)	Planned Total Waste Rock[a,b] (m^3)	Cumulative Waste Rock[a,b] (m^3)
2022	0	0.0%	n/a	0	0	0	0
2023	0	0.0%	n/a	0	0	0	0
2024	197,000	0.1%	n/a	197,000	0	197,000	197,000
2025	0	0.0%	n/a	0	0	0	197,000
2026	0	0.0%	n/a	0	0	0	197,000
2027	0	0.0%	n/a	0	0	0	197,000
2028	0	0.0%	n/a	0	0	0	197,000
2029	0	0.0%	n/a	0	0	0	197,000
Total	**197,000**	**N/A**	**N/A**	**197,000**	**0**	**197,000**	**N/A**

(a) Values rounded to the nearest thousand.

(b) Planned waste rock deposited in the EWRD does not track exactly with planned waste rock production as: 1) planned production is diverted to WP2 in 2023, and 2) deposition into the WRD is managed with an allowable deposition rate and excess is stored temporarily in WP2 then subsequently drawn down at a later time.

(c) Available deposition front is not examined for EWRD.

WRD = waste rock dump; EWRD = east waste rock dump; N/A = not applicable.

4.3.4 Temporary Surface Stockpiles

Waste rock that cannot be immediately deposited into the WRTSF would be stored in two temporary surface stockpiles. WP1 is currently located on the existing WRD platform, beyond the historical shoreline. Proposed WP2 stockpile(s) is expected to be located on land near the proposed EWRD and consist of multiple small stockpiles to facilitate first-in, first-out waste rock management.

Chart 1 presents the predicted change in volumes of WP1 and WP2 over time based on the mine waste production plan, existing WP1 storage, and assumed drawdown rates. To allow for the timely drawdown of WP1, all planned production is assumed to be diverted to WP2 stockpile(s) until 1 May 2024.

Chart 1: Temporary Waste Rock Surface Stockpile Volume over Time

4.3.4.1 WP1

Table 10 presents waste rock management at WP1 beginning from mid-July 2022. The maximum WP1 stockpile design size of approximately 332,225 m^3 would be exceeded in 2023 without the southern contingency extension design. If the WP1 southern extension option is utilized, the maximum capacity of 376,625 m^3 would not be exceeded in any year of production.

Table 10: Change in WP1 Volume over Time

Year	Received Waste Rock Volume[(a)] (m^3)	Withdrawn (Deposited) Waste Rock Volume[(a)] (m^3)	Maximum Stockpile Size[(a)] (m^3)	End of Year Stockpile Volume[(a,d)] (m^3)
2022[(b)]	84,000	15,000	268,000	231,000
2023	115,000	346,000	346,000	0
2024[(c)]	0	0	0	0
2025	37,000	37,000	37,000	0
2026	7,000	7,000	7,000	0
2027	4,000	4,000	4,000	0
2028	1,000	1,000	1,000	0
2029	0	0	0	0
Total	**248,000**	**410,000**	**N/A**	**N/A**

(a) Values rounded to the nearest thousand.

(b) Initial volume of WP1 on 15 July 2022 = 162,552 m3.

(c) Waste rock was assumed to be stockpiled at WP2 from September 2023 to May 2024.

(d) Following 2022, WP1 is predicted to be a seasonal structure, expanded during the winter season when deposition into the WRTSF is not operationally viable and fully drawn down during the summer season.

WRTSF = waste rock and tailings storage facility; N/A = not applicable.

4.3.4.2 WP2

Table 11 presents waste rock management at WP2 beginning from mid-July 2023.

Table 11: Change in WP2 Volume over Time

Year	Received Waste Rock Volume[(a)] (m^3)	Withdrawn (Deposited) Waste Rock Volume[(a)] (m^3)	Maximum Stockpile Size[(a)] (m^3)	End of Year Stockpile Volume[(a)] (m^3)
2022[(a)]	0	0	0	0
2023[(b)]	69,000	0	69,000	69,000
2024[(b)]	127,000	197,000	197,000	0
2025[(c)]	0	0	0	0
2026[(c)]	0	0	0	0
2027[(c)]	0	0	0	0
2028[(c)]	0	0	0	0
2029[(c)]	0	0	0	0
Total	**197,000**	**197,000**	**N/A**	**N/A**

(a) Values rounded to the nearest thousand.

(b) All planned produced waste rock hauled to surface was assumed to be stockpiled at WP2 from May 2023 to May 2024.

(c) Following 2024, WP2 is predicted to be fully depleted and not receive waste rock. Planned production is predicted to be received at the existing (Main) WRD following 2024, with WP1 being expanded and drawn down seasonally as described in Table 10.

WRD = waste rock dump; N/A = not applicable.

5.0 CLOSURE

The reader is referred to the Study Limitations, which follows the text and forms an integral part of this technical memorandum.

We trust the above meets your present requirements. If you have any questions or requirements, please contact the undersigned.

1.0 INTRODUCTION

Golder Associates Ltd., a member of WSP (WSP Golder) has been retained by Newcrest Mining Ltd. (Newcrest) to complete a geotechnical assessment, stability analysis, and setback analysis of the Waste Pile 1 (WP1) structure for Brucejack Mine, British Columbia.

A large temporary stockpile of waste rock has been stored on the surface of the waste rock dump (WRD) and is currently referred as WP1 and was previously known as Ore Pad 2. Due to safety and operational concerns at the waste rock and tailings storage facility (WRTSF) from the July 2022 WRD partial crest failure, waste rock placement was limited to the WP1 stockpile. Additional waste stockpile storage capacity is required for the winter of 2022/2023 as limited waste rock deposition expected during the winter. Taking this into consideration, the WP1 stockpile was reassessed and a design that meets the target factor of safety (FOS) criteria was developed.

This report presents a summary of geotechnical subsurface conditions at the site, stockpile design criteria, slope stability analyses, stockpile hazard classifications, and geotechnical stockpile construction monitoring and recommendations for the WP1 stockpile.

2.0 OBJECTIVE

The objective of the WP1 stockpile geotechnical assessment report is to provide geotechnical recommendations for the reconfiguration of the waste rock stockpile including expansion. The scope of the work presented in this report includes the following:

- Summary of subsurface conditions.
- Seismic site classification and seismic hazard parameters.
- Limit equilibrium slope stability analyses for static and seismic (pseudo-static) loading conditions.
- Recommendations for stockpile material placement and instrumentation monitoring.

3.0 SUBSURFACE CONDITIONS

The existing WP1 stockpile is located on the WRD which is underlaid by an assumed variable thickness of lakebed sediments over bedrock based on limited geophysical data from 2013 (Frontier Geosciences 2013). It is understood by WSP Golder that no geotechnical investigation has been conducted in the footprint of the WP1 stockpile. For modelling purposes, Newcrest provided WSP Golder with the most recent topography from an aerial LiDAR completed in July and August 2022 (Newcrest 2022a and 2022b) and lake bathymetric reconnaissance of the WRTSF collected in 2021.

Strata were assigned based on the review of the following surfaces:

- Top of bedrock (2013 geophysics depth to bedrock subtracted from 1,364.29 masl).
- Lakebed sediment thickness (Frontier Geosciences 2013).
- Top of lakebed sediment could be interpreted from one of the following:
  - 2013 bathymetry (Frontier Geosciences 2013).
  - 2013 geophysics thickness of sediment overlain on top of bedrock (Frontier Geosciences 2013).
  - 2017 (and later years) bathymetry (Pretium 2017, 2018, 2021).
- A composite surface of 2013, 2017, and 2021 bathymetries was used for the geometry of the top of the lakebed sediments unit.

As available data became less accurate and available towards the southern area of WP1, the following assumptions were made:

- Stratigraphy below the south area of WP1 presents an assumed and narrower thickness of lakebed sediment as bedrock was encountered at the southern perimeter of WP1.
- Flat surface along the base of WP1 is at constant elevation of 1,365 masl.
- Competent bedrock surface was assumed based on the geotechnical characterization of the rock mass of the Brucejack Mine area, which indicates that the rock unit near-surface presents good quality and moderate discontinuity spacing and the p-wave velocity ranging from 4,790 to 4,080 m/s in the geophysical survey of the Brucejack Lake property (Frontier Geosciences 2013).
- Uniform lakebed sediment unit presents homogeneous material properties.
- Constant water table is at 1,365 m elevation.

WSP Golder recommends completing additional investigation of the lakebed sediments and material properties of the subsurface conditions of the WP1 stockpile. Newcrest and WSP Golder are planning for a geotechnical subsurface investigation to understand and characterize the subsurface material properties.

4.0 STOCKPILE LOCATION AND CONFIGURATION

In 2020, due to resourcing and site conditions, waste rock was stockpiled at the southern end of the WRTSF in an area known as Ore Pad 2. Additional storage capacity was required due to waste rock deposition limitations which resulted in a waste rock stockpile up to 15 m constructed on the southern portion of the WRTSF, which is now known as the WP1 temporary stockpile. Currently the crest of WP1 is at approximate elevation of 1377.7 masl at its highest location and the north toe of WP1 is located at about 38 m from the crest of the WRD.

Newcrest plans to increase production to 4,950 tpd as part of the revised life of mine plan. As part of preparation for winter operations in 2022/2023 with the expected reduction in subaqueous waste rock deposition, a conceptual configuration of WP1 with south extension option was developed to provide additional temporary storage capacity. Table 1 summarizes the conceptual designs. The proposed design took into consideration the maximum extent limits and incorporated into the WP1 configuration with south expansion.

Table 1: Conceptual WP1 Design Volumes and Footprint Area.

WP1 Conceptual Designs ID Description	Estimated Additional Volumetric Capacity (m^3) Over August 2022 Survey	Surface Area (m^2)
Proposed WP1 configuration	104,000	18,000
Proposed WP1 configuration south expansion	132,000	19,900

WP1 = Waste Pile 1.

Based on stability analysis and input from the operations team on equipment loading, WP1 has been reconfigured slightly from the existing WP1 layout. The proposed WP1 configuration drawing list is presented in Drawing 1. The conceptual layout plan and cross-sections are presented in Drawings 2 and 3, respectively, in Appendix D.

Design geometry for WP1 is summarized below by main slope area of the temporary stockpile

Table 2: Temporary Stockpile WP1 Slope and Height Configuration

Slope face	Overall Slope Angle	Overall Maximum Height (m)
North	2H:1V (Constructed in stages of angle of repose 1.4H:1V as shown in Drawing 3)	13
East		13 (20 at the southern portion, refer to Drawings 2 and 3)
South		20
West		13 (20 at the southern portion, refer to Drawings 2 and 3)

5.0 SEISMIC SITE CLASSIFICATION

The level of importance of seismic loading at any site is related to factors such as the subsoil conditions and soil behaviour during an earthquake; the magnitude, duration, and frequency level of strong ground motion; and the probable intensity and likelihood of occurrence of an earthquake.

The *Canadian Foundation Engineering Manual* (CGS 2006) contains seismic analysis and design methodology. The seismic site class value, as defined in Table 6.1A (CGS 2006), depends on the average shear wave velocity and/or average standard penetration testing N-values of the upper 30 m of soil and/or rock below founding level. The *Canadian Foundation Engineering Manual* permits the site class to be specified based solely on the stratigraphy and in situ testing data.

No detailed geotechnical investigation was carried out within the general area of WP1 foundation. The subsurface conditions were interpreted from the 2013 bathymetry and geophysics survey (BGC 2014). As there are uncertainties in the thickness and properties of lakebed sediment within the area of WP1, and rock is predominantly present below the WP1 foundation, Site Class C was assigned to obtain preliminary seismic hazard calculations from 2020 National Building Code of Canada Seismic Hazard Tool.

Table 3 summarizes the seismic parameters for the site, based on a 2% probability of exceedance in 50 years and a 10% probability of exceedance in 50 years. For the stability assessment of WP1, a design earthquake with a 2% probability of exceedance in 50 years and a peak ground acceleration (PGA) of 0.0892 g (NBC 2020) was used. Appendix A presents a summary of the Seismic Hazard Calculation.

Table 3: 2020 National Building Code of Canada Seismic Hazard Calculation

Probability of Exceedance	PGA	Sa (0.05)	Sa (0.1)	Sa (0.2)	Sa (0.5)	Sa (1.0)	Sa (2.0)
2% in 50 years (2,475 AEP)	0.0892	0.103	0.16	0.199	0.207	0.162	0.114
10% in 50 years (475 AEP)	0.0344	0.0359	0.0527	0.0702	0.101	0.0846	0.0589

Note: Location based on Latitude 56.47º, Longitude -130.174 as shown in NBC 2020 for site location (Appendix A).
AEP = annual exceedance probability; g = acceleration due to gravity; PGA = peak ground acceleration; Sa = spectral acceleration.

6.0 GEOTECHNICAL ASSESSMENT AND DESIGN PARAMETERS

Geotechnical material properties used in the stability analysis of WP1 are summarized in Table 4. It was assumed that waste rock material from WP1 and the WRD are free draining and that no excess pore water pressure will develop. Therefore, the same material properties for waste rock from the previous WRD stability report were used (SRK 2015).

The bedrock foundation was characterized as a strong and competent material, and no failures were expected to occur through the bedrock unit; therefore, the infinite strength model was assigned for static and pseudo-static loading conditions.

The material properties for the lakebed sediment were based on the back-analysis assessment for the WRD failure completed on 17 October 2022 (WSP Golder 2022). For drained conditions, an effective friction angle of 27° and effective cohesion of 0 kPa was used based on consolidated undrained isotropic triaxial test results completed for material (BGC 2014) and mean value used in the probabilistic analysis (SRK 2020). FOS of 1.5 was estimated for the WRD under drained condition. For undrained conditions, the lakebed sediment was modelled using the range of 0.27 to 0.40 shear strength ratio model ($\frac{S_u}{\sigma_v'}$) based on consolidated undrained isotropic triaxial test results (BGC 2014) and back analysis of failure completed by Golder (WSP Golder 2022). The strength parameters under undrained conditions were estimated based on a FOS of approximately 1, which is a conservative assumption since there was no available information of the subsurface conditions of the WP1 stockpile.

A geotechnical investigation in the WRTSF was conducted by WSP Golder with Gregg Drilling and Testing Canada from 13 to 20 September 2022. The proposed investigation included seven cone penetration tests along tailings and lakebed sediments. Currently, the preliminary results of the investigation and interpretation have not been fully completed and incorporated into the stability analysis models. It should be noted that the 2022 geotechnical investigation extended north of the WRD platform in the WRTSF, and complementary testing along the WP1 area is to be considered to understand the material behaviour of the WP1 foundation.

Table 4: Material Properties

Material Name	Behaviour Type	Material Model	Unit Weight (kN/m³)[(a)]	Effective Cohesion c′ (kPa)	Effective Friction Angle	Undrained Shear Strength	Undrained Shear Strength Ratio	Minimum Shear Strength
Waste rock dump	Drained	Mohr-Coulomb	22	0	38[(a)]	N/A	N/A	N/A
WP1	Drained	Mohr-Coulomb	22	0	38[(a)]	N/A	N/A	N/A
Lakebed sediments	Drained	Mohr-Coulomb	16	0	27[(a)]	N/A	N/A	N/A
	Undrained	Undrained shear strength ratio	16[(a)]	N/A	N/A	N/A	0.32 assumed[(b)]	10 assumed[(b)]
Bedrock	Drained/ Undrained	Infinite strength	24	N/A	N/A	N/A	N/A	N/A

(a) SRK 2015.

(b) BGC 2014; WSP Golder 2022.

kN/m³ = kilonewtons per cubic metre; kPa = kilopascal; N/A = not applicable; WP1 = Waste Pile 1.

6.1 Stockpile Design Criteria and Hazard Classification

Based on the waste dump and stockpile stability rating and hazard classification system discussed in the *Guidelines for Mine Waste Dump and Stockpile Design* (Hawley and Cunning 2017), for the proposed WP1 stockpile was classified as a Moderate instability hazard.

The system takes into consideration 22 factors that affect the stability of the structure (Hawley and Cunning 2017); each factor has a numerical rating assigned that helps to characterize a hazard class for a waste dump or stockpile. The assessment of WP1 scored 50, suggesting an instability hazard class III – Moderate. Appendix B presents a detailed results summary of the stockpile stability rating and hazard classification assessment.

Table 5 summarizes the target and minimum FOS values that were used for the stockpile assessment. The target FOS values are suggested design values from the *Mined Rock and Overburden Piles Investigation and Design Manual – Interim Guidelines* (BCMWRPRC 1991) for Case A defined as:

- Low level of confidence in critical analysis parameters.
- Possibly unconservative interpretation of conditions, assumptions.
- Severe consequences of failure.
- Simplified stability analyses method (chart, simplified method of slices).
- Stability analysis method poorly simulates physical conditions.
- Poor understanding of potential failure mechanism(s).

The minimum FOS values from the *Guidelines for Mine Waste Dump and Stockpile Design* by Hawley and Cunning (2017) based on a low confidence and moderate consequence which are considered applicable to the WP1 stockpile are presented in Table 5.

Table 5: Target and Minimum Factors of Safety

Loading Condition	Target FOS Values – Case A (BCMWRPRC 1991)	Minimum FOS Values (Hawley and Cunning 2017)
Spoil surface stability – short-term	1	-
Spoil surface stability – long-term	1.2	-
Overall stability – short-term (static)	1.3	-
Overall stability – long-term (static)	1.5	-
Overall stability (static)	-	1.4
Overall stability – pseudo-static	1.1	1.1

FOS = factor of safety; - = not applicable

The WP1 is a temporary stockpile and the overall long term static long-term FOS criteria is not considered to be applicable. The selected stockpile design FOS criteria for stability have been selected using the most conservative of BCMWRPRC 1991 and Hawley and Cunning 2017. A FOS of 1.5 was selected, similar to case A long-long term, to accommodate some data gaps yet to be verified in the foundation conditions of the WRD platform that WP1 is founded on. The target FOS may be reassessed following new information from subsurface investigations and laboratory testing and analyses values.

6.2 Liquefaction Potential

Liquefaction is a phenomenon whereby seismically induced shaking generates shear stresses within the soil under undrained conditions. These stresses tend to densify the soil (i.e., leading to potentially large surface settlements) and under undrained conditions, generate excess pore pressures. The excess pore pressures can also lead to sudden temporary losses in strength. Where existing static shear stresses are present, the loss of strength can lead to significant lateral movements, also referred to as “lateral spreading,” or under certain conditions, even catastrophic slope failures referred to as “flow slides”. Understanding the soil liquefaction potential will provide input into the design and potential changes in the construction methods or procedures to prevent unwanted events.

A geotechnical investigation and instrumentation program is being planned for 2023 to provide input into a static and seismic liquefaction potential assessment which is also expected to be completed in 2023 as part of the detailed design for the waste rock stockpiles.

7.0 FOUNDATION CONDITIONS

Foundation of the existing WP1 is on the WRD crest which is assumed to be existing waste rock material placed over partially displaced lakebed sediments as the main WRD was developed. Expansion of WP1 to the design limits shown in Drawing 2 is expected to be on the main WRD rockfill crest and the southern rockfill access road.

Should additional storage be required for 2022/2023 winter season, an additional WP1 south expansion is also shown in Drawing 2 which will require ground preparation to remove some laydown materials and temporary structures to the base rockfill pad. The laydown pad foundation of this area is noted by Newcrest as non-acid generating rockfill. A separation barrier such as geotextile is to be placed to provide a visual barrier to aid in removal of the WP1 expansion potentially acid generating rockfill materials. WP1 will be remined at a future date and placed in the WRTSF.

Cross-sections of WP1 stockpile illustrating the proposed WP1 and south expansion are shown in Drawing 3.

8.0 SLOPE STABILITY ASSESSMENT

Slope stability analyses were completed for the WP1 stockpile using the program Slide2 V9.0, a two-dimensional limit equilibrium computer software developed by Rocscience Inc. The general limit equilibrium (GLE)/Morgenstern-Price and Spencer methods were employed to analyze potential failure surfaces through the stockpile slopes and underlying foundations. The slope stability analyses were conducted to locate the critical failure surfaces along the north and south side slopes of WP1 using the block and search and the non-circular auto-refine search method. Slope stability analyses were conducted using the effective stress analysis parameters. Slope stability analysis results for the WP1 stockpile are included in Appendix C.

Post-earthquake analyses (i.e., using residual shear strengths for liquefied foundation materials) were not carried out for WP1 because of limitations in available information for the in situ conditions. Pseudo-static analyses were carried out to confirm if WP1 meets the minimum and target FOS criteria discussed in Section 6.1.
The pseudo-static analyses were carried out in accordance with the method proposed by Hynes-Griffin and Franklin (1984). In this method, a horizontal acceleration coefficient of 0.045 g (equal to half of the bedrock PGA) was applied.

The slope stability of WP1 was completed for the WP1 conceptual design. The analysis considered the active load of a haul truck dumping waste rock at 6 m and 10 m distance from the WP1 crest, and a dozer pushing waste rock at the edge of the WP1 crest. It was concluded that the dozer scenario was the most critical condition, which suggested a flatter slope from 1.36H:1V (angle of repose) to a 2H:1V upper and lower slope in the WP1 conceptual design.

The selected cross-section for analysis corresponds to the greatest slope height and inferred maximum thickness of lakebed sediments. The static stability assessment of WP1 was initially checked for drained and undrained conditions at different failure depths from 5 m to 20 m using the block search and non-circular auto refine search method along the north and south side slopes of WP1. Once the critical slip failure surface was identified, a pseudo-static analysis was completed.

Table 6 summarizes the most conservative results of the slope stability analyses for WP1 under long-term, short-term, and pseudo-static conditions (when dozer pushing at edge of WP1). With revised geometry as shown in the drawings (Appendix D), the proposed WP1 configuration design meets the target FOS in all scenarios (long-term, short-term, and pseudo-static conditions).

Table 6: Slope Stability Results for WP1 Stockpile

Condition	Loading Condition	Target FOS	FOS GLE/ Morgenstern-Price Method	FOS Spencer Method	Figure (Appendix C)
South slope – Proposed WP1 conceptual design (2H:1V)	Long-term conditions	1.5	1.64	1.70	C-3
	Short-term conditions	1.3	2.06	2.03	C-4
	Pseudo-static drained conditions	1.1	1.53	1.58	C-3
	Pseudo-static undrained conditions	1.1	1.76	1.74	C-4
South slope – Proposed WP1 conceptual design south extension (2H:1V)	Long-term conditions	1.5	1.64	1.72	C-6
	Short-term conditions	1.3	2.03	2.01	C-7
	Pseudo-static drained conditions	1.1	1.55	1.58	C-6
	Pseudo-static undrained conditions	1.1	1.72	1.72	C-7
North slope – Proposed WP1 conceptual design (2H:1V)	Long-term conditions	1.5	1.66	1.70	C-5
	Pseudo-static drained conditions	1.1	1.60	1.55	C-5

Note: Green values meet criteria, red values do not meet criteria.

FOS = factor of safety; WP1 = Waste Pile 1; GLE= general limit equilibrium.

Setback distances between the north toe of WP1 and the crest of the WRD were assessed as part of the stability analysis of WP1. Stability analyses were performed setback distances of 38.2 m (current condition) and 60 m. The assessment only considered active loading from the dozer pushing waste rock at the crest of WP1 and no active load from heavy equipment working at the north side crest of the WRD. The Spencer and GLE/Morgenstern-Price methods were used in the setback distance assessment of WP1. For interpretation of results, the GLE/Morgenstern-Price method was used since the FOS was generally lower than Spencer method.

The results of the stability analyses for long-term conditions showed that a 38.2 m and 60 m set back distance between the north toe of WP1 and the WRD crest are enough to achieve a minimum FOS close to 1.3 for long-term static condition. However, the minimum FOS was not achieved when assessing the stability of the WRD under long-term (current condition) and pseudo-static undrained conditions and does not meet the FOS for long-term shallow slip surface condition with a 60 m setback of WP1 from the WRD crest edge. As earthquakes lead to pseudo-static conditions, an earthquake monitoring system is being considered by Newcrest which includes an alarm to trigger evacuation of personnel from the dump in the event of an earthquake.

Table 7 summarizes the setback FOS from the critical slip surface under long-term, short-term, and pseudo-static undrained conditions. Long term condition FOS of 1.3 for the WRD setback to WP1 for global stability of the WRD platform, consistent with design basis from SRK (2020) and is considered a reasonable basis along design approach of the observational method (Terzaghi and Peck 1967; Peck 1969). To confirm that the required level of stability is achieved, careful construction and monitoring are required to reduce undrained conditions of the lakebed sediments when excess pore pressure is generated from active loading at the WRD.

Table 7: WP1 Setback from Waste Rock Dump Platform Crest Analysis Results

Condition	Loading Condition	Target FOS	Lowest FOS GLE/ Morgenstern-Price Method	Distance from Crest (m)	Figure (Appendix C)
Setback analysis – current (Aug 2022) north toe of WP1	Long-term conditions	1.3	1.27	15.2	C-8
	Short-term conditions	1.1	1.15	32.3	C-11
	Pseudo-static undrained conditions	1.1	0.98	32.3	C-13
Setback analysis – 60 m setback from conceptual design north toe of WP1	Long-term conditions	1.3	1.26 (shallow slip surface)	15.2	C-9
	Long-term conditions	1.3	1.59 (deeper slip surface)	60.0	C-10
	Short-term conditions	1.1	1.15	32.3	C-12
	Pseudo-static undrained conditions	1.1	0.99	32.3	C-14

Note: Green values meet criteria, red values do not meet criteria.

FOS = factor of safety; WP1 = Waste Pile 1; GLE= general limit equilibrium.

The recommended minimum set back of WP1 is 60 m, which provides operational haulage equipment loading between 40 m and 60 m (meeting minimum distance for short term condition FOS) from the WRD crest.

9.0 WP1 STOCKPILE DEVELOPMENT

9.1 Surface Water Management

A surface water management plan is to be developed for the WP1 stockpile area that ties into the site-wide water management plan. Surface water management is to include surface diversion channels to prevent ponding of water at the crest of WP1. Water should be diverted from WP1 to a downstream water collection system and into the WRTSF. Surface water management and/or sediment control measures should be implemented prior to beginning stockpile foundation preparation and waste placement.

9.2 Stockpile WP1 Dumping Operations

The stockpile is to achieve a 2H:1V slope for the upper and lower bench as shown in Figure 3 by a series of four lifts of angle of repose (assumed to be 1.36H:1V) to elevation 1385 m at the south portion of the stockpile. Figure 3 illustrates cross-sections and typical bench dimensions. Both haul trucks and dozer are not expected to be on WP1 at the same time. The dumping sequence is to consider haul traffic.

Newcrest proposed operation for waste rock placed in WP1 is to be dumped at least 6 m (setback) from the 1377 m elevation crest and push with a dozer to the crest edge. Safety shoulder berms are to be maintained on all dump crests and haul roads of sufficient height to prevent the largest mine equipment from inadvertently driving over the crest. The height of the shoulder berms is to be no less than half the height of the largest haul truck tire. Shoulder berms are not to be used as a wheel stop when backing up to the dump.

The condition of the dump platform is to be monitored visually for any signs of instability. The operator responsible for spreading dumped waste materials and site geotechnical team is to confirm that the surface of the dump and dump platform is maintained in good condition. The dump platform is to be maintained with an uphill grade to the

crest, except for local areas to direct surface run off at a grade, of not less than 2% to facilitate surface water drainage away from the crest edge.

Stockpile stability is influenced by many factors, including dump height, dump materials, dump geometry, climatic conditions, foundation materials, and surface and groundwater conditions. However, the loading rate of the WRD crest edge advancement in the WRTSF also have an influence on global slope stability of the WRD which WP1 is founded on. Refer to the WRD back analysis and slope stability results in the back analysis report (WSP Golder 2022).

Downstream catch berms are to be placed at the toe of the WP1 stockpile, similar to the existing WP1, around the perimeter of WP1.

9.3 Geotechnical Inspections

Continuing routine scheduled inspections and survey monitoring of the WP1 stockpile and WRD, as identified in the most current operation, maintenance, and surveillance manual (Pretium 2021b), is a key component to the early detection of concerns relating to physical stability. The visual inspection program includes observations by operations staff, daily inspections by the geotechnical engineering team, and annual inspections by the Engineer of Record and qualified geotechnical engineer(s). Visual inspection of ramps and haul roads near dump crests or slopes are to be conducted frequently during stockpile development operations. Haul truck operators, dozer operators, and any others who routinely visit the WRD are to be trained in the recognition of hazards and reporting procedures.

Operations staff, equipment operators, surveyors, and other personnel that regularly visit the waste dumps are to be trained to recognize the following potential indications of instability:

- excessive or abnormal cracking
- excessive crest deformation or settlement
- excessive over-steepening of the crest
- abnormal platform tilting
- seepage breakout on the face
- bulging of the face
- toe spreading

Observations of any of these indicators are to be evaluated to determine if there is a developing slope instability issue.

9.4 Geotechnical Instrumentation Monitoring

Monitoring of the physical performance of the WP1 stockpile is recommended to confirm that performance is consistent with design assumptions and operations. The monitoring program is to consider potential failure mechanisms including foundation instability. Consideration is to be given to the installation of vibrating wire piezometers in the foundation materials in the WRD north of WP1, to assess the excess pore water pressure generation during loading (i.e., waste rock unloading and placement). In addition, the installation of slope inclinometers is to be considered to monitor the side slope and foundation deformation. A revised trigger action

response plan is to be established for future piezometers and slope inclinometers. It should be noted that Newcrest is looking into wireless subsurface monitoring systems to monitor porewater pressure.

9.5 Operational Guidelines

The operation of a waste dump or stockpile must be consistent with the design basis and assumptions. Operational guidelines and standard operating procedures are to be reviewed, updated, and included in the next revision of the operation, maintenance, and surveillance manual using the design basis presented in this document and reviewed by the design engineer and Engineer of Record in 2023.

10.0 CONCLUSION

We have assessed WP1, as presented in the drawings and stability of WP1, and it is expected to meet the FOS criteria with the following key recommendations and considerations:

- Complete an additional investigation of the lakebed sediments and material properties of the subsurface conditions of the WP1 stockpile.
- The minimum set back of WP1 is 60 m.
- Operational haulage equipment loading to be between 40 m and 60 m from the WRD platform crest.
- Monitoring of the physical performance of the WP1 stockpile to confirm that performance is consistent with design assumptions and operations.
    - Consideration is to be given to the installation of vibrating wire piezometers in the foundation materials in the WRD north of WP1 to assess the excess porewater pressure generation during loading.
    - Installation of slope inclinometers is to be considered to monitor the side slope and foundation deformation.
    - A revised trigger action response plan is to be established for the piezometers and slope inclinometers.
- Operational guidelines and standard operating procedures are to be reviewed, updated, and included in the next revision of the operation, maintenance, and surveillance manual.
- A surface water management plan is to be developed for the WP1 stockpile area that ties into the site-wide water management plan.

11.0 CLOSURE

The reader is referred to the Study Limitations, which precedes the text and forms an integral part of this report.

We trust the above meets your present requirements. If you have any questions or additional requirements, please contact the undersigned.

Seismic Hazard Calculation

Government of Canada Gouvernement du Canada

Canada.ca > Natural Resources Canada > Earthquakes Canada

2020 National Building Code of Canada Seismic Hazard Tool

This application provides seismic values for the design of buildings in Canada under Part 4 of the National Building Code of Canada (NBC) 2020 as prescribed in Article 1.1.3.1. of Division B of the NBC 2020.

Seismic Hazard Values

User requested values

Code edition	NBC 2020
Site designation X_S	X_C
Latitude (°)	56.47
Longitude (°)	-130.174

Please select one of the tabs below.

NBC 2020 | Additional Values | Plots | API | Background Information

The 5%-damped spectral acceleration ($S_a(T,X)$, where T is the period, in s, and X is the site designation) and peak ground acceleration (PGA(X)) values are given in units of acceleration due to gravity (g, 9.81 m/s^2). Peak ground velocity (PGV(X)) values are given in m/s. Probability is expressed in terms of percent exceedance in 50 years. Further information on the calculation of seismic hazard is provided under the *Background Information* tab.

The 2%-in-50-year seismic hazard values are provided in accordance with Article 4.1.8.4. of the NBC 2020. The 5%- and 10%-in-50-year values are provided for additional performance checks in accordance with Article 4.1.8.23. of the NBC 2020.

See the *Additional Values* tab for additional seismic hazard values, including values for other site designations, periods, and probabilities not defined in the NBC 2020.

NBC 2020 - 2%/50 years (0.000404 per annum) probability

$S_a(0.2, X_C)$	$S_a(0.5, X_C)$	$S_a(1.0, X_C)$	$S_a(2.0, X_C)$	$S_a(5.0, X_C)$	$S_a(10.0, X_C)$	$PGA(X_C)$	$PGV(X_C)$

APPENDIX B

Stockpile Hazard Classification

Appendix B
Slope Stability Analysis Results

Waste Pile 1 (WP1)

Engineering Geology Index (EGI)

Group	Factor	Value	Index	Rating
Regional Setting	Seismicity	PGA= 0.03g (10% in 50 years) based on (NBC, 2020)	very Low	2
	Precipitation	Total annual precipitation ranged from 1,129 to 1,968 mm recorded from the Brucejack Lake climate station (SRK,2015)	High	2
Foundation Conditions	Foundation Slope	Based on CAD cross section	flat	5
	Foundation Shape	Convex on Gentle slopes; Planar or concave on moderate slopes	flat	2
	Overburden Type	Assumed Lacustrine deposits as WRD foundation located in lake	Type 2	1
	Overburden Thickness	Assumed thick unit of lakebed sediments	>5 m	0
	Undrained Failure Potential	Saturated Condition of Lakebed sediments with high potential of excess pore pressure	Moderate	-5
	Foundation Liquefaction Potential	Unknown Liquefaction Potential	Moderate	-5
	Bedrock	P-wave velocity from 4080 m/s to 4790 m/s which suggests Fair rock mass based on Q classification system	Type D	3
	Groundwater	Water Table at surface	High	0
Material Quality	Gradation	Assumed gradation - 10 to 25% fines and 25 to 50% greater than 75 mm	Mixed gradation	3.5
	Intact Strength and Durability	Medium strong rocks. Limited information are available and the rock quality cannnot be justified based on the available information	Type 3	4
	Material Liquefaction Potential	WP1 material is Waste rock	Negligible	0
	Chemical Stability	Neutralization Potential Ratio (NPR) ranging from 1 to 2.6 - (BGC, 2013)	Moderate reactive	0
			Total	12.5

Design and Performance Index (DPI)

Group	Factor	Value	Index	Rating
Geometry & Mass	Height	WP1 height is 20 m	Very Low	4
	Slope Angle	Overall Slope is 22 degrees	Flat	3
	Volume and Mass	Volume <1 x 10^6	Very Small	2
Stability Analysis	Static Stability	FOS of 1.64 for drained conditions at south slope of WP1. There is low level of confidence in the input parameters.	> 1.5	7
	Dynamic Stability	FOS of 1.53 for pseudo-static condition at south slope of WP1	> 1.15	3
Construction	Construction Method	Lift Heights < 50 m	Method 5	8
	Loading Rate (m3/d/m)	based on Daily reports current November rate on average is 893 m3/day	Low	5
Performance	Stability Performance	Tension cracks along crest of WP1	Good	7.5
			Total	39.5

Appendix 3-3: Brucejack Backfill Management Plan

PRETIUM RESOURCES INC.
A member of the Newcrest Group of companies

Report

Brucejack Backfill Management Plan Rev-05

Pretium Resources Inc.

Revised by Brucejack Mine Geotechnical Engineering Team
10 March 2023

Revision history

Revision version	Title	Date	Comments
R0	Pretium Brucejack Backfill Management Plan Review Rev-0	7 March 2018	First Issue
R1	Pretium Brucejack Backfill Management Plan Review Rev-1	22 June 2018	Revised Golder barricade drawings in Section 8 and updated Appendix H
R2	Brucejack Backfill Management Plan Rev-2	18 October 2018	Added Appendix M Waste Fill Fence Design for Paste Fill
R3	Brucejack Backfill Management Plan Rev-3	18 November 2021	Updated with current SOPs in Section 4; Table 5.1 updated; Added Appendix N BJ-ENG-SOP-033 Rock Barricade Construction
R4	Brucejack Backfill Management Plan Rev-4	25 March 2022	Peer review of R3 document by AMC Mining Consultants (Canada) Ltd, with updates to target strengths, new paste recipes updated quality control analysis and fill barricades
R5	Brucejack Backfill Management Plan Rev-5	10 March 2023	Change target tonnage to 3800 tpd. Removed Horizontal belt filter section

Executive summary

This manual is the Brucejack Backfill Management Plan was collated by AMC Mining Consultants (Canada) Ltd (AMC) for Pretium Resources Inc. (Pretium). This document was developed in collaboration with Outotec (the plant designers), and Pretium's processing, mine operations, mine planning and geotechnical engineering staff. It contains a series of standard operating procedures (SOPs) in the form of task lists together with reference design and background information used to design and operate the Brucejack paste fill system.

British Columbia Ministry of Energy and Mines (BCMEM) has directed Pretium to provide the following information:

> *The Permittee shall develop a Mining-Backfill Standard Operating Procedure Manual that shall be available at any time at the mine site to any Mines Inspector. The Mining-Backfill Standard Operating Procedure manual shall include, but is not limited to, the following information:*

- *Barricade design for anticipated loading conditions.*
- *Procedures for determining suitable barricade location.*
- *QA/QC procedures for constructed barricades.*
- *Design rationale for minimum strength requirements for operating beside and underneath backfill at the design dimensions.*
- *Prescribed fill rates within stopes.*
- *Paste line flushing procedures.*
- *Procedures to ensure tight backfill has occurred.*
- *Safe filling procedures that include safe worker setback distance from active paste pours.*
- *QA/QC backfill testing requirements.*

The manual has been designed as a guide for employees working in paste fill related design and operations at Pretium Brucejack mine. It is also intended to serve as a reference manual for experienced users who interact with the paste fill system either at design or at operational level. The manual has been updated to final status following commissioning of the Brucejack Paste Fill System and has incorporated changes resulting from the commissioning process and the analysis of QC data.

The information contained herein is intended as a basis for design, but innovative solutions are encouraged when based on sound principles. In case of significant changes or discrepancies, please bring these to the attention of the Senior Geotechnical Engineer for resolution or correction.

All design documentation and drawings for the Brucejack paste fill system referenced in this document were supplied by Outotec and can be obtained from the Brucejack Reference files on the network. The Standard Operating procedures were developed in conjunction with mining and processing operations staff.

In June 2020 Outotec merged with Metso Minerals to form Metso Outotec, commonly referred to as MoGroup. This document retains references to supplied documentation in the original Outotec format.

The manual also refers to the Brucejack mining contractor, Procon.

Quality control

The signing of this statement confirms this report has been prepared and checked in accordance with the AMC Peer Review Process.

Important information about this report

Confidentiality

This document and its contents are confidential and may not be disclosed, copied, quoted or published unless AMC Mining Consultants (Canada) Ltd. (AMC) has given its prior written consent.

No liability

AMC accepts no liability for any loss or damage arising as a result of any person other than the named client acting in reliance on any information, opinion or advice contained in this document.

Reliance

This document may not be relied upon by any person other than the client, its officers and employees.

Information

AMC accepts no liability and gives no warranty as to the accuracy or completeness of information provided to it by or on behalf of the client or its representatives and takes no account of matters that existed when the document was transmitted to the client but which were not known to AMC until subsequently.

Precedence

This document supersedes any prior documents (whether interim or otherwise) dealing with any matter that is the subject of this document.

Recommendations

AMC accepts no liability for any matters arising if any recommendations contained in this document are not carried out, or are partially carried out, without further advice being obtained from AMC.

Outstanding fees

No person (including the client) is entitled to use or rely on this document and its contents at any time if any fees (or reimbursement of expenses) due to AMC by its client are outstanding. In those circumstances, AMC may require the return of all copies of this document.

Public reporting requirements

If a Client wishes to publish a Mineral Resource or Ore / Mineral Reserve estimate prepared by AMC, it must first obtain the Competent / Qualified Person's written consent, not only to the estimate being published but also to the form and context of the published statement. The published statement must include a statement that the Competent / Qualified Person's written consent has been obtained.

Certification

This document was reviewed and approved by the undersigned.

1 Introduction

This Paste Fill System Manual has been designed as a guide for employees working in paste fill related design and operations at Pretium's Brucejack mine. It is also intended to serve as a reference manual for users who interact with the paste fill system either at design or at operational level. The Manual contains details of Standard Operating Practices (SOPs) for key activities.

The information contained herein is intended as a basis for design, but innovative solutions are encouraged when based on sound principles. In case of significant changes or discrepancies, please bring these to the attention of the Senior Mining Engineer for resolution or correction.

All design documentation and drawings for the Brucejack paste fill system referenced in this document were supplied by Outotec and can be obtained from the Brucejack Reference files on the network.

The reader is referred to in the text as the "User".

The management of this manual is the responsibility of the **Senior Mining Engineer** who will ensure that copies in circulation are consistent with the master copy. The master copy will always be the latest edition and the starting point for any revisions. All revisions are to be suitably marked and dated and, where applicable, the older versions must be removed and destroyed.

This manual does not contain all the detailed information regarding the paste fill system, but references are given to other Pretium documentation, to published papers and various other useful sources of information.

All activities related to the paste fill system are subject to Pretium workplace Occupational Health and Safety requirements and conventions.

2 General backfill information

2.1 Objective

At Brucejack mine, paste fill is required as an integral part of underground mining operations in order to:

- Maximize ore recovery by eliminating the need for permanent ore pillars.
- Provide local and regional stability support.
- Serve as a working platform when mining the upper lifts of stopes.
- Enable tight filling of adjacent stopes to ensure stope back stability.
- Enable reduction of the volume of tailings stored in the Brucejack lake.

The objective of this technical manual is to provide an overview of the Brucejack paste backfill system to ensure safe and efficient backfill operations.

This manual is intended to provide background information and to detail the operating and control strategy for the paste backfill plant and underground distribution system. It has been designed for use in conjunction with the equipment operating / maintenance manuals. This technical manual is to be used by plant operators, supervisors, engineering staff, and maintenance personnel.

Paste fill operations are complex and involve interdependent activities that require interaction between mine planners, geotechnical engineers, mine operators and supervisors, plant operators and supervisors, mill operators and supervisors, and maintenance personnel.

It is imperative that all key stakeholders have a good common understanding of the key aspects of the entire backfill operations from the production stage on surface through to the final exposure of fill mass in open stopes underground. It is crucial that the key stakeholders operate within the guidelines given in this manual to make the right decisions during their involvement in filling operations.

Failure to operate within the technical and operating guidelines has the potential to lead to plant failures or substandard fill product that may lead to reticulation problems, pipeline blockages and ore loss or dilution. Barricade and large fill mass failures may in turn have far reaching consequences including endangering the safety of personnel and equipment or causing severe production losses and delays.

2.2 Paste fill system overview

All mill tailings are delivered to a Deep Cone Thickener (DCT). Tailings are thickened to a nominal 63%[1] w/w (solids by weight) and when not required for backfill purposes are pumped to the Brucejack Lake for underwater storage. When the paste fill plant is operating, thickened tailings are pumped to an agitated storage tank. The slurry density is consistently thickened to greater than or equal to 63%, the slurry is pumped directly to the paste mixer.

Tailings slurry, binder, and trim water is combined in the continuous paste mixer to produce the required paste recipe. The paste overflows the mixer and discharges to one of two Geho positive displacement (PD) pumps for transfer to the underground distribution system. The combined paste fill tailings, binder, and water will produce a nominal 125 m^3/hr of paste fill. The PD pumps and

[1] Percentage solids by weight = mass of solids / (mass of solids + mass water).

valving enable the delivery of paste fill through one of two parallel pipelines to the mine portal and down the decline, either directly to the stopes or via the UG pump booster station.

The paste fill system uses a blended cementitious binder consisting of ground blast furnace slag and general usage cement (Lafarge Terraflow product). The binder is commonly referred on site as cement and is transferred from stacked isotainers to a nominal 160 t binder silo (actual 100 t due to low density of Terraflow binder) and delivered via a weigh conveyor and augers to the paste mixer. The rate of binder addition varies depending upon the required paste fill strength and the defined recipe and typically ranges between 2% and 15% of total backfill solids. High strength paste is used in undercut sill pillars, medium strength in primary and secondary stopes and low strength in bulk fill where no future exposures are required.

With the mine operating at 3,800 tpd, the plant is designed to produce paste fill at approximately 140 m^3 per hour from 141 dry tonnes per hour (dtph) of dewatered tailings with a minimum slurry density of 63% w/w, and an average of 7.6 dtph of binder (at 5% of total dry solids dosing average). Where paste recipes call for different binder rates or milling is conducted at different rates, these values will change pro-rata.

The wet bulk density of the paste fill slurry is approximately 1.68 t/m^3 and at an average 5% binder dosing contains 67 kg/m^3 of binder. Details of actual recipes are given later in the manual.

Assuming a monthly and annual utilization of 66% and 50%, the plant is designed to produce approximately 33,000 m^3 of paste per month and 400,000 m^3 per year, respectively. When the paste plant is not operating, thickened tailings are diverted to the Brucejack Lake for sub aqueous disposal. The paste plant is designed to process the full tailings stream when paste fill is being placed underground.

The Brucejack paste fill system combines thickened mill tailings mixed with binder to produce cemented paste backfill for stopes underground. The cured paste fill enables the extraction of adjacent ore in pillar stopes and reduces the quantity of sub aqueous tailings storage in the Brucejack Lake. Paste fill is produced in the surface plant and pumped underground in high-pressure piping either directly to stopes or via an underground pump booster station for stopes higher in the mine.

Figure 2.1 shows the paste fill plant process schematic.

Figure 2.1 Brucejack paste fill plant schematic

A schematic of the overall underground reticulation system is shown in Figure 2.2 including the Booster Pump Station. ***NOTE: The Horizontal Belt FLter has been removed from the operation. The slurry, at 63% solids, is pumped directly from the Tailings Stock Tank to the Past Mixer**

Figure 2.2 Schematic of underground reticulation system including Booster Station

Paste fill is delivered underground by pumping to the stoping areas via a pair of pipelines installed in the main access decline. The lines pass through the "dogleg borehole" and up to the booster pump station via the VOK incline. Paste can be pumped directly from surface to stopes underground or via the underground booster pump station to fill stopes higher in the mine.

The Booster Station is located at 1320 RL and consists of a feed hopper and provision for a pair of GEHO PD pumps with the same specifications as the surface unit. Initially, only one pump was installed due to low utilization rates. The second pump will be installed later when availability and utilization rates require it.

Table 2.1 illustrates the key operating parameters for the paste fill system.

Table 2.1 Paste fill system rates

3.1.1 Overview – tailings backfill

Tailings are dewatered for either underground backfill or subaqueous deposition at rates up to 145 tonnes per hour (dry weight tailings). When challenging dewatering conditions occur, a stream of up to 20 tonnes per hour (dry weight tailings) may be diverted and additionally dewatered by vacuum filtration to maintain targeted slurry densities. When backfilling, the slurry and the filter cake are mixed with binder, tempered with water for slump and delivered to the Underground Delivery System (UDS) by a hydraulically powered paste pump.

The UDS will have a receiving hopper and an additional paste pump for pumping to various locations underground.

Before the mixer and paste pumps are put into operation the line should be “slicked” with water. This wets the inside surface and prevents the initial paste put down the pipe from being sucked of moisture. Underground should make provision for disposing this volume of water as well as an equal volume at the end of the pour to clean out the lines.

This also proves that the pipelines, valves and manual transfers have been orientated according to the deposition plan developed by mine personnel.

3.1.2 Tailings dewatering

Tailings need to be dewatered for use in either backfill or subaqueous disposal. Pumping to Brucejack Lake is permitted with "a solids content target of around 55 to 65% by weight (w/w)".

There is now a single stage of dewatering equipment at Brucejack. This stage is comprised of the Tailings Paste Thickener. The second stage Horizontal Vacuum Belt Filter has been removed from service and decommissioned.

Rougher scavenger tailings are pumped to the Tailings Thickener Feed Tank (3126-TK-003) of the Tailings Paste Thickener (3126-TH-001). Flocculant is added to the Tailings Thickener Feed Tank and injected into the feed line ahead of the feed well with dilution water to ensure proper mixing of the flocculant. The Tailings Paste Thickener is sized to provide 6 to 8 hours of retention time, which allows tailings to settle and densify / thicken. See Sections 3.2 and 3.3 for the Tailings Thickener Feed Tank, Tailings Paste Thickener, and flocculant addition.

Any spillage captured by the Tailings Dewatering Area Sump Pump (3126-PU-008) is also added to the Tailings Thickener Feed Tank, along with tailings filtrate, Paste Plant Sump Pump (3128-PU-013) contents, water from the Wet Scrubber (3128-SB-031), and any paste plant spillage obtained from downstream in the process. Also, if the thickener has to be drained or if there is a major spill, the sump pump can be directed to the Tailings Disposal Surge Tank (3126-TK-001). See Section 3.2.1 for the sump pumps. The thickener overflow flows by gravity to the Process Water Tank (3232-TK-001).

Depending on the minerology, testing has shown that if the thickener can produce tailings at 63% w/w solids, it can be used to produce paste. If the thickener underflow is between 63% and 65% w/w, and paste is not currently required, an operational decision will be made to pump it either to the Tailings Stock Tank (3128-TK-001) or directly to the Tailings Disposal Surge Tank (3126-TK-001). If not required for backfill, tailings are pumped to the Tailings Disposal Surge Tank. Underflow densities greater than 72% cannot be pumped from the Tailings Disposal Surge Tank due to the limitations of the pumping system. Dilution water is added to the Tailings Disposal Surge Tank if high density slurry occurs. The Tailings Disposal Surge Tank and pumping therefrom is outside of Outotec's responsibility.

The Tailings Stock Tank is a large, agitated tank with a full capacity of 1,145 m^3. The live capacity of this tank is roughly the top half of the tank, due to minimum slurry level requirements above the agitator blades. The Tailings Stock Tank Agitator (3128-AG-001) agitates the slurry keeping the tailings in suspension.

Two Recirculation Pumps (3126-PU-003 & 004) are designed to recirculate slurry within the thickener discharge cylinder in an attempt to shear the material and reduce the viscosity. During normal plant operation, it is anticipated these pumps will run continuously at a speed that is based on 100% to 150% of the flow of the underflow pumps. One of the recirculation pumps is also able to pump sheared material above the thickener knuckle if required.

Both the paste backfill process and tailings disposal (subaqueous) require thickened tailings. Both paste backfill and subaqueous disposal have tailings density requirements. When the tailings do not meet these density requirements, additional dewatering is required. The 20 tonnes/hour stream of thickened tailings is then pumped from the Tailings Stock Tank to the Horizontal Belt Filter (3128-FL-011) and vacuum filtered to ~80% w/w solids. The filter cake stream produced by the

Horizontal Belt Feeder is conveyed to the Paste Mixer (3128-MX-031) where it will merge with the thickened slurry stream and effectively increase the density of the slurry.

3.1.3 Sub-aqueous tailings disposal

When not placing paste backfill underground, Brucejack disposes the tailings under water. Thickened tailings are pumped through a pipeline to the nearby Brucejack Lake. In order to meet the Permit requirements, slurry densities of the tailings must be between 63% and 65% solids by weight. Dewatering equipment in the plant ensures discharged tailings satisfy the Permit requirements.

Tailings disposal pumps draw thickened slurry from the agitated Tailings Disposal Surge Tank. This tank is fed either from the Thickener Underflow Pumps or from the Tailings Stock Tank discharge pumps.

When tailings are being disposed, it is preferable to bypass the Tailings Stock Tank and pump tailings slurry directly to the Tailings Disposal Surge Tank from the Tailings Paste Thickener. This reduces the overall power consumption and equipment wear.

It may be necessary to send tailings slurry from the Tailings Stock Tank to disposal during challenging conditions or when maintenance is required. Tailings can be sent to disposal from the Tailings Stock Tank when paste production is occurring. The valves in these lines are configured to allow slurry to both the Disposal Tank and the Paste Mixer simultaneously.

When slurry densities are too high for pumping, process water will be added to the Tailings Disposal Surge Tank to decrease the density to be within acceptable capabilities. Water addition will be automatic and will be controlled by the process control system (PCS).

3.1.4 Paste backfill

The plant is designed as a continuous system. Continuous monitoring of the process by the PCS and on-stream instrumentation allows the plant control to adapt process flows and conditions in real-time, maintaining control of the final product. The paste plant is automated with a goal of operating at steady state as per a paste recipe entered by the operator and a production rate determined by underground.

The production rate will determine the flow rate of the slurry to the mixer. This is reduced by the flow to the Horizontal Belt Filter if the % solids is low. The paste recipe will determine the feed rate of binder added. Tempering water is added by recipe to start and varied as stated below.

Tailings is pumped to the Tailings Paste Thickener providing approximately 6 to 8 hours of residence time prior to feeding the Underflow Pumps and an agitated Tailings Stock Tank. The residence time of the Tailings Stock Tank will minimize fluctuations in density for various ore types. Minimizing fluctuations in density and flowrate are critical for paste production, as final paste quality and slump are sensitive to variations in density.

The slurry is pumped from the Tailings Stock Tank, using centrifugal pumps, to the Paste Mixer and the Horizontal Belt Filter (if required). The Horizontal Vacuum Belt Filter acts as a second stage of dewatering when thickening is insufficient to produce required product density. The belt filter transfers filter cake into the Paste Mixer by the Filter Cake Transfer Conveyor (3128-CV-011) followed by the Reversing Filter Cake Weigh Feeder (3128-FE-011). Water recovered from filtration will return to the feed box of the Tailings Thickener Feed Box.

Under normal circumstances, the thickener will provide sufficient dewatering for paste production when combined with the binder in the Paste Mixer. When challenging conditions occur and the thickener alone cannot dewater sufficiently, the Horizontal Belt Filter provides a second stage of dewatering.

Flow rates of thickened tailings slurry, binder, tempering water and filter cake are controlled such that the ratio provides a consistent slump within the Paste Mixer.

This is accomplished by measuring:

1. Pressure difference after the paste pumps.
2. Density measured after paste pumps.
3. Hydraulic pressure powering the paste pumps.
4. Amperage draw from the mixer motors.
5. If the values for 1 through 4 are increasing and / or manual measurements of slump indicates a lower slump than required, then the tempering water will be increased.
6. Conversely, if the values for 1 through 4 are decreasing and the slump is higher than required, then tempering water will be decreased.

Density measurement downstream of the Paste Mixer can be used to confirm and maintain the target density of the paste. Manual slump measurements on paste collected from the Paste Mixer are used to confirm that the density set-point is achieving the desired slump. If it is not, the set-point can be adjusted accordingly.

Dry binder is delivered from the Knipple Transfer Station to the paste plant in bulk isotainers. Storage and handling is provided inside the mill complex with a pneumatic transfer system capable of handling bulk binder isotainers. Binder is pneumatically conveyed into a binder silo for use in the plant. This is a manual system that will require an operator to switch air supply line to the isotainer to be off- loaded and the air / product line from the isotainer to the silo recharge line. Offloading the isotainer is done by manually operating butterfly valves on the belly of the isotainer to introduce binder into the conveying airstream. The binder silo is equipped with a bin vent for dust collection. The bin vent fan will only be used when the silo is being loaded.

Binder is metered on a continuous basis into the Paste Mixer using a rotary vane feeder and weigh-belt feeder. Two screw conveyors in series are used to transport the binder from the weigh-belt feeder into the Paste Mixer. Binder addition at the Paste Mixer is controlled based on the targeted binder content and the measured dry weight of tailings entering the Paste Mixer.

The Paste Mixer blends the filter cake, thickener underflow, trim water, and binder together, achieving a homogenous paste mix. Continuous monitoring of the flowrate and solids content of the material entering and exiting the process will allow a consistent mixture to be achieved.

A wet scrubber type dust collector is used at the mixer to prevent the release of any dry products from the Paste Mixer to the atmosphere. The same scrubber is be used to eliminate dusting at the weigh-belt feeder as required. The dust collected is recycled back to the Tailings Thickener Feed Tank as a dilute slurry.

Any spills resulting from the operation of the paste plant is directed to three (3) clean-up sumps located within the paste plant footprint. Material collected is pumped to the Tailings Thickener Feed Tank. Care must be taken to avoid introducing large quantities of cemented material into the sump which could potentially damage equipment downstream from the sump.

This overflow type mixer continuously discharges cemented paste to one of the paste pumps. From the paste pumps it flows into one of two lines of the underground distribution system through a pair of diverter valves in series. The first diverter valve allows for pig insertion for cleaning after a pour and the second diverts flow into one of the two lines to underground.

The underground distribution system is comprised of a network of 8” pipe and a booster pump station located near the VOK mining zone. The Booster Station includes a receiving hopper, flush water tank and pumps, valves, and a single paste pump. The paste pump located in the Booster Station is identical to the ones located in the surface plant with the exception of having air cooling instead of water cooling. It is similarly controlled by the PCS. Operation of the booster pump station is linked and coordinated with the surface pumps to avoid spills and damage to equipment.

After each paste campaign, the lines are flushed by supplying process water to the Paste Mixer and using the paste pumps to push water and a cleaning pig through the lines.

The paste plant Overhead Crane (3128-CK-001) services the area as needed.

3.1.5 Gland water for slurry pumps

To minimize the dilution of the slurry, all the GIW centrifugal slurry pumps have been fitted with type KE seals. These pump seals are fed with individual valve trains to each pump at a pressure of ~70 kPa (10 psi) higher than the discharge pressure of that pump. Gland water to any pump is proved to allow it to operate (FISL on each line).

3126-PU-008	Tailings Dewatering Area Sump	0031

3.2.2 Start-up sequence

For this thickener, refer to FLS document, Tailings Thickener, Control and Operating Philosophy 177421-PJ020-C03-0002_S1.

In general, the following start-up sequence is employed:

- Rake mechanism
- Recirculation pumps
- Feed from Thickener Feed Tank
- Flocculant addition
- Overflow pumps

3.2.3 Control description

3.2.3.1 Tailings Thickener Underflow Pumps (3126-PU-001/002)

The two Thickener Underflow Pumps (3126-PU-001 and 3126-PU-002) draw from the bottom of the discharge cylinder that is the lowest part of the paste thickener. Both pumps are isolated by automated knife gate valves on the pump inlet lines (3126-XV-5311/5321) and discharge lines (3126-XV-5315/5325). Additionally, manual gate valves are located between the thickener outlet flange and the pump inlet knife gate valve for maintenance.

During normal operation of the thickener, one of the two underflow pumps transports the thickened tailings to either the tailings stock tank or the tailings disposal surge tank. The thickener should be monitored for:

- Density
- Outflow in balance with incoming feed
- Rake torque
- Bed interface
- Bed pressure

If the density or the rake torque increases the amount of material pulled from the thickener should be increased.

Refer to Section 3.2.3 for the control of the thickener.

Both pumps are operated with variable frequency drives (VFDs). Flow and density are measured on the pump discharge line (3126-FE-5332 and 3126-RX-5331) and are used to control the pump speed. The target flow will depend on the current control philosophy for the thickener. Density and pressure are also measured and are used for the operation of the thickener and pump systems (3126-DI-5331 and 3126-PE-5333). Normally, thickeners are run where the dry solids mass flow out of the thickener equals the dry solids mass flow into the thickener and the bed is kept constant. When the backfill rate is drastically different from the thickener feed rate, the agitated stock tank can act as a buffer, so that the thickener is operated in “steady state”.

In the event the thickener underflow density is too low, the underflow pumps can be slowed and directed to either tank or returned to the Tailings Thickener Feed Tank. The underflow pump can even be stopped if required, however then the density measurement on the underflow is not available. In the event of upset conditions such as a power outage, the tailings can be recycled to the Tailings Thickener Feed Tank.

The inlet lines for all pumps have sample ports with manual plug valves.

Automated globe valves prior to each pump (3126-XV-5312/5322) are used for the flushing of the pumps and lines with water. Automated knife gate valves (3126-XV-5313/5323) are also located prior to the pumps for draining the pumps and pipes.

A series of automated knife gate valves are also used to direct the flow of slurry from the underflow pumps to the Tailings Stock Tank, Tailings Disposal Surge Tank, or back to the Tailings Thickener Feed Tank. These include 3126-XV-5334, 3126-XV-5336 and 3126-XV-5338, while 3126-XV-5335/3126-XV-5337/3126-XV-5339 are used to drain the respective lines when pumping to a specific location stops.

3.2.3.2 Tailings thickener recirculation slurry pumps

Similar to the two thickener underflow pumps, the two recirculation pumps will draw from the bottom of the discharge cylinder that is the lowest part of the paste thickener. These pumps are also isolated by automated gate valves on the pump inlet (3126-XV-5341/5351) and discharge lines (3126-XV-5348A/5348B/5355). Additionally, manual gate valves are located between the thickener outlet flange and the pump inlet knife gate valve for maintenance.

During normal operation of the thickener, one or two of the two recirculation pumps transports the thickened tailings from bottom of the discharge cylinder and reinjects it into the top of the same discharge cylinder. Both pumps are powered by VFDs. The volumetric flowrate of this recirculation is targeted at 1.25 to 1.5 times the flow through the underflow pump.

Both recirculation pump discharge lines are outfitted with flow meters (3126-FE-5340/5350), and both pumps are able to recirculate the tailings within the discharge cylinder.

One of the Recirculation Pumps (3126-PU-004) is only able to perform this recirculation duty while the other (3126-PU-003) is also able to pump tailings further up into the thickener (above the thickener knuckle). Item 3126-PU-003 can pump to the discharge cylinder or the nozzles above the knuckle, but not to both destinations at once. There are two inlets on the thickener for such recirculation, opposite each other. Three knife gate valves are opened to allow for the pumping of slurry above the knuckle (3126-XV-5345/5347A/5347B). This recirculation will only be employed when the thickener rake torque is abnormally high, when the underflow pumps are not in operation or during periods when tailings are not being introduced into the thickener.

During high torque events, the tailings can be recirculated to both the discharge cylinder and above the knuckle, or alternatively can be recirculated only to the upper lines.

Automated knife gate valves are used to help drain both pumps as well as the recirculation lines (3126-XV-5343/5353/5356/5349/5346).

Flush water for the recirculation pumping system is introduced with two automated globe valves prior to each pump (3126-XV-5342/5352).

Manual plug valves allow for sample collection prior to each recirculation pump.

3.2.3.3 Tailings dewatering area sump pump

The Tailings Dewatering Area Sump Pump (3126-PU-008) is turned on and off locally with the use of high and low-level switches (3126-LSL-5300 and 3126-LSH-5300), with a “high high” alarm (3126-LAHH-5300) displayed on the PCS screen which uses the standard HMI graphic template to monitor the status of the pump.

3.3.3 Control description

3.3.3.1 Tailings Disposal Tank Agitator (3126-AG-016)

The tailings stock tank agitator is powered by a VFD to assist in start-up with slurry in the tank. The tailings stock tank agitator is designed with a single set of 4 blades and will only agitate the bottom 1/2 of the material in a full tailings stock tank. Do not be concerned if the tailings stock tank agitator is operating and the visible material on top is not moving.

The tailings stock tank agitator should be operated whenever there are tailings in the tailings stock tank above the 19% level (see 3128-LE-5401 below). The signal back from the VFD will generate a "Permissive to run - Agitator Running".

It is possible to operate the agitator without liquid. The liquid level should be above the level of the slap ring that steadies the bottom of the agitator shaft.

3.3.3.2 Tailings Disposal Pumps (3126-PU-005/6)

There are four (4) pumps that empty the tailings stock tank. Two are the Horizontal Belt Filter (HBF) Feed Pumps 3128-PU-001 and 3128-PU-002, GIW 3x2 centrifugal pumps designed to pump a maximum of 20.5 m^3/hour at a design SG of 1.63 (at 60% w/w solids) against a head of 57.4 m. These HBF feed pumps are designed as redundant, one in operation and one as a standby. They pump from the tailings stock tank to HBF 3128-FL-011 (actually to the HBF Feed Splitter 3128-BN-001). The other two pumps are the Mixer / Tailings Disposal Surge Tank Feed Pumps 3128-PU-003 and 3128-PU-004, GIW 6x4 centrifugal pumps designed to pump a maximum of 148 m^3/hour at a design SG of 1.78 against a head of 26.2 m. These mixer / tailings disposal surge tank feed pumps are designed as redundant, one in operation and one as a standby. They pump from the tailings stock tank to either Paste Mixer 3128-MX-031 or the Tailings Disposal Surge Tank.

All these pumps are equipped with Type KE type stuffing boxes (gland) that require water under pressure control (usually at 0.7 bar (10 psi) above discharge pressure). Gland water must be proved before a pump can be turned on and if the gland water flow is low, the pump should be shut down.

The inlet piping to each pump is equipped with a flush water valve; during a routine shut down this valve is opened to allow the pump to flush itself and the discharge line to be flushed with process water.

The inlet piping to the HBF feed pumps is fitted with a 6" manual knife gate valve, while the two mixer / tailings disposal surge tank feed pumps are fitted with an 8" manual knife gate valve. These manual valves should always be open during operation. It is closed to do maintenance on the automated knife gate valve that feeds an individual pump.

3.3.3.3 Tailings Stock Tank (3128-TK-001)

The Tailings Stock Tank is a large, agitated tank that buffers the thickener from paste backfill production. This helps to minimize any variability in the slurry density to the mixer, the belt filter and the tailings disposal surge tank. It also allows the paste plant to continue operation during any interruptions in the thickener underflow. When not completely full, it offers buffering should backfill underground need to stop for short periods of time. This buffer also facilitates switching the underflow from the Thickener to the Tailings Disposal Surge Tank if the backfill rate is low without interfering with Thickener operation.

The Agitator (3126-AG-016) will operate continuously. Tank level is measured by a continuous level sensor (3128-LE-5401) while separate level switches are used for the high-level alarm (3128-LSHH-5402) and the low-level alarm (3128-LSLL-5402). The low level will protect the pumps from running dry.

The tank is connected to a pair of mixer feed pumps as well as a pair of filter feed pumps (one operating, one stand-by for both).

3.3.3.4 Horizontal Belt Filter Feed Pumps (3128-PU-001/2)

The Horizontal Belt Filter Feed pumps are similarly configured to the Tailings Thickener Underflow Pumps in terms of instrumentation and valving. This includes:

- Pump inlet – manual knife gate valves
- Pump inlet – automated knife gate valves (3128-XV-5411/5421)
- Water valves for flushing – globe valves (3128-XV-5412/5422)
- Draining of line – pump inlet – automated knife gate valves (3128-XV-5413/5423)
- Pump outlet – automated knife gate valves (3128-XV-5415/5425)
- Flow measurement (3128-FE-5432)
- Pressure measurement (3128-PE-5433)

If the slurry density is in the required range, the Horizontal Belt Filter as well as the Horizontal Belt Filter Feed Pumps will not be required. The Horizontal Belt Filter will only be operated when the slurry density is lower than the optimal range due to mineralogical variations.

If the density in the Tailings Stock Tank is not sufficient, then vacuum filtration will be required to increase the density of tailings. The flow and density measurements (3128-FE-5432 and 3128-DI-5461) will be used to control the pumps to maintain a target tailings feed rate to the filter. This target will be a set-point based on the slurry density that can be changed by the operator.

3.3.3.5 Mixer / Tailings Disposal Tank Feed Pumps (3128-PU-003/4)

The Mixer / Tailing Disposal Tank Feed Pumps are similarly configured to the Tailings Thickener Underflow Pumps and Horizontal Belt Filter Feed Pumps in terms of instrumentation and valving. This includes:

- Pump inlet – manual knife gate valves
- Pump inlet – automated knife gate valves (3128-XV-5441/5451)
- Water valves for flushing – globe valves (3128-XV-5442/5452)
- Draining of line – pump inlet – automated knife gate valves (3128-XV-5443/5453)
- Pump outlet – automated knife gate valves (3128-XV-5445/5455)
- Flow measurement (3128-FE-5462)
- Pressure measurement (3128-PE-5463)
- Density measurement (3128-DI-5461)

Using knife gate valves 3128-XV-5464 and 3128-XV-5466, the operating pump can pump tailings either to the Paste Mixer or to the Tailings Disposal Surge Tank. The system is only able to pump to one or the other, not to both at the same time. When pumping stops or when the location changes, the line no longer in use (to the mixer or tank) is drained by opening knife gate valves 3128-XV-5465 and 3128-XV-5467, respectively.

When paste backfill is being produced, the operating Mixer / Tailings Disposal Tank Feed Pump is controlled with the VFD such that the dry tailings in the slurry meet the set-point for plant throughput. If the Horizontal Belt Filter is operating, then the combined feed to the mixer and the filter are controlled to match the plant set-point.

When tailings are being pumped from the Tailings Stock Tank to the Tailings Disposal Surge Tank, the pump speed can be controlled based on the level of the Tailings Disposal Surge Tank.

3.4.3 Control description

3.4.3.1 Binder Silo (3128-SO-021)

The binder addition system includes a silo, a variable speed rotary feeder, a binder weigh feeder and a pair of screw conveyors in series to transfer the binder from the weigh feeder to the paste mixer.

Binder is delivered to Knipple Transfer Station in bulk trucks and stored in a dedicated silo. The binder will then be transferred into isotainers capable of holding 20 tonnes each, and subsequently weighed. These isotainers can then be transported to the Brucejack site.

At site, the isotainer is unloaded inside the mill building and moved with the overhead crane into position. There is space for 6 of the isotainers to be stored adjacent to the backfill binder system.

One of two Blowers (3128-BL-021 or 3128-BL-022) are used to transfer the binder from the isotainers into the binder silo. This will require that two hoses be connected to the isotainer, one from the blower to the isotainer to supply air and one from the isotainer to the silo piping which transports the binder into the silo.

A Bin Vent (3128-BH-021) with Fan (3128-FA-023) atop the silo filters and vents the pressurized air during charging of the silo to outside. The fan on the bin vent will only run when the silo is being charged.

Instrument air is used to pulse the filter to discharge any binder from the cartridges back into the silo. The pressure difference across the filter is also monitored (3128-PDIT-5525) and used to control pulsing to ensure good filter performance. The bin vent will allow air into the silo when binder is being drawn down.

While the binder system is operating, instrument air is used for aeration of the cone at the bottom of the silo (3128-XV-5527A/5527B/5527C) controlled by timer 3128-XC-5527 using Solimar fluidizers. This helps to avoid bridging and keeps the binder flowing into the binder silo rotary valve (3128-RV-021).

The silo is equipped with a continuous level sensor (3128-LI-5522). This will alarm if the level is too high, to prevent overfilling of the silo, will show when the silo is capable of receiving a full isotainer of binder, or too low to warn the operator that binder may run out during a pour.

A discreet level sensor 3128-LSHH-5523 will sense when the silo is full and will alarm the system which will turn on a horn (3128-YA-5522A) and a blue light (3128-YA-5522B) to warn the operator to shut down the silo filling system.

The binder silo storage capacity is 160 tons, in addition to six (6) isotainers which hold up to 20 tonnes each. This combines to a total capacity of 280 tonnes within the plant, sufficient to service approximately 36 hours (1.5 days) of continuous paste backfill plant operation at the design paste backfill rate of 145 dry t/h tailings, and at a binder consumption rate of 5% (7.7 t/h) (by dry weight paste backfill).

3.4.3.2 Binder Silo Rotary Valve (3128-RV-021)

The Binder Silo Rotary Valve serves to meter binder out of the silo and onto the Binder Weigh Feeder (3128-FE-021). It has a motor controlled by VFD, the speed of which is slaved to the head pulley of the weigh feeder.

The rotary valve is fitted with air purge seals and air is fed through 3128-XV-5528.

3.4.3.3 Binder Weigh Feeder (3128-FE-021)

The Binder Weigh Feeder receives binder from the Binder Silo Rotary Valve, and meters the binder based on the binder content specified in the recipe as well as the mass of tailings entering the Paste Mixer.

The Binder Weigh Feeder is equipped with a Speed Sensor (3128-SE-5533) and Load Cells (3128-WE-5533A/5533B) that measure the binder going across the weigh feeder. The Integrator (3128-WIT-5533) calculates binder added and varies it according to the recipe and the solids feed rate to control the VFD on the belt drive, which in turn will control the rotary valve.

During a normal shutdown of the binder addition system, the rotary valve should stop first and the binder weigh feeder run for a period of time to clear it of binder.

3.4.3.4 Binder Screw Conveyors (3128-CV-021/022)

The Binder Screw Conveyors simply transport the binder from the Binder Weigh Feeder into the Paste Mixer. They both operate at a fixed speed and should run whenever the weigh feeder is operating.

During a normal shutdown of the binder addition system, following the Binder Weigh Feeder stopping, the Binder Screw Conveyors should continue to run for a period of time to ensure they are empty.

The second Screw (3128-CV-022) is fitted with a sampling port for calibration purposes.

3.4.3.5 Paste Mixer (3128-MX-031)

The Paste Mixer is a twin shaft high shear mixer that operates in a continuous manner. The tailings slurry, filter cake, binder and water are all introduced into the top of the Mixer at one end.

At the opposite end of the Paste Mixer, there are two overflow ports and each goes to a separate chute that carries the mixed paste from the Mixer to one of two paste pumps. These chutes are isolated from the Mixer with automated square knife gate valves (3128-XV-5577/5581), so that the paste will only flow into the chute for the corresponding paste pump that is being used.

Each chute is outfitted with a level sensor (3128-LI-5574/5584). This sensor is used to control the stroke rate of the paste pump to maintain a constant head of material in the chute. It is backed up by pressure transmitters in each chute (3128-PIT-5573/5585). An inspection hatch is located on the chute for viewing as well as cleaning of the chutes at the end of every pour. A separate sampling chute is used for collection of paste that is required for slump tests during the pour, the results of which are used to tune the target density for the paste. Paste is also collected from the chute for casting cylinders that are stored and tested for strength after a certain amount of time as part of the QA/QC program for backfill.

The level in these chutes will be slightly lower than the level as the paste inside the Mixer and will be used to help control the speed of the paste pumps.

The inlet to each square valve 3128-XV-5571/5581 has a trash screen with 30 mm openings which will prevent large debris from entering the pumps or the UDS.

The initial cleaning of the Mixer is accomplished with process water that is piped to the Mixer by Valve 3128-XV-5556. When the Mixer has been flushed of product, the Mixer is emptied by Knife Gate Valves 3128-XV-5572 and 3128-XV-5582 opening and closing alternately so that the local sump is not overflowed. The mixer is 5 m^3 when full and can be emptied in ~15 seconds when both 10” drain valves are fully opened; the receiving sump has a capacity of 1 m^3. The drain valves will have to opened and closed several times to empty the mixer without overflowing the sump. After the mixer has been emptied, the high-pressure wash will run 6 wash heads in the mixer individually for ~2 minutes each. This wash water is pumped at 100 bar (1,450 psi) and is extremely dangerous. It must be stressed that access hatches to the Mixer must stay shut during mixing and especially during cleaning. Although these hatches have limit switches which will shut down the Mixer or the high-pressure water pumps, operators need to be advised of the potential hazard. When the cleaning cycle is complete, the water in the Mixer (~1.5 m^3) should be drained to the sump in the method described above.

When water no longer flows from the Mixer, water to the Paste Pump Chutes (3128-CH-041 or 3128-CH-042) is fed by Valves (3128-XV-5557/5558 and 3128-FCV-5555) for cleaning of the

system and flushing of the distribution system. The flow control valves are used based on level measurement in the chute to avoid overfilling while cleaning.

Following that, the cleaning of the Paste Mixer and Chutes is performed using a high-pressure washing system. Automatic, rotating nozzles allow the high-pressure water to wash down all the interior surfaces of the mixer after it has been drained. Six spray nozzles are mounted on the mixer with solenoids prior to each so they can be sequenced by the control panel located on the mixer. After the nozzles have finished their cycles, the water inside shall be emptied using the dump valves (3128-XV-5572 and 3128-XV-5582).

The clean-up sequence is designed to automatically clean and empty the mixer and the chutes once a pour is completed. This includes draining of the mixer with automated valves to a Sump (XV-5572/5582). The drain valves will have to be cycled throughout the clean-up and tied into the level of the sump as the volume and pumping capacity of the sump requires that the mixer be drained in stages. However, the chutes require manual cleaning with a high-pressure spray wand at the end of every pour.

Sensors on the Paste Mixer doors (ZY-5541A/5541B) will alarm if the doors are opened while the mixer is operating, and will interlock the mixer motors, shutting them down.

3.4.3.6 High-Pressure Wash Pumps (3128-PU-031/032)

The High-Pressure Wash Pumps is automated to turn on as part of the shutdown sequence in order to supply the spray nozzles within the Paste Mixer with high-pressure water.

The pumps also supply high-pressure water to wands that are used to clean up the mixer and chutes following a pour. The operator is required to manually turn a pump on prior to using the wands. These pumps produce water at a pressure of 100 bar (1,450 psi). These wands should be used with extreme caution.

Sensors on the Paste Mixer doors (ZY-5541A/5541B) will alarm if the doors are opened while the high-pressure wash system is operating, and will interlock the pump motors, shutting them down.

3.4.3.7 Wet Scrubber (3128-SB-031)

The Wet Scrubber is fed process water which passes through nozzles to make a fine mist inside the scrubber. The water feeding the scrubber is monitored for flow (FE-5562/5563) and pressure (PI-5565A/5565B) to ensure that the scrubber is operating properly.

The Wet Scrubber Fan (3128-FA-031) is attached to the body of the scrubber which pulls air from the Paste Mixer, through the scrubber and vents to outside the building. Air pressure measurement near the scrubber inlet and exit helps to monitor the scrubber's performance (3128-PI-5564A/5564B). Fan performance is monitored by pressure measurements (3128-PG-5565A/5565B).

The Seal Pot (3128-TK-031) helps to ensure that a seal is maintained at the bottom of the scrubber, by provided water against which the fan pulls. A valve on the process water into the Seal Pot (3128-XV-5568) helps to maintain a level of water inside the Seal Pot (3128-LS-5568). A low-level switch will alarm if the level in the Seal Pot drops (3128-LSLL-5699).

The primary reason for the scrubber is to minimize any airborne binder from escaping the paste mixer and ending up in the atmosphere.

A second line pulls a slight negative pressure on the binder weigh belt feeder.

A discharge pump (3128-PU-0330) is used to pump water and collected binder from the scrubber back to the Tailings Thickener Feed Tank. The VFD for this pump is controlled to maintain a target level of water inside the cone at the bottom of the scrubber, measured by 3128-LI-5566.

The Wet Scrubber is automated to run whenever the binder addition system or the mixer is in operation.

3.4.3.8 Paste Pumps (3128-PU-041/042)

Two hydraulic driven piston paste pumps are located underneath the mixer, one fed by each of the overflow chutes. One is operated when backfilling, with the other in standby mode.

Each pump has its own hydraulic power pack (3128-HY-041/042) that is used to drive the pump. The power pack uses the pressurized hydraulic fluid to alternately push paste from the two cylinders of the paste pump. The flow rate of the hydraulic fluid controls the paste pump speed, which in turn controls the flow rate of the cemented paste backfill. This is varied to maintain level in the overflow chute.

These pumps will normally run at 80 bar but are capable of 150 bar. There are progressive alarms at increasing pressure.

High-pressure reflects a reduction of flow that could have many causes; a pipe restriction, a partial plug in the line, an incorrectly chosen mix due to changes in minerology. Taking slump measurements on a regular basis is key to preventing pressure build-up due to mix irregularities. Communications between the paste pump(s) operator(s) and the pour site is essential. The pour site can confirm flow of slick water first, can confirm paste (by colour), and rate decrease during instances of higher than normal pressure.

Two manually operated diverter valves are located after the paste pumps. One to switch between the two pumps and also to allow for the insertion of pigs for cleaning the line (3128-DV-041), and a second one (3128-DV-042) to switch between the two trunk lines that connect the paste plant to the UDS and Booster Station. The diverter valves are powered by their own hydraulic power unit (3128-HY-043). The Paste Pumps are interlocked to stop pumping prior to actuation of either diverter valve. The Paste Pump should be locked out and tagged out and pressure proved to be zero before the pig insertion process is initiated.

Pressure sensors (3128-PI-5597/5598) following the paste pumps are used to monitor the operation of the pumps. The PCS will have to filter the pressure readings so that spikes associated with changes between paste pump strokes are not seen as high-pressure alarms. Additional pressure sensors (3128-PI-5601/5602 and PI-5603/5604) following the diverter valves are spaced 100 m apart in order to provide real time feedback on system pressure losses, which will help with the safe operation of the UDS.

Density measurement (3128-DI-5591) is performed between the diverter valves which will monitor the final density of the paste backfill leaving the plant. This, along with the strokes rate of the paste pump will give indication to the mass flow rate of paste.

4 Mill paste plant standard operating procedures

This section summarizes the SOPs developed to establish the mandatory requirements for the safe and responsible working standards for operating the Paste Plant.

4.1 List of SOPs

The following SOPs are summarized in this section:

- BJ-PBF-SOP-551 Paste Plant Start-up Procedure (Control Room)
- BJ-PBF-SOP-553 Paste Plant Shutdown Procedure
- BJ-PBF-SOP-555 Transfer of Binder from ISO-VEYOR to Bulk Storage Silo
- BJ-PBF-SOP-557 Casting of Cylinders for Strength Test - Underground
- BJ-PBF-SOP-558 Casting of Cylinders for Strength Test
- BJ-PBF-SOP-559 Determination of Unconfined Compressive Strength for Cylinders
- BJ-PBF-SOP-560 Diverter Gate Operation & Pigging Procedure
- BJ-PBF-SOP-562 Paste Plant Mixer Cleaning
- BJ-PRO-SOP-564 Operating Overhead Door with Safety Edge Bypassed

4.2 BJ-PBF-SOP-551 Paste plant start-up procedure (control room)

4.2.1 Objective

To establish mandatory requirements for the safe and responsible working standards for starting up the Paste Plant.

4.2.2 Scope

This SOP covers the process and procedures which are used to start up the Paste Plant.

4.2.3 Health, safety & reclamation code of BC

Section 1.11.1 (Training)

4.2.4 Definitions

- DCS
  - Distributed Control System: a computerized control system for a process or plant usually with a large number of control loops, in which autonomous controllers are distributed throughout the system, but are monitored by a central control operator.
- MAN
  - Manual mode: term used when the control parameters within the DCS are switched to operator (human) control.
- AUTO
  - Automatic mode: term used when the control parameters are monitored by the DCS.
- CAS
  - Cascade mode: term used in DCS control when one parameter or parameter dictates when another parameter is activated or deactivated.
- No.
  - Abbreviation for "number"
- CRO
  - Control Room Operator

- Paste Watcher
  - Person responsible for monitoring the paste fill UG.
- Paste Operator
  - Person responsible for monitoring the paste plant.
- TPH
  - Acronym for "Tonnes per hour"
- M^3/hr - abbreviation for flowrate: cubic meters per hour.

4.2.5 Preparation

- Hazards
  - No hazards.
- Tools
  - No additional tools required to complete task.
- Requirements
  - Must be trained to operate the DCS or work within close contact with a trained operator.

4.2.6 Job steps

1 Paste Discussion Telephone Meeting (Person Responsible – Mill Operations Supervisor, Procon Underground Supervisor, Mine Captain and Control Room Operator)
   - A discussion will be held by all parties to ensure everyone is aware and in agreement of the paste backfill plan.

2 Prestart Checks (Person Responsible – Control Room / Paste Operator)
   - Procon Supervisor or Paste Watcher will contact Mill Control Room when they are ready to receive paste as discussed in a telephone meeting.
   - Ensure stope fill, paste and binder information has been provided to the underground paste watcher and they are ready to accept paste. **NOTE: Contact Procon Paste Watcher on Channel 5 (BJC: Paste). If the Paste Watcher cannot be reached, the CRO will contact the Procon Supervisor on Channel #2 (Underground: Mine Ops).**
   - **NOTE: All advice and directives from the Underground Paste Watcher must be adhere too.**
   - Check the level in the Tailing Stock Tank (5401) to ensure there is adequate material for paste mixing.
   - Check the Binder Silo level (5522) to ensure there is adequate material for paste mixing.
   - Ensure the diverter gates on the underground paste distribution lines are in the correct positions.
   - Ensure the paste pump hydraulic system temperature is within operating range. If the paste pump hydraulic system temperature is not within operating range, contact Paste Plant Operator to resolve issue.
   - Call Paste Operator to verify manual rinsing chamber water is on.
   - Ensure that binder recipe is to set point per stope requirements.

3 Start Wet Scrubber (Person Responsible - Central Control Room Operator / Paste Operator)
   - Open Wet Scrubber Fresh Water Supply Valve (5561).
   - Start Wet Scrubber Exhaust Fan (FA031M) at 50% speed and adjust as needed for dust extraction.

4 Start Paste Mixer (Person Responsible - Central Control Room Operator)
- Close Paste Mixer drain valve (5572/5582).
- Open Paste Mixer overflow valve (5571/5581).
- Start Paste Mixer (MX031M1) and fill mixer with water until overflows into desired pump - will be indicated with the paste pump level sensor when it overflows or have the Paste Operator verify visually.

5 Start Binder Delivery System (Person Responsible- Central Control Room Operator)
- Start Binder Screw Conveyor No.2 (CV022).
- Start Binder Screw Conveyor No.1 (CV021).
- Start Binder Weigh Feeder (FE021) and set to auto.
- Ensure Binder Silo Vent (5527) and Binder Silo Aeration supply (5528) are in CAS mode.
- Ensure Rotary valve (RV021) in CSA mode. This will cause the Binder Silo Vent (5527) and Binder Silo Aeration supply (5528) to open automatically once tailing has been received to the mixer.
- Ensure Binder Weigh Feeder controller (WIC5533) is in CAS mode.

6 Start Paste Pump (Person Responsible- Central Control Room Operator)
- Ensure the correct paste pump duty is “Selected”.
- Start the hydraulic unit for the selected paste pump (PU41HU/PU042HU).
- Set Paste Mixer Chute Level (LIC5574/5584) to 90% set point in MAN mode.
- Open Paste Mixer and Chute Flush Water valve (FIC55555) and put the set point to 70 to 80 m^3/hour in AUTO mode.
- Start the selected Paste Pump (PU041DH/PU042DH) and set the speed to 10% in MAN mode.
- Open desired Paste Mixer Chute valve (5557/5558). Increase the paste pump speed accordingly to maintain level (90%) in the chute (40 to 50% speed).
- Flush / Slick underground distribution paste line until Paste Watcher confirms clear flow of water exiting the pipe and there are no leaks on the distribution paste line.
- Turn water off to chute and all contributing valves are close (5555/5556/5557/5558).

7 Start Tailings Stock Delivery System to Paste Mixer in "Manual" Mode (Person Responsible - Central Control Room Operator)
- Set Mix Feed Pump controller to 80 TPH of feed (FIC5462) in AUTO mode. This is to allow a “softer start” as requested by vender.
- Open Tailings Stock Tank Feed Pump to Mixer valve (5464).
- Open "Pump Select" faceplate and sure that the desired pump (5445/5455) is selected as duty.
- Ensure Drain valve and gland water is in CAS mode.
- Open the desired discharge valve and suction valve on mixer feed line.
- Start desired Mixer feed pump (5445/5455 in AUTO mode.

4.3 BJ-PBF-SOP-553 Paste plant shutdown procedure

4.3.1 Objective

To establish mandatory requirements for the safe and responsible working standards for shutting down the Paste Plant.

4.3.2 Scope

This SOP covers the process and procedures which are used to shut down the Paste Plant.

4.3.3 Health, safety & reclamation code of BC

Section 1.11.1 (Training)

4.3.4 Definitions

- DCS
  - Distributed Control System: a computerized control system for a process or plant usually with a large number of control loops, in which autonomous controllers are distributed throughout the system, but are monitored by a central control operator.
- MAN
  - Manual mode: term used when the control parameters within the DCS are switched to operator (human) control.
- AUTO
  - Automatic mode: term used when the control parameters are monitored by the DCS.
- CAS
  - Cascade mode: term used in DCS control when one parameter or parameter dictates when another parameter is activated or deactivated.
- No.
  - Abbreviation for "number".
- CRO
  - Control Room Operator.
- Paste Watcher
  - Person responsible for monitoring the paste fill UG.
- Paste Operator
  - Person responsible for monitoring the paste plant.
- TPH
  - Acronym for "Tonnes per hour".
- UG
  - Underground.
- Pig
  - A device to clean and scour pipes / lines.

4.3.5 Preparation

- Hazards
  - No hazards.
- Requirements
- Must be trained to operate the DCS or work within close contact with a trained operator.

4.3.6 Job steps

1 Stopping Tailings Stock Delivery to Paste Plant

2 All contact will be made on Paste Channel #5

- Inform Procon Underground Paste Watcher / Booster Station Operator that the Paste Plant will be shutting down and the flush will start.
- Dependent on Tails Stock Tank level requirements, switch Tails Paste Thickener U/F to Tails Disposal Surge Tank.

3 Stop Paste Mixer / Binder Delivery System

- Stop Paste Mixer Feed Pump (003/004).
- Close Paste Mixer Feed Pump suction valve (5441/5451).
- Open Paste Mixer Feed Pump flush valve and flush line and mixer for 15 min (5442/5452).
- Start Paste Mixer Feed Pump (003/004), run in manual at about 12 to 15% speed.
- Flush Mixer feed line for 15 minutes or until the density gauge (FI5462) reaches 0% solids.
- Stop Paste Mixer Feed Pump (003/004).
- Ensure Binder Rotary Valve (RV021) is down. (When in CAS will shut down on low mixer feed density).
- Ensure Binder Weigh Feeder (FE021) is run off by checking that Weightometer (WIC5533) is reading 0 TPH.
- Allow feeder and screws to run for 5 to 10 minutes to ensure all residual binder has been run off.
- Stop Binder Weigh Feeder (FE021).
- Stop Binder Screw Conveyor No.1 (CV021).
- Stop Binder Screw Conveyor No.2 (CV022).
- Close Paste Mixer Feed Pump flush valve (5442/5452).
- Open Paste Mixer Feed Pump drain valve (5443/5453).

4 Flush Paste Mixer

- Close Mixer Slump Control water valve (5551).
- Inform Paste Plant Operator to start High-Pressure Pump (PU31/32) and run a 15-minute wash cycle.
- Adjust Paste Pump in Man mode to achieve a level (90 to 93%) in chute and put paste pump into AUTO.
- Flush water through the Paste Mixer for a minimum of 5 minutes. Call the Paste Operator to verify that the mixer has had enough flush time.

5 Flush Paste Line

- Contact Procon Underground Paste Watcher and inform that the 1-hour flush of the paste line has been initiated.
- Once the mixer has been flushed. Open Chute Flush Water Valve (5557/5558)
- Close paste feed pump valve (5442/5452).
  - NOTE: Ensure all processes have been turned off to mixer before closing overflow valve.
- Close Mixer Overflow Valve (5571/5581). Verify with operator that the valve fully closed.
- Adjust Paste Mixer and Chute Flush Water Controller (FIC5555). Dependent on water availability aim for 50 m^3/hr.

- Adjust paste pump speed to 40% output in MAN to achieve a level (90 to 93%) in chute and put paste pump into AUTO.
- Line is to be flushed until Paste watcher confirms.
- Adjust Paste Mixer and Chute Flush Water Controller (FIC5555) in MAN mode to a flowrate of 0 m^3/hr.
- Draw down the Paste Mixer Pump Chute.
- De-energize Paste Pump (041DH/042DH).
- Pig the Paste Line to Underground.
- Contact Paste Plant Operator to insert the clean out pig. (Refer to: BJ-PBF-SOP-560-Diverter Gate Operation & Pigging Procedure). If the Booster Station is running contact the Booster Operator also. Refer to: (BJ-PRO-SOP-570 Operating Underground Booster Station) for the shutdown procedure of the Booster Station.
- Contact Procon Underground Paste Watcher and inform them that a hard pig has been inserted into the paste line and flushing will re-initiate and to make contact when pig has been received.
- Start Paste Pump (041DH/042DH) and adjust in MAN mode to 40% speed.
- Adjust Paste Mixer and Chute Flush Water Controller (FIC5555) dependent on water availability aim for 50 m^3/hr.
- Adjust paste pump speed to 40% output in MAN to achieve a level (90 to 93%) in chute and put paste pump into AUTO.
- When confirmation has been received from the Paste Watcher that the hard pig has exited the paste line: De-energize the paste pump and repeat the above steps for the soft pig. If there is a T valve installed have the Paste Watcher open after the soft pig exits for remainder of flush.
- Once the 1-hour flush has been completed adjust Paste Mixer and Chute Flush Water Controller (FIC5555) to 0 m^3/hr.
- Close Process Water to Paste Mixer Chute (5557/5558).
- Draw down the Paste Mixer Pump Chute and de-energize Paste Pump (041DH/042DH).
- De-energize the Paste Pump Hydraulic Unit.
- Emergency contacts in the event of paste line failure.
- In the event, that there is a diverter gate or pump failure and unable to flush the paste line, the CR operator will contact the Supervisor and / or Mill Operation Superintendent / Mill Manager, who will then notify, within 30 minutes, the Mine Captain and / or Mine Manager.
- The Control room operator will email the Paste Update group on the status of the paste line clearing as they receive updates or as required.

6 Stop Wet Scrubber System (Person Responsible - Control Room Operator)

- Commence Wet Scrubber System shutdown after the paste plant has been down for a minimum of 30 minutes.
- Close Water valve (5561).
- Stop Wet Scrubber Fan (FA031).

4.4 BJ-PBF-SOP-555 Transfer of binder from ISO-VEYOR to bulk storage silo

4.4.1 Objective

To establish mandatory requirements for the safe and responsible working standards for transferring Binder from the ISO-Veyor to the Bulk Storage Silo.

4.4.2 Scope

This SOP covers the process and procedures which are used to transfer binder from the ISO-Veyor to the Bulk Storage Silo.

4.4.3 Health, safety & reclamation code of BC

Section 1.11.1 (Training)

4.4.4 Definitions

- ISO – container
  - A tank container which is built to the ISO standard (International Organization for Standardization). ISO tanks are suitable for multiple transportation methods such as truck, rail, or ship.

4.4.5 Preparation

- Hazards
  - Elevated noise levels
  - Dust (binder)
  - Pinch points
  - Caustic material (binder)
  - Overhead load (crane operation)
  - Slip, trips, & falls
- Tools
  - Pretium standard PPE
  - Half mask or full-face respirator
  - Wire brush
  - Keeper pins
  - Whip stops
- Requirements
  - Must be trained or working within close contact with a trained operator.
  - Air Purifying Respirator Evaluation & Fit Test.

4.4.6 Job steps

1 Pre-Start Checks (Person Responsible- Paste Plant Operator)
  - Once the ISO-container is staged, ensure the following conditions are met:
    - Ensure the silo vent fan and baghouse air are on.
    - Ensure vent valve is open and there is no pressure in ISO-container.
    - Top air vent valve is closed.
    - Material discharge valves are closed.
    - Aeration valves (6) are closed.
    - Boost valve is fully closed.
    - Ring jet is closed.

2 Hose Connections
  - Remove the cap from the ISO-container connector ports (Both feed and discharge ends).
  - Ensure gasket is seated in coupler.

- Connect both air intake and binder discharge hoses to the corresponding ISO-container connections.
- **NOTE: All keeper pins and whip stops must be in place before progressing onto the next step.**

3 Pressurizing the ISO-container

- Close the vent valve.
- Ensure blower discharge valve is open.
- Air inlet and binder discharge valves opened at header.
- Open all (6) aeration valves.
- Energize the Binder Unloading Blower (021M/022M).
- Allow the ISO-container to pressurize to approximately 1.2 bar / 120 kPa.
- **NOTE: Do not exceed 2.0 bar / 200 kPa.**

4 Discharging ISO-container

- When the pressure within the ISO-container reaches operating pressure (approx. 1.2 bar / 120 kPa), open top air vent valve and open the boost valve ¼ of the way.
- Close the aeration valves for bay 1 and bay 3.
- Open the discharge valve for bay 2.
- **NOTE: If the pressure in the ISO-container is increasing, open the boost valve accordingly to maintain adequate pressure. (1.2 - 1.8 bar / 120 – 180 kPa).**
- Discharge is complete when a drop in tank pressure is indicated on the pressure gauge.
- Close the Discharge Valve for bay 2.
- Open aeration valves for bay 3.
- Open the Discharge valves for bay 3.
- Close the Aeration valve for bay 2.
- **NOTE: If the pressure in the ISO-container is increasing, open the boost valve accordingly to maintain adequate pressure. (1.2 - 1.8 bar / 120 - 180 kPa).**
- Discharge is complete when a drop in tank pressure is indicated on the pressure gauge.
- Close the discharge valve for bay 3.
- Open the aeration valve for bay 1.
- Close the Aeration valve for bay 3.
- **NOTE: If the pressure in the ISO-container is increasing, open the boost valve accordingly to maintain adequate pressure. (1.2 - 1.8 bar / 120 – 180 kPa).**
- Discharge is complete when a drop in tank pressure is indicated on the pressure gauge.
- Close the discharge valve for bay 1.
- Open the aeration valves for bay 2
- Close aeration valves for bay 1.
- Repeat process for bay 2 to empty the ISO-container.
- Discharge is complete when a drop in tank pressure is indicated on the pressure gauge.
- Close discharge valve for bay 2.
- Close aeration valves for bay 2.
- Fully open boost valve to purge material remaining in discharge line.
- De-energize the blower.

5 Depressurizing the ISO-container

- Open vent valve slowly to bleed off pressure.

- Ensure boost valve is open.
- When the ISO-container pressure gauge displays 0 bar and you can no longer hear air discharging from the vent, remove locking pins disconnect the discharge hose and the blower hose from the ISO-container.
- Install the shipping caps onto the ISO-container connector ports.

4.5 BJ-PBF-SOP-557 Casting of cylinders for strength test – underground

4.5.1 Objective

To establish mandatory requirements for the safe and responsible working standards for collecting paste samples and casting of cylinders for strength test.

4.5.2 Scope

This SOP covers the process and procedures which are used to determine the optimal binder ratios relative to strength of the backfill material.

4.5.3 Health, safety & reclamation code of BC

- Section 1.11.1 (Training)
- Sections 1.8.2, 1.8.3, 1.8.4, and 1.8.5 (Personal Protective Equipment)

4.5.4 Definitions

- UCS
  - Unconfined Compressive Strength.
- TAMP
  - To press down lightly in an up and down motion.
- QA/QC
  - Quality Assurance / Quality Control.
- UG
  - Underground Preparation.

4.5.5 Preparation

- Hazards
  - Noise
  - Respiratory
- Tools
  - Pretium Standard PPE
  - Recommended Half-Mask Respirator
  - Ensure all the following materials are available before proceeding:
    - Bucket or pail
    - Slump Cone & Tamping Rod
    - 3 x 3 Plywood Board
    - Ruler
    - Trowel
    - UCS Cylinders
    - Knife

- Duct tape
- Sharpie
- Plastic
- Elastics
- Milk crate

- Requirements
  - Must be trained to operate the Paste Plant or work within close contact with a trained operator.
  - Underground Orientation.

4.5.6 Job steps

1 Determination of Time Delay (Person Responsible - Control Room Operator)
   - Control Room Operator will determine the time delay it takes for paste to leave the mill and reach the stope. This time delay is communicated to the Surface and UG Paste Operators at the beginning of each stope and used for the entire length of the pour.

2 Communication (Person Responsible - Surface Paste Plant Operator)
   - When surface samples have to be taken, the Surface Paste Plant Operator must contact the UG Paste Operator and inform them the exact time of sampling.
   - The UG Paste Operator will use the time delay to determine what time to take the underground samples.

3 UCS Cylinder Preparation (Person Responsible - UG Paste Operator)
   - Cut each cylinder and using duct tape, seal each cylinder split seam.
   - Label each cylinder as follows: YYYY-MMM-DD HH:MM UG. Example: 2017- SEP-19 09:45 UG. The date (YYYY-MMM-DD) can be written in advance of sample collection, but the time (HH:MM) must be written just before sampling. Ensure that UG is specified on all the cylinders.

4 Sample Collection (Person Responsible - UG Paste Operator)
   - Sample collections are conducted using the information from the Surface Paste Operators and the time delay.
   - Underground samples are only to be taken on dayshift.
   - 1 sample set equals 4 cylinders (2 x 7 day and 2 x 28 day samples).
   - Ensure latex or rubber gloves are donned prior to collecting sample.
   - Place pail under sample pipe extending off the T-Valve.
   - Open the T-Valve and collect enough paste to perform a slump and pour 4 cylinders.
   - Procon Paste Watcher can assist with collection of samples as needed.

5 Slump Test (Person Responsible - UG Paste Operator)
   - Place the slump cone on the wetted 3'x3' plywood. Ensure the surfaces of both the plywood and the cone are clean and moistened with water to eliminate sample sticking to equipment.
   - Stand on the foot tabs of the cone to hold it firmly during filling, taking precaution to keep constant force with little to no movement.
   - Fill the cone in three layers, each approximately one third the volume of the cone. Each layer is tamped with 25 strokes and uniformly distributed over the cross section of the cone. The second and top layers each are tamped throughout their depth, so that the strokes penetrate into the previous underlying layer.

- After the top layer has been rodded, the surface of the backfill material is stricken off at the top of the cone with the steel rod, so that the cone is exactly full.
- Lift the cone straight up and away from the backfill material counting slowly to 5, taking precaution to lift uniformly. Invert the cone and place it next to the slumped pile of backfill material gently ensuring not to disturb the slumped material. Place the steel rod horizontally across the inverted cone, so that the rod extends over the slumped material.
- Measure the distance between the bottom of the steel rod and the top of the slumped pile of material at three intervals across the top of the pile using a meter stick or ruler in inches. Record the Slump on the raw data Casting Sheet.

6 Filling UCS Cylinders with Sample (Person Responsible - UG Paste Operator)

- Fill each UCS cylinder (4), to a height of approximately 1/3 of the total height of the UCS cylinder.
- Tamp each UCS cylinder 25 times.
- Fill each UCS cylinder (4) to a height of approximately 2/3 of the total height of the UCS cylinder.
- Tamp each UCS cylinder 25 times.
- Fill each UCS cylinder (4), so that each UCS cylinder is full to top.
- Tamp each UCS cylinder 25 times.
- Cover UCS cylinders (4) with plastic and secure with elastic bands.

7 Sample Collection and Storage (Person Responsible- UG Paste Operator)

- Transport all 4 UCS cylinders directly to the curing chamber using a milk crate or similar container in a timely manner. Note: Cylinders must directly be transferred to the humidity lab and cannot be temporarily stored in any location.
- Place two UCS cylinders into each curing time shelf.

8 Data Collection (Person Responsible- UG Paste Operator)

- Fill in the Paste Casting Sheets and document that the samples were taken underground.
- Hand in Casting Sheets to the Metallurgist Group upon completion.

9 Clean up (Person Responsible- Paste Plant Operator)

- Clean up work area and tools.
- Place tools in proper storage area.

4.6 BJ-PBF-SOP-558 Casting of cylinders for strength test

4.6.1 Objective

To establish mandatory requirements for the safe and responsible working standards for casting of cylinders for strength test.

4.6.2 Scope

This SOP covers the process and procedures which are used to determine the optimal binder ratios relative to strength of the backfill material.

4.6.3 Health, safety & reclamation code of BC

- Section 1.11.1 (Training)
- Sections 1.8.2, 1.8.3, 1.8.4, and 1.8.5 (Personal Protective Equipment)

4.6.4 Definitions

- UCS
  - Unconfined Compressive Strength.
- TAMP
  - To press down lightly in an up and down motion to achieve a homogenous solution without any air bubbles, deformities, etc.
- QA/QC
  - Quality Assurance / Quality Control.

4.6.5 Preparation

- Hazards
  - Noise
  - Corrosive material
- Tools
  - Ensure all the following materials are available before proceeding:
    - UCS Cylinders
    - Scoop
    - Slump Cone
    - Moisture Tins
    - Tampering Rod
    - Small Taming Rod
    - Oven
    - Curing Room
    - Duct tape
    - Marker Pen (Sharpie)
- Requirements
  - Must be trained to operate the Paste Plant or work within close contact with a trained operator.

4.6.6 Job steps

1 UCS Cylinder Preparation (Person Responsible - Paste Plant Operator)
  - Regular sample set include 2 cylinders for 7/14/28/365 Days.
    - Under special circumstances two cylinders for 21days may be required.
    - only cast these extra samples at the direction of the Geotechnical department.
  - Using duct tape, seal each cylinder split seam.
  - Label each cylinder as follows: YYYY-MMM-DD HH:MM. Example: 2017- SEP-19 09:45. The date (YYYY-MMM-DD) can be written in advance of sample collection, but the time (HH:MM) must be written just before sampling.

2 Sample Collection (Person Responsible - Paste Plant Operator)
  - Sample collections are conducted under the following conditions.
  - Sample collections are conducted under the following conditions.
    - At least 1 hour after start-up and circuit is stable.
      - Ensure water isn't being added.
      - if % solids, binder % ore fill rate is outside of normal operating parameters.

- If recipe changes during the shift.
- Ensure latex or rubber gloves are donned prior to collecting sample.
- Inform Control room that you will be taking a slump sample so they can put paste pump into manual mode as not to interfere with the level control of the paste hopper.
- Transfer the required amount of sample from the sample port into a clean collection pail to fill the required casting cylinders.

3 Filling UCS Cylinders with Sample (Person Responsible - Paste Plant Operator)

- Fill each UCS cylinder (8), to a height of approximately 1/3 of the total height of the UCS cylinder.
- Tamp each UCS cylinder 25 times.
- Fill each UCS cylinder (8) to a height of approximately 2'3 of the total height of the UCS cylinder.
- Tamp each UCS cylinder 25 times.
- Fill each UCS cylinder (8), so that each UCS cylinder is full to top.
- Tamp each UCS cylinder 25 times.

4 Sample Collection Storage (Person Responsible- Paste Plant Operator)

- Transport the 7 day / 14 day / 28 day UCS cylinders to the curing chamber located adjacent to the Paste Plant lab.
- Place two UCS cylinders into each curing time shelf
  - Starting at the left-hand side moving clockwise.
  - For each type of sample (7, 14, 21, and 28 day).
    - Ensure the new samples are placed at the end of the block of samples.
    - Each row will store 3 sets (6 cylinders deep).
    - Once the current shelf is full, move to the next shelf in sequence.
    - Once the last shelf is full, there should be room to restart storing samples at the upper left-hand shelf.
    - Remember 21 is a priority stope and is only cast at the direction of the Geotechnical Department).
- Please keep the cylinders in order, if you are unsure ask your supervisor for clarification.
- Transport the 365 cylinders to the new curing room (located beside the Met lab under the tails thickener).
  - Starting at the left-hand side spiralling down clockwise.
  - Samples are stored 2 sets (4 samples) per row.
  - The room is set up in similar fashion to the original curing room. The start is at the top left corner and spirals downward. Please keep the samples in order.

5 Data Input (Person Responsible- Paste Plant Operator)

- Fill out the Casting Paste Cylinders Log sheet.
  - A new sheet is required for each Set of Cylinders (8).
  - Ensure you record the actual date and time.
  - Hand in the sheet (along with all other Paste operator sheets) to the Metallurgists Office.

6 Data Input (Person Responsible – Metallurgy)

- Ensure all Casting sheets were handed in. If sheets are missing, contact the Mill Operations Supervisor or Paste operator for clarification.

- Scan and save the Casting Paste Cylinders Log sheet in the following folder, under the appropriate Year / Month.
- J:\Mill Tech Services\PASTE BACKFILL\99-Paste Lab - QAQC\Strength Testing\01 Casting Sheets

7 Clean up (Person Responsible- Paste Plant Operator)

- Clean up work area and tools.
- Place tools in proper storage area.

4.7 BJ-PBF-SOP-559 Determination of unconfined compressive strength for cylinders

4.7.1 Objective

To establish mandatory requirements for the safe and responsible working standards for determining the UCS for cylinders.

4.7.2 Scope

This SOP covers the process and procedures which are used to determine the optimal binder ratios relative to strength of the backfill material.

4.7.3 Health, safety & reclamation code of BC

- Section 1.11.1 (Training)
- Sections 1.8.2, 1.8.3, 1.8.4, and 1.8.5 (Personal Protective Equipment)

4.7.4 Definitions

- UCS
  - Unconfined Compressive Strength.
- ARD
  - Acid Rock Drainage.
- QA/QC
  - Quality Assurance / Quality Control.
- kN
  - Abbreviation for kilo newton. A newton is the Standard International (SI) unit of force. One Newton is the force required to cause a mass of one kilogram to accelerate at a rate of one meter per second squared.
- Failure Threshold
  - Defines the load at which the machine starts looking for a failure. The machine ignores any failures below this level.
- Loading Rate
  - The rate at which the machine applies force to the sample specimen.

4.7.5 Preparation

- Hazards
  - Noise
  - Corrosive material
- Tools
  - Karol Warner Compression Machine Core sample saw
  - Ruler (or callipers)

- Scale
- Dust mask (recommended)
- Computer with Unconfined software installed

4.7.6 Requirements

Must be trained to operate the Paste Plant or work within close contact with a trained operator.

4.7.7 Job steps

1 USC Cylinder Preparation and Collection (Person Responsible - Paste Plant Operator)

- Obtain the list of cylinders to be broken from Metallurgy or Geotechnical Department (usually 7-10 days worth of cylinders).
- Submit a UCS testing log sheet even if no samples are scheduled for the that day.
- Fill out the Paste UCS Testing Log sheet with the Cylinder ID and Design Cure time.
- Enter the Tester, Date, and shift.
- Relocate from the new curing room to the original curing room the new month's worth of 365 samples at the start of each month.
- Arrange the samples in chronological order to ensure adequate space and ease for breaking.
- Go to the original curing room (adjacent to the Paste Plant Lab).
- Collect the required 7/14/28/365-day samples.
- Remove the samples in the opposite order that they were placed.
- Get guidance from the supervisor if you are unsure.
- Record on the UCS Test sheet all missing cylinders.
- Place the cylinders on the workbench.

2 Sample Collection (Person Responsible - Paste Plant Operator)

- Remove the tape holding the cylinder together.
- Gently remove the sample from the cylinder and place it upright on the workbench.
- Use a Pretium approved knife to remove the cemented backfill by cutting the plastic cylinder mould's length.
- Note: Ensure all cylinders that cannot be re-used or broken pieces of cylinders are disposed of in the hard plastic bin and not the paste reject bin.
- Inspect the sample for damage or deformities (cracks, air bubbles).
- Record any deformations in the record / notes section of the Paste UCS testing Log sheet.
- Ensure the following tasks are conducted on the core saw before using:
  - Check safety guards are in place and functional.
  - Clear work area from debris.
  - Check core saw water discharge hose run into the floor drain.
  - Use core saw only when sample is hard.
  - Cut each sample with the core saw to make flat ends on each side.
  - Use a flat ruler or device to flatten the end by scraping when the sample is too soft.
  - Place each sample upright on the workbench.
  - Measure the sample's diameter in two locations using a callipers or ruler.
  - Calculate the average diameter in mm.

- Record the average diameter of the sample into the USC Test Sheet.
- Place each sample onto its side on the workbench.
- Measure the sample's length in two locations.
- Calculate the average length in mm.
- Record the average length of the sample into the UCS Test sheet.
- Weigh the sample on the scale.
- Record the mass of the sample to the nearest gram.
- Record any irregularities with the cylinder on the UCS Test sheet, like air pockets, oval or bent shape.

3 USC Test (Person Responsible- Paste Plant Operator)

- Turn on the power to the Compression test machine, data readout and computer.
- Open the Karol-Warner Unconfined Software.
- Check that the software read port is correctly selected and select "Connect".
- Set Auto-stop test when load fall below peak = 20.
- Set Run test to Record Every(s) = 1.
- Set Compression Machine Strain Rate = to 2 kN/s up to a maximum strain value of 7%.
- Check the compression machines fittings are tight.
- Click the new file button.

- Enter Project ID = Cylinder ID (MMM-DD-YYYY hh:mm AM/PM - Design Cure Time (d)).
- Example: MAR 02 2021 0105 AM- 28.
  - Enter Cylinder ID = Test 1 or 2.
  - Click Set File.
  - Set the file location to local drive, preventing issues of generating corrupt data.
  - C:\KW UCS Results\yyyy\mm mmm\dd.
- Example for yyyy\mm mmm\dd is 2021\05 May\01.
  - Input the average length and diameter of the sample (mm).
  - Place the sample upright into the compression test machine and, using the jog switch, raise the sample until a small gap of approximately one millimetre is achieved.
  - Click Tare and then Start test on the software.
  - Push the toggle up on the compression test machine. A green light should appear indicating the direction it is running.
  - Push the RED stop button on the compression machine when it done. The program stops by itself.
  - Record on the paper log sheet the peak stress and peak load.
  - Click Save.
- An example of the file name is below.
  - MAR 03 2021 0140 AM – 7 UC 1.
- Use the jog toggle switch on the compression machine to retract the hydraulics.
- Reserve a small piece of sample for moisture analysis.
- Discard the sample into the discarded sample chute.

4 Sample Data Entry (Person Responsible- Paste Plant Operator)
- Cut up the step 3.23 sample into very fine pieces (smaller than rice).
- Place a clean, dry pan into the moisture analyzer, zero the scale.
- Weigh between 5-10 g of sample on the tray.
- Spread it out so it will dry faster.
- Hit start.
- Record the moisture on the sheet, when the cycle is complete.
- **Note:** Moisture analysis may take up to 30 minutes per sample. If needed, you can stockpile the broken pieces on the bench (label the pieces, so you know which sample is which). All moisture samples must be completed on the shift that the cylinders were tested.

5 Sample Data Entry and Copying to Network folder (Person Responsible- Paste Plant Operator / Metallurgical Technician)
- Fill out the Paste UCS Testing Log sheet.
- Start a new sheet for the other cylinders if more than 10 cylinders are tested.
- Record the actual date and time.
- Make a note on the sheet if samples were not tested due to missing or not found on the shelf.
- Check the data file is saved to the appropriate file name and location.
- C:\KW UCS Results\yyyy\mm mmm\dd.
- File name: MMM DD YYYY HHMM AM/PM - Cure Days UC SAMPLE 1 or 2.
- Example: MAR 03 2021 0401 AM – 7 UC 2.
- Copy the data files to the network folder inside same yyyy/mm mmm/dd folder.
- J:\Mill Tech Services\PASTE BACKFILL\99-Paste Lab - QAQC\Strength Testing\09 KW UCS Results\yyyy\mm mmm\dd.
- Hand in the sheet (Along with all other paste operator sheets) to the Metallurgists Office.

6 Data Input (Person Responsible – Metallurgy)
- Scan and save the Paste UCS Testing Log sheet in the following folder, under the appropriate Year / Month.
- J:\Mill Tech Services\PASTE BACKFILL\99-Paste Lab - QAQC\Strength Testing\02 Paste UCS Sheets.

7 Clean up (Person Responsible- Paste Plant Operator)
- Clean up work areas and tools.
- Place tools in the proper storage area.
- Ensure that Pretium standard waste separation practices are followed, and that plastics and other debris ARE NOT mixed with cylinder sample waste.

4.8 BJ-PBF-SOP-560 Diverter gate operation & pigging procedure

4.8.1 Objective

To establish mandatory requirements for the safe and responsible working standards for operating the Paste Plant Diverter Gate and inserting clean-out pigs into the Paste Plant discharge lines.

4.8.2 Scope

This SOP covers the process and procedures which are used to standardize operation of the Paste Plant Diverter Gate and the insertion of clean-out pigs into the Paste Plant discharge lines.

4.8.3 Health, safety & reclamation code of BC

- Section 1.11.1 (Training)
- Sections 1.8.2, 1.8.3, 1.8.4, and 1.8.5 (Personal Protective Equipment)

4.8.4 Definitions

- Clean-Out Pig
  - Round shaped foam which is cut or poured out of an open cell polyurethane.
- Pigging
  - Refers to the practice of inserting a clean out pig into pipelines to clean / remove material build up within the pipeline.
- Pinch Point
  - A pinch point is any point at which it is possible for a person or part of a person's body to be caught between moving parts of a machine, or between the moving and stationary parts of a machine, or between material and any part of the machine. A pinch point does not have to cause injury to a limb or body part, although it might cause injury - it only has to trap or pinch the person to prevent them from escaping or removing the trapped part from the pinch point.

4.8.5 Preparation

- Hazards
  - Pinch Points
  - Noise
  - Pressure in Paste Line
- Tools
  - Broom handle
  - Clean-out Pig

4.8.6 Requirements

Must be trained to operate the Paste Plant or work within close contact with a trained operator.

4.8.7 Job steps

1 Diverter Gate Operation
  - Visually inspect the pressure gauge on the Paste Lines (Discharge side of Paste Pumps) and ensure the pressure is reading 0 kPa.
  - Check the Diverter Gate Hydraulic Pack for adequate oil; oil level can be checked by using the site glass.
  - Contact the Control Room Operator and have them start (HY043) Diverter Gate Hydraulic Pump.
  - NOTE: Before moving / repositioning the Diverter Gate, grease the Diverter Gate.
  - The Diverter Gate (Connected to the Paste Line) can be moved to three different positions.
    - Paste Pump 1 is the centre position.
    - Paste Pump 2 is the left position.
    - Pigging Port is the right position.

- Use the black lever (Mounted on the south side of the Diverter Gate Enclosure) to move the gate to the desired position.

2 Insertion of Clean-Out Pig into Paste Discharge Line

- Ensure the Diverter Gate is in the pig position.
- Insert the pig into the pipe opening. Do not push the pig into the line using any part of the body.
- Use a broom handle to push the pig past the Diverter Gate into the Paste Line**. Do not to allow any part of the body to enter the pipe.**
- Use the black hydraulic lever to position the Diverter Gate to the desired Paste Pump.
- Contact the Control Room Operator to notify them that the pig has been inserted and the Diverter Gate is in the correct position for the pump being used.

4.9 BJ-PBF-SOP-562 Paste plant mixer cleaning

4.9.1 Objective

To ensure the Paste Mixer has been flushed and thoroughly washed when paste production is complete.

4.9.2 Scope

This SOP covers the process and steps involved to flush out the paste mixer and thoroughly wash using the high-pressure washing system.

4.9.3 Health, safety & reclamation code of BC

- Section 1.11.1 (Training)
- Sections 1.8.2, 1.8.3, 1.8.4, and 1.8.5 (Personal Protective Equipment)

4.9.4 Definitions

- LOTO
  - Lockout / Tagout: a safety procedure which is used in industry to ensure that dangerous machines and equipment are properly shut off and not able to be started up again prior to the completion of maintenance or service work.

4.9.5 Preparation

- Hazards
  - Respiratory
  - Slips & Falls
  - Elevated Noise
  - High-Pressure Water
  - Equipment damage
- Tools
  - Pretium standard PPE
  - Pressure washer
  - Air hammer / chisel
  - Respiratory Protection (when entering the Paste Mixer)
  - Face Shield (when operating the pressure washer and / or air hammer / chisel)

- Requirements
  - Lockout / Tagout training.
  - Confined Space training when entering the Paste Mixer.
  - Qualified Paste Plant Operator or working within close contact with a qualified Paste Plant Operator.

4.9.6 Job steps

The Paste Mixer must be thoroughly cleaned as soon as a paste pour is complete or during extended interruptions.

1 Washing the Paste Mixer (Persons Responsible - Paste Plant Operator)

- Once a Paste Pour is complete and the Control Room operator has finished flushing the Paste Mixer with water, the Control Room operator will contact the Paste Plant operator to divert the paste area sump (PU-013) to the Paste Mixer chute.
- Control Room Operator will be contacted and asked to open the Paste Mixer Drain Valves (HS-5572/5582).
- Paste Plant Operator will check the flow from the Paste Mixer Drain Valves (HS-5572/5582) to ensure there is no obstruction plugging the line.
- If the Paste Mixer is not draining, the Paste Plant Operator must conduct the following tasks:
  - Close the Paste Mixer drain valves (HS-5572/5582).
  - Open the flush water valve located between the Paste Mixer and drain valves and back flush the material back into the Paste Mixer.
  - After back flushing, close the flush water valve and open the Paste Mixer drain valves.
  - Check for flow from the Paste Mixer drain valves.
  - **If the back flush did not dislodge the paste build up, the mixer agitator must be shut down and locked out to manually dislodge blockage.**
- While the Paste Mixer is draining, the high-pressure water pump (PU-031/032) can be started on the 15-minute wash cycle.
- Once the wash cycle completes and the basement is pumped down, contact the Control Room Operator and divert the sump back to the Tailings Disposal Surge Tank.
- The interior of the Paste Mixer and the Paste Mixer Agitators must be inspected for build-up of paste. **It is very critical to ensure that all build-up of paste is removed from the interior of the Paste Mixer and the Paste Mixer Agitators.**
- Paste Plant Operator will use the High-Pressure Washer wand and clean out the interior of the Paste Mixer the best they can before entering. **Face shield must be worn when using the pressure washer**.
- Before entering the Paste Mixer for inspection and further cleaning, the Paste Mixer Agitators (MX-031M1/M2) and all associated equipment must be locked out according to the Lockout Isolation Point Checklist located in the following directory: J:Mill/Mill Lockout & Tagout/LOTO Checklists/Completed/Paste Production & Pumping.
- Confined Space procedures must be followed when entering the Paste Mixer. **Half masked respirator fit with P100 cartridges must be worn when inside the Paste Mixer.**
- Paste Plant Operator will continue cleaning out the Paste Mixer with an air hammer/chisel and any other tools needed to remove all hardened paste build up. **Pressure Washer will not be used while any persons are inside the Paste Mixer.**

- Any chunks of paste that are too large to be washed down the drain will be lifted out. **All residual pieces must be removed before the agitators in the Paste Mixer can be started.**
- If maintenance is required, the Paste Mixer can now be turned over to the Maintenance Department.
- If maintenance was conducted, operator and maintenance personnel must both be at the Paste Mixer before it is started. The Paste Mixer will be started at 10% speed while testing agitators for proper function.

4.10 BJ-PRO-SOP-564 Operating overhead door with safety edge bypassed

4.10.1 Objective

To establish mandatory requirements for safe responsible working standards for operating an overhead door when the safety edge is bypassed.

4.10.2 Scope

This procedure covers the steps involved for operating an overhead door when the safety edge is bypassed. This includes opening the overhead door and closing the overhead door.

4.10.3 Health, safety & reclamation code of BC

Section 1.11.1 (Training)

4.10.4 Definitions

No definitions.

4.10.5 Preparation

- Hazards
  - Any obstruction that may interfere with opening or closing the overhead door.
- Tools
  - No additional tools required.
- Requirements
  - Trained in operating overhead door when safety edge is bypassed.

4.10.6 Job steps

1 Opening Overhead Door
- Ensure door entrance is clear of obstructions.
- Push Up / Down button (Black) to open door.
- Do not allow any vehicular traffic through the doorway until the overhead door is fully opened.
- Direct vehicular traffic through doorway.
- Closing Overhead Door.
- Ensure vehicle has passed through the doorway and is clear of the overhead door.
- Press Up / Down button (Black) to close door.
- Visually monitor doorway to ensure no vehicles try to drive through the doorway as door is being lowered.
- **Note:** When the Safety bump is bypassed there is no door protection for the door encountering obstructions. This why it is imperative that the operator pays strict attention to when the door is being lowered or raised. Failure to do so could render the door inoperative due to equipment damage.

5 Underground standard operating procedures

All SOP must conform to the relevant Mine Regulations and Pretium Health and Safety Policies.

Key areas for each SOP are:

- Objective
- Scope
- Health, safety & reclamation code of BC
- WorkSafe BC Regulations
- Definition
- Preparation – hazards, tools, and knowledge
- Responsibilities
- Job Steps
- Revisions
- Approval signature record

The key guideline information is provided in the following Outotec functional description documents:

- 177421-0000-DC00-PHL-0001-R0 Process Control Philosophy.pdf – Appendix A
- J15-0015-FD-010-R0-Underground Booster Station.pdf
- J15-0015-FD-009-R0-Paste Pumps to Underground.pdf

5.1 Stope fill design note SOP

The purpose of the stope fill design note is to determine the following parameters:

- Dimensions and volume of the as-built stope.
- Size and shape of future fill exposures to adjacent stopes alongside, below, and above.
- Determine the strength of cured paste fill required for stable vertical and undercut exposures.
- Determine the volume of and binder requirements for each strength zone for fill runs.
- Determine the filling rate and vertical rise rate of fill within the stope and any restrictions to duration of fill runs due to barricade load limitations.
- Location of fill barricade(s), personnel entry limits and waste rock catch bunds (if any).
- A summary sheet to be issued to the Paste Production for fill pouring instructions.
- Any special notes or cautions with regard to fill operations, access or local safety issues.

5.1.1 References

- Section 7 in this report – Paste fill duty and target strength design.
- Section 9.3 in this report – Paste strength test work.
- Section 8 in this report – Paste barricade design.

5.1.2 Stope fill design note procedure

The stope fill design note will be produced by the mining engineer in conjunction with the Geotech engineer. It can be started using design parameters and progressively updated with as-built survey information for access development, stope cavity monitoring survey (CMS) including any material (ore, waste or fill falloff) remaining in the stope at the end of production. Stopes will typically be mined and filled over one sub level – 30 m, floor to floor and up to 15 m wide, along strike. The main variable will be the stope length which could vary from a maximum of 30 m to as short as

10 m. Narrow and short stopes will have a high fill raise rate and will require restricted fill pour durations to limit barricade pressures.

- The responsible engineer will examine the design or as built shape of the stope to be filled and will load into the model all other stopes in close or direct proximity to the stope.
- If the stope will be exposed at the base by a stope mined from the level below, the engineer will note that a high strength fill sill beam will be required in the initial pour. The thickness of this sill beam will be a minimum of one half of the width of the stope (15 m wide stope will require minimum 7.5 m thick beam). Pretium has specified a 10 m thick high strength (1,100 kPa) beam in all initial stopes.
  - The shape and dimension of the sill will be recorded. This will apply to all primary and secondary stopes at a sill level.
- The shape and dimensions of each vertical exposure to directly adjacent stopes will be recorded.
  - Most Primary stopes will have up to three vertical wall exposures which will be exposed sequentially (never simultaneously) during mining of pillars in secondary stopes. The first exposure will be a narrow 15 m wide face on retreat. The two following exposures will be 30m on either side, exposed as the adjacent secondary stopes are mined. These stopes will require regular strength fill as follows:
    - First 15 m high (Regular Strength recipe A) 350 kPa.
    - Fill above 15 m high (Regular Strength recipe B) 250 kPa.
  - Most Secondary stopes will have only one vertical wall exposures which will be exposed as a narrow 15 m wide face on retreat. These stopes will require low strength fill up to 200 kPa.
  - Bulk fill stopes will have no vertical wall exposures (but may have a sill beam) and will only require liquefaction resistant fill up of 100 kPa throughout or above the sill beam.
- Current design practice is to place a one-metre-thick cap of high strength (800 kPa) paste on the top of the fill to form a strong mucking surface, typically also capped with broken rock for improved traction. This cap design has been proven successful at Brucejack Mine.
- Using the six paste strength types shown in Table 5.1, calculate the volumes of each strength type to be placed in the stope and note the elevations within the stope where these binder changes occur.

Table 5.1 Paste fill strength type and current binder* dosing (February 2022)

Paste type	Usage	Design 28-day strength (kPa)	QC Average 28-day strength (kPa)	Current binder dosage by (%)	Current binder dosage (kg/m³)	Minimum paste slurry density (% w/w)	In situ density dry paste (t/m³)	In situ density wet paste (t/m³)
High-strength Paste	Sill beams up to 15 m wide	1,100	1,252	11.0%	125.5	63%	1.11	1.71
High-strength Paste	Top of stope caps for mucking	800	965	9.8%	111.8	63%	1.11	1.71
Regular Strength A	Regular stope in the first 15 m high	350	340	6.4%	73	63%	1.11	1.71
Regular Strength B	Regular stope at 15 m or higher	250	206	5.5%	62.7	63%	1.11	1.71
Low Strength Paste	Secondary stopes with short wall exposure	200	171	4.3%	49.1	63%	1.11	1.71
Liquefaction resistant Paste	Secondary stopes with no future exposures	100	110	3.8%	43.4	63%	1.11	1.71

Note: *Binder specified is Lafarge Terraflow T90 containing 90% slag and 10% general usage limestone (GUL) cement. Product details are supplied in Appendix F.

Brucejack will use the six paste binder recipes specified in Table 5.1 for the six fill strength types. The QC strength results should be reviewed regularly to ensure that design target strengths are being achieved and recipes adjusted when required.

The target design strengths and paste fill recipes have been adjusted from initial designs based on continuous review of QC paste strength data and the introduction of zoned paste fill strengths as originally recommended in the original Backfill Management Plan.

The mining engineer will prepare the fill note to include:

- Stope name to be filled, filling level and barricade level.
- Nominate the stope as primary or secondary and whether a high strength sill beam pour will be required.
- Agreement on reticulation route, specify which pump and which trunk pipelines and the length of pipes and boreholes will be used for flushing volume calculation.
- Volume of stope to be filled and density, strength and binder recipes required. A table of stope plan areas in one metre increments.
- Specify width and depth of sill pour.
- Confirm filling rate in m³/hr and estimate fill rise rate in stope. If rate exceeds 11.6 m in any 24 hours, fill run will terminate at that elevation and not restart until the 24-hour period has completed.
- Confirm start date for filling not earlier than 72 hours after barricade shotcrete completed and stope released by Backfill Operations.
- Document all agreed points and include with stope file note along with any Special Instructions.

The following page shows the SOP with example data inserted for the first stope to be filled.

5.2 Stope fill reticulation note SOP

The purpose of the stope fill reticulation note is to determine the following parameters:

- Route of UDS including fill placement level and drawpoint level.
- Main trunk pipe connections from surface to stope.
- Length and volume of UDS for flush run calculations.
- Estimate of friction losses for this stope and expected pump pressures.

5.2.1 References

Section 9.2 in this report – Paste fill rheology.

5.2.2 Stope fill reticulation design procedure

- The mining engineer will review the Stope Fill Design Note and will determine the fill placement level and the drawpoint level.
- If currently accessible, the engineer will inspect the route of the UDS on the fill placement level from the base of the fill borehole, along the steel trunk lines and to the fill crosscut.
- The engineer will record where manual pipe transfer changes are required and the various steel and HDPE pipe and bend installations required.
- Using the mine design software, the engineer will prepare a UDS string file of the full length of UDS from the paste pump discharge via the declines and boreholes to the discharge into the stope.
  - The engineer will calculate the length and volume of the UDS and will record the flushing water volume as 2x (twice) that volume.
  - The engineer will measure the static head difference between the paste pump outlet and the discharge into the stope and calculate the hydraulic gradient (static head / UDS length).
  - Using the friction losses in Table 5.2, calculate the total friction loss along the UDS length and correct for (add or subtract) the static head difference using default values for 63% w/w solids and 1.71 t/m^3 slurry density.
    - Example calculation: Pump 1407 RL, UDS outlet 1350 RL, static head -57 m.
    - Slurry head = -57 * 1.71 * 9.81 = 956 kPa.
    - If total UDS length is 500, then friction losses are 10 * 500 = 5,000 kPa.
    - Pressure at pump exit is 5,000 + (-956) = 4,044 kPa (or 40.4 bar).
  - The pump working pressure is then recorded on the Fill Reticulation Design note.

Table 5.2 Flow model parameters

Slump (mm and inches)	Cemented paste fill (w/w % solids)	Friction losses (kPa/m)
175 mm (7”)	65%	15 kPa/m
210 mm (8.5”)	63%	10 kPa/m
250 mm (10”)	61%	4 kPa/m

5.3 Fill preparation SOP

The purpose of the fill preparation SOP is to ensure that the stope is ready to receive paste fill. This will include:

5.3.1 References

Section 7 in this report - Paste fill duty and target strength design.

5.3.2 Stope fill preparation procedure

- The mining engineer will review the Stope Fill Design Note and will determine the fill placement level and the drawpoint level.
- Check that UDS is correctly connected, and pressure sensors and pressure relief valves are present and correct.
- CMS survey of stope void to determine shape and volume to fill and stope plan area to determine fill rise rate.
- All entry points to the stope are inspected to be safe, and travel restriction barricades and signage installed.
- Fill Barricade location has been inspected, confirmed, and recorded.
- Waste rock bund walls and or travel restriction areas defined and recorded.
- All locations recorded on maps for filling level and drawpoint level.
- The stope has been released by production for fill preparation.
- At the end of production operations, the stope is signed off as completed and ready for fill preparation activities. This includes preparation of stope fill note containing:
  - Details of fill volume, limits to either fill pouring rate or duration of fill runs and resting periods, if any.
  - Details of future cured fill exposures including vertical and undercut exposures (if any) with strength requirements.
  - List of fill pour volumes, 28-day strength requirements and binder recipes for each volume increment.
  - Location and dimensions of all barricades.
  - Instruction on tight filling and or top dressing with waste rock for each stope.
  - Installation of level piping (steel) and crosscut piping (HDPE) and establishment of safe pouring location from upper level.
  - If filling via borehole into stope, ensure that breather hole is available to monitor tight filling and pressure break to ensure no excess pumping or static head pressure can be transmitted to barricade walls.
  - Installation of cameras for remote observation, if required.
  - Installation of safety barriers, access warning signs to manage or prevent access to stope filling activities.
  - Installation of pressure monitoring equipment in stope, if required.

5.4 Fill barricade construction SOP

The current design of fill barricades for Brucejack are limited to a maximum working wall capacity limit of 200 kPa. At a wet slurry density of 1.71 t/m^3. This is equivalent to a paste slurry height of 11.9 m behind the wall. Pretium has stated the maximum height of pour behind a wall in any 24 hours of paste filling will be 10 m. If the stope plan area is less than 250 m^2, this rate could be exceeded at 140 m^3/hr paste filling rate. In this case, the fill pour must be suspended and not restarted until the 24-hour time span from the start of the previous fill run has been reached.

The only exception to this rule is where a vertically oriented total pressure cell has been mounted behind the barricade and the remote readings continue to show less than 200 kPa horizontal stress and has been verified by the Geotechnical Engineer. In this case only, fill pouring may continue under advice from the Geotechnical Engineer.

5.4.2 Arched shotcrete barricade construction procedure

- At the completion of production from a stope, the stope is signed off as complete and available for fill preparation activities.
- The drawpoint is inspected and made safe as per the Pretium Ground Control Management Plan. If space is available, a small bund of waste rock should be placed under the brow of the drawpoint to act as a catch bund in case of small rock falloff within the stope to protect construction activities.
- The wall and back will be inspected and a suitable location between 5.0 and 6.0 m back from the brow will be marked. A paint line arc with a radius of 4.5 m will be drawn on the floor from the centreline of the drive at this point and up the walls of the drive where they intersect. If a better location due to wall shape or poor ground the location of the wall can be moved along the drive on the direction of the Geotechnical Engineer or Supervisor.
- The walls and back will be cleaned of all loose rock and washed down to at least 1.0 m on either side (2.0 m total) of the paint line. This rubble and the floor will then be cleared to 2.0 m width to expose the rock floor and also cleaned of all loose rock.
- A series of shear pin holes will be drilled at 600mm intervals along the centreline of the barricade to a depth of 1.5 m and at least 25 mm diameter. Each hole will have a 2.7 m long #8 (20 mm) Dywidag bar inserted and grouted, or rock bolt resin installed to full depth.
- The wire mesh 400 mm x 400 mm channel frames will be erected vertically along the centre line of the barricade and clipped to the Dywidag shear pins. As the channel frames are being erected, the bedspring mesh and burlap backing will be installed, clipping to both the shear pins and channel frames.
- 6m long 20 mm diameter rebars bent to 4.5 m radius will then be installed horizontally across each wall Dywidag dowel and connected across the drift. Vertical straight 20 mm rebars will be installed vertically from back to floor.
- 825 mm long shotcrete thickness depth gauge bars will be installed parallel to the drawpoint axis, located 750 mm from the sidewall of the drive.
- The final task will be to install sheets of 100 mm x 100 mm mesh to the 20 mm rebars and channel frames. The construction framework should be inspected prior to the next stage of shotcreting.
- When the barricade framework has been completed, shotcrete can be applied. The shotcrete mix used will have an unconfined compressive strength (UCS) of 20 MPa at three days of curing. The shotcrete will be sprayed in multiple passes to ensure even thickness and complete penetration of the barricade to the burlap backing. The minimum thickness of the shotcrete will be 400 mm to completely embed the channel frames in the centre of the barricade. The thickness will be progressively increased outwards from the centre to be 825 mm thick at the outer depth gauges and to the wall. The objective is to achieve a wall contact of at 1,950 mm of shotcrete to minimize shear loading and improve the efficiency of the load bearing arch shape.
- When shotcreting is complete the wall will be inspected for complete full depth coverage. Any areas which are incomplete will be shotcreted to completion. The date and time of completion will be recorded by the supervisor, and it is recommended that this also be spray painted on the wall. The stope will not be released for paste filling until 7 days or until the shotcrete has reached 20 MPa, whichever is the sooner. after the shotcreting has been completed to ensure

the design UCS has been reached and the barricade has reached is design working load capacity.

- QC procedures will be carried out at all stages of barricade construction including:
  - Checking on the location of the wall with respect to the bow.
  - Condition of boundary interfaces.
  - Dimensions of all components within the wall.
  - Checking of pin spacing.
  - Checking correct installation of depth gauges.
  - Depth of shotcrete applied to the wall.
  - Collection of QC samples to confirm strength development.
  - Marking of date and stope name on completed wall.
- At the end of construction, a no travelling unless authorized sign will be placed at the entrance to the drawpoint from the level access drive. During filling activities only authorized persons will have access to the barricade for the purpose of inspection or data collection. If required, a waste rock bund will also be placed at the entrance to act as a catch berm in the event of fill leakage.

5.5 Starting a fill run directly to underground SOP

This SOP refers only to stopes being filled directly from surface pumping and bypassing the Booster Station. When filling via the Booster Station BJ-PRO-SOP-570 Operating the Underground Booster Station is to be used.

5.5.1 References

Outotec Functional Description - J15-0015-FD-009-R0-Paste Pumps to Underground.pdf.

5.5.2 Fill run start up procedure

- Stope Fill Design Note
- Stope Fill Pouring Note
- Pre-Pour Meeting
  - Backfill co-ordinator –surface and underground, mine planning and production, Geotech.
  - Stope name to be filled, filling level and barricade level.
  - Agreement on reticulation route, specify which pump and which trunk pipelines and the length of pipes and boreholes will be used for flushing volume calculation.
  - Volume of stope to be filled and density, strength and binder recipes required.
  - Specify whether high strength sill beam pour required and depth of sill pour.
  - Confirm filling rate in m^3/hr and estimate fill rise rate in stope. If rate exceeds 11.6 m in any 24 hours, fill run will terminate at that elevation and not restart until the 24-hour period has completed.
  - Confirm start date for filling not earlier than 72 hours after barricade shotcrete completed and stope released by Backfill Operations.
  - Document all agreed points and include with stope file note along with any Special Instructions.
- Stope Ready Permission
  - No water or paste will be delivered until permission has been received that the stope is ready to receive fill.

- Slick the Fill Line
  - Water will be pumped through the fill line for 10 minutes to ensure the line is wet and correctly routed to the stope.
  - The UG Pour Leader will signal the arrival of the water at the stope and will instruct the Paste operator to start making paste.
- Running Paste.
  - On receipt of permission to start making paste, the paste operator will combine thickened tailings slurry, tailings cake from the horizontal belt filter (if required), binder and any adjustment trim water to start producing the paste fill.
  - The paste operator will monitor paste slurry density, binder addition and the pressure sensor readings in the surface Utilidor and underground to manage the quality of the paste fill. The operator will aim to achieve the highest paste density within the limits of reticulation and pumping pressure and managing the risk of pipeline blockage.
  - The paste operator will record paste activities at hourly intervals into the shift record sheets or spreadsheets.
  - The paste operator will collect QC samples at least twice per shift as per the paste QC SOP.
  - The UG Pour Leader will monitor the paste placement into the stope from the pouring level and from the barricade level as required. If pressure instrumentation has been installed in the stope, this can be used as an additional monitoring tool.
  - In the event of an upset condition the Paste Operator can halt the paste fill production and commence a flushing cycle. If the upset event is minor and can be rectified within one hour, the paste line can be left full for one hour maximum and restarted when fixed. If the upset is still not fixed after one hour maximum, the line must be flushed clean.
  - In the absence of upset conditions, paste fill will be placed continuously using pressure and remote video monitoring to either an agreed volume for that run or until advised by the UG Pour Leader that the fill run is to be terminated. Paste can be placed during changes of shift using remote monitoring.

5.6 Stopping a fill run directly to stopes underground

This SOP refers only to stopes being filled directly from surface pumping and bypassing the Booster Station.

In the event of an upset condition the Paste Operator can halt the paste fill production and commence a flushing cycle. If the upset event is minor and can be rectified within one hour, the paste line can be left full for one hour maximum and restarted when fixed. If the upset is still not fixed after one hour maximum, the line must be flushed clean.

Stopping a fill run will require all of the paste currently in the mixer and the volume of the delivery system to be pumped into the stope. Due to the binder addition to the paste, the line must be thoroughly flushed with water to push a pig through the line.

Due to the design of the UDS, water will always be present in the dog leg section between the VOK borehole and the booster station to an elevation of 1360 RL after any flush run. Any maintenance work on this section of pipeline should assume the line has a static pressure of 60 m water head or 600 kPa and which must be relieved before work commences.

5.6.1 References

Outotec Functional Description - J15-0015-FD-009-R0-Paste Pumps to Underground.pdf.

5.6.2 Fill run stopping procedure

- Paste operator will shut down feeds to the paste mixer. The binder system will be shut down and if the Horizontal Belt Filter (HBF), is in use, the belt will be emptied, and tailings returned to the tailings storage tank. The HBF will be flushed clean.
- Water will be introduced to the mixer for flushing and will continue until the discharge is clear of cemented paste. The water and paste pump will continue for two minutes to commence the flushing of the pump system.
- The Paste operator will notify the UG Paste Leader that the line is being stopped to insert a pig.
- The pump will be turned off and the pressure will be confirmed at zero before adjusting the diverter valve to the middle position.
- The paste operator will insert the pig and return the diverter valve to the original position and notify the UG Paste leader that flushing is now commencing.
- The paste operator will now pump water and the pig through the line until the volume of water is two times the volume of the line to that stope.
- The UG Paste Leader will observe the discharge and will either see the pig and or the water behind the paste becoming progressively clear. If the line does not clear, the UG operator can instruct the Paste Operator to insert another pig or to keep flushing until advised. Extra flushing should be minimized.

5.7 Operating the Underground Booster Station

To establish mandatory requirements for the safe and responsible working standards for operating the Underground Booster Station.

5.7.1 Operating the Underground Booster Station Job Steps

NOTE: All advice and directives from the Underground Paste Watcher must be adhered to.

- Pre-start Checks (Person Responsible- Underground Paste Plant Operator)
  - Start Hydraulics (2153-HY-003) to Diverter Valves.
  - Set Diverter Valve to Paste Pump (PU-020).
  - Verify Destination Valve is correct for Destination: 1350 Level, Lower VOK or Upper VOK".
  - Stop Hydraulics to Diverter Valves.
  - Wet the Live Bottom Hopper.
- Pre-Start checks (Person Responsible - Control Room Operator and Underground Paste Booster Operator)
  - Close Hopper Discharge Valve (2153-HS-5613) to Booster Paste Pump (PU020}.
  - Start Bottom Hopper Augier Forward (2153-HO-001}.
  - Verify Flush Water Tank Level (2153-Ll-5621) is greater than 80% and set to CAS mode.
- Pre Wetting Live Bottom Hopper (Person Responsible - Control Room Operator)
  - Use slick water from surface paste plant.
  - If water from surface is not available, start selected Flush Water Pump (2153-PU-001 or 2153-PU-002}.
  - Set Live Bottom Hopper Level (2153-LIC-5611) to approximately 67% in AUTO mode.
- Prepare Booster Pumps for Start-up (Person Responsible- Control Room Operator)
  - Open Hopper Discharge Valve (2153-HS-5613) to Paste Pump (PU-020).

- Start Booster Paste Pump (Person Responsible - Control Room Operator)
  - When the Underground Paste Plant gives the confirmation that "Underground is ready for Start-up", the surface paste plant will be started using water.
  - The Underground Paste Plant Operator will inform the Control Room Operator when water is received into the Live Bottom Hopper.
  - The Underground Paste Plant Operator will inform the Control Room Operator that "Underground is ready for paste.
  - Allow the Live Bottom Hopper to attain a level of approximately 70%, then start Booster Paste Pump (PU-020).
  - Adjust pump stroke to maintain a level of 65%- 67% in the Live Bottom Hopper, then switch to AUTO mode.
  - The Surface Paste Plant Operator will start pumping paste underground.
  - The Underground Paste Plant Operator will inform the Control Room Operator when paste is discharging into the Live Bottom Hopper.
  - If the Booster Paste Pump (PU-020), was turned off, turn the pump back on and set to AUTO mode and set the level in the Live Bottom Hopper to around 67% on (2153-LIC-5611}.
- Shutdown and Clean Out Mode (Person Responsible - Control Room Operator)
  - After the pour of Paste is complete, the surface plant will go into cleanout mode. This process will send dirty water to Live Bottom Hopper and Booster Station.
  - The Underground Booster Paste Pump (PU-020} will remain running until the Underground Paste Plant Operator verifies that "clean11 water is discharging into the Live Bottom Hopper.
  - Stop Underground Paste Booster Pump (PU-20).
- Pigging the Surface Line (Person Responsible- Control Room Operator & Mill Surface Paste Plant Operator)
  - Surface Paste Plant Operator will prepare the surface line for pigging as per Pretium Pigging SOP1.
  - When confirmation from the Underground Paste Plant Operator has been given that the pig has arrived and the pig has been removed from the Live Bottom Hopper and the flow into the Live Bottom Hopper is clear, the surface paste pump can be shut down and the procedure for pigging the underground paste line from the booster pump to the stope can be conducted.
- Flush the Live Bottom Hopper (Person Responsible - Underground Paste Operator)
  - Close the drain on Live Bottom Hopper to catch any excess water for pigging the underground process. Remaining water will report to sump via Live Bottom Hopper overflow.
  - Start Underground Paste Booster Pump (PU-20}.
  - Flush the underground line for approximately two minutes with water from the Live Bottom Hopper.
  - Stop Booster Paste Pump (PU-020}.
  - Confirm a loss in line pressure at 2153-PI-5641 and 2153-PI-5646.
  - To prevent backflow, start the Diverter Hydraulic Power Pack 2153-HY-003 and move Diverter Valve No.1 (2153-DV-001} to the centre pigging port and verify with 2153-PI-5646.
- Pigging the Underground Line (Person Responsible-Underground Paste Operator)
  - Turn Diverter Valve Hydraulic Power Pak (2153-HY-003) on.

- Place both Diverter Gates to Neutral position.
- After the line pressure has been proven to be zero (2153-PI-5647 and 2153-PI-5646).
- Insert the pig into the line making sure it is beyond the rotating plate of the diverter plate.
- Return the Diverter Valves to previous position for Booster Paste Pump (PU-020) and verified by 2153-ZI-5643A.
- Turn Diverter Valve Hydraulic Power Pak (2153-HY-003} off.
- Start Paste Pump (2153-PU-020}.
- Once the UG Paste Plant Operator verifies that the Pig has been released and the UG Paste Watcher verifies clean water is exiting the pipe, stop Paste Booster Pump (2153-PU-020).
- Position Diverter Valve No. 1 slowly to the centre Pig Insertion Port (B) and allow remaining water to drain into the sump.
- Stop the Paste Pump Hydraulic Power Unit (2153-HY-020) allow for cool down period.
- Conduct general circuit clean up.

5.8 Paste line blockage

The Pretium paste system UDS has been designed with multiple pressure monitoring points and a high-capacity pump to enable operators to manage the paste density and react to and prevent potential blockage events before they occur. During commissioning, working pressure trends will be developed and guidelines for operators will be provided and updated in the SOP. The system allows for fine tuning of trim water addition to modify the paste rheology and manage paste line pressures and prevent blockages occurring.

This SOP applies when a major upset event occurs such as extended power loss or if the normal Stopping of the Fill Run SOP has failed to empty the line of paste.

In the event of a blockage occurring due to power loss, safe working practices around a potentially energized paste pipeline are paramount and careful, timely response to clearing the line during cement binder setting is important. Experience at other mines has shown that the paste line can be shut down and restarted within one hour in the event of an extended power loss or other short term breakdown event. If the returned power is emergency only, then the normal Stopping the Fill Run SOP applies.

The Pretium paste system UDS has been designed with two parallel lines available into the mine and twin pumps with the ability to use either pump on either line. Subject to safe working conditions, paste pumping underground may continue during clean out of the other blocked line.

5.8.1 References

- Outotec Functional Description - J15-0015-FD-009-R0-Paste Pumps to Underground.pdf
- Stopping the Fill Run SOP

5.8.2 Paste line blockage procedure

- The operator will carry out the Stopping the Fill Run SOP. If this cannot be completed due to loss of power or a blockage occurring, the operator will notify their supervisor and the UG Paste Leader that a blockage has occurred.
- The operator will ensure that all tailings and binder feed to the mixer has stopped and only water is being added.

- If power is available and under instruction by the paste plant supervisor, the normal peak pressure of the pump can be increased to the maximum operating limit of 150 Bar to attempt to clear the blockage with water.
- If this is unsuccessful, the pump will be shut down and depressurized and the UG Paste leader advised that the line is now blocked.
- If the line is blocked at the base of the VOK borehole or other vertical paste borehole, the UG Paste Leader will depressurize the line and open it to enable the paste to flow out of the borehole by gravity into the adjacent sump.
- If the pump is available actions may include:
  - Restarting the pump with water and flushing any remaining paste in the upper line section into the same sump.
  - Closing the line again at the base of the VOK borehole and opening the line by the 1350 Bypass sump and attempting a flush that section of the line up the VOK decline.
  - If that is successful, the line can be progressively broken and reconnected to pump and flush out each section until the line is completely clear to the stope.
- If the line cannot be cleared by pumping, or the pump is not available, then each pipe length or spool starting from the delivery end at the stope will be progressively opened. Using a pipe cap with a high-pressure water connector, the soft paste will be washed out of each pipe section.
- If any of the boreholes are blocked, a drill rig will be mobilized and the hardened paste will be drilled out.
- If the paste fill has set hard in the pipes, the blocked pipes will be dismantled and returned to surface to be drilled out and cleaned using a boring rig.

5.9 Tight filling a stope into an open void

In many circumstances, stopes will be tight filled to the shoulders of the original drill drive to ensure that the crown of each stope is adequately confined and that large unsupported spans do not occur during adjacent secondary stope extraction. This SOP covers activities required when filling into an open void from the upper level of the stope and the final fill surface is visible to the observer. The objective is to bring the elevation of the top surface of the fill to be in good contact with the shoulders of the stope up to the floor of the upper drill drive. This will ensure that the back of the stope is confined on either side of the drill drive and no void will be present when the secondary stopes alongside are mined. Extended back spans will be prevented.

This SOP does not cover tight filling a stope through a closed borehole and adjacent breather hole, either from the drawpoint elevation below or through rock or fill from alongside or above the stope. That SOP is the next section in the manual.

The key risks are both under filling (poor support to the back of the stope) and over filling (spillage of fill at that level). In some cases, the tight fill will be carried out with high strength fill to enable a good mucking surface.

5.9.1 References

Outotec Functional Description - J15-0015-FD-009-R0-Paste Pumps to Underground.pdf.

5.9.2 Tight filling a stope into an open void procedure

- During the design of the fill runs for the stope the Engineer will note whether the stope requires to be tight filled. This will be true in most cases.
- The Engineer will specify the volume of fill that will be placed as “tight fill”.

- The Engineer may specify a lower fill placement rate if required for level control.
- The binder recipes of the fill will be taken from the fill run design note and note that recipes may change during tight filling.
- Filling operations will take place for the lower part of the stope until the elevation of the tight fill is reached.
- The UG Paste Leader will advise the Operator and Engineer that tight filling is commencing and may continue filling operations.
- The UG Paste Leader will monitor the fill level visually at frequent intervals during the shift and when the fill run is within 200 m^3 of the tight fill volume will arrange for continuous monitoring for the last few hours of filling.
- When the observer sees that the fill has covered the shoulders of the stope and nearly reached the elevation of the level, they will inform the operator that the stope is now full and to commence a fill run shut down. The additional volume of fill in the reticulation will be placed into the stope and the line flushed.
- The UG Paste Leader will advise the Operator and Engineer that the stope is tight filled.

5.10 Tight filling a stope through a borehole and breather borehole

Tight filling is required in some stopes to ensure that the crown of each stope is adequately confined and that large unsupported spans do not occur during adjacent secondary stope extraction.

This SOP covers activities required when filling via boreholes from below or above the top of the stope and the final fill surface is not visible to the observer. The objective is to bring the elevation of the top surface of the fill to be in good contact with the shoulders of the stope up to the floor of the upper drill drive. This will ensure that the back of the stope is confined on either side of the drill drive and no void will be present when the secondary stopes alongside are mined. Extended back spans will be prevented.

When a stope is mined with retreating blind upholes and there is no physical access to the top of the stope, filling will take place via a pair of angled boreholes drilled from the drawpoint at a steep angle to intercept the top of the stope. One borehole will act as the fill hole and the other as a breather hole. During tight filling operations, the breather hole will be observed for displaced airflow and at the first sign of fill reaching the breather hole the fill run will be terminated.

An alternate situation where a stope can be accessed by boreholes from the upper level or above, sometimes through previously cured fill. Again, two boreholes will be used, one to fill and the other as a breather. If there is any positive static head available at the collars of the two boreholes it is recommended that a small launder be fitted to the filling borehole which is filled from the reticulation piping. This will eliminate the possibility of overpressure from static head.

The key risks are both under filling (poor support to the back of the stope) and over filling (over pressure of the fill in the stope, putting the drawpoint barricade at risk). There have been several recorded instances of barricade failure caused by applying excess static head pressure to the semi liquid fill from the fill line during these operations.

5.10.1 References

Outotec Functional Description - J15-0015-FD-009-R0-Paste Pumps to Underground.pdf.

5.10.2 Tight filling a stope through a borehole and breather borehole procedure

- During the design of the fill runs for the stope the Engineer will note whether the stope requires to be tight filled. This will be true in most cases.

- The Engineer will specify the volume of fill that will be placed as “tight fill”.
- The Engineer may specify a lower fill placement rate if required for level control.
- The binder recipes of the fill will be taken from the fill run design note and note that recipes may change during tight filling.
- Filling operations will take place for the lower part of the stope until the elevation of the tight fill is reached.
- The UG Paste Leader will advise the Operator and Engineer that tight filling is commencing and may continue filling operations.
- The UG Paste Leader will arrange to monitor the air flow from the breather hole at frequent intervals during the shift and when the fill run is within 200 m^3 of the tight fill volume will arrange for continuous monitoring for the last few hours of filling.
- When the observer sees any evidence that the fill has reached the breather hole, they will immediately inform the operator that the stope is now full and to commence a fill run shut down. If the additional volume of fill in the reticulation system can be diverted from the stope, this should be done.
- The UG Paste Leader will advise the Operator and Engineer that the stope is tight filled.

6 Underground paste distribution system

This section covers all underground activities related to the distribution of paste by pump and gravity to the stopes.

6.1 Reticulation system

A schematic of the overall reticulation system is shown in Figure 6.1 including the Booster pump station.

Figure 6.1 Schematic of underground reticulation

Paste fill is delivered underground by pumping to the stoping areas via a pair of pipelines installed in the main access decline. The lines pass through the "dogleg borehole" and up to the booster pump station via the VOK access drift. During commissioning and initial operations, paste will be pumped directly to the first few stopes to be filled. During this time, the booster pump station will be commissioned and used wherever higher density paste can be placed.

The Booster Station is located at 1320 RL and consists of a feed hopper and provision for a pair of GEHO PD pumps with the same specifications as the surface unit. To date, one pump has been installed due to the expected low utilization rates. The second pump will be installed if availability and utilization rates require it.

When the paste system is operating, the pressures will generally be much lower and controlled entirely by the balance of the total friction losses throughout the entire reticulation system and the static head developed in the boreholes and pipelines to overcome those friction losses. Table 6.1 and Figure 6.2 shows the expected pressure losses for surface pumping.

Table 6.1 Flow model parameters

Slump (mm & inches)	Cemented paste fill (w/w % solids)	Friction losses (kPa/m)
175 mm (7”)	65	15
210 mm (8.5”)	63	10
250 mm (10”)	61	4

Figure 6.2 Brucejack reticulation density and friction limits from surface pumping

Figure 6.3 shows the expected pressure losses for underground booster station pumping.

Figure 6.3 Brucejack reticulation density and friction limits from booster station pumping

6.2 Piping design standards

All piping at Brucejack must comply to the Pretium Brucejack Design Specifications. These are shown in Table 6.2 though Table 6.5.

Table 6.2 Piping design standards

Piping design standard	Type	Material	Design pressure (kPa)	Application
PCC7FS	High-pressure piping	Ultratech 600	15,200	From paste plant to Booster Station to the level and borehole connections
PCC5HS	Level piping	Carbon steel		Sub levels from borehole connections to stope crosscuts
PPE2US	Cross cut piping	HDPE		Stope and levels where distance to pipe discharge is less than 90 m based on maximum design pressure of 1,380 kPa and design pressure loss of 15 kPa/m

Table 6.3 PCC7FS – high-pressure piping - Ultratech

Item	Size	Material	Mfg. method	Material spec	Pressure class	End prep	Spec
Pipe	8″	Induction hardened carbon steel	ERW	Ultra 600 (Ultratech) or approved eq.	Sch. 80	Plain end	UT600
	8″	Carbon steel	SMLS	ASTM A53 Gr. B Type 5.	Sch. 120	Plain end	ASME B36.10M
Fittings	8″	Induction hardened carbon steel	ERW	Ultra 600 (Ultratech) or approved eq.	Sch. 80	Plain end	UT600

6.5 Reticulation above and below booster station

A series of cased 200 mm boreholes have been drilled between each of the levels above and below the Booster Station, with take-off points on each level to permit paste reticulation wherever required.

7 Paste fill duty and target strength design

Paste fill placed underground at Brucejack is required to perform a number of stability functions. These functions include:

- Static strength requirements:
  - Stand open in vertical faces when exposed by adjacent pillar mining.
  - Support the weight of loading equipment when used as a mucking floor.
  - Permit mining underneath fill by production blasting for undercut ore extraction.
  - Permit mining through fill in development headings for the purposes of access or ventilation.
  - Confine the rock mass surrounding the stope to maintain local and regional stability within mining areas.
- Dynamic loading requirements:
  - Withstand the effects of proximity blasting from production stopes or development headings.
  - Withstand the effects of regional seismic events.

7.1 Vertical fill exposures

The transverse long hole open stoping method achieves a high resource recovery by the sequential extraction and filling of primary and secondary transverse long hole stopes, with a typical plan dimension of 30 mL x 15 mW x 30 mH. The mining of secondary stopes will expose the fill placed in most of these stopes, so it must be strong enough to remain stable when the confining rock pillar is removed.

AMC uses the strength design method by Terzaghi (1946)[2] as modified by Bloss (1997)[3] and Baldwin & Grice (2000)[4]. The technique is based on Terzaghi's arching method of stress estimation which allows calculation of backfill strength for fill masses with multiple sequential exposures (not simultaneous). From the input parameters, the average vertical stress in the fill can be calculated for each exposure. The design fill strength required is the largest of the calculated values, multiplied by the factor of safety (FoS) for each elevation zone in the stope. The method allows for variable strength zoning in the stope.

A wet fill bulk density of 1.71 kg/m^3 was used to represent high strength consolidated fill and a FoS of 1.25 applied.

Table 7.1 illustrates the design input parameters for vertical stope exposures and the geometry of the stope as a regular prism.

Width	15.0	m	Width is across strike
Height	30.0	m	
		Perimeter	90.0 m

Figure 7.1 plots the calculated average vertical stresses in the fill (shown in blue colour), progressively increasing in value with depth in the stope. A primary stope has three sequential exposures, 15 m wide x 30 m high and two exposures 30 m long and 30 m high. The peak average vertical stress after three exposures at the base of the stope is 285 kPa and multiplied by the FoS and rounded to the next 100 kPa gives 400 kPa. Note that the vertical stress diverges significantly from the linear depth stress line (shown in brown colour), illustrating the effect of arching within the fill. Inspecting the graph in 5m depth increments shows that optimized zoning of strengths can be carried out.

Figure 7.1 Charts of design strength of primary stope with three exposures (metres depth v stress kPa)

These graphs also show that it is possible to zone the strength of the fill within the stope. The cured strength of the fill need only meet the required strength at that elevation, permitting a reduction of cement dosing in the upper parts of stopes. However, for initial operations at Brucejack, the mine has elected to define three fill strength recipes. These are the high strength sill pour, the main fill zone of the stope and a thin high strength cap to finish the stope.

Table 7.2 summarizes the strength requirements for the various Brucejack stope geometries currently being planned using the above calculation method. Four stope cases are presented all of which are 15 m wide, 30 m long, and 30 m high. The cases are:

- Primary stope with no sill beam and three sequential exposures, 1 x 15 m wide and 2 x 30 m wide.
- Primary stope with sill beam and three sequential exposures, 1 x 15 m wide and 2 x 30 m wide.
- Secondary stope with no sill beam and one exposure, 1 x 15 m wide.
- Secondary stope with sill beam and one exposure, 1 x 15 m wide.

This table shows the optimized fill strengths that could be used to meet the stable exposure requirements. However, as discussed above, a simplified sill, main and cap zone system has been adopted for early paste fill operations until both extensive QC data and exposure experience has been gained.

7.2 Undercut sill exposures fill strength design

Undercut (sill) exposures will require higher strength backfill, primarily dependant on stope span. The first stopes mined on 1320 L will form a sill pillar to stopes below and high-strength fill will be required to ensure stable extraction of the resulting pillar. All of these stopes will require a high-strength beam of thick paste fill to ensure stable extraction with minimal dilution.

AMC has developed an undercut fill strength spreadsheet design tool based on the method described by Mitchell & Roetger (1989)[5]. This technique assesses stability of sills against five possible failure mechanisms of sliding, caving, flexural bending, crushing and rotation. Figure 7.2 illustrates each of these potential fill failure mechanisms. Each of the failure mechanisms are tested for the geometry in question and the target design strength is the maximum of each failure mechanism, multiplied by the FoS. It is a conservative two-dimensional approach.

[5] Mitchell, R.J. & Roetger, J., 1989. Analysis and modelling of sill pillars. In Innovations in Mining Backfill Technology, Hassani et al.(eds.). pp. 53–61.

Figure 7.2 Mitchell sill design method – failure mechanisms

Table 7.4 shows the input parameters for the undercut sill designs.

Table 7.4 AMC Mitchell sill input parameters

General Assumptions			
Geotechnical Data			
Sill Pillar Fill Type	Paste		Non Entry Mining Method (FoS >= 1.25)
Elastic Modulus E MPa	200		
Ratio of Compressive to Tensile Strength	8.0		
Gravity g ms-2	9.81		
Wet Fill Density γ kg/m^3	1.71	Sill Pillar	
Wet Fill Density σ_v γ kN/m^3	16.8	Sill Pillar	
Wet Fill Density γ kg/m^3	1.71	Surcharge Load	
Wet Fill Density σ_v γ kN/m^3	16.8	Surcharge load	
Factor of safety FoS	1.25		FoS >= 3.0 for man entry
Backfill mix increments kPa	100		

Under Terzaghi's arching principles, for a sill of 30 m long and 15 m wide, the dominant arching effect occurs over the narrow span. The Mitchell design method produces a conservative design result, considering only the narrow span in a 2D analysis and ignoring the additional arching that does occur at the ends of the stope. Table 7.5 shows the calculation results for each exposed sill for a range of sill exposure widths. This table shows the required backfill strengths for each failure mechanism. The results show that for spans up to 15 m stope width the limiting failure mechanism will be caving failure (highlighted in red).

The model also calculates the minimum thickness of the high strength sill beam. The nominal thickness is one half of the span to accommodate a parabolic shaped caving surface of 7.5 m. For initial operations at Brucejack, AMC recommends that 10 m thickness of high strength cemented paste fill should be placed to ensure stability.

AMC concludes that all stopes undercut by future stoping with a span of 15 m will require a 10 m thick beam of 1,100 kPa paste fill to ensure stability during sill pillar recovery. The curing time available for these sill beams is in the order of months and years, again permitting efficient use of binders to minimize operating cost.

Table 7.5 Backfill strengths for undercut sills

Required Undercut Backfill Strength

Maximum of Flexure, Crushing, Caving, Shear and Rotational Stability Limits

Width of Sill (HW to FW) m	5.0	6.0	7.0	8.0	9.0	10.0	11.0	12.0	13.0	14.0	15.0

7.3 QC data analysis

Figure 7.3 shows a subset of QC samples tested at 28 days curing time for a range of binder dosing rates plotted as percent solids by weight. The recipe dosing rates of 6.5%, 11%, and 12.5% can be clearly seen and the average strength trend line is included. Figure 7.4 shows the same data set but this time plotted as kg/m^3 of binder in the cured QC samples. This graph is more useful since it takes in to account the significant variable of paste density. In this example the binder doing rates for the above binder rates cluster around 70, 120, and 140 kg/m^3 respectively.

This analysis introduces the concept of characteristic strength whereby 95% of all samples tested are above that value. Comparison of the characteristic and average strengths validate the adoption of a FoS of 1.25.

Figure 7.3 28 day curing UCS QC samples plotted by binder addition by weight

Figure 7.4 28 day curing UCS QC samples plotted by frequency

7.4 Binder dosing requirements and paste fill recipes

Using the simplified strength fill zone designs, the paste recipes can be determined from the original FS designs and updated with the latest QC data.

The design-strength-zone variations for all fill recipes are summarized in Table 7.6, repeated here from Table 5.1.

Table 7.6 Paste fill strength zones for each fill type application

Paste type	Usage	Design 28-day strength (kPa)	QC Average 28-day strength (kPa)	Current binder dosage by (%)	Current binder dosage (kg/m³)	Minimum paste slurry density (% w/w)	In situ density dry paste (t/m³)	In situ density wet paste (t/m³)
High-strength Paste	Sill beams up to 15 m wide	1,100	1,252	11.0%	125.5	63%	1.11	1.71
High-strength Paste	Top of stope caps for mucking	800	965	9.8%	111.8	63%	1.11	1.71
Regular Strength A	Regular stope in the first 15 m high	350	340	6.4%	73	63%	1.11	1.71
Regular Strength B	Regular stope at 15 m or higher	250	206	5.5%	62.7	63%	1.11	1.71
Low Strength Paste	Secondary stopes with short wall exposure	200	171	4.3%	49.1	63%	1.11	1.71
Liquefaction resistant Paste	Secondary stopes with no future exposures	100	110	3.8%	43.4	63%	1.11	1.71

7.5 Importance of QC data collection

The results of the previous test work have provided design binder recipes to achieve the required fill strengths at 28 days curing. The tests have shown that results are sensitive to binder content, clay content and paste slurry density. The test work carried out has reported strengths of tested samples and these values have been applied to the recommended binder recipes.

Brucejack has established a Paste QC lab as an integral part of the backfill plant and will generate strength results from paste samples collected each shift. As part of that QC work, the mine will also investigate and quantify the effect of the key variables of clay, density and binder dosing. These results are compiled and the trends of average strength and variability for each of the key parameters for the actual tailings and binder being used for the paste fill.

These results are used to continually refine the paste fill recipes to improve strength or optimize binder addition. In the event that average strength QC results start to trend below the design requirements, the initial response are to increase binder levels in all recipes until the source of the problem can be identified. Other responses include increasing slurry density where practical.

The Engineer will review the QC data and investigate whether large volumes of under strength fill has been placed into stopes prior to the identification of the problem. If low strength bands of fill or large volumes are identified at risk in individual stopes, remedial mine design will be undertaken. This will consist of evaluation of the future exposure dimensions and the required strength.

An example action could be for a secondary stope planned to be 30 m long and 30 m high on one of the side fill exposures not being to the required strength. In this case the Engineer will determine

the stable exposure at the lower strength and will reduce the number of rings to be drilled and fired, reducing the length of the stope and the size of the exposure. That stope would be filled and, after curing, the remaining stope taken and subsequently filled.

The Engineer may also choose to leave an ore pillar against the lower strength fill and not expose it to prevent failure and ore loss from unplanned dilution.

Assessment of fill QC records are a routine part of each stope design to anticipate fill performance problems and minimize the risk of dilution and ore loss.

8 Paste barricade designs

Historically, Brucejack has adopted two types of paste fill barricades to retain curing paste fill in stopes. These are:

- Shotcrete arched walls – Golder design
- Waste rock with shotcrete bunds – SRK design

Most commonly, Brucejack uses waste rock with shotcrete bunds as paste barricades due to the limited available space for barricade construction. Barricades are retaining structures that are constructed at the base of open stopes to retain paste fill until it gains sufficient strength to become self-supporting.

Prior to commencement of filling operations, barricades are constructed in the draw points of empty production stopes to retain the paste fill. Figure 8.1 shows an example of a shotcrete arched wall barricade.

Figure 8.1 Example of arched shotcrete barricade

It is important to prevent or divert any ground water or service water entering the stopes being filled. This will ensure that there is no build-up of pore water pressure behind these structures. Exploration boreholes intersecting stopes should be routinely grouted to eliminate or minimize inflow.

Risk and safety issues relating to barricade construction and operation are discussed in some detail in Section 10.11 and the user is directed there for further information.

8.1 Barricade loading specification

Field measurements and modelling of stresses within early curing age paste fill at other mines has shown that barricade pressures typically reach a maximum around 24 hours after the start of filling. Paste fill behaves initially as a viscous liquid exhibiting geostatic loading conditions. Within 8 to 12 hours, consolidation commences as some of the pore water exudes and the tailings particles start to develop frictional shear strength. In uncemented fill types, the peak pressure is reached at 24 hours and remains at the value despite further fill placement above this elevation in the stope. More commonly, the fill is cemented and the development of cohesive strength from the curing binder causes the peak pressure to drop to residual levels.

AMC has developed a barricade loading model based on the calculations published by Kuganathan (2003) which allow for arching in the consolidating and curing fill in the stope and arching within the drawpoint, further reducing loading on the barricade. A binder curing model based on Mitchell (1983) is used to generate cohesive strength. The values for transition from initial geostatic loading to fully arched are manually input as 8 and 24 hours respectively based on papers by Hughes 2008, Yumlu & Guresci, 2007, and Veenstra, 2013.

Figure 8.2 shows the calculated loading result for a Brucejack stope filling at 140 m^3/hr in a stope with a base area of 15 m x 30 m or 450 m^2.

Figure 8.2 Barricade loading model – 140 m^3/hr

The chart shows depth stress increasing linearly over 30 m height of the stope and the expected Terzaghi arch vertical stress acting on the base of the stope. The blue line plots the pressure acting horizontally on the barricade as it transitions from geostatic to arched load, reducing below the vertical stress (as expected) and alongside the drawpoint walls. The peak arched barricade pressure is calculated as 50 kPa in this example and the maximum geostatic pressure at 24 hours is 160 kPa.

For Brucejack the stope fill runs have been designed to provide a high strength sill beam of up to 10 m thick in the base of the stope with the rest of the stope filled with normal strength fill for up to three sequential (never simultaneous) fill exposures. The last half metre will be capped with high strength fill to provide a clean mucking surface and prevent loss of grade into soft paste.

Brucejack has selected 10 m as the maximum height rise in 24 hours at the base of any sized stope. Table 8.1 lists the expected arch horizontal pressures on the barricades and peak geostatic loads for 24 hour pours or up to 10 m height, whichever occurs sooner. Table 8.2 illustrates the range of stope dimensions, rise rates and peak pressures that could be encountered. All stopes below 350 m^2 plan area will be limited to 10 m maximum height rise per 24 hours.

Table 8.1 Calculated arched and geostatic bulkhead pressures at 140 m^3/hr

Dimensions	Plan area	Estimated horizontal pressure (kPa)	Maximum geostatic pressure at 24 hours (kPa)	Barricade design working pressure (kPa)
30 mL x 15 mW x 30 mH	450 m^2	50 kPa	125	200
23.5 mL x 15 mW x 30 mH	350 m^2	64 kPa	168	200
Limit to 10 m rise per 24 hours	Less than 350 m^2	64 kPa	168	200

Stope width (m)	20	7.1	6.3	5.4	4.5	3.6	2.7	1.8
	15	5.4	4.7	4.0	3.3	2.7	2.0	1.3
	10	3.6	3.1	2.7	2.2	1.8	1.3	0.9
		24 hour Max Geostatic Load (kPa)						
Stope length (m)		40	35	30	25	20	15	10
Stope width (m)	20	70	81	94	113	141	168	168
	15	94	107	125	150	168	168	168
	10	141	161	168	168	168	168	168

Based on the above analysis, Brucejack arched barricades are designed for a maximum working load of 200 kPa to allow for geostatic limit conditions with the expectation that actual pressures will be considerably lower. This will be monitored by instrumentation in the first stopes using earth pressure cells and piezometers and in the case of significant variations during close monitoring, filling operations will be modified to ensure safe operations at all times.

8.2 Shotcrete arch barricade designs and location

Golder Associates was engaged to provide a design of reinforced compressive arch shotcrete barricades for a design working pressure of 200 kPa. Two barricade opening sizes were selected to cover largest possible dimension drawpoints. Current practice at Brucejack is to mine drawpoints at 5.0 m wide and 4.5 m high, which is smaller than the barricade design dimensions.

Barricade location is specified using common practice for most paste backfill operations around the world. The centre line of the barricade arch is located one drive width (usually 5.0 m) back from the brow of the stope. The barricade has an arch radius of 4.5 m with a thickness of 0.400 m the peak of the arch is located 3.9 m back from the brow. Based on work by Kuganathan (2008), this 5.0 m setback further reduces the peak arched loading on the wall from the curing paste fill and is a practical location for mining of the adjacent stope.

The location may be varied by an authorized person due to local ground conditions or drawpoint geometry. In the event that the barricade is moved closer to the brow, the filling rules relating to maximum fill height rise must be reviewed.

The current barricade designs for 5 x 5 m and 6 x 6 m sized drawpoint openings are shown in the following section. The reference drawings for these illustrations are taken from and are included in this report as Appendix H.

- Appendix H2 - Ref Drawing – Golder 5 x 5 Barricade 1776046_S-03_R0.pdf

8.3 Rock Barricade designs and location

SRK Consulting was engaged to provide the design of a fill fence used as a barricade for paste backfill of mined stopes at Brucejack Mine. The fill fence will be constructed with waste rock material generated from development extraction. SRK provided a waste fill fence design as shown in Figure 8.7 to meet the current requirements for shotcrete fences when 200kPa of lateral pressure is applied.

The capacity of the waste fill fence will depend on the shear resistance of the waste material against the lateral pressure from the paste fill column. The resisting contributing force must take into account the shear against the floor and the walls of the drift. It is expected that the friction between the waste, and the walls, floor and back of the drift, will be greater than the internal friction of the waste due to drift profile irregularities, therefore the internal friction of the waste material will be assumed for the calculations.

According to Aubertin et al, 2009 considering a worst-case scenario of waste fence being fully saturated with water.

Equation 1: $L = \frac{\mathrm{P}}{\lambda}$

Where:

- L is the required length of waste fence.
- P is the maximum lateral pressure: 200 kPa.
- λ is equal to Equation 2.

Equation 2: $\lambda = Tan\varphi K_R \left(\gamma_\omega \mathrm{h} + \frac{\gamma_s - 2\gamma_\omega}{3}\mathrm{h}\right)\mathrm{h} + Tan\varphi \left(\gamma_\omega \mathrm{h} + \frac{\gamma_s - \gamma_\omega}{2}\mathrm{h}\right)\mathrm{w} + \mathrm{Tan}\varphi K_R \gamma_\omega (\frac{h^2}{3})$

Where:

- γ_ω is the unit weight of the waste fill: 2,200 N/m^3.
- γ_s is the unit weight of the saturated waste fill: 2,450 N/m^3 (assuming 23% void).
- φ is the internal friction angle of the waste material: 38°.
- K_R is a coefficient of friction = $\frac{1-sin\varphi}{1+sin\varphi}$.

Therefore, for a maximum lateral pressure of 200 kPa, the fill fence with a safety factor of 1.4 which is equivalent to 0.77 m.

SRK recommends the following:

- Use a minimum 5 m length waste fill fence from toe to toe.
- Ensure a minimum contact of 1 m in the back.
- Fill any gap between the back and the waste fill fence with shotcrete.
- To avoid leakage cover the toe of the barricade with shotcrete with a minimum thickness of 50 mm.

Reference – Appendix H

- Appendix H4 Ref Drawing – SRK Consulting - Waste Barricade General Arrangement SRK - Rockfill Barricade Design R3.pdf

The rock barricade should be located as close to the stope brow as possible in meeting the length requirement as the space for the scoop operation is the main concern for the waste rock barricade construction.

In addressing the potential paste leakage through the waste rock porosity, Pretium had chosen to have the waste rock barricade length longer than the design. This has been based on the understanding that the waste rock slope will be much shallower than the design. Instead of using the toe to toe 5 m long of the rock barricade, Pretium is using the 5 m tight back length to construct the waste rock barricade, which have been proved successful.

A copy of the Brucejack Muck Barricade Case Study Memo outlining the company's most recent practices can be found here.

Figure 8.7 SRK waste rock barricade design

8.4 Barricade monitoring and QC

Detailed construction information is provided in the above description which will ensure the structural integrity of the barricade. This includes dimensions and spacing of components, material specifications, barricade location, and shotcrete standards and thickness.

Pretium is testing the shotcrete used in the barricade with samples collected from each barricade and tested in UCS mode at 1, 2, 3, 7, 14, and 28 days to confirm required strengths.

The initial fill pours at Brucejack were monitored to determine the stress regime within the early curing age fill. Both total pressure (flat jacks) and pore pressure (piezometers) instrumentation were installed to resolve the components of stress and vectors and compare with height of the fill.

Figure 8.8 plots the pressure data for a recent stope 1290-09 as a time series. The sensor measuring vertical stress within the stope reaches 475 kPa. However, the maximum horizontal stress at the brow, acting on the barricade does not exceed 35 kPa. The low-pressure conditions from consolidation can be seen and the pressures become decoupled from paste depth within one day indicating the onset of major binder hydration and curing.

Figure 8.8 Stope and Barricade pressure monitoring – 1290-09 Stope - time series

The data collected to date validate the working design capacity of the paste fill barricades of 200 kPa.

9 Reference sections

This section covers the background to the test work used to design the Brucejack paste fill system. This can be progressively updated with site data as it becomes available.

9.1 Paste fill characterization

This section will firstly cover the component materials and their characteristics that make up paste fill. This will be followed by an introduction to paste fill rheology and the various flow properties required to deliver cost effective paste underground. The section will conclude on the strength performance of paste fill. All three areas are heavily interdependent, and it will be shown that the prime objective is to design and produce a paste that will meet the design requirements at the lowest practical cost.

9.1.1 Mineralogy

The predominant minerals contained in the Brucejack tailings are shown in (Table 9.1).

Table 9.1 Mineralogical characteristics of Brucejack tailings

Mineral	Bulk sample (%)
Quartz	46
Calcite	14
Illite	14
Kaolinite	11
Pyrite	6
Siderite	3
Plagioclase Feldspar	3
Aragonite	3

9.1.2 Sizing curves

The particle size distribution (PSD) curves for Brucejack full plant tailings together with simulated cyclone underflow and underflow PSD curves and predicted paste fill PSD are plotted in a chart in Figure 9.1. This data set also includes recent sampling of tailings after paste plant commissioning.

Figure 9.1 Comparative particle size distribution curve

The tailings are finer than the standard sizing criterion for paste fill of more than 15% passing 20 microns. Total Brucejack mill tailings can be classified as a fine grind.

9.1.3 Binder type and properties

The main cost driver in the manufacture of cemented backfill is the binder costs, which can account for between 50% and 75% of the operating cost. It is therefore important to determine the optimal binder type and content in order to meet the required design strength at the lowest operating cost.

Binder is supplied by Lafarge and delivered in isotainers to site. The binder consists of a 90% slag and 10% General Purpose (GP) cement blend which has shown to perform well with the clay rich tailings at Brucejack.

The SG and bulk density of binder are 3.14 and 0.95 t/m^3 respectively.

9.1.4 Water quality

The quality of water has a strong impact on the strength and rheology of paste fill. Water that has a low pH and a high total dissolved solids (TDS) content can be detrimental to the strength development of paste fill. Water with a pH of 5 or lower should be avoided. Similarly, water that contains ≥35,000 mg/L of TDS should be avoided.

Brucejack water quality is suitable for paste fill.

9.2 Paste rheological properties

Rheology is the study of the deformation and flow of matter. Knowledge of the flow properties of paste fill is critical to the design and successful operation of the paste fill system.

In general, the binder content required is reduced as the solids concentration and yield stress of the paste is increased. Therefore, the primary economic goal will always be to minimize the binder addition rate through maximizing the paste solids concentration.

Constraining the achievement of this goal is the increased risk of borehole or pipe blockage with thicker paste densities. The system must be operated in a narrow band that produces an effective compromise.

This section discusses the issues of rheology that are pertinent to Brucejack paste fill. Flow will only occur when the driving head exceeds the wall shear stress. If the solids concentration of the paste is too high, flow will not occur and the paste will set in the borehole, which may result in line blockages. Conversely if the yield stress of the paste fill is too low, then the paste fill strength will be compromised due to the lower solids density.

9.2.1 Paste fill rheology

Paste fill rheology closely conforms to the Bingham Plastic flow model which is strongly non-Newtonian in its behaviour. Figure 9.2 shows Newtonian and non-Newtonian fluid models and plots the change in shear stress as a function of the shear rate. Water is the best example of a Newtonian fluid, exhibiting no shear strength at zero shear rates and linear increases in shear stress with increases in shear rate.

Figure 9.2 Definition of viscosity and yield stress parameters - index values

Bingham Plastics in general and paste fill in particular, exhibit a significant shear stress which must be overcome before movement (shearing) commences. This value of shear stress is commonly referred to as yield stress (or yield shear stress). Once shearing has commenced, the rate of rise of shear stress with shear rate is closely linear. The gradient of this line is the viscosity of the fluid.

Paste fill frequently exhibits slippage at low shear rates. This is caused by sliding of the paste fluid on a thin boundary film of water at the pipeline walls. This serves to reduce the friction losses and introduces non-linear behaviour for the typical delivery velocities of paste fill.

Rheological Consulting Services (RCS) conducted rheological test work on Brucejack Paste blends.

9.2.2 Yield stress versus solids concentration

The key determinant of paste fill rheological behaviour is the yield stress. For paste fill and other Bingham Plastics, the yield stress is exponentially proportional to the solids concentration of the fluid.

Figure 9.3 plots yield stress against solids concentration for the three blends tested.

Figure 9.3 Yield stress as a function of solids concentration

Using curve fitting software an empirical relationship between the variables can be written as:

Blend 1	$\tau_0 = 1.178\times10^{-6}\times e^{25.98x}$ $\tau_0 = 1.178\times10^{-6}\times e^{25.98x}$	0.5924<***x***<0.7759	Equation (4)
Blend 2	$\tau_0 = 3.321\times10^{-6}\times e^{25.52x}$ $\tau_0 = 3.321\times10^{-6}\times e^{25.52x}$	0.6054<***x***<0.7592	Equation (5)
Blend 3	$\tau_0 = 1.687\times10^{-5}\times e^{24.05x}$ $\tau_0 = 1.687\times10^{-5}\times e^{24.05x}$	0.5711<***x***<0.7288	Equation (6)

where τ_0 = yield stress (Pa)

x = Solids concentration % solids (expressed as a decimal)

9.2.3 Friction factors

Paste pipe friction loss can be determined most easily from the Buckingham equation, neglecting 4th order terms (not derived here). The pressure drop (P) per metre length (L) of pipe is given by:

$$P/L = 5.33\ \tau_0/D + 32\ \eta\ V/D2 \qquad \text{Equation (7)}$$

Where

τ_0 = Bingham Yield Stress

D = Inside pipe diameter

η = Bingham viscosity

V = Paste flow velocity

Viscosity can be calculated from the slope of the shear rate to shear stress curve. For paste fill at low shear rates in laminar flow, change in shear rate contributes only approximately 5% of the wall shear stress value. The yield stress value is the dominant variable for design consideration, whilst viscosity is usually ignored.

Other tables can be generated for different flow rates and pipe diameters using the above formulae. For Brucejack, the operating range of densities is between 63% and 68% solids by weight.

9.2.4 Flow control strategy

The Brucejack paste flow control strategy involves yield stress adjustment to maximize paste slurry density by measuring the pressure from the sensors installed on the reticulation system. For a stope of any given reticulation geometry to be filled in the mine, there will be a combination of flow rate, driving head and friction losses that will maximize the density. The key variable is that of the paste yield stress. This is determined mostly by the solids concentration of the paste. Therefore, a control strategy can be developed which modifies the solids concentration so as to maintain the paste column within a fixed range.

This control strategy will:

- Maximize the solids concentration for any given reticulation geometry and layout which in turn ensures the optimum binder addition rates are achieved.

9.3 Paste strength test work

AMC engaged McGill University to conduct the test work in their specialized backfill laboratory in Montréal. Pretium provided tailings samples from metallurgical test work on a new bulk sample. This report is an addendum to the AMC Brucejack Feasibility Study Update.

This study was Stage 3 of backfill testing of Brucejack tailings. Stages 1 and 2 were conducted in Australia using Brucejack tailings from drill core and equivalent Australian binders. Stage 3 testing was conducted on fresh bulk tailings using Canadian and Chinese binders.

9.3.1 Brucejack backfill system

The primary means of backfilling is paste fill, generated from unclassified mill tailings mixed with adequate cementitious binder to meet the strength requirements of re-exposure. Regular strength paste fill is commonly required where there will be re-exposure of vertical stope walls.

Stopes that will not be re-exposed by adjacent mining may be backfilled with unconsolidated waste and / or by paste fill with sufficient binder to remove any risk of future liquefaction (low-strength

paste fill). High-strength paste fill will be required in the lower portion of all primary and secondary stopes that will be undercut by sill extraction from below.

9.3.2 Previous paste backfill test work – Stages 1 & 2 (2013)

Pretium previously engaged AMC to undertake a high-level study on the suitability of using mill flotation tailings for paste fill at the Brucejack mine. Stage 1 and 2 tests were carried out in Australia.

Most of the samples were prepared at a yield stress of 250 Pa, which corresponds to a paste slurry density of around 66% solids by weight. Four batches were also prepared at 100 and 500 Pa (62% and 69%) to investigate the effect of slurry density on paste fill strength.

Stage 1 results carried out on initial metallurgical testing tailings showed a higher-than-expected cement requirement for the range of determined paste fill strengths. The pulp density of the paste was low and resulting strengths required higher-than-expected cement content to achieve the target strengths.

Stage 2 test work was then carried out to identify other classes of binders that would achieve target strengths at lower dosing rates. In particular, Stage 2 investigated the use of blended blast furnace slag and fly-ash with cement, as possibly better paste mix recipes.

The Stage 2 test work program included the following:

- Material characterization tests in areas such as specific gravity and particle size distribution.
- Determination of paste fill density at a yield stress of 250 Pa as the benchmark for the paste fill mix.

UCS tests of mixes using GP cement, slag, and fly-ash blend cements to look at the effect of adding fine-ground iron blast furnace slag and fly-ash to the GP cement binder. Two slag blends were tested; Minecem (MC) containing 55% slag and Sunstate Slag Blend (SS) containing 35% slag. Medium-size fly-ash (FA) was also used.

The Brucejack tailings paste fill mixes responded very favourably to the slag-based and fly-ash binders. The test program demonstrated a significant improvement in the strength values for the paste fill mix with slag-based (MC and SS) and FA binders compared to GP cement.

9.3.3 Stage 3 paste backfill test work

With the availability of bulk ore and tailings samples, Stage 3 test work was carried out in Canada using full plant tailings, clay washed tailings, Canadian slag / cement (M90:10) and Chinese slag / cement (C90:10). Most of the samples were prepared at a yield stress of 250 Pa, which corresponds to a paste slurry density of around 66% solids by weight. Four batches were also prepared at 100 and 500 Pa (62% and 69%) to investigate the effect of slurry density on paste fill strength.

9.3.4 Rheology testing

Rheological tests were carried out on various cemented Brucejack tailings to measure of yield stress vs. solids content. As expected, the shear yield stress of the Brucejack tailings increased exponentially with increasing solids concentration. For the full plant tailings, a shear yield stress of approximately 250 Pa corresponds to a solids concentration of approximately 67.0% w/w. For the washed tailings, 250 Pa yield stress corresponds to 74.0% w/w. The high clay content of the full plant tailings can explain the variable rheology. The clay traps water in the paste making a lower density product compared to the washed tailings. This behaviour is common in high clay tailings paste fill mixes and Figure 9.3 plots the same rheology data against two other paste fill materials

tested by AMC. The curve labelled Kencana represents an example of another mine with very high clay content and the curve labelled Lisheen has very low clay content. Brucejack paste fill lies between these two examples.

In AMC's opinion, the Brucejack tailings are suitable for paste fill delivery. The actual rheology will vary as a function of the density and clay content of the tailings and monitoring of this parameter will be required during operations. Where clay content is higher, paste density will be lower as the clay traps the water in the cured backfill. Where the clay content is lower, more will be removed during dewatering and higher densities will be achieved. In each of these cases, AMC expects there will be little or no bleed water from the paste.

Stage 3 strength test work results are summarized in Table 9.2.

Table 9.2 Summary of stage 3 UCS results

Batch	Tailings type	Tailings	Washed tails	GP cement	Canadian 90/10 Slag cement	Chinese 90/10 Slag cement	Yield stress (Pa)	7 days UCS (MPa)	14 days UCS (MPa)	28 days UCS (MPa)	56 days UCS (MPa)

Brucejack high clay fine tailings showed good response to Canadian 90:10 slag binder prepared at 250 Pa yield stress (67.0%$_{CW}$). By comparison, BJ1 tailings prepared at 250 Pa yield stress with 5% normal Portland cement (NPC) showed poor response with a similar curing curve to 3% 90:10 slag binder. For the high clay fine BJ1 tailings, the slag based binders strongly outperform normal Portland cement binder.

As expected, increasing paste slurry density will result in higher strengths for a given binder content and curing time. At 28 days, 5% paste prepared at 100 Pa yield stress will achieve 400 kPa. At 250 Pa it will achieve 600 kPa and at 500 kPa will achieve 800 kPa.

AMC emphasizes that placing paste fill at the highest practical density commensurate with delivery requirements will produce the highest performing fill. Depending upon the stope being filled and the distance and elevation of that stope a range of paste slurry densities will be required. The binder content can be varied to ensure adequate strength performance.

The removal of clay makes a significant improvement to the strength of the paste fill. If clay is reduced or removed from paste fill then reductions in slag cement binder can be expected. By the

same token, variability in strength resulting from changes to clay content in full plant tailings will impact on paste fill performance during operations and should be closely monitored.

AMC would have expected better response to the BJ2 coarse tailings by the Chinese Slag. However, the Chinese slag significantly underperformed Canadian slag used on the finer BJ1 tailings sample. The Chinese slag was the worst performer achieving just under 100 kPa at 28 days compared to 180 kPa for NPC and 600 kPa for Lafarge slag. Based on these results, AMC advises against the importing of Chinese binder for Brucejack paste fill.

The Stage 3 test work has demonstrated the suitability of paste fill for the backfill system at Brucejack mine. Canadian sourced slag cement provides good performance at economic dosing rates and is the recommended binder.

10 Safety and risk assessment

Risks are discussed below with the important risks in each area of the paste fill system covered.

10.1 Liquefaction risk

The primary hazard of slurry based backfills such as paste fill is the potential for the fill mass to remobilize after placement, a process known as liquefaction. The quantity of backfill that could be remobilized and the proximity of personnel and equipment to the area govern the level of risk.

Paste fill requires a minimum of 15% -20 micron size fraction in order to achieve the flow behaviour and water retentive nature of a paste with a typical permeability in the order of 10^{-8} ms^{-1}.

There have been a number of failure events in paste fill operations involving uncontrolled in rush of fluid paste fill into mine workings. In each case the maximum amount of paste fill mobilized was placed less than 24 hours previously. Paste that had cured for longer periods did not liquefy.

There are three conditions relevant to liquefaction potential:

- The paste fill has a contractant behaviour under load.
- The paste fill is saturated.
- The loss or lack of cohesion.

In tri-axial testing, paste fill generally contracts under load, thereby meeting the first criterion.

Paste fill permanently maintains a state of near saturation since it is by nature a non-draining material thereby meeting the second criterion.

In order to minimize the risk of liquefaction, binder is always added to paste fill in order to generate inter particle cohesion.

Paste fill develops cohesive strength over time. Therefore, during early stages of filling and immediately after when the paste fill has not achieved sufficient strength to be self-supporting, there is still potential for paste liquefaction.

Only by using a combination of the correct fill recipe, filling regime and design of barricades, liquefaction of paste fill can be effectively controlled or eliminated.

Clough et al (1988)[6] tested weakly cemented sands with a range of cementation levels and unit weights in a cyclic tri-axial shear device. For the sands under investigation, a UCS of 100 kPa was enough to prevent liquefaction under cyclic loads typical of a very large earthquake.

AMC recommends that the minimum strength design of 100 kPa is used for all bulk paste fill. This strength can be achieved with approximately 2.8% binder.

10.2 High-pressure risk from blocked paste reticulation

High-pressure risks can exist in the case of blocked boreholes and or pipelines. If either of the two surface boreholes become blocked it is possible that geostatic pressures could occur at the base of

[6] Clough, GW, Iwabuchi, J, Rad, NS and Kuppusamy, T (1989) Influence of Cementation on liquefaction of sands, Journal of Geotechnical Engineering, 115(8):1107-1117 in Pierce et al (ibid).

the boreholes. For the paste fill design and geometry at Brucejack, it is possible to generate pressures of around 4.3 MPa in the case of a blockage.

The borehole casing, breastplates and pipes are rated above these values and in normal operations measurements taken underground indicate that normal working pressures in the pipeline are way below the geostatic pressures.

The hazard exists to personnel if the line is opened without some form of pressure relief. For breastplates and transition pipes above and below the Booster Station, remotely operated knife gate valves are recommended to enable pressure relief prior to unblocking operations.

10.3 Paste plant risk

Operations in the paste fill plant are covered by standard operating procedures. The paste fill plant is automated and many of the processes are controlled by PLC logic. Error conditions that can generate a safety hazard are discussed in some detail below. All of the hazards identified relate to the placement of fill underground rather than to the plant or operations itself. Operations in the surface plant could trigger these hazard conditions underground.

10.4 Low binder addition - high risk

It is possible to generate a process condition whereby insufficient binder could be added to the paste fill. If the resulting cured strength does not exceed 100 kPa then the paste may be subject to future liquefaction as a result of either a barricade failure, production blasting or from a regional seismic event.

Binder addition is controlled via the PLC system. Binder content can be varied to produce paste with differing strength targets if required.

Daily binder consumption and binder stock levels should be checked and reconciled with the binder supplier to identify any potential discrepancies in dosing.

Insufficient binder dosing leads to the substandard paste fill product that may in turn lead to potentially large-scale failures in primary stopes during secondary pillar extraction process. Results of laboratory and in-situ strength tests should be checked, analyzed, and compared to the fill design requirements before exposures are made.

10.5 No binder addition – substantial risk

It is standard practice to place an approximately 5 m^3 of uncemented paste at the start of each fill run in order to 'slick' or lubricate the line. A secondary benefit is that cemented paste fill is not in direct contact with the pipe walls reducing build up and the risk of pipe blockage.

At the end of each run it is also common practice to place a similar small volume of uncemented paste in order to ensure that effective flushing is achieved. These small quantities of uncemented paste represent a safe working practice and pose no concern.

It is possible to consider the sustained placement of uncemented paste fill but the PLC logic should prevent this from occurring.

Operators should ensure that excessive slick volumes (greater than 20 m^3) are not delivered at start up or shut down times.

10.6 Flushing water - moderate risk

The flushing water must be metered and controlled by PLC to deliver a fixed amount of water in order to avoid incidents where an excessive amount of water is inadvertently sent into the stope causing significant pore water pressures behind the barricades.

There is a major safety risk if the retaining barricade fails due to excessive water in the fill, releasing large quantities of water and paste into the mine. It is possible that all paste placed in the previous 24 hours can be mobilized with the barricade failure.

The manual flushing system has been replaced by an automated one that will deliver a fixed quantity.

Plant operators must ensure that excessive flushing quantities are not delivered underground.

10.7 Yield stress too high or too low - moderate risk

Paste fill prepared at a solid density or yield stress that is too high could result in borehole or pipe blockages. This, in turn could expose personnel to high-pressure paste during clean out operations.

Running the paste fill system at a yield stress that is too low could result in low strength fill and blocked lines.

For primary stopes this may cause low strength fill that may collapse during secondary mining potentially leading to fill dilution and / or production loss and delays. The hazard that could arise for secondary stopes would be either a slower than expected achievement of the 100 kPa minimum strength target and a longer susceptibility to liquefaction.

Regular control and monitoring of the key properties of the tailings material such as SG, PSD, mineralogy and slump consistency or yield stress of the mixed product is required in order to ensure that desired paste rheology is maintained at all times. Paste rheology is measured directly using the slump or vane shear viscometer and indirectly using the mixer drive power draw.

Rheological properties are strongly influenced by the yield stress of the paste fill. The impact of sudden changes in metallurgical processing operations should be considered.

10.8 Reticulation system risk

Safety hazards primarily relate to exposure of personnel to paste at high-pressure.

Paste fill is distributed via twin, steeply angled boreholes from surface and through high-pressure pipelines from the paste plant to the stopes under the force of gravity.

Generally speaking, the highest-pressure point occurs at the base of the surface borehole on 12 Level and the lowest pressure at the discharge point into the stope.

Brucejack runs the paste fill system with the surface borehole full to 50 m below the collar of the boreholes. This ensures that the maximum driving head is available to deliver the paste and that the minimum slump (stiffest paste) is achieved at all times.

10.9 Borehole blockage - low risk

The surface boreholes are vertical and are cased throughout. The casings and breastplates are rated for hydrostatic pressure, a condition that could arise if the pipeline is blocked.

In practice, working paste pressures are primarily a function of the downstream paste flow conditions and is generally much lower than static pressure due to the frictional losses in pipelines.

In order to prevent production loss and delays, some level of redundancy is required in the reticulation system. At Brucejack two boreholes were drilled to provide an alternative route in case of blockage.

In case of blockage of the surface borehole, it is imperative that the borehole is cleared as quickly as possible. Generally, there is less than two hours available to detect and clear a blockage before binder hardening makes the task very difficult.

Pressure relief for the boreholes is generally achieved by the use of remotely operated knife gate valves.

10.10 Pipeline blockage - low risk

The introduction of pressure relief valves enables the dissipation of the high gravity pressures in the system prior to the opening of the horizontal segments of the pipeline.

The highest pressures that are likely to be encountered are those resulting from line friction. These pressures will be largely dissipated through opening of the gate valves.

10.11 Stope placement

The primary hazard to personnel and equipment is an uncontrolled inrush of paste fill into the workings following the failure of a retaining barricade. The main danger would be if personnel or equipment are impacted by the flowing paste material.

Because paste fill is designed with binder to eliminate liquefaction risk, the likely consequences of a failure are comparatively much lower than that of a saturated uncemented hydraulic fill.

However, all mines operating paste fill tend to assume that paste fill less than 24 hours old has no cohesive strength. Retaining structures must therefore be designed to meet this loading condition and in the absence of field data, hydrostatic loading conditions must be assumed.

10.12 Barricade failure during tight filling - substantial risk

There is a substantial risk of barricade failure due to overloading during tight filling operations.

AMC is aware of several serious paste fill inrushes associated with barricade failures during tight filling activities.

Proper protocols for tight filling must be developed and implemented in order to control or eliminate this risk.

10.13 Barricade failure during normal filling - substantial risk

Stope filling is based on the following commonly accepted practices.

It is a common practice to fill stopes in two separate pours. In the first pour a plug of fill is placed behind the barricade. The paste fill is poured at a controlled rate to a depth (usually 2 m to 3 m

above the drawpoint) that adequately covers the barricade in a single pour. Filling is then suspended for a period of time to permit partial curing of this plug.

Paste filling then continues at the safest maximum rate until the next sub level is reached. On each level this process is repeated. In this method, the barricades need to be strong enough to withstand the hydrostatic loading of the plug in slurry form. In Brucejack's case this would be approximately 150 kPa. The rest time for curing is then determined as the time taken for the paste to achieve this strength (approximately three days). The reminder of the stope is then filled at such a controlled rate that the strength gain of the paste is at least equivalent to the induced hydrostatic loading from the height rise of the paste.

The second practice is to convert the curing rate into an instantaneous filling height limit. In this case, the strength gain in 24 hours is determined from laboratory test work. For a typical gain of 100 kPa in 24 hours this depth stress is reached in 5 m. As curing continues and shear strength increases, confinement and arching will become dominant factors and there will be a divergence between vertical and horizontal loadings on any retaining structure.

The majority of paste fill operations have designed their barricades to withstand a horizontal working load of 150 kPa. For Brucejack 200 kPa has been selected.

10.14 Paste leakage through drill holes - moderate risk

In an Australian paste fill operation, paste fill was observed entering a level from a stope and was flowing via adjacent production blast holes. As a result of this incident, the pre-start stope check list was revised to inspect for blast holes and diamond drill holes which may permit the transfer of paste from one stope to another and to sand bag these off where necessary. The safety risk here is minor but has production delay consequences if not detected early.

10.15 Water in stope - moderate risk

Excessive flushing of boreholes and pipelines with water should be avoided. AMC recommends approximately 50 m^3 of water should be used for flushing. If extensive line flushing is required to clean the blocked lines, then it should be diverted outside the stope.

Excessive ground water inflow though production or diamond drill holes should be avoided. Prior to filling the stope, all diamond drill holes should be grouted.

In an incident in an Australian paste fill operation, a large quantity of flushing water was released into a stope as a result of a valve being inadvertently left open. This water, along with very wet paste slurry, breached the barricade in the base of the stope and made its way to the lower levels, causing major problems with the main dewatering pumps. The flow rates were not great but the quantity of fine tailings that were mobilized was high enough to cause significant problems with both clean up and final disposal.

All inrush situations are very serious and the need to minimize flushing water placed in stopes is very important.

10.16 Liquefaction risk

The geotechnical issues relating to liquefaction have been covered in Section 10.1 in some detail. This part briefly considers the specific risk issues for Brucejack. They key issue is whether any dynamic vibration source will act upon the paste fill and induce liquefaction either:

- Prior to achieving strength greater than 100 kPa, or
- By damaging cohesive binder bonding and reducing strength to below 100 kPa.

10.16.1 Liquefaction by blasting - moderate risk

Lilley and Chitombo (1998)[7] note that little work has been carried out on the dynamic stability of backfill when exposed to blasting vibrations. They observed that backfill is a strong attenuator of blast vibration and calculated for a simple model that up to 0.4 m of damage (plastic deformation) could be expected in drained cemented hydraulic fills. Bloss (1992)[8] considered the issue in some detail and looked at the effect of blast energy on the rock to fill interfaces and within the fill mass itself. He notes that energy transmission across the interfaces is poor but suggested that failure would be possible if the compressive or tensile stresses induced were greater than the strength of the fill at that point.

All the researchers were concerned with blasting adjacent to cured fill masses. In the situations under consideration, the blasting events are at sufficient distance from the fill being placed (greater than 40 m) such that the magnitude of blast energy transferred to the fill is not considered to be significant.

In the pre-cured state, paste fill will only be susceptible to liquefaction if the strength is less than 100 kPa and with an age of less than 24 hours. Further, this would only present a risk situation if the liquefied paste could flow into the workings.

10.16.2 Liquefaction by seismic event - moderate risk

The scenario described above also applies to seismic events with the difference being the magnitude of the vibration is higher but the exposure of the mine is significantly lower. There has been considerable research into civil engineering aspects of soil and foundation stability in seismically prone areas and it is from this work that the seismically resistant strength of 100 kPa has been derived.

A secondary issue is the long-term strength of paste fill over the life of the mine. Since paste fill is effectively a non-draining material, it will remain at or close to saturation conditions for many years. It is important that the long-term strength of paste fill is assessed to ensure that significant deterioration does not occur.

Brucejack needs to carry out tests at a laboratory scale on paste fill to confirm that there are no long-term strength loss issues, which may pose a future risk of liquefaction as a result of a large regional seismic event. When these results become available, they need to be incorporated into this technical manual.

10.16.3 Disposal of spilled paste - moderate risk

Paste fill which has failed into a stope (dilution), spilled onto a drive floor or been mucked from a fired face will have lost most or all of its cohesive strength. When large quantities of dilution occur, caution is required to ensure that mixed ore and paste sludge will not flow uncontrollably.

A fatal accident involving the mucking of uncemented hydraulic fill occurred at Mount Isa Mines in the mid nineteen eighties. In this incident, spilled hydraulic fill was tipped into a short vertical pass and water was deliberately added to mobilize the fill and prevent it from hanging up. The saturated material rushed from the pass and buried the loader operator.

---

[7] Lilley, CR & Chitombo, GPF (1998) Development of a near field damage model for cemented hydraulic fill, Sixth International Symposium on Mining with Backfill, AusIMM, Brisbane.

[8] Bloss, ML (1992) Prediction of cemented rockfill stability - Design procedures and modelling techniques, PhD Thesis, University of Queensland, Brisbane.

A more likely scenario is the contamination of ore or mullock with fill in passes which could make the material more susceptible to an inrush situation.

Brucejack is in the process of developing of operating procedures to ensure the safe storage and transfer of loose paste fill.

10.17 Failure of exposed paste - moderate risk

Fill mass wall / pillar failures in open stopes during mucking can lead to severe risks to people and equipment.

Large scale paste fill fall-off can cause backfill dilution, disrupt mining activities, and adversely affect local and regional ground stability and potential production delays and ore losses.

Smooth blasting practices should be implemented in order to minimize blast damage.

Undercutting of paste fill in stope sidewalls with loaders during mucking should be avoided.

Development ground support procedures have been developed in order to consider the hazards involved with mining through or alongside paste fill.

Appendix C
Combined Brucejack Mill SOPs November 2021

Objective

To establish mandatory requirements for the safe and responsible working standards for starting up the Paste Plant.

Scope

This SOP covers the process and procedures which will be used to start up the Paste Plant.

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

Definitions

DCS – Distributed Control System : a computerized control system for a process or plant usually with a large number of control loops, in which autonomous controllers are distributed throughout the system, but are monitored by a central control operator.

MAN – Manual mode: term used when the control parameters within the DCS are switched to operator (human) control.

AUTO – Automatic mode: term used when the control parameters are monitored by the DCS.

CAS – Cascade mode: term used in DCS control when one parameter or parameter dictates when another parameter is activated or deactivated.

No. – abbreviation for "number".

TPH – acronym for "Tonnes per hour".

Preparation

Hazards

- No hazards

Tools

- No additional tools required to complete task

Requirements

- Must be trained to operate the DCS or work within close contact with a trained operator.

Job Step

1. **Prestart Checks (Person Responsible – Central Control Room Operator)**
   - Ensure stope fill, paste and binder information has been provided to the underground paste crew and they are ready to accept paste. Note: Contact Procon Paste Crew on channel 5 (BJC: PASTE).
   - Check the level in the Tailing Stock Tank (5401) to ensure there is adequate material for paste mixing.

- Check the Binder Silo level (5522) to ensure there is adequate material for paste mixing.
- Ensure the diverter gates on the underground paste distribution lines are in the correct positions.
- Ensure the paste pump hydraulic system temperature is within operating range. If the paste pump hydraulic system temperature is not within operating range, contact Paste Plant Operator to resolve issue.

2. **Start Wet Scrubber (Person Responsible – Central Control Room Operator)**
   - Open Wet Scrubber Fresh Water Supply Valve (5561).
   - Open Seal Pot Process Water Supply Valve (5568).
   - Start Wet Scrubber Exhaust Fan (FA031M).
   - Start Wet Scrubber Recirculating Pump (PU033VFD).
   - Set Wet Scrubber Cone (5566) to AUTO mode.

3. **Start Paste Pump (Person Responsible – Central Control Room Operator)**
   - Ensure the correct paste pump is enabled as duty on both paste mixer and paste pump details page.
   - Start the hydraulic unit for the selected paste pump (PU41HU/PU042HU).
   - Start the selected Paste Pump (PU041DH/PU042DH) and set the speed to 10% in MAN mode.

4. **Flush Underground Feed Line (Person Responsible – Central Control Room Operator)**
   - Set Paste Mixer Chute Level (LIC5574/5584) to 90% set point.
   - Open Process Mixer to Paste Mixer Chute valve (5557/5558).
   - Set Paste Plant speed to 100% in MAN mode.
   - Open Paste Mixer and Chute Flush Water valve (FIC5555) and put the set point to 130 m^3/h in MAN mode.
   - As Paste Mixer Chute Level (LIC5574/5584) reaches 90% set point, set pump speed to 90 % in MAN mode. As pump speed reaches 90%, switch pump speed to AUTO mode.
   - Flush underground distribution paste line until Procon Paste Crew confirms clear flow of water exiting the pipe and there are no leaks on the distribution paste line. (Approximately 5 minutes)

5. **Start Paste Mixer (Person Responsible- Central Control Room Operator)**
   - Close Paste Mixer drain valve (5572/5582).
   - Open Paste Mixer overflow valve (5571/5581).
   - Start Paste Mixer (MX031M1).
   - Open Paste Mixer Slump water control valve (5551).
   - Ensure Paste Mixer water controller (FIC5552) is in CAS mode.

6. **Start Binder Delivery System (Person Responsible- Central Control Room Operator)**
   - Start Binder Screw Conveyor No.2 (CV022).
   - Start Binder Screw Conveyor No.1 (CV021).

- Start Binder Weigh Feeder (FE021).
- Ensure Binder Silo Vent (5527) and Binder Silo Aeration supply (5528) are in CAS mode.
- Start Rotary Valve (RV021) in AUTO mode, and it will change itself to CAS mode. This will cause the Binder Silo Vent (5527) and Binder Silo Aeration supply (5528) to open automatically.
- Ensure Binder Weigh Feeder controller (WIC5533) is in CAS mode.

7. Start Tailings Stock Delivery System to Paste Mixer in "Manual" Mode (Person Responsible – Central Control Room Operator)

- Set Paste Pump into MAN mode.
- Set Mix Feed Pump TPH to 117 (FIC5462) in AUTO mode.
- Open Tailings Stock Tank Feed Pump to Mixer valve (5464).
- Open "Pump Select" faceplate and sure that the desired pump (5445 /5455) is selected as duty.
- Open Sequence faceplate and ensure Duty pump and all associated valves are in CAS mode. (Selected valves are indicated by green check marks beside the valve description).
- Press "START SEQ".

NOTE: If the line pressures in the Paste Lines are below target value and not further adjustments can be made on paste solids target, the Horizontal Belt Filter will need to be brought online. (Refer to Horizontal Belt Filter Startup Procedure)

PRETIVM	BJ-PBF-SOP-553 **Paste Plant Shutdown Procedure (Control Room)**		
Owner: Brent Bachewich Bryan Dodding	Approver: Peter Nelega	Revision Number:	Creation Date: Sept. 18, 2017 Revision Date:

Objective

To establish mandatory requirements for the safe and responsible working standards for shutting down the Paste Plant.

Scope

This SOP covers the process and procedures which will be used to shut down the Paste Plant.

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

Definitions

DCS – Distributed Control System: a computerized control system for a process or plant usually with a large number of control loops, in which autonomous controllers are distributed throughout the system, but are monitored by a central control operator.

MAN – Manual mode: term used when the control parameters within the DCS are switch to operator (human) control.

AUTO – Automatic mode: term used when the control parameters are monitored by the DCS.

No. – Abbreviation for "number".

TPH – acronym for "Tonnes per hour".

Preparation

Hazards

- No hazards

Tools

- No additional tools required to complete task

Requirements

- Must be trained to operate the DCS or work within close contact with a trained operator.

Job Step

1. **Stopping Tailings Stock Delivery to Paste Plant in Manual Mode (Person Responsible – Central Control Room Operator)**
   - Inform Procon Underground Paste Crew that the Paste Plant will be shutting down.
   - If Horizontal Belt Filter is running, shut it down first. (Refer to Horizontal Belt Filter Shutdown Procedure.

- Open Paste Mixer Feed Pump flush valve (5442/5452).
- Close Paste Mixer Feed Pump suction valve (5441/5451).
- Flush Paste Mixer for a minimum of 5 minute.
- De-energize Paste Mixer Feed Pump (003/004).
- Close Paste Mixer Feed Pump flush valve (5442/5452).
- Close Paste Mixer Feed Pump discharge valve (5445/5455).
- Open Paste Mixer Feed Pump drain valve (5443/5452).

2. Stopping Tailings Stock Delivery to Paste Plant in Auto Mode (Person Responsible – Central Control Room Operator).

- Open Sequence Faceplate and press "STOP SEQ".

3. Flush Paste Mixer

- Close Mixer Slump Control water valve (5551).
- Open Paste Mixer Flush water valve (5556).
- Adjust Paste Pump in Man mode to 100%.
- Adjust Paste Mixer (5555) and Chute Flush Water Controller to a flowrate of approximately 130m^3/hr. – 145m^3/hr. to match the flowrate used during the paste pour.
- Flush water through the Paste Mixer for a minimum of 5 minutes.

4. Stop Binder Delivery System (Person Responsible- Central Control Room Operator)

- Verify Binder Rotary Valve (RV021) is down.
- Ensure Binder Weigh Feeder (FE021) has been run off by checking that Weightometer (WIC5533) is ready 0.
- Stop Binder Weigh Feeder (FE021).
- Stop Binder Screw Conveyor No.1 (CV021).
- Stop Binder Screw Conveyor No.2 (CV022).

5. Flush Paste Mixer and Paste Line (Person Responsible – Central Control Room Operator)

- Adjust Paste Mixer (5555) and Chute Flush Water Controller to 0 m^3/hr.
- Open Process Water valve (5557/5558) to Paste Mixer Chute. (Sump line is tied into the process water line for clean-up).
- Close Paste Mixer Flush valve (5556).
- Contact Paste Plant Operator to divert Paste Area Sump pump (013), to Paste Mixer Chute.
- Open Paste Mixer drain valves (5572/5582),
- Inform Paste Plant Operator to start High Pressure Pump (1032) and run for 15 minute flush cycle.
- Once the Paste Plant Operator has confirmed that the Paste Mixer has stopped draining and the cleanup is complete, inform the Paste Plant Operator to diver the sump back to the Tailings Disposal Surge Tank.

- Close Paste Mixer Overflow (5571/5581) to Paste Pump.
- As the Paste Pump reaches the set point (90%), switch Paste Pump speed to AUTO mode.
- Adjust Paste Mixer (5555) and Chute Flush Water Controller to a flowrate of approximately 130m³/hr. – 145m³/hr. to match the flowrate used during the paste pour.
- Set Paste Mixer (5555) to AUTO mode.
- As the level in the Paste Mixer chute reaches 90% set point, in MAN mode, adjust the Paste Pump speed to 90%
- **Contact** Procon Underground Paste Crew and inform them that flushing of the paste line has been initiated and they are to contact the Central Control Room operator when the paste line has completed flushing "**clean water**" is coming out of the end of the paste line.
- Adjust the Paste Mixer (5555) and Chute Flush Water controller in MAN mode to a flowrate of 0 m^m/h.
- Close Process Water valve (5557/5558) to Paste Mixer chute.
- Draw down the Paste Mixer Pump Chute
- De-energize the Paste Pump (041DH/042DH).

6. Pig the Paste Line to Underground (Person Responsible – Central Control Room Operator).

- Contact Paste Plant Operator to insert the clean out pig. (Refer to: BJ-PBF-SOP-56- Diverter Gate Operation & Pigging Procedure).
- **Contact** Procon Underground Paste Crew and inform them that a clean out pig has been inserted into the paste line and flushing will re-initiate.
- Inform the Procon Underground Paste Crew to notify the Central Control Room Operator when the clean out pig has discharged from the paste line and "**clean water**" is being discharged for the end of the paste line.
- Start Paste Pump (041DH/042DH) and adjust in MAN mode to 100%.
- Adjust Paste Mixer (5555) and Chute Flush Water Controller to a flowrate of approximately 130m³/hr. – 145m³/hr. to match the flowrate used during the paste pour.
- As the Paste Pump reaches the set point (90%), switch Paste Pump speed to AUTO mode.
- As the level in the Paste Mixer Chute reaches 90% switch control to AUTO mode.
- When confirmation has been received from the Procon Underground Paste Crew that the clean out pig has discharged from the paste line and "**clean water**" is being discharged for the end of the paste line, adjust the flowrate for Paste Mixer (5555) and Chute Flush Water Controller, in MAN mode, to 0 m³/hr.
- Close Process Water to Paste Mixer Chute (5557/5558).
- Draw down the Paste Mixer Pump Chute and de-energize Paste Pump (041DH/042DH).
- De-energize the Paste Pump Hydraulic Unit.

7. Stop Wet Scrubber System

- Commence Wet Scrubber System shutdown after the paste plant has been down for a minimum of 1 hour.
- Close Water valve (5561).
- Stop Pump (033VFD)
- Stop Wet Scrubber Fan (031M).

- **Approval Signatures Record**

PRETIVM	BJ-PBF-SOP-555 **Transfer of Binder from ISO-VEYOR to Bulk Storage Silo**		
Owner: Brent Bachewich Bryan Dodding	Approver: Peter Nelega	Revision Number:	Creation Date: Sept. 25, 2017 Revision Date:

Objective

SCANNED

To establish mandatory requirements for the safe and responsible working standards for transferring Binder from the ISO-Veyor to the Bulk Storage Silo.

Scope

This SOP covers the process and procedures which will be used to transfer binder from the ISO-Veyor to the Bulk Storage Silo.

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

Definitions

ISO-Veyor– term used for containers where the material is introduced and extracted from the container by using air.

MT- abbreviation for the word "Empty."

Preparation

Hazards

- Dust
- Noise

Tools

- No additional tools are required to complete the tasks.

Requirements

- Must be trained to operate the Paste Plant or work within close contact with a trained operator.

Job Step

1. **Pre-Start Checks (Person Responsible- Paste Plant Operator)**
   - Ensure the following conditions are met on the Iso-Veyor:
     - Vent valve is open.
     - Top air vent is open.
     - Material discharge valves are closed.
     - Aeration valves (6) are closed.
     - Boost valve is fully open.

- Ring jet is closed.
- Correct valving from ISO-Veyor to bulk storage silo.

2. Discharge Hose Connection (Person Responsible- Paste Plant Operator)

- Remove the cap from the ISO-Veyor connector ports
- Ensure gasket is seated in coupler.
- Connect the discharge hose to the corresponding ISO-Veyor and delivery connection.

  NOTE: Locking pins must be in place before progressing onto next step.

3. Pressurizing the Iso-Veyor (Person Responsible- Paste Plant Operator)

- Close the Boost valve.
- Open all (6) aeration valves.
- Close the vent valve.
- Energize Binder Unloading Blower (021M/022M).
- Allow the ISO-Veyor to pressurize to approximately 1.9 bar.

  NOTE: Do not exceed 2.0 bar.

4. Discharging ISO-Veyor (Person Responsible – Paste Plant Operator)

- When the pressure within the ISO-Veyor reaches operating pressure (1.9 bar), open the boost valve ¼ of the way.
- Close the aeration valves for bay 1 and bay 3
- Open the discharge valves for bay 2.

  NOTE: If the pressure in the ISO-Veyor is increasing, open the boost valve to full open position.
- Discharge is completed when a drop in tank pressure is indicated on the pressure gauge.
- Open the boost valve to purge material in the discharge line.
- Close the discharge valve for bay 2.
- Close the boost valve
- When the pressure within the ISO-Veyor reaches operating pressure (1.9 bar), open the boost valve ¼ of the way.
- Open the aeration valves for bay 3.
- Open the discharge valve for bay 3.

  NOTE: If the pressure in the ISO-Veyor is increasing, open the boost valve to full open position.
- Discharge is completed when a drop in tank pressure is indicated on the pressure gauge.
- Open the boost valve to purge material in the discharge line.
- Close the discharge valve for bay 3.
- Close the boost valve.
- When the pressure within the ISO-Veyor reaches operating pressure (1.9 bar), open the boost valve ¼ of the way.
- Open the aeration valves for bay 1.

- Open the discharge valve for bay 1.

  NOTE: If the pressure in the ISO-Veyor is increasing, open the boost valve to full open position.
- Discharge is completed when a drop in tank pressure is indicated on the pressure gauge
- Open the boost valve to purge material in the discharge line.

5. Flushing Delivery System (Person Responsible – Paste Plant Operator)

- Close the boost valve.
- Allow the ISO-Veyor to pressurize to 1.9 bar.
- Open bay 1 discharge valve.
- Open one bay 1 aeration valve.
- When the pressure in the ISO-Veyor drops below 1 bar, close the aeration valve.
- Allow the ISO-Veyor to pressurize to 1.9 bar.
- Open the additional aeration valve for bay 1.
- When the pressure in the ISO-Veyor drops below 1 bar, close the aeration valve.
- Close bay 1 discharge valve.
- Allow the ISO-Veyor to pressurize to 1.9 bar.
- Open bay 2 discharge valve.
- Open one bay 2 aeration valve.
- When the pressure in the ISO-Veyor drops below 1 bar, close the aeration valve.
- Allow the ISO-Veyor to pressurize to 1.9 bar.
- Open the additional aeration valve for bay 2.
- When the pressure in the ISO-Veyor drops below 1 bar, close the aeration valve.
- Close bay 2 discharge valve.
- Allow the ISO-Veyor to pressurize to 1.9 bar.
- Open bay 3 discharge valve.
- Open one bay 3 aeration valve.
- When the pressure in the ISO-Veyor drops below 1 bar, close the aeration valve.
- Allow the ISO-Veyor to pressurize to 1.9 bar.
- Open the additional aeration valve for bay 3.
- When the pressure in the ISO-Veyor drops below 1 bar, close the aeration valve.
- Close bay 3 discharge valve.
- De-energize the blower.

6. Depressurizing the ISO-Veyor (Person Responsible- Paste Plant Operator)

- Open the vent valve fully.
- Open the boost valve fully.
- Close all aeration valves.

- Ensure the blower is de-energized.
- When the ISO-Veyor pressure gauge displays 0 bar, disconnect the discharge hose and the blower hose from the ISO-Veyor.
- Install caps onto the ISO-Veyor.
- Attach an "MT" tag onto bay 1 discharge valve.

PRETIVM		BJ-PBF-SOP-557 **Casting of Cylinders for Strength Test - Underground**	
Owner: Bryan Dodding Kayla Johnston Brent Bachewich	**Approver:** Ward Philips Peter Nelega Dave Archiblad	**Revision Number:**	**Creation Date:** Jan. 28, 2018 **Revision Date:**

Objective

To establish mandatory requirements for the safe and responsible working standards for collecting paste samples and casting of cylinders for strength test.

Scope

This SOP covers the process and procedures which will be used to determine the optimal binder ratios relative to strength of the backfill material

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

1.8.2, 1.8.3, 1.8.4, 1.8.5 (Personal Protective Equipment)

Definitions

UCS – Unconfined Compressive Strength

TAMP – To press down lightly in an up and down motion.

QAQC – Quality Assurance Quality Control

U/G – Underground

Preparation

Hazards

- Noise
- Respiratory

Tools

- Pretivm Standard PPE
- Recommended Half-Mask Respirator
- Ensure all the following materials are available before proceeding:
    - Bucket/pail
    - Slump Cone
    - Tamping Rod
    - 3x3 Plywood Board
    - Ruler
    - Trowel
    - UCS Cylinders
    - Knife
    - Duct tape
    - Sharpie
    - Plastic
    - Elastics
    - Milk crate

Requirements

- Must be trained to operate the Paste Plant or work within close contact with a trained operator.

- Underground Orientation

Job Step

1. **Determination of Time Delay (Person Responsible – Control Room Operator)**
   - Control Room Operator will determine the time delay it takes for paste to leave the mill and reach the stope. This time delay will be communicated to the Surface and U/G Paste Operators at the beginning of each stope, and used for the entire length of the pour.
2. **Communication (Person Responsible – Surface Paste Plant Operator)**
   - When surface samples have to be taken, the Surface Paste Plant Operator must contact the U/G Paste Operator and inform them the exact time of sampling.
   - The U/G Paste Operator will use the time delay to determine what time to take the underground samples.
3. **UCS Cylinder Preparation (Person Responsible – U/G Paste Operator)**
   - Cut each cylinder and using duct tape, seal each cylinder split seam.
   - Label each cylinder as follows: YYYY-MMM-DD HH:MM UG. Example: 2017- SEP-19 09:45 UG. The date (YYYY-MMM-DD) can be written in advance of sample collection, but the time (HH:MM) must be written just before sampling. Ensure that UG is specified on all the cylinders.
4. **Sample Collection (Person Responsible – U/G Paste Operator)**
   - Sample collections are conducted using the information from the Surface Paste Operators and the time delay.
   - Underground samples are only to be taken on dayshift
   - 1 sample set equals 4 cylinders (2x7day and 2x28day samples)
   - Ensure latex or rubber gloves are donned prior to collecting sample.
   - Place pail under sample pipe extending off the T-Valve.
   - Open the T-Valve and collect enough paste to perform a slump and pour 4 cylinders.
   - Procon Paste Watcher can assist with collection of samples as needed
5. **Slump Test (Person Responsible – U/G Paste Operator)**
   - Place the slump cone on the wetted 3'x3' plywood. Ensure the surfaces of both the plywood and the cone are clean and moistened with water to eliminate sample sticking to equipment.
   - Stand on the foot tabs of the cone to hold it firmly during filling, taking precaution to keep constant force with little to no movement.
   - Fill the cone in three layers, each approximately one third the volume of the cone. Each layer is tamped with 25 strokes and uniformly distributed over the cross section of the cone. The second and top layers each are tamped throughout their depth, so that the strokes penetrate into the previous underlying layer.
   - After the top layer has been rodded, the surface of the backfill material is stricken off at the top of the cone with the steel rod, so that the cone is exactly full.
   - Lift the cone straight up and away from the backfill material counting slowly to 5, taking precaution to lift uniformly. Invert the cone and place it next to the slumped pile of backfill material gently ensuring not to disturb the slumped material. Place the steel rod horizontally across the inverted cone, so that the rod extends over the slumped material.

- Measure the distance between the bottom of the steel rod and the top of the slumped pile of material at three intervals across the top of the pile using a meter stick or ruler in inches. Record the Slump on the raw data Casting Sheet.

6. Filling UCS Cylinders with Sample (Person Responsible – U/G Paste Operator)

- Fill each UCS cylinder (4), to a height of approximately $^1/_3$ of the total height of the UCS cylinder.
- Tamp each UCS cylinder 25 times.
- Fill each UCS cylinder (4) to a height of approximately $^2/_3$ of the total height of the UCS cylinder.
- Tamp each UCS cylinder 25 times.
- Fill each UCS cylinder (4), so that each UCS cylinder is full to top.
- Tamp each UCS cylinder 25 times.
- Cover UCS cylinders (4) with plastic and secure with elastic bands.

7. Sample Collection and Storage (Person Responsible- U/G Paste Operator)

- Transport all 4 UCS cylinders directly to the curing chamber using a milk crate or similar container in a timely manner. Note: Cylinders must directly be transferred to the humidity lab and cannot be temporarily stored in any location.
- Place two UCS cylinders into each curing time shelf.

8. Data Collection (Person Responsible- U/G Paste Operator)

- Fill in the Paste Casting Sheets and document that the samples were taken underground.
- Hand in Casting Sheets to the Metallurgist Group upon completion.

9. Clean up (Person Responsible- Paste Plant Operator)

- Clean up work area and tools.
- Place tools in proper storage area.

Approval Signatures Record

PRETIVM		BJ-PBF-SOP-558 **Casting of Cylinders for Strength Test**	
Owner: Brent Bachewich Bryan Dodding	Approver: Peter Nelega	Revision Number:	Creation Date: Sept. 18, 2017 Revision Date:

Objective

To establish mandatory requirements for the safe and responsible working standards for casting of cylinders for strength test.

Scope

This SOP covers the process and procedures which will be used to determine the optimal binder ratios relative to strength of the backfill material

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

1.8.2, 1.8.3, 1.8.4, 1.8.5 (Personal Protective Equipment)

Definitions

USC – Unconfined Compressive Strength

TAMP – to press down lightly in an up and down motion.

QAQC – Quality Assurance Quality Control

Preparation

Hazards

- Noise
- Corrosive material

Tools

- Ensure all the following materials are available before proceeding:
  - USC Cylinders - Scoop
  - Slump Cone - Moisture Tins
  - Tampering Rod - Small Taming Rod
  - Oven - Curing Room
  - Duct tape - Marker Pen (Sharpie)

Requirements

- Must be trained to operate the Paste Plant or work within close contact with a trained operator.

Job Step

1. USC Cylinder Preparation (Person Responsible – Paste Plant Operator)

- 1 sample set equals 8 cylinders.
- By using duct tape, seal each cylinder split seam.
- Label each cylinder as follows: YYYY-MMM-DD HH:MM. Example: 2017- SEP-19 09:45. The date (YYYY-MMM-DD) can be written in advance of sample collection, but the time (HH:MM) must be written just before sampling.

2. **Sample Collection (Person Responsible – Paste Plant Operator)**
   - Sample collections are conducted under the following conditions
     - At least 1 hour after start up and circuit is stable (1 set = 8 cylinders)
     - If recipe changes during the shift (1 set = 8 cylinders)
   - Ensure latex or rubber gloves are donned prior to collecting sample.
   - Transfer the required amount of sample from the sample port into a clean collection pail to fill the required casting cylinders.
3. **Filling USC Cylinders with Sample (Person Responsible – Paste Plant Operator)**
   - Fill each USC cylinder (8), to a height of approximately $^1/_3$ of the total height of the USC cylinder.
   - Tamp each USC cylinder 25 times.
   - Fill each USC cylinder (8) to a height of approximately $^2/_3$ of the total height of the USC cylinder.
   - Tamp each USC cylinder 25 times.
   - Fill each USC cylinder (8), so that each USC cylinder is full to top.
   - Tamp each USC cylinder 25 times.
4. **Sample Collection Storage (Person Responsible- Paste Plant Operator)**
   - Transport all 8 USC cylinders to the curing chamber.
   - Place two USC cylinders into each curing time shelf.
5. **Data Input (Person Responsible- Paste Plant Operator)**
   - By using the computer located with the Paste Plant Lab, open the excel file "QAQC-Strength Testing Sheets and click the icon "INPUT CASTING DATA".
   - Input data in the cell highlighted in yellow.
   - Review data entries to confirm the entries are correct. It data is incorrect, input correct data. If data is correct, click "TRANSFER" button, then click "SAVE" button.
   - Close the excel file "QAQC-Strength Testing Sheets".
6. **Clean up (Person Responsible- Paste Plant Operator)**
   - Clean up work area and tools.
   - Place tools in proper storage area.

Mill Superintendent	Peter Nelega		

PRETIVM	BJ-PBF-SOP-559 **Determination of Unconfined Compressive Strength for Cylinders**		
Owner: Brent Bachewich Bryan Dodding	Approver: David Towle	Revision Number:	Creation Date: Sept. 19, 2017 Revision Date:

Objective

To establish mandatory requirements for the safe and responsible working standards for determining the Unconfined Compressive Strength (UCS) for cylinders.

Scope

This SOP covers the process and procedures which will be used to determine the optimal binder ratios relative to strength of the backfill material

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

1.8.2, 1.8.3, 1.8.4, 1.8.5 (Personal Protective Equipment)

Definitions

UCS – Unconfined Compressive Strength

ARD - Acid Rock Drainage

QAQC – Quality Assurance Quality Control

KN – abbreviation for kilo newton. A newton is the Standard International (SI) unit of force. One newton it the force required to cause a mass of one kilogram to accelerate at a rate of one meter per second squared

Preparation

Hazards

- Noise
- Corrosive material

Tools

- Ensure all the following materials are available before proceeding:
  - Compression Test machine
  - Core Sample Saw
  - Ruler
  - Caliper
  - Dusk Mask (Recommended)
  - Calculator
  - Scale
  - Camera

Requirements

- Must be trained to operate the Paste Plant or work within close contact with a trained operator.

Job Step

1. **USC Cylinder Preparation (Person Responsible – Paste Plant Operator/Metallurgical Technician)**
   - Open the excel file "QAQC – Strength Testing Sheets."
   - Press "PRINT" to obtain a hard copy of the QAQC – Strength Testing Sheet.
   - Remove the required samples (cylinders) from the curing chamber and place onto the work bench.

- Remove all the tape holding each cylinder together.
- Remove the top collar from the cylinders if applicable.
- Remove the samples from the cylinders and place each sample upright on the work bench.
- Inspect each sample for damage or deformities (cracks, air bubbles). Record any deformities in the record/notes section in the QAQC file.

2. Sample Collection (Person Responsible – Paste Plant Operator/Metallurgical Technician)

- Ensure the following tasks are conducted on the core saw prior to using
  - Safety guards are in place and functional.
  - Work area is clear of debris.
  - Core saw water discharge hose is discharged into the floor drain.
- Cut each sample with the core saw to make flat ends on each side.
- Place each sample upright on the work bench.
- By using the calipers, measure the diameter of each sample in two locations and calculate the average diameter. Record the average diameter of the sample into the USC Test Sheet.
- Place each sample onto their side on the work bench.
- By using the calipers, measure the length of each sample in two and calculate the average length. Record the average length of the sample into the USC Test Sheet.
- Place sample upright on the work bench.

3. USC Test (Person Responsible – Paste Plant Operator/Metallurgical Technician)

- Turn on the power to the Compression test machine.
- Turn on the hydraulics for the Compression test machine.
- Input the length and diameter of the sample into the test program.
- Remove the sample from the work bench and place the sample upright into the Compression test machine.
- If the space between the top of the sample and the hydraulic ram is greater than 1 centimeter, lower the ram until a gap of approximately one centimeter is achieved.
- Start test by turning handle to "Meter Advanced"
- Lower the ram at a constant speed.
- Continue breaking the sample until failure. The Compression test machine will stop when sample failure is achieved.
- Retract the hydraulic ram.
- Press the magnifying glass on the display and record the following data onto the USC Test Sheet.
  - Maximum load (kN)
  - Machine Stress (MPa)
- Take a picture of the sample.
- Visually inspect the sample to determine the fracture type.
- Record fracture type onto the USC Test Sheet.

- Obtain a sample bag, and by using a sharpie, write the following data onto the sample bag
  - The sample ID (Date/Shift/Time of pouring)
  - Attach a label with the following description "ARD SAMPLE".
- Place the ARD sample into collection box.
- Conduct testing on all samples before performing next step.

4. Sample Data Entry (Person Responsible- Paste Plant Operator)

- Open the excel file QAQC – Strength Testing Sheets.
- Click "INPUT UCS STRENGTH DATA" and enter the data from the USC Test Sheet into the computer.
- Review data entry for accuracy.
- Once data is confirmed correct, click the "TRANSFER" and then click "SAVE".
- Hole punch the USC Test Sheet and place in the data records binder.

5. Clean up (Person Responsible- Paste Plant Operator)

- Clean up work area and tools.
- Place tools in proper storage area.

PRETIVM		BJ-PBF-SOP-560 **Diverter Gate Operation & Pigging Procedure**	
Owner: Brent Bachewich Bryan Dodding	Approver: David Towle	Revision Number:	Creation Date: Sept. 18, 2017 Revision Date:

Objective

To establish mandatory requirements for the safe and responsible working standards for operating the Paste Plant Diverter Gate and inserting clean-out pigs into the Paste Plant discharge lines.

Scope

This Standard Operating Procedure (SOP), covers the process and procedures which will be used to standardize operation of the Paste Plant Diverter Gate and the insertion of clean-out pigs into the Paste Plant discharge lines.

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

1.8.2, 1.8.3, 1.8.4, 1.8.5 (Personal Protective Equipment)

Definitions

Clean-Out Pig - Round shaped foam which is cut or poured out of an open cell polyurethane.

Pigging – Refers to the practice of inserting a clean out pig into pipelines to clean/remove material buildup within the pipeline.

Pinch Point - A pinch point is any point at which it is possible for a person or part of a person's body to be caught between moving parts of a machine, or between the moving and stationary parts of a machine, or between material and any part of the machine. A pinch point does not have to cause injury to a limb or body part, although it might cause injury – it only has to trap or pinch the person to prevent them from escaping or removing the trapped part from the pinch point.

Preparation

Hazards

- Pinch Points
- Noise
- Pressure in Paste Line

Tools

- Broom handle
- Clean-out Pig

Requirements

- Must be trained to operate the Paste Plant or work within close contact with a trained operator.

Job Step

1. **Diverter Gate (Person Responsible – Paste Plant Operator)**
   - Visually inspect the pressure gauge on the Paste Line (discharge side of the Paste Pumps) and ensure the line pressure is reading 0 kPa.
   - Check the Diverter Gate Hydraulic Pack for adequate oil; oil level can be checked by using the site glass.
   - Contact Central Control Room to energize the Diverter Gate Hydraulic Pump (HY043).

- Move the Diverter Gate to the desired position, by using the black lever (Mounted on the south side of the Diverter Gate Enclosure).The Diverter Gate (connected to the Paste Line) can be moved to three positions:
    - Paste Pump 1 is the center position
    - Paste pump 2 is the left position
    - Pigging port is the right position

2. **Insertion of Clean-Out Pig into Paste Discharge Line (Person Responsible – Paste Plant Operator)**
    - Ensure the Diverter Gate is in the pig position.
    - Insert the clean-out pig into the pipe opening. **Do not push the clean-out pig into the pipe using any part of your body.**
    - Push the clean-out pig past the Diverter Gate into the Paste Line by using a broom handle. Do not allow any part of your body to enter the pipeline opening.
    - Position the Diverter Gate to the desired Paste Pump by using the black hydraulic lever.
    - Contact the Central Control Room Operator to notify them that the clean-out pig has been inserted and the Diverter Gate is in the correct position.
    - Contact Central Control Room to de-energize the Diverter Gate Hydraulic Pump (HY043).

Black Lever: This lever is used to control the position of the Diverter Gate.

Red Lever: This lever is used to lock the hydraulics to the Diverter Gate. Pulling the lever to a horizontal position will cut off the hydraulic fluid to the cylinders.

Pig Port: This is where the clean out pig is inserted. Insert clean out pig into the line using a broom handle. Never place any part of your body inside the pig port.

The above picture shows the gate in the center position, which would connect the paste line to Paste Pump #1.

PRETIVM SCANNED		BJ-PBF-SOP-561 **Energizing/De-energizing the Paste Pumps (GeHo) Hydraulic System in Manual Mode**	
Owner: Brent Bachewich Bryan Dodding	Approver: Peter Nelega	Revision Number:	Creation Date: Sept. 18, 2017 Revision Date:

Objective

To establish mandatory requirements for the safe and responsible working standards for energizing the Paste Plant Pumps (GEHO) hydraulic system in manual mode.

Scope

This SOP covers the process and procedures which will be used to energize the Paste Pumps (GEHO) hydraulic system in manual mode.

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

1.8.2, 1.8.3, 1.8.4, 1.8.5 (Personal Protective Equipment)

Definitions

GEHO – trade name for a diaphragm pump developed by Weir. The GEHO pump is a crankshaft driven high pressure piston diaphragm pump designed to handle abrasive tailings slurries and underground paste.

PLC- acronym for "Programmable Logic Controller". A PLC is an industrial computer that has been adapted for the control of manufacturing and has a high control reliability and ease of diagnosing process faults.

Local/Remote – refers to operator control of the PLC. Local refers to operating the PLC is the field. This is usually conducted in close proximity to the equipment controlled by the PLC. Remote refers to operating the PCL from a control room.

Preparation

Hazards

- Noise
- Electrical

Tools

- No additional tools required to complete task.

Requirements

- Must be trained to operate the Paste Plant or work within close contact with a trained operator.

Job Step

1. **Energizing the Paste Pump Hydraulic System in Manual Mode (Person Responsible – Paste Plant Operator)**
   - Visual inspect "TIA temperature" on PLC display screen. If temperature is below 50° Celsius, energize the Paste Plant hydraulic system.
   - Turn PLC control to "LOCAL".
   - Conducted the following steps using the touch screen located on the PLC cabinet in the following order:
     - Press "Service" to enter service mode screen

- Press "Yes" to acknowledge that you want to go into service mode.
  NOTE: When you press "YES", all safety features are overridden.
- Enter access code. Contact supervisor for access code.
- Press "START" to switch PLC into service mode. The status light will change from grey to green
- Press "START" to energize M6 motor.
- Press "START" to open Y21 valve.
- Press "START" to open Y35 valve
- Press "START" to energize M3 motor.
- Press "START" to energize M4 motor.
- Press "START" to energize M5 motor.
- Press "MAIN" to exit service screen and to display main display screen
- Monitor "TIA Temperature". When temperature reaches 60° Celsius, de-energize the paste pump hydraulic system.

2. De-energizing the Paste Pump Hydraulic System in Manual Mode (Person Responsible – Paste Plant Operator)

- Ensure PLC control is in "Local" mode.
- Conduct the following steps using the touch screen located on the PLC cabinet in the following order:
  - Press "Service" on main screen to enter service mode screen.
  - Press "Yes" to acknowledge that you want to go into service mode.
  - NOTE: When you press "YES", all safety features are disengaged
  - Enter access code. Contact supervisor for access code.
  - Press "STOP" to de-energize M5 motor.
  - Press "STOP" to de-energize M4 motor.
  - Press "STOP" to de-energize M3 motor.
  - Press "STOP" to close Y35 valve.
  - Press "STOP" to close Y21 valve.
  - Press "STOP" to de-energize M6 motor.
  - Press "STOP" to deactivate Service mode.
  - Press "MAIN" to exit service screen and to display main display screen.
  - Monitor "TIA Temperature". When temperature drops to 50° Celsius, energize the paste pump hydraulic system up.

PRETIVM		BJ-PBF-SOP-562 Paste Plant Mixer Cleaning	
Owner: Bryan Dodding Brent Bachewich	Approver: Peter Nelega	Revision Number:	Creation Date: Oct 12, 2017 Revision Date:

Objective

To ensure the Paste Mixer has been flushed and thoroughly washed when paste production is complete.

Scope

This SOP covers the process and steps involved to flush out the paste mixer and thoroughly wash using the high pressure washing system.

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

Definitions

TDST – Tailings Disposal Surge Tank

Preparation

Hazards

- High Pressure Water
- Equipment starting

Tools

- Pressure Washer
- Face Shield

Job Steps

1. Washing the Paste Mixer (Persons Responsible – Paste Plant Operator)

- Once the Control Room operator has finished flushing the Paste Mixer with water, they will contact the Paste Plant operator to divert the paste area sump (PU-013) to the Paste Mixer chute.
- Control Room will open the Paste Mixer drain valves (HS-5572/5582).
- Check for flow from the drains to ensure there isn't a plug in the line.
- If the Paste Mixer doesn't drain, the line will be built up with hardened paste between the Paste Mixer discharge and drain valve. Close the Paste Mixer drain valves (HS-5572/5582) and open the flush water located in this section to try and flush the material back into the mixer. After flushing, shut off water and open the drain valves. Check for flow.
- If the water flush doesn't remove the buildup, maintenance will have to break the line so it can be cleaned out.
- Once the Paste Mixer has completed draining, the high pressure washer pump (PU-031/032) can be started on a 15 minute flush cycle.
- When flush has completed, the Paste Mixer will be inspected for buildup of hardened paste inside the tank and on the agitators. **It is very crucial to ensure that all buildup of paste is removed.**
- If further cleaning is required, the Paste Mixer agitators (MX-031M1/M2) must be locked out.
- Use the pressure washer to spray off all hardened build up.

  Note: Face Shield must be worn when using the pressure washer.

- If an Operator has to reach inside or enter the Paste Mixer, both lock-out and confined space procedures must be followed.
- Contact the Control Room operator when cleanup is complete and divert the sump back to TDST.

PRETIVM		BJ-PRO-SOP-564 **OPERATING OVERHEAD DOOR WITH SAFETY EDGE BYPASSED**	
Owner: Bryan Dodding Brent Bachewich	Approver: Dave Archibald Peter Nelega	Revision Number:	Creation Date: Jan. 11, 2018 Revision Date:

Objective

To establish mandatory requirements for safe responsible working standards for operating an overhead door when the safety edge is bypassed.

Scope

This procedure covers the steps involved for operating an overhead door when the safety edge is bypassed. This includes opening the overhead door and closing the overhead door.

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

Definitions

No definitions

Preparation

Hazards

- Any obstruction that may interfere with opening or closing the overhead door.

Tools

- No additional tools required.

Requirements

- Trained in operating overhead door when safety edge is bypassed.

Job Steps

1. **Opening Overhead Door (Person Responsible – Mill Operator)**
   - Ensure door entrance is clear of obstructions.
   - Push Up/Down button (Black) to open door.
   - Do not allow any vehicular traffic through the doorway until the overhead door is fully opened.
   - Direct vehicular traffic through door way.
2. **Closing Overhead Door (Person Responsible – Mill Operator)**
   - Ensure vehicle has passed through the door way and is clear of the overhead door.
   - Press Up/Down button (Black) to close door.
   - Visually monitor doorway to ensure no vehicles try to drive through the door way as door is being lowered.

PRETIVM		BJ-PRO-SOP-570 **Operating Underground Booster Station**	
Owner: Brent Bachewich Bryan Dodding	**Approver:** David Archibald Peter Nelega	**Revision Number:**	**Creation Date:** Feb. 13, 2018 **Revision Date:**

Objective

To establish mandatory requirements for the safe and responsible working standards for operating the Underground Booster Station.

Scope

This procedure covers the steps required for starting the Underground Booster Station, operating the Underground Booster Station and shutting down the Underground Booster Station.

Health, Safety & Reclamation Code of BC

1.11.1 (Training)

1.8.2, 1.8.3, 1.8.4, 1.8.5 (Personal Protective Equipment)

Definitions

CAS – Cascade

UG –Underground

SOP- Safe Operation Procedure

Preparation

Hazards

- Noise
- Working underground.
- Pinch points
- Pressure in Paste lines, hydraulic lines, airlines and water lines

Requirements

- Underground Orientation
- Trained or working with a trained Underground Paste Plant Operator
- Trained in Lockout/tagout (LOTO).
- Trained & Signed off on BJ-PRO-SOP-560 Diverter Gate Operation & Pigging Procedure

Job Step

NOTE: All advice and directives from the Underground Paste Watcher must be adhered to.

1. Pre-start Checks (Person Responsible- Underground Paste Plant Operator)

- Start Hydraulics (2153-HY-003) to Diverter Valves.
- Set Diverter Valve to Paste Pump (PU-020).
- Verify Destination Valve is correct for Destination: 1350 Level, Lower VOK or Upper VOK".
- Stop Hydraulics to Diverter Valves.

- Wet the Live Bottom Hopper.

2. **Pre-Start checks (Person Responsible – Control Room Operator and Underground Paste Booster Operator)**
   - Close Hopper Discharge Valve (2153-HS-5613) to Booster Paste Pump (PU020).
   - Start Bottom Hopper Augier Forward (2153-HO-001).
   - Verify Flush Water Tank Level (2153-LI-5621) is greater than 80% and set to CAS mode.
3. **Pre Wetting Live Bottom Hopper (Person Responsible – Control Room Operator)**
   - Use slick water from surface paste plant.
   - If water from surface is not available, start selected Flush Water Pump (2153-PU-001 or 2153-PU-002).
   - Set Live Bottom Hoper Level (2153-LIC-5611) to approximately 67% in AUTO mode.
4. **Prepare Booster Pumps for Startup (Person Responsible- Control Room Operator)**
   - Open Hopper Discharge Valve (2153-HS-5613) to Paste Pump (PU-020).
5. **Start Booster Paste Pump (Person Responsible – Control Room Operator)**
   - When the Underground Paste Plant gives the confirmation that "Underground is ready for Startup", the surface paste plant will be started using water.
   - The Underground Paste Plant Operator will inform the Control Room Operator when water is received into the Live Bottom Hopper.
   - The Underground Paste Plant Operator will inform the Control Room Operator that "Underground is ready for paste.
   - Allow the Live Bottom Hopper to attain a level of approximately 70%, then start Booster Paste Pump (PU-020).
   - Adjust pump stroke to maintain a level of 65%- 67% in the Live Bottom Hopper, then switch to AUTO mode.
   - The Surface Paste Plant Operator will start pumping paste underground.
   - The Underground Paste Plant Operator will inform the Control Room Operator when paste is discharging into the Live Bottom Hopper.
   - If the Booster Paste Pump (PU-020), was turned off, turn the pump back on and set to AUTO mode and set the level in the Live Bottom Hopper to around 67% on (2153-LIC-5611).
6. **Shutdown and Clean Out Mode (Person Responsible – Control Room Operator)**
   - After the pour of Paste is complete, the surface plant will go into cleanout mode. This process will send dirty water to Live Bottom Hopper and Booster Station.
   - The Underground Booster Paste Pump (PU-020) will remain running until the Underground Paste Plant Operator verifies that "clean" water is discharging into the Live Bottom Hopper.
   - Stop Underground Paste Booster Pump (PU-20).
7. **Pigging the Surface Line (Person Responsible – Control Room Operator & Mill Surface Paste Plant Operator)**
   - Surface Paste Plant Operator will prepare the surface line for pigging as per Pretivm Pigging SOP[1]
   - When confirmation from the Underground Paste Plant Operator has been given that the pig has arrived and the pig has been removed from the Live Bottom Hopper and the flow into the Live Bottom Hopper is clear, the surface paste pump can be shut down and the procedure for pigging the underground paste line from the booster pump to the stope can be conducted.

8. Flush the Live Bottom Hopper (Person Responsible – Underground Paste Operator)

- Close the drain on Live Bottom Hopper to catch any excess water for pigging the underground process. Remaining water will report to sump via Live Bottom Hopper overflow.
- Start Underground Paste Booster Pump (PU-20).
- Flush the underground line for approximately 2 minutes with water from the Live Bottom Hopper.
- Stop Booster Paste Pump (PU-020).
- Confirm a loss in line pressure at 2153-PI-5641 and 2153-PI-5646.
- To prevent backflow, start the Diverter Hydraulic Power Pack 2153-HY-003 and move Diverter Valve No.1 (2153-DV-001) to the center pigging port and verify with 2153-PI-5646.

9. Pigging the Underground Line (Person Responsible- Underground Paste Operator)

- Turn Diverter Valve Hydraulic Power Pak (2153-HY-003) on.
- Place both Diverter Gates to Neutral position.
- After the line pressure has been proven to be zero (2153-PI-5647 and 2153-PI-5646).
- Insert the pig into the line making sure it is beyond the rotating plate of the diverter plate.
- Return the Diverter Valves to previous position for Booster Paste Pump (PU-020) and verified by 2153-ZI-5643A.
- Turn Diverter Valve Hydraulic Power Pak (2153-HY-003) off.
- Start Paste Pump (2153-PU-020).
- Once the UG Paste Plant Operator verifies that the Pig has been released and the UG Paste Watcher verifies clean water is exiting the pipe, stop Paste Booster Pump (2153-PU-020).
- Position Diverter Valve No. 1 slowly to the center Pig Insertion Port (B) and allow remaining water to drain into the sump.
- Stop the Paste Pump Hydraulic Power Unit (2153-HY-020) allow for cool down period.
- Conduct general circuit clean up.

Average vertical stress σ_z	153	0	0	0	kPa
cohesion	48	0	0	0	kPa
Design Strength (UCS)	191	0	0	0	kPa
Backfill Mix Strength - 3rd Section				200	kPa

Backfill Strength - 4th Section

Height	30		Depth Stress	503	kPa
Average vertical stress σ_z	154	0	0	0	kPa
cohesion	48	0	0	0	kPa
Design Strength (UCS)	192	0	0	0	kPa
Backfill Mix Strength - 4th Section				200	kPa

Backfill Strength - Undercut

Base of Undercut zone	Not undercut	Depth Stress	kPa
Height of Undercut	m		
Design Strength (UCS)			kPa
Backfill Mix Strength - Undercut			kPa

Calculation of average vertical stress in backfill and UCS for each increment (kPa)

UCS values denote backfill mix strength at the base of each incremental zone

Depth	1st Exp	2nd Exp	3rd Exp	4th Exp	Max Average Vert Stress	Cohesion	Depth Stress	Min Strength x FoS	UCS
0	0	0	0	0	0	0	0	0	
5	61	0	0	0	61	19	84	77	100
10	96				96	30	168	120	200
15	119				119	37	252	148	200
20	134				134	42	336	168	200
25	145				145	45	419	182	200
30	154				154	48	503	192	200

Summary of backfill mix strength

UCS values for manually zoned backfill

Zone	Depth	σz	cohesion	UCS	Zoned UCS
	0	0	0	0	200
1st	10	96	30	120	200
2nd	15	119	37	148	200
3rd	29.5	153	48	191	200
4th	30	154	48	192	200
U/C	30			192	200

Calculation of average vertical stress in backfill (kPa)

Terzaghi 3D

$$\sigma_z = \frac{\frac{W}{N}\left(\rho_g - \frac{c}{W}\left(1 - e^{-\frac{(N.k.z.\tan\phi)}{W}}\right)\right)}{k.\tan\phi}$$

Key to Terzaghi 3D formula

σz	Average vertical stress	kPa
c	Cohesion	kPa
ρg	Bulk density of backfill	KN/m3
ϕ	Friction angle	degrees
k	Poisson's ratio	
W	Width of backfill exposure	m
Z	Depth of fill (Height of exposure)	m
N	Number of intact rock walls	

Brucejack Strength Design summary

Appendix F
Brucejack Mitchell Sill V1.9 February 2018

AMC Worksheet to estimate the strength and thickness of an undercut fill slab Version 1.9 - February 2010

Adapted from Mitchell & Roettger (1989) Analysis and Modelling of Sill Pillars, Innovations in Mining with Backfill, Montréal, Balkema

General Assumptions

Geotechnical Data

Sill Pillar Fill Type	Paste	Non Entry Mining Method (FoS >= 1.25)
Elastic Modulus E MPa	200	
Ratio of Compressive to Tensile Strength	8.0	
Gravity g ms-2	9.81	
Wet Fill Density γ kg/m^3	1.71	Sill Pillar
Wet Fill Density $\sigma_v \gamma$ kN/m^3	16.8	Sill Pillar
Wet Fill Density γ kg/m^3	1.71	Surcharge Load
Wet Fill Density $\sigma_v \gamma$ kN/m^3	16.8	Surcharge load
Factor of safety FoS	1.25	FoS >= 3.0 for man entry
Backfill mix increments kPa	100	

Stope Information

Stope Name

Brucejack Undercut Sills

Select closure method ==> Distance / Strain

and use spinner to adjust

Stope Geometry

Closure Spinners ==> 0.005 0.10%

Include surcharge load (Distance / Strain (%))

Length of Sill (Strike length) m	100										
Backfill lift height m	30.0										
Orebody Dip β degrees	90										
Width of Sill (HW to FW) m	5.0	6.0	7.0	8.0	9.0	10.0	11.0	12.0	13.0	14.0	15.0
Actual depth of cemented sill d m	2.5	3.0	3.5	4.0	4.5	5.0	5.5	6.0	6.5	7.0	7.5
Suggested sill depth values m	2.50	3.00	3.50	4.00	4.50	5.00	5.50	6.00	6.50	7.00	7.50
Surcharge depth m	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Suggested surcharge depth (1.6*span) m	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Closure (HW to FW) m	0.005	0.006	0.007	0.008	0.009	0.010	0.011	0.012	0.013	0.014	0.015
Minimum Span (L) m	5.00	6.00	7.00	8.00	9.00	10.00	11.00	12.00	13.00	14.00	15.00
Sill Self Weight kN/m	210	302	411	537	680	840	1,016	1,209	1,419	1,645	1,889
Surcharge load σ_v kN/m	0	0	0	0	0	0	0	0	0	0	0
Uniform Loading (Sill + Surcharge) kN/m	210	302	411	537	680	840	1,016	1,209	1,419	1,645	1,889
Uniform Loading (Sill + Surcharge) w kPa	42	50	59	67	76	84	92	101	109	118	126

Test for Flexure Failure

Calculation

Closure stress σ_c (Eδ/L) kPa	200	200	200	200	200	200	200	200	200	200	200
Tensile Strength (σ_t) kPa	0	0	0	0	0	0	0	1	18	35	52
Compressive strength kPa	0	0	0	0	0	0	0	12	146	281	415
UCS for Flexure Stability (inc FoS) kPa	0	0	0	0	0	0	0	100	200	400	600

$$\sigma_t = \frac{w}{2}\left(\frac{l}{d}\right)^2 - \sigma_c$$

Test for Crushing Failure

Calculation

Closure stress σ_c (Eδ/L) kPa	200	200	200	200	200	200	200	200	200	200	200
UCS for Crushing Stability (inc FoS) kPa	300	300	300	300	300	300	300	300	300	300	300

$$UCS = \sigma_c$$

Test for Caving Failure

Calculation

Tensile Strength (σ_t) kPa	34	40	47	54	60	67	74	81	87	94	101
Compressive strength kPa	269	322	376	430	484	537	591	645	698	752	806
UCS for Caving Stability (inc FoS) kPa	400	500	500	600	700	700	800	900	900	1,000	1,100

$$\sigma_t = \frac{\gamma l}{2.5}$$

Test for Shear Failure

Calculation

Shear Stress (τ_f) kPa	42	50	59	67	76	84	92	101	109	118	126
UCS for Shear Stability (inc FoS) kPa	100	100	100	100	100	200	200	200	200	200	200

$$\tau_f = \frac{sin^2\beta wl}{2d}$$

Test for Rotational Failure

Calculation

Test for dimensional stability	Stable	Stable	Stable	Stable	Stable	Stable	Stable	Stable	Stable	Stable	Stable
Tensile Strength (σ_t) kPa	0	0	0	0	0	0	0	0	0	0	0
Compressive strength kPa	0	0	0	0	0	0	0	0	0	0	0
UCS for Rotational Stability (inc FoS) kPa	0	0	0	0	0	0	0	0	0	0	0

$$\sigma_t = \frac{w(2l(l - dcot\beta)(sin^2\beta))}{d^2}$$

Appendix H1
Golder Barricade Design Construction Notes

GENERAL REQUIREMENTS

1. CODE: ALL DESIGN WORK FOR THIS PROJECT SHALL CONFORM TO THE BRITISH COLUMBIA BUILDING CODE (BCBC), LATEST EDITION AND CONSTRUCTION WORK SHALL CONFORM TO CANADIAN STANDARDS.

2. FURNISH ALL LABOR, MATERIALS AND EQUIPMENT NECESSARY TO COMPLETE THE WORK SHOWN OR INFERRED BY THESE DRAWINGS.

3. THE CONTRACTOR SHALL REVIEW AND COMPARE THE STRUCTURAL DRAWINGS WITH ALL OTHER CONTRACT DOCUMENTS, VERIFYING ALL DIMENSIONS AND ELEVATIONS, AND REPORT ANY INCONSISTENCIES, ERRORS, OR OMISSIONS TO GOLDER'S STRUCTURAL ENGINEER BEFORE PROCEEDING WITH THE WORK.

4. THE CONTRACTOR SHALL TAKE FIELD MEASUREMENTS, VERIFY FIELD CONDITIONS AND SHALL COMPARE SUCH FIELD MEASUREMENTS AND CONDITIONS WITH THE STRUCTURAL DRAWINGS, AND REPORT INCONSISTENCIES TO THE ENGINEER BEFORE PROCEEDING WITH THE WORK.

5. THE DESIGN LOADS SHALL NOT BE EXCEEDED DURING CONSTRUCTION. THE CONTRACTOR SHALL MAKE ADEQUATE PROVISIONS FOR CONSTRUCTION LOADS AND PROVIDE ADEQUATE TEMPORARY BRACING TO KEEP THE STRUCTURE PLUMB AND IN TRUE ALIGNMENT AT ALL PHASES OF CONSTRUCTION.

6. GOLDER ASSOCIATES SHALL NOT BE RESPONSIBLE FOR CONSTRUCTION SAFETY, MEANS, TECHNIQUES AND CONSTRUCTION PROCEDURES, OR ANY TEMPORARY WORKS AS MAY BE REQUIRED BY THE CONTRACTOR TO BUILD AND COMPLETE THE STRUCTURE IN CONFORMITY WITH THE CONTRACT DOCUMENTS. THE CONTRACTOR SHALL BE RESPONSIBLE FOR OVERALL PROJECT SAFETY AND SHALL CONFORM TO BRITISH COLUMBIA REGULATION RESPECTING OCCUPATIONAL HEALTH AND SAFETY IN MINES.

ROCK

1. BARRICADE TO BE CONSTRUCTED AGAINST SOLID ROCK WITH A MIN. STRENGTH OF 25 MPa (TO BE VERIFIED AT SITE).

2. DESIGN OF ROCK ANCHORS TO BE REVIEWED AND CONFIRMED BY A GEOTECHNICAL PROFESSIONAL LICENSED IN THE JURISDICTION OF THE WORK AND FAMILIAR WITH THE ROCK STRUCTURE.

SHOTCRETE

1. COMPLY WITH THE PROVISIONS OF THE LATEST EDITION OF THE FOLLOWING EXCEPT WHERE MORE STRINGENT REQUIREMENTS ARE SHOWN OR SPECIFIED:

A. CSA-A23.1-09 / A23.2-09
- CONCRETE MATERIALS AND METHODS OF CONCRETE CONSTRUCTION
- METHODS OF TEST AND STANDARD PRACTICES FOR CONCRETE

B. CSA-A23.3-04.
- DESIGN OF CONCRETE STRUCTURES

2. REINFORCING MATERIALS:
WELDED WIRE FABRICS (WWF) SHALL CONFORM TO CSA G 30.5

3. SHOTCRETE MINIMUM 28-DAY COMPRESSIVE STRENGTH: 20 MPa

4. CEMENT: CAN/CSA-A3001, TYPE GU; GREY COLOUR

5. MAXIMUM AGGREGATE SIZE SHALL BE: 10mm.

6. MINIMUM CONCRETE COVER FOR REINFORCEMENT: 40mm.

FORMWORK

1. FORMWORK AND FALSEWORK SHALL CONFORM TO THE REQUIREMENTS OF CAN/CSA-S269.3-M92 & CSA-S269.1-1975 AND THE NATIONAL BUILDING CODE OF CANADA.

PRODUCTION AND PLACING OF CONCRETE

1. PLACING OF CONCRETE SHALL NOT COMMENCE UNTIL THE FRAMEWORK AND REINFORCEMENT HAS BEEN INSPECTED AND APPROVED BY THE OWNER'S INSPECTOR.

CURING AND PROTECTION

1. CONCRETE SHALL BE CURED AND PROTECTED IN ACCORDANCE WITH CAN/CSA A23.1 & A23.2 AND THE NATIONAL BUILDING CODE OF CANADA.

TESTING AND INSPECTION

1. TESTING AND INSPECTION SHALL CONFORM TO THE REQUIREMENTS OF PROJECT STANDARD SPECIFICATIONS FOR CONCRETE CONSTRUCTION.

SUBMITTALS

1. SUBMIT SHOP DRAWINGS FOR REVIEW. INDICATE REINFORCING BAR SIZE, GRADE, SPACING, LOCATIONS, QUANTITIES, LAP SPLICES, LENGTHS, BENDING AND CUTTING SCHEDULES AND ONE SPARE SUPPORTING AND SPACING DEVICES

2. SUBMIT CERTIFICATION THAT THE MIX PROPORTIONS SELECTED WILL PRODUCE CONCRETE OF QUALITY, YIELD AND STRENGTH AS SPECIFIED AND WILL COMPLY WITH CSA A23.3-04.

3. SUBMIT MANUFACTURER'S TEST DATA & CERTIFICATION BY QUALIFIED INDEPENDENT INSPECTION & TESTING LABORATORY THAT ALL MATERIALS USED IN THE PRODUCTION OF CONCRETE MEET CSA A23.3-04

Plan View

General Notes:

- The following are minimum requirements
- Waste barricade design for paste fill maximum lateral pressure of 200 kPa.
- Only one - 10m high plug can be poured against the waste barricade.
- Plug must cure to sutain the pressure genrated by the 20 m high main fill body pour
- 3 m minimum length of waste pile against the back.
- Waste pile to be placed to the back as much as possible. Ensure proper compaction using rammer-jammer.
- for Slicking and flush water follow SOP BRUCEJACK-UND-SAF-004
- Ensure that the top of the barricade is at a minimum distance of 3m to the brow and in undamaged ground from blasting.
- Waste material to have a minimum internal friction factor of 30°
- Waste material to have a minimum unit mass of 1,800 kg/m³
- While pouring plug follow SOP BRUCEJACK-UND-SAF-004.

To Prevent Leaks Prior to Pouring Plug:

- Fill any gaps to the back with shotcrete for a minimum length of 1m.
- Apply a nominal 50mm thick layer of shotcrete over the final face of the waste pile.

Lafarge TerraFlow Binder Brochure

Product Data Sheet

Lafarge TerraFlow™

LAFARGE

An engineered solution for backfilling in underground mines.

LAFARGE

Product Data Sheet

LAFARGE TERRAFLOW™

Product Description

TerraFlow is a specialized blend of cementitious and other construction materials that allows for more efficient and cost effective backfilling in underground mines. It is formulated to work with mine backfill material to meet the unique needs of the underground mining industry and is not suitable for use in concrete or concrete product applications. TerraFlow can be custom blended for a given mine based on local conditions.

Benefits of TerraFlow:

- Allows for more efficient and cost effective backfilling in underground mines
- Optimizes use/reuse of material, including cementitious byproducts
- Pre-blended before arriving on site to promote maximum working efficiency
- Blend proportions may be varied according to specific requirements as determined by preliminary testing
- Saves energy and natural resources
- Cost savings

TerraFlow is produced using stringent quality control procedures. Product claims are based on proper use in accordance with recognized industry standards. Please contact your Lafarge representative for assistance.

Precautions
Direct contact with wet cement should be avoided. If contact occurs, the skin should be washed with water as soon as possible. Exposure can cause serious, potentially irreversible tissue destruction in the form of chemical (caustic) burns. If cement gets into the eyes, immediately rinse thoroughly with water and seek medical attention. For more information, reference the applicable Lafarge Material Safety Data Sheet (MSDS). The MSDS should be consulted prior to use of this product and is available upon request and online at www.lafarge-na.com.

Engineering the New Olympic Dam Backfill System

By G Baldwin [1] and A G Grice [2]

Abstract

WMC Resources Pty Ltd – Copper Uranium Division operates the large underground Olympic Dam Mine at Roxby Downs, South Australia. These operations mine and process the ore to produce refined copper, uranium oxide, gold and silver. In mid 1996, the company committed to the Olympic Dam Expansion Project (OEP) to expand production from 3.0 million tonnes per annum of ore (85,000 tonnes per annum of copper metal) to over 9.0 million tonnes per annum of ore (over 200,000 tonnes per annum of copper metal). Along with the increase in the ore production capacity of the underground mine and the surface ore handling and processing facilities, expansion of the backfill system was required. The target backfill placement rate was 2.0 million cubic metres of backfill per annum which was to be predominantly delivered as cemented aggregate fill (CAF). This paper discusses the engineering activities undertaken to assess and change the method of designing the required strength of fill exposures. In addition, the operational changes that were introduced to achieve the required fill quantities and the mix designs to meet the specified strengths, including the use of alternate binders, are discussed. This work resulted in a large increase in the fill placement rate and a reduction in the overall unit cost of fill.

Introduction

WMC Resources Pty Ltd – Copper Uranium Division operates the large underground Olympic Dam Mine at Roxby Downs, South Australia. These operations mine and process the ore to produce refined copper, uranium oxide, gold and silver. In mid 1996, the company committed to the Olympic Dam Expansion Project (OEP) to expand production from 3.0 million tonnes per annum of ore (85,000 tonnes per annum of copper metal) to over 9.0 million tonnes per annum of ore (over 200,000 tonnes per annum of copper metal). Along with the increase in the ore production capacity of the underground mine and the surface ore handling and processing facilities, expansion of the backfill system was required. The target backfill placement rate was 2.0 million cubic metres of backfill per annum which was to be predominantly delivered as cemented aggregate fill (CAF).

Historical practice at Olympic Dam had been placing a high strength CAF for around a decade. Fill was prepared in a surface mixing plant using various combinations of dewatered tailings, dune sand, crushed mine waste rock, cement, flyash and water. The fill was batched in standard concrete mixing bowls ($6m^3$ nominal capacity) and transported by open semi-tipper trucks to boreholes drilled vertically to each high-rise open stope. The hole depths varied between 350 and 500 metres depending on the stope crown location. Surface cylinder testing showed typical strengths in excess of 5 MPa and coring through fill in situ showed values over 12MPa. The upgraded CAF Mixing Plant as part of OEP was based on continuous CAF mixing in a pugmill that was process controlled with delivery using the existing semi-trailer tipper trucks.

Olympic Dam Operations undertook a further critical review of the backfill process in early 1998 and a project manager was appointed. The opportunity to review the strength requirements and mix designs for cemented fill was realised after literature searches and a visit to Mount Isa Mines in June 1998. The basis of the revised strategy was to "design the fill mass" for the geometry of each stope and to develop a delivery process utilising the continuously mixed and process controlled CAF mixing plant that satisfied the specified fill mass design, in particular the specified strength for cemented fill. The review of the CAF strength design and mixing processes was expected to yield the most significant cost savings due to the high cost of cement and flyash in CAF. Preliminary investigations of past practices and literature (internally and externally) identified the more cost effective strategy of using zoned strengths of CAF in each stope. In general, stronger CAF would be required at the base of the stope and progressively weaker CAF placed in zones in the upper sections of the stope.

The mine engaged Australian Mining Consultants (AMC) to conduct a technical review and develop a "fill mass design process" with particular emphasis on CAF strength design. A "design study project" was initiated to investigate the zoned strength requirements for the size and geometry of Olympic Dam stopes and to cope with the sequential multiple face exposures. This was carried out using numerical modelling software. At the same time, a spreadsheet based design tool was developed suitable for use by mine design - backfill engineers to permit design of individual fill stopes. The design study showed that the maximum strength required, with appropriate conservatism, was 4.5 MPa. The basis of the CAF strength

1. Manager, Engineering and Site Services, WMC, Olympic Dam Operations, P O Box 150, Roxby Downs SA 5725. E-mail: gary.baldwin@wmc.com
2. Principal Mining Engineer, AMC Consultants Pty Ltd, 19/114 William Street, Melbourne Vic 3000. E-mail: tgrice@amcconsultants.com.au

design spreadsheet was that CAF would be available in 0.5 MPa increments from 0.5 to 5.0 MPa.

In parallel with the design study, investigations were undertaken to evaluate the options for backfill mix designs. The objective was to determine the most economical mix recipes for the series of strengths ranging from 0.5 to 5.0 MPa in 0.5 MPa increments using all of the aggregate ingredients available at the mine site. This investigation required the testing of a wide range of cementitious and pozzolanic binders with the locally available aggregates consisting of underground mullock, quarried limestone, classified tailings (tails sand) and dune sand. A very recent development has been the elimination of dune sand, which has been replaced with limestone fines from the quarry.

Backfill Design

Backfill generally consists of assemblages of natural materials; fine ground mineral particles, sand, crushed rocks and a range of cementitious binder materials. These materials contain voids, which are filled with air and/or water.

There are two important properties to consider for the design of backfill.

- **Flow properties**, which enable the delivery and placement of backfill into the underground workings. This is achieved by adding water to form either thin or viscous slurries. The water is also used to hydrate cementitious binders and excess water, where present, drains off.
- **Strength properties,** which enable the fill to withstand the internal stresses generated by gravitational loading of fill caused either by exposure of free fill faces or from dynamic external sources such as blasting or seismicity.

This paper considers only the strength properties of backfill and will focus on the strength required for vertical, freestanding faces. The effects of dynamic loads on fill are not considered. There is little useful quantitative information in this area and this tends to support the opinion that well controlled stope blasting practices result in minor fill damage. Backfill is a good attenuator of blast energy and it is intended that dynamic loading conditions will be investigated in future work.

Aspects of Backfill Geomechanics

The fundamentals of soil mechanics are extensively described by Terzaghi & Peck (1967) and Lambe and Whitman (1979). The reader is directed to them for further detailed information. The following discussion is adapted for backfill from Lambe and Whitman (1979).

Relative sliding between particles is the most important mechanism of deformation within a fill mass. The resistance of fill to deformation is influenced strongly by the shear resistance at contacts between particles. Determining the magnitude of shear resistance and the factors that influence it are the keys to understanding the behaviour of backfill. A further critical aspect to consider is the interlocking of particles, which is a function of packing density.

Interparticle shear resistance is frictional in nature. In some situations, part of the shear resistance between particles is independent of the normal force pushing the particles together; i.e., even if the normal force is decreased to zero there is still a measurable shear resistance. In such cases, there is true cohesion between particles. In backfill, this property is achieved by the use of binders such as Portland cement and pozzolans.

The strength of soil is usually defined in terms of the stresses developed at the peak of the stress strain curve. The Mohr-Coulomb failure law simplifies the envelope to a straight line and can be expressed by:

$$\tau_f = c + \sigma_f \tan \phi \qquad (1)$$

where

τ_f = shear stress at failure along the failure plane

σ_f = normal stress perpendicular to the failure plane

c = cohesion

ϕ = friction angle

The strength of backfill can be therefore be described in terms of the cohesion and the friction angle of the material. The friction angle is a property of the backfill particulate make up and the degree of packing density. The cohesion is a function of the binder addition and the development of chemical bonds between particles. A backfill can be considered to be stable when the shear strength exceeds the current state of shear stress at any point in the fill.

Terzaghi (1943) described the mechanism of arching in a two dimensional column of soil. Terzaghi observed that the vertical stress induced by the self-weight of the soil is transferred to adjacent soil or containing walls. This phenomenon of pressure transfer is known as arching.

For a given prism of soil located above a void a stable condition exists when the self-weight of the soil is resisted by the shearing stresses along its lateral boundaries. He stated that the ultimate pressure on the base of the soil is practically independent of the depth of the layer of the soil. If the soil has a trace of cohesion, the soil will not fail into an underlying void.

Figure 1 – *Theoretical assessment pf arching mechanism*

Bloss (1992) describes the two-dimensional force equilibrium equation for a mass of fill in a stope as illustrated in Figure 1.

Solving, Bloss gives

$$\sigma_z = \left\{ \frac{(W\rho g - c)}{K \tan\phi} \right\} \left\{ 1 - e^{\frac{-k \tan\phi z}{W}} \right\} \qquad (2)$$

where

z = vertical coordinate (m)

σ_z = vertical stress (kPa)

σ_x = horizontal stress (kPa)

W = half width of stope (m)

ρ = material density (t/m^3)

g = gravitational constant (m/s^2)

k = ratio of horizontal to vertical stress (σ_x / σ_z)

c = material cohesion (kPa)

ϕ = friction angle (°)

Bloss notes that there are two assumptions:

- uniform stress distribution and
- full mobilisation of the shear strength of the fill (c + σ_x tan ϕ) at the wall contacts.

Askew *et al* (1978) caution that the use of the cohesion term is not referring to the cohesive strength of the backfill but the cohesion developed between the fill and stope wall contact. Where the walls are sub vertical and rough, this cohesion should not be less than the backfill cohesion. Where walls are inclined, however, this contact cohesion may be less than the backfill cohesion.

The effect of arching and the comparison with self-weight is plotted in Figure 2. The arched vertical stresses are considerably lower than the corresponding depth stress values.

Cowling (1983) describes the state of the initial stresses developed in backfill as a result of placement in stopes. He notes that when cemented fills are placed, they are in a liquid state and can have high water contents for some time after they have been placed. Hence, each fill pour shows an initial hydrostatic vertical stress profile. The fill commences curing and the stiffness increases linearly with time. This locks in the stress profile for the lift and the pattern is repeated with each discrete fill run. The modulus continues to increase with time. This generates a characteristic zigzag of shear and horizontal stresses down the centre line of the fill during modelling. This feature is noted by Barrett *et al* (1978) and Bloss (1992) and is illustrated schematically in Figure 2. The features shown are a function of the modelling process and would be different for discrete fill runs.

There are very few in-situ stress measurements to back these assumptions of backfill behaviour. Coulthard and Dight (1979) measured hydrostatic loading during fill placement but Cowling (1983) reported that depth stresses (in cured fill) have not been recorded in-situ and that arching effects substantially reduce the vertical stress values. Although the description of the zigzag loadings is generally accepted, Cowling comments that there is little direct evidence to support the notion.

In summary, the effect of arching significantly reduces the stress levels within fill. Since the stress at any point in the fill can be determined, it is therefore possible to zone the fill strength such that the cement content is varied through the height of the stope in order to match the required performance at that elevation. This then permits the design and placement of a cost optimised backfill.

Figure 2 – ***Comparison of vertical stress in arched and unarched modes***

Backfill Design Techniques

Various authors have published backfill design techniques and these are briefly reviewed in the following section. The techniques discussed are:

- freestanding vertical faces,
- vertical slopes,
- limit equilibrium wedge,
- arching.

Free standing Vertical Face

Mitchell *et al* (1982) note that the largest shear stresses in backfill are caused by self-weight. The cemented backfill can be designed as a freestanding vertical face. A freestanding wall where the unconfined compressive strength required at any depth in the fill is given as

$$\sigma_z \geq \rho g\, z \qquad (3)$$

where

σ_z =unconfined compressive strength (kPa)

ρg =bulk density of backfill (KN/m^3)

z =depth of backfill from the surface (m)

Vertical Slope

Mitchell *et al* (1982) discuss the vertical slope method where $\phi = 0$ for a constant strength fill

$$\sigma_z = \rho g\, H / 2 \qquad (4)$$

where:

H = overall height of exposed fill (m)

Limit Equilibrium Wedge– Mitchell

Mitchell *et al* (1982) used physical centrifuge modelling to develop a model for a single exposure, three-dimensional fill mass.

$$\sigma_z = \frac{\gamma H}{\left(1 + \frac{H}{L}\right)} \qquad (5)$$

where:

σ_z = design UCS

H = height of fill exposure and

L = width of fill exposure.

There are four assumptions with this model:

1. The mobilised wall shear stress is equal to the material cohesion.
2. The material friction angle is zero.
3. The fill height is much greater than fill depth.
4. Stresses are evenly distributed.

This formula is commonly applied to backfill design strength estimation. Stone (1993) presents a methodology for the design of backfill using the limit equilibrium approach in the form of standardised charts.

A limitation of this technique is that it only applies to single exposures of a fill mass. Even in small and narrow primary-pillar orebodies, most backfill masses are exposed on two opposing faces. The design technique must assume that two wedges are laid back to back and do not interfere with each other. The technique cannot cope with the exposure of adjacent faces, a common occurrence in large mines such as Olympic Dam.

Arching – Terzaghi

Askew (1982) and Bloss (1998, personal communication) independently adapted the Terzaghi equation for regular three dimensional square plan area stopes. Their solutions are shown below as equation 6.

$$\sigma_z = \frac{\frac{W}{N}\left(\rho_g - \frac{c}{W}\right)\left(1 - e^{-\frac{(N.k.z.\tan\phi)}{W}}\right)}{k.\tan\phi} \qquad (6)$$

where

N = Number of exposed equal sized fill faces

W = Width of exposures (m)

AMC has further modified the equation to cope with irregular prismatic stopes as commonly encountered at Olympic Dam. The modification is illustrated in Figure 3.

Figure 3 – *Modification of Terzaghi analysis to incorporate prismatic stope shapes.*

For Olympic Dam, prismatic stope shapes are the normal design occurrence. It can also be seen that there will be a difference in stress estimation depending on the sequence of large and small face exposures made.

AMC therefore applied a further modification that changed the number and size of exposures to that of contact surface area. During initial fill placement and curing, the fill is confined by all the surrounding rock walls. As each face is successively exposed, the contact area is reduced progressively from 100% contact until all faces are open. This would imply that a stope which has been exposed on all four walls should be considered a free standing prism and therefore subject to depth stresses.

Bloss (1998) investigated this issue using numerical modelling techniques. He concluded that, for a regular set of stopes:

- The arching mechanism is still dominant in stabilising the fill even when adjacent extraction is complete.
- The effect of Poisson's ratio in developing confinement is significant in stabilising the fill.
- If the fill remains primarily elastic, the final stresses after complete extraction are similar even though the path to the final result may vary as a result of differing extraction sequences.
- For the stope geometries considered, plastic strain levels are close to or at the limit for stability proposed by Bloss (1992). This suggests that, even though vertical stresses are below that for failure, the arching mechanism is on the verge of breaking down due to excessive shear stress adjacent to the wall contacts. This can lead to complete failure of the fill.

AMC has therefore incorporated two factors into the calculation of average vertical stress.

- The loss of contact area due to successive fill exposures is modified in line with the results reported by Bloss (1998). The loss of arching is reduced to allow for the benefit from fill to fill arching.
- The resultant average vertical stress calculated at a particular elevation is multiplied by a factor of safety but limited by the maximum depth stress calculation at that elevation. The selection of the factor of safety is a function of the degree of conservatism that is required and a scaling component that converts small-scale test strengths to real world scale exposure performance. AMC currently recommends a factor of safety of 2.0 for the Olympic Dam situation. In the absence of failure data for ODC stopes this is considered to be conservative and it is expected that this can be relaxed with improved experience.

Design Tools Summary

Of the existing techniques, the only method suitable for development and application at Olympic Dam is Terzaghi's arching. This method can cope with the shape and multiple exposure issues and lends itself to a spreadsheet based design tool.

However, before the method was advanced further, numerical modelling was undertaken to investigate the distribution of stresses in Olympic Dam backfill. The results of the previous modelling and the current work were then compared with the Terzaghi results to ensure that the AMC Terzaghi Spreadsheet would provide a simple proxy solution to the complex real world problem.

Numerical Modelling

Numerical modelling was carried out using MAP3D boundary element software and validated and calibrated to earlier work conducted by Olympic Dam Operations.

Backfill material properties were not available from Olympic Dam backfill material at the start of the project. The material properties used in the preliminary analyses were therefore based on published data from Mount Isa by Cowling *et al* (1983), from Broken Hill by Askew *et al* (1978) and from Canada by Cundall *et al* (1978). These parameters are listed in Table 1.

Table 1 – *Backfill material properties*

Material Property	Symbol	Value	Unit
Friction angle	ϕ	34	degrees
Cohesion	c	250	kPa
Modulus	E	500	MPa

The initial modelling was conducted to repeat earlier work and this was used to validate and calibrate the model. Purple 54 was then selected as an example of a tall, slender Olympic Dam stope. The exposures modelled were cumulative in nature. No fill was placed back into the adjacent void and the benefit of fill to fill arching was not included. Therefore these results contain a degree of conservatism. The results of the modelling are shown in Figures 4a to 4d and are graphed in Figure 5.

Figure 4a shows the geometry of Purple 54 stope, 140m high by 15m long by 85m wide. The stope has been modelled in 7 segments, each 20m high. The stope is to be exposed on the two widest opposing faces.

Figure 4b shows vertical stress distribution prior to exposure of any fill faces. Note that significant arching is occurring which keeps stresses levels at around 300 kPa with a concentration at the toe of around 600 kPa. This is well below depth stress of around 3,350 kPa. The zigzag vertical stress profile has been locked into each of the 20m segment boundaries representing discrete fill pours.

In Figure 4c the first wide face has been exposed. There has been a small increase in stress at the toe of the exposure and a small decrease in the upper part. At this point, around 57% of the fill perimeter is in contact with rock and arching is significant.

In Figure 4d the second face has been exposed and only 15% of the fill perimeter is in contact with rock. Vertical stress has increased to 1,200 kPa but is still well below depth stress levels.

Comparison of Terzaghi Method with Numerical Modelling

The numerical modelling using MAP3D confirmed magnitudes of stress level development in the backfill as successive exposures were made. Figure 5 plots the vertical stress distribution in Purple 54 against the Terzaghi method and correlation in the distribution and magnitude of stresses can be seen. For the one and two exposure cases the maximum average vertical stress at the foot of the fill mass calculated by Terzaghi method and MAP3D are similar. At all other points Terzaghi estimates a higher value. It can be seen that in the case of the second exposure, arching is starting to break down and the maximum values are around one third of depth stress values.

Figure 4A, B, C and D – ***Results of numerical modelling of Purple 54 stope.***

Figure 5 – ***Comparison of Terzaghi method with numerical modelling***

AMC concluded that the Terzaghi method provides a valid approximation to the distribution and magnitude of average vertical stresses in backfill. Since the values derived are conservative, it can therefore be used as the basis of a simplified design tool.

Development of the Backfill Design Strength Tool

The primary objective of this part of the project was to develop an effective method to determine the required strength of backfill for use in open stope mining at Olympic Dam. Most of the backfill design techniques described earlier do not allow for the complex geometry and sequencing of exposures of fill masses as experienced at Olympic Dam. Neither is it practical to run numerical modelling for every fill exposure option. The results of the study show that the Terzaghi method can meet all of the design requirements.

It was therefore decided to develop a spreadsheet based version of the 3D Terzaghi equation. The software was designed to run as a simple Excel worksheet without macros. The following sections document the underlying geomechanics assumptions and the software design criteria.

AMC Terzaghi Spreadsheet

The AMC Terzaghi Spreadsheet is designed to print out on a single landscape sheet of A4 paper and contains no macros. There are a number of calculation areas outside of the main print area. The sheet is split into several functional areas and each of these will be discussed in turn. In general, text in blue on an indented pale green background represents data entry. Text in black on an indented pale yellow background represents calculation results. Other numbers are intermediate, advisory calculations. Units are indicated where appropriate. Figure 6 illustrates the general assumptions.

The key geotechnical data entries are friction angle and Poisson's ratio. The fill density is the wet bulk density of the fully drained backfill. Depth zone increments permit the user to control the thickness of fill zones in the backfill strength model. The choice of this number is one of convenience and the practicality of control of fill placement into stopes. AMC would tend to recommend 10 metres as a lower limit and 25 metres as the upper limit.

CAF is prepared to a number of discrete recipes of generally increasing binder content with an increase in strength. Depending on the controls available it is possible to mix batches with incremental strengths of between 250 and 500 kPa UCS. For Olympic Dam the batch increment selected is 500 kPa, ranging up to 4,500 kPa maximum.

The final entry is the Factor of Safety, a term which loosely describes the degree of conservatism in the design process. AMC favours a probabilistic approach to failure assessment where the design process, the lab scale test data and their statistical variance and back analysis to a large data set of full sized fill exposures which exhibit various degrees of performance and failure are considered. Olympic Dam has no history of major fill failures. This, combined with evidence of very high test sample strengths, renders this approach unsuitable at this time. It was considered that a Factor of Safety of 2 should be applied until real performance data emerged. At some time in the future the Factor of Safety could then be adjusted or the process modified. Figure 7 shows the entry of stope information.

The geometry of the stope is entered in the stope information section. The geometry is designed to cope with regular prismatic vertical stopes. Length is defined as the stope plan distance along strike of the orebody and width is the plan distance in the perpendicular horizontal direction. Height is generally the full vertical stope height. Frequently however, the exposure of the fill mass is not over the full height of the stope. In this case, the height of the exposure can be entered. In the examples that follow a square plan stope, 40m wide by 160m high has been selected with four successive exposures. Figure 8 shows the exposure geometry.

Figure 9 – ***Calculation of average vertical stress***

Calculation of average vertical stress in backfill and UCS for each increment (kPa)

UCS values denote backfill mix strength at the base of each incremental zone

Depth	1st Exp	2nd Exp	3rd Exp	4th Exp	Max Average Vert Stress	Cohesion	Depth Stress	Min Strength x FoS	UCS
0	0	0	0	0	0	0	0	0	
20	298	333	379	426	426	113	481	481	500
40	427	506	625	765	765	204	961	961	1,000
60	496	608	795	1,041	1,041	277	1,442	1,442	1,500
80	536	674	918	1,268	1,268	337	1,923	1,923	2,000
100	561	719	1,010	1,459	1,459	388	2,403	2,403	2,500
120	577	750	1,080	1,620	1,620	431	2,884	2,884	3,000
140	587	772	1,136	1,758	1,758	467	3,365	3,365	3,500
160	594	788	1,179	1,877	1,877	499	3,846	3,754	4,000

Details of sequential fill exposures are entered in the exposure geometry section. For each of up to four exposure faces, the width is entered in sequence of exposure. This value is then adjusted to permit fill to fill arching modification in the following calculations and a value for the length to width factor (B`) is computed. The perimeter removed is then calculated as a percentage and factored back into the number of intact walls. Figure 9 shows the results of the calculations.

The average vertical stress is computed for each depth increment for successive exposures. The maximum average vertical stress at each depth increment is recorded along with a corresponding value for depth stress for comparative purposes. Figure 10 shows the computed average vertical stresses for each exposure plotted as a graph. Note that the fourth exposure is still exhibiting a curved shape that shows the continuance of fill to fill arching.

The strength required at that depth increment is then calculated as the lesser of the average vertical stress multiplied by the Factor of Safety and the depth stress. In order to determine the strength of the fill to be placed in that depth sector, this value is rounded up to the next fill strength increment.

Figures 11a to Figure 11d show the fill strength zones required for one, two three and four exposures stopes. Taking the height of each of the computed zones it is then possible to develop a schedule of fill placement and a cumulative volume of fill required to be placed in each zone.

Backfilling strategy and Mix Design development: Phase 1

Overview of the Olympic Dam Mining Method and Backfilling Requirements.

The expansion strategy for Olympic Dam has evolved from the proposals considered by a scoping study team in 1993 to the detail designs that have been constructed and commissioned by OEP in 1998 and subsequently put into operation by ODO.

Early in this review process, determination was reached that retained the long hole open stoping mining method. As a consequence, mining of ore continued with this historical practice, which similarly enshrined CAF as the predominant fill material. With this mining method, stopes are generally production drilled from access drives which are generally 50-60 metres apart vertically and allow both uphole and downhole drilling. A typical stope consists of a bottom level extraction drive which allows LHDs to "bog ore" from multiple extraction points and a top level drill drive which also allows the "slot" (internal rise) to be drilled which creates the void to allow the blasting of the ore to occur.

The typical geometry for a stope is an upside down milk carton except the stope is generally rectangular rather than square. Dimensions taper up from approximately 6 metres wide at the base (for extraction purposes) and attain a maximum stope width of say 35 metres, a length up to 40 metres and a height from 60 to 270 metres determined by ore body characteristics and mine design considerations. The "fill void" for a stope ranges in volume from a minimum of 50,000m^3 to the largest designed to date of approximately 250,000m^3 (270m high).
Traditionally stopes have been filled with CAF which were of a constant strength, mixed to attain at least 5.0 MPa and probably achieving in excess of 10 MPa (based on very limited in situ coring of one or two stopes). The predominant fill mass historically was CAF with some fill void being filled with underground development waste or mullock where there was no adjacent stope to be mined (and hence the stope face not being exposed). Wherever CAF is exposed by an adjacent mined stope, it is required to remain fully supported with no face fall off.

Summary and Observations: Phase 1

During the pre-feasibility and feasibility study stages for the expansion of Olympic Dam, particular emphasis was placed on defining CAF properties, utilising existing aggregates available on site. Particular emphasis was placed upon defining the CAF strength characteristics when utilising "tails sand" to replace dune sand as the regular fine aggregate and a significant amount of the coarse aggregate. A typical graphical representation of test results is given in Figure 12 where UCS (Uniaxial Compressive Strength) on the vertical axis is plotted against % binder (cement and flyash) on the horizontal axis.

In general the following observations can be made from Figure 12 and the Phase 1 investigations.

- Test work was undertaken with 30mm crushed mullock (and limestone where tested) which was not truly representative of the crushed rock used in the actual CAF mixing conducted in the old batch plant and planned for the new mixing plant. The aggregate top size was determined by the test cylinder size rather than investigating the intended process being utilised. The on site fixed crushing plant was operated in an open circuit configuration which resulted in maximum lump approaching 120-150mm. Whilst this top size is too big, it was important to understand the maximum lump size available from closed crushing and a properly graded aggregate - generally, the smaller the rock top size, the greater the crushed rock cost and this is a non-linear cost as rock size reduces.

Figure 12 - ***Strength variations with cement content for samples with crushed mullock***

- All test work results were recorded and reported on a percentage dry basis. Simple test work using a small (builder's) concrete mixer revealed that water requirements varied considerably between crushed mullock and limestone as well as the grading of the course aggregates. It was apparent that "mix designs" required specification of all the ingredients inclusive of the water added (both directly and indirectly).
- All test work undertaken was on the basis of cement and flyash being used in the proportions of 1 to 2. No test work results/reports existed to substantiate this nor define an appropriate relationship of strength versus percentage binder (cement and flyash) with variable proportions e.g. 1 to 2, 1 to 3, 1 to 4 etc. The economics of landed cement and flyash cost meant that for a given CAF mix design strength, the quantity of flyash should be maximised to meet the strength requirement because the landed cost was 5 to 6 times cheaper.
- All test work strengths were for 56 days; 3 test cylinders were crushed at 14, 28 and 56 days and the results averaged to yield a single strength value for the elapsed curing time. There were no results/reports, which investigated and defined post "56 days" curing times. A literature search revealed that this was most probable and clearly required defining. The most appropriate way to represent this phenomenon was to graph UCS (MPa) versus curing time (days). This knowledge should have been established and defined.
- All test work was undertaken using traditionally available binders (cement and flyash); cement was supplied from Adelaide and flyash (Zone 1) ex the Port Augusta Power Station (coal fired). It is well documented that ground granulated blast furnace slag when processed correctly will develop pozzolanic properties. A well-established blast furnace exists at Whyalla (BHP) and no serious discussions had been entered into that resulted in an appropriate test program utilising GGBFS and the locally available aggregates at Olympic Dam.

The test work undertaken in 1995 had provided some valuable and useful information regarding mix designs, which had been carried forward to process and plant design. However, there seemed as many unanswered questions as those that were answered.

Figure 13 – ***CAF Plant process flow diagram***

The recommendations that were carried forward are in essence summarised in Figure 13. The main features are:

- CAF was to be mixed at the respective strengths of 2.0, and 3.5 MPa using readily available aggregates from site. Whilst a general strategy for selecting the CAF strength existed (i.e. stronger at stope bottom and weaker towards the top - depending upon number of exposed faces), there was no well-defined systematic design method for determining the minimum specified CAF strength for all stope mining situations.
- CAF mix designs to attain the minimum specified strengths did not differentiate between crushed mullock and crushed limestone. Simple test work with the concrete mixer had revealed that there was at least a 2–3% w/w (weight wet) difference in water requirements between CAF mixes with mullock compared to limestone.

The real concern was the over simplification of the mix designs and thus the subsequent process and actual plant design. These and other important factors revealed from critical review conducted in July 1998 prompted a rapid investigation and test work program. At that point in time the upgraded plant was being constructed, with commissioning planned for early to mid September 1998. The clock was well and truly ticking and the delivery of CAF to fill the underground fill (stope) voids was essential to the highly planned and well-coordinated mining at Olympic Dam. Any serious delay to the reliable delivery of CAF would have impacted significantly on the mining operations during the critical underground production ramp-up phase to meet the new production capability of the process plant. Any delay to a stope going into production due to late backfilling was untenable.

Backfilling Strategy and Mix Design Development: Phase 2

Overview: Phase 2

By early August 1998 the high level strategy was to:

- Establish a clearly defined design process, which allowed the fill mass to be engineered. The outcome of the design process was to determine the minimum specified CAF strength.
- Develop mix designs that allowed CAF to be mixed continuously in a modern process controlled plant and delivered using semi-trailer tipper trucks.

The outcome of the test work was the development of mix designs using mullock as the main coarse aggregate ingredient due to the significant surface stockpiles available from the OEP mine development and normal mining operations. Preliminary work was commenced on mix design test work with limestone, which would be mined from a nearby quarry and required after the surface mullock stockpiles were exhausted. Similarly, test work was undertaken using the small concrete mixer.

- Define a stope filling strategy which attempts to maximize the uncemented fill mass relative to the cemented fill (CAF) mass.

The intent here would be to refine the stope filling design process so that uncemented fill could be maximized. Thus, utilisation of surface rockfill and hydraulic (sand) fill were potentially suitable uncemented fill types that could be delivered quickly and efficiently from the surface, in addition to the underground development waste.

Figure 14 – ***Simplified flow schematic for CAF production***

CAF Ingredients for 1,971,000 m3/yr : cement / flyash = 1 to 2					
Mullock CAF - representative mix, S.G. = 2.45					
Crushed Rock	Sand	Cement	Flyash	Water	Wet Tonnes
62.00%	21.75%	2.25%	4.50%	9.50%	100.00%
2,993,950	1,050,300	108,650	217,300	458,700	4,828,900
Limestone CAF - representative mix, S.G. = 2.15					
Crushed Rock	Sand	Cement	Flyash	Water	Wet Tonnes
59.75%	20.69%	2.52%	5.04%	12.00%	100.00%
2,532,000	876,770	106,790	213,580	508,520	4,237,660

These refinements were not the immediate priority due to the need to get the upgraded CAF mixing plant constructed and commissioned as quickly as possible. It was obvious that the promised completion dates would not be achieved and the work program was split into more sensible packages that gave greatest priority to completing all facilities directly associated with CAF mixing.

Operating Experience: November 1998 to April 2000.

A simplified flow schematic for CAF production is shown in Figure 14. This schematic is applicable to the time frame from November 1998 to April 2000. This was when the fixed crushing and screening plant was operational. From mid April 2000 an in-pit track mounted (mobile) two-stage crushing and screening plant has been operational. It was supplied by Nordberg and is owned by Brambles Industrial Services and supplies crushed rock under the "Backfill Services Contract" along with the mixing and delivering of CAF.

For the stated period of time, the following milestones and observations are relevant.

Upgraded Backfill (CAF Mixing) Plant Commissioning Milestones:

- CAF Mixing in pugmill: 1/9/99(plan), 1/11/98 (actual).
- New Binder (cement and flyash) Silos: 1/10/98 (plan), 15/1/99 (actual).
- Neutralised Tails Sand Supply System: 1/11/98 (plan), 20/8/99 actual).

The pugmill was re-designed and upgraded in April '99 with respect to wear materials for the mixing chamber. The pugmill was further redesigned and upgraded in August '99 with respect to bearings and mixing chamber sealing along with a complete overhaul. The mix designs are entered into a recipe menu in the process control system for the required CAF strength as specified by the "CAF delivery schedule"

Specific mix designs exist for CAF strengths from 0.5 MPa to 5.0 MPa in 0.5 MPa increments, utilising the following ingredients:

- Crushed mullock / dune sand / cement and flyash / water.
- Crushed mullock / dune sand and tails sand / cement and flyash / water.
- Crushed limestone / dune sand / cement and flyash / water.
- Crushed limestone / dune sand and tails sand / cement and flyash / water.

Tails sand is supplied as neutralised tailings sand slurry at around 50-53% solids (for the current single stage neutralisation circuit). Cement and flyash are normally mixed in the ratios of 1:2 or 1:3 depending upon the availability of flyash from the Port Augusta Power Station.

Properly graded crushed rock is essential to ensure the repeatability of CAF mixing using process control and delivery using semi-tipper trailers to dropper holes. The fixed crushing and screening plant was successfully operated in closed circuit from March 1999 onwards after the successful commissioning of a "trash removal facility" within the circuit. This capability is essential whenever underground waste mullock is used so as to remove the significant quantities of metallic and non-metallic rubbish that reports with the mullock from underground. The fact that the crushing and screening plant did not have this capability was a significant oversight.

Twelve test cylinders are taken on every shift so that testing can be conducted at 14, 28, 56 and 90 days elapsed curing time. These cylinders need to be cured in a controlled environment - water baths are preferred at Olympic Dam. The water bath temperature is controlled at 35°C to approximately represent the "in-stope temperature" where curing of the CAF occurs. The rock temperature is generally above 40°C in the ore zones and CAF is cured in a hot moist environment which is also affected by aquifer water running into the stopes (it is intersected by the CAF dropper hole).

Despite the benefits of a continuous, process-controlled CAF mixing plant, CAF consistency (hence water content) is best determined by the simple and reliable "slump test". This test is conducted on an hourly basis when CAF mixing occurs and the results logged - it is part of the contract key performance indicators (KPI) for the "Backfill Services Contract". Brambles Industrial Services were the successful tenderer for the new contract awarded in September 1999.

Slump of the CAF is specified to be 150-180 mm and when ingredients are mixed and controlled correctly, the slump of the CAF can be consistently between 160-170 mm. Water management against mix design is the most critical parameter to be controlled to ensure delivery of the minimum specified strength for CAF.

Due to the delivery of CAF in semi- tipper trailer trucks (payload currently 12-13m^3 per trailer), correct slump means no segregation occurs when the CAF is transported over gravel roads where a loaded one-way trip can be in excess of 2km. The purpose designed semi-tipper trailers (supplied under the new contract and owned by Brambles) are capable of a 15m^3 payload. This transport method is very flexible and effective when a prompt stop of CAF delivery to any stope is required for whatever reason.

Drilling of the "CAF/ Fill Dropper Holes" is now always an 8 inch percussion drilled hole from the surface, which is then reamed to 12.25 inch diameter. Wherever possible, holes are drilled directly into a stope to provide the simplest and most cost effective delivery method. Hole depth is between 350-500 metres and to an accuracy of +/- 1% of depth. For a period of 9 months dropper holes were drilled at 8 inch as a simpler and lower cost delivery hole. Despite the improvement in the crushed rock grading and quality from the closed circuit operation of the crushing and screening plant (implemented March 1999), some dropper holes continued to fail prematurely by blocking up and the practice was abandoned in June 1999.

The "CAF/ Fill Dropper Holes" are steel cased to hard rock from the surface (generally 40-50 m.) and a tundish (= a funnel with screening grates) is installed on the top of the casing into which the CAF delivery trucks tip directly. The tundish design is now at "mark 3" and is very reliable from a wear perspective. The dropper hole below the steel casing is in the natural rock and generally lasts between 80,000-100,000 m^3 of CAF and/ or surface rockfill delivery. The design of the new semi-tipper trailers and tundish allows both CAF and SRF (surface rockfill) to be delivered to the stope in accordance with the fill design and delivery schedule.

The "process control system" was upgraded in July/ August 1999 to accommodate the supply of the neutralised tailings sand as a slurry (NTSS). The basis of the process design was that a dry sand product would be available to supplement the NTSS supplied from the process plant. This was required due to the variable density and supply reliability from the process plant deslime circuit. The quantity of tails sand and neutralised liquor is calculated from the slurry flow and density and compared with the mix design values for "sand" and "water". The shortfall in tails sand is made up with a dry sand product and similarly with the water. There has been a "trim water" circuit added to allow the operator to adjust the water requirement set point due to change in the "slump" of the CAF.

Surface rockfill (SRF) was first delivered under the new design process to Purple 80 (stope designation) from October to December ' 99. The stope was filled to a defined level as per the fill design with CAF. Then, CAF and SRF were simultaneously delivered down separate fill dropper holes so that a CAF plug was created on one side of the stope and straight rockfill on the other. This was due to the stope only having a single face exposure. This method means stope fill void is filled with a significantly cheaper fill mass for the SRF (approximately 60-70% cheaper) compared with the CAF.

Operating Experience from April 2000 and Future Developments

To improve the quantity, quality and reliability of tailings sand supply from the process plant, the "deslime circuit" was redesigned and simplified. This was implemented and commissioned in May/ June 2000. The quantity of tails sand has now reached in excess of 50% of the sand requirement for the CAF mixes. The "process plant deslime circuit" supplies acid tailings sand slurry (ATSS) to the backfill plant where it is neutralised with a "milk of lime slurry" prepared in a dedicated lime slaking plant. The neutralised tailings sand slurry (NTSS) is then supplied to the pug mill on demand from storage tanks.

A plan has been developed to reduce the dune sand consumption to zero for cost and environmental reasons. This will ultimately require the "mix design sand %" to be supplied as tails sand at 0.75 and limestone fines at 0.25 which will replace the dune sand. The limestone fines will be produced by screening (scalping) out the fines in the quarried limestone drill and blast feed rock to the new mobile in-pit crusher. Field trials have confirmed around 30% by weight can be screened out which will sustain the intended replacement process. The new in-pit mobile crushing and screening plant was supplied by Nordberg to Brambles who are the owner. It is capable of 600 tph and utilises a Nordberg Lokotrak Configuration of LT 125 primary crusher and LT 1500 secondary crusher.

Mixing trials with the pug mill have also been conducted to confirm the process control and CAF mixing consistency using the limestone fines. To increase the tailings sand supply to the backfill plant so that the 0.75 proportion can be achieved, a new upgraded capacity pump station will be constructed and commissioned at the tailings disposal area. This pump station will supply tailings to the "deslime" circuit reliably and at the required rates, even at the upgraded CAF mixing rates required over the forthcoming years.

The CAF Mixing Plant production amounts on a per annum basis (actuals/ forecast) are given in Table 2.

Table 2 – *Fill schedule*

Year	Fill Volume m^3	Fill Tonnes
1999	1,256,000	2,888,000
2000	1,450,000	3,371,250
2001	1,850,000	4,347,500
2002	1,950,000	4,582,500
2003	2,050,000	4,817,500
2004	2,150,000	5,052,500
2005	2,200,000	5,170,000

It is believed that the CAF Mixing Plant maximum reliable production capacity is around 2,200,000m^3 per year. This equates to a continuous delivery of 335m^3 per hr at 75% use, which is considered a very achievable figure with the current redesigned pug mill and binder delivery feeders. It will be necessary to conduct some very minor upgrades to achieve this e.g. conveyor, feeder and pump speed-ups.

The current neutralisation process is single stage using "milk of lime slurry" produced from slaking quicklime. It is effective from a process perspective; however, the costs are high due to the cost of lime.

Waste products from a soda ash works in Adelaide, which have neutralisation properties, are available. Laboratory scale test work has revealed their effectiveness in neutralising ATSS (acid tailings sand slurry) from 1.0/ 1.5 pH to 4.0/ 5.0 pH. This will allow the neutralisation of the ATSS to be effected in a 2-stage process. The existing lime slaking facility will be used to trim the pH value up to the set point of 7.0 which is then classified as NTSS (neutralised tailings sand slurry) and ready to be supplied to the pug mill for CAF mixing.

Technical investigations have been conducted into the use of "ground granulated blast furnace slag (GGBFS)". An agreement has been entered into with BHP and test work conducted by the CSIRO on GGBFS from both Newcastle and Whyalla. This product will be able to in essence replace cement as the main binder in CAF mixes. Depending upon the economics, it may be possible to replace some or all of the flyash. The other application for this product is in neutralisation of acid tailings sand slurry and acid liquors. At the time of writing this paper, BHP - Whyalla and WMC-ODO have tendered for the supply of GGBFS on a contract basis. A final decision on the use of GGBFS will be made late in year 2000.

CAF Displacement Rockfill (CDR) is being developed for stopes which are currently planned to be 100% CAF. This method is based on the design requirement of only having a 10m CAF pillar. This need has been developed and defined for stopes where CAF is at one end and rockfill at the other (as was the case for Purple 80). Thus, it is possible to introduce SRF (surface rockfill) into the centre of a stope and generally have the SRF remain in the stope centre. SRF is delivered by semi-tipper truck along with CAF to a defined ratio e.g. 1 to 10. Whilst this method may only displace around 5% CAF, the cost savings are appreciable if this can be applied to only 50% of stopes currently receiving CAF. For 50,000m^3 of CAF displaced, the estimated savings would be $ 500,000-$ 600,000 per year.

Conclusions

The results of the design study project have been to define the required minimum CAF strengths and produce an interactive design spreadsheet able to be used by mine design/ backfill engineers on site. The CAF mix designs to meet the required minimum CAF strengths have been developed on site for a wide range of aggregates that are available. These have been mixed in the new CAF mixing plant and delivered to the U/G stopes by well proven methods developed at Olympic Dam This investigation and implementation process has generated some new insights into backfilling at Olympic Dam, especially for cemented fill (CAF) and for surface rockfill (uncemented fill).

The project has delivered a simple and effective design tool, which is used on a routine basis to determine zoned CAF fill strengths. The design mixes that have been developed ensure that these strengths are then achieved at the most economical cost. The unit cost of CAF as backfill has reduced approximately 15-20% since the new design, mixing and delivery processes have been optimised. Monitoring of the performance of the new backfill system is in progress.

Olympic Dam has successfully engineered the backfill system to meet the needs of the expanded mining operation. This has been achieved through improved design processes, rigorous investigations and the introduction of an innovative approach to backfill mixing and placement. As future mine fill needs increase in quantity and change in requirements, the knowledge base of personnel about the backfill system ensures that Olympic Dam is well positioned to meet those changes - and continue to deliver a cost effective fill mass at a reducing unit cost per cubic metre of void filled.

Acknowledgements

The management of WMC – Olympic Dam Corporation and Australian Mining Consultants are thanked for giving their permission to publish this paper. Ken McNabb of MINCAD Systems Pty. Ltd. carried out the modelling of the backfill and the authors acknowledge the previous work of both Dick Cowling and Martyn Bloss in particular, towards the understanding of cemented rockfill behaviour and upon which much of this work has been based.

SECTION 6

A Model to Predict Bulkhead Pressures for Safe Design of Bulkheads

Kugan Kuganathan – Senior Backfill Technology Engineer, Mount Isa Mines Pty Ltd

Introduction

At present there is no procedure available to mine operators to estimate the expected bulkhead pressures to design a satisfactory bulkhead. Some mines are constructing bulkheads after their initial investigations carried out years ago. Other mines have simply borrowed the ideas from the pioneer mines and happily repeating in their areas. It is long overdue that we develop a rational approach to estimate the expected bulkhead pressures for the design of bulkheads. Numerical modelling of fill and bulkhead interaction is an interesting exercise, but not very easy to be handled by practicing mining engineers. We need a simple model that could be understood and used by the mine operators in a day-to-day basis. This paper presents a model to predict the bulkhead pressures for designing safe bulkheads.

The Bulkhead Pressure Model Development

The following conditions were assumed for the development of the theory for bulkhead pressure.

- The bulkhead is free draining or a shotcrete bulkhead with adequate wall drain system installed.
- The total lateral pressures acting on the bulkhead are made of two components namely the fill pressure through the inter-granular mechanism, and the pore water pressure or the seepage forces.
- The seepage forces transferred to the fill solids act like a body force similar to gravity body force, but in the horizontal direction.
- The granular skeleton of the fill solids in the stope and drive, develop shear strength and interact with the rock walls to promote arching.
- The saturated and loose nature of the fill in the access drive, cannot develop very high shear strength, hence arching in the drive is very minimal.
- The bulkhead structure prevents the fill solids from moving laterally as the result of fill and water pressures. This results in compaction and accumulation of fines in the fill near bulkhead.
- As we move from the stope in to the access drive, the seepage forces tend to increase the lateral stress whereas the shear resistance between the rock wall and the fill tend to reduce the lateral stresses.
- The fill in the drive undergoes creep, and progressively increases the lateral stress acting on the bulkhead especially at higher stress levels.
- The access drive is horizontal and the seepage takes place in horizontal direction only.
- The hydraulic backfill in the stope and in the access drive has settled and consolidated to equilibrium conditions.
- The seepage in the stope is predominantly in the vertical direction.
- The effective stresses both σ'_z and σ'_x in the stope and at the bulkhead level stabilised at the fully arched condition.

- Further filling will not appreciably change σ'_z and σ'_x at the bulkhead level. Only pore water pressure will increase and accordingly the σ'_z and σ'_x will change.
- The total stress σ_x at the entry to access drive is made of σ'_x and $\mathbf{U_0}$, where $\sigma'_x = \mathbf{k_0} . \sigma'_{z\,(stope)}$.
- The total stress σ_x at the bulkhead is equal to the effective stress σ'_x at the bulkhead, and this is only true if the pore water pressure at the bulkhead is zero or very small. If the bulkhead is blended then additional water pressure will (over 100kPa) act on the bulkhead.
- The unbalanced horizontal force of A. $(\sigma_x - \sigma_b)$ is balanced by the friction and cohesion forces along the rock fill interface in the drive.

Let the stope filling rate is **R** dtph, the area of stope be $\mathbf{A_s}$ m^2, the filling time be $\mathbf{T_1}$ hours, the resting time be $(24 - T_1)$ hours, the hydraulic fill slurry concentration be **S%** and the tailings solids specific gravity be $\mathbf{G_s}$. Let the final moisture content of the drained fill mass be **m%** of the dry mass and the final dry density of the fill mass is γ_d t/m^3.

The Amount of Water Entering the Stope

The water entering the stope in a 24 hour (m^3/day) $T_1 . R . (100 - S) / S$
The water retained in the fill after drainage is (m^3/day) $T_1 . R . m/100$
Hence excess water entering the stope is $I = T_1 . R . [(100-S)/S - m/100]$
Where the excess eater per tonne of hydraulic fill $W = [(100-S)/S - m/100]$

Vertical Filling Rate

Let the vertical filling rate is given by (m/day) $Y = T_1 . R / (A_s . \gamma_d)$

The Rate of Fill Drainage

Let the fill drainage rate be Q m^3/day

Pore Water Pressure Distribution in the Drive

A simplified procedure has been developed for the pore water pressure calculations as follows. Let the flow parameters for the stope are as follows (Figure 1) :

K_s is the permeability of the fill in the stope
A_s is the plan area of the fill mass
I_s is the hydraulic gradient in the stope
H_1, H_2, and H_3 are the total potential for the seepage flow at locations 1 (top of fill mass), 2 (at the entry to the access drive), and 3 (at the free draining bulkhead)

Hence, the hydraulic gradient in the stope $I_s = (H_1 - H_2)/ Z = (Z-h)/Z$,
Where Z is the height of the water table, h is the hydraulic head at the entry to access drive.

The flow through the stope is given by:-

$$Q = k_s \cdot i_s \cdot A_s = k_s \cdot \left(\frac{(z-h)}{z} \right) \cdot A_s$$

A typical Hydraulic Fill in a Stope Durin Filling

Figure 1

Let the number of draining bulkheads be n. In most cases n = 1.

The total flow through all the n bulkheads is qual to the stope drainage rate as calculated above and will be given by

$$Q = n \cdot k_d \cdot i_d \cdot A_d \quad = \quad n \cdot k_d \cdot \left(\frac{h}{L}\right) \cdot A_d$$

Since the flow through the stope is equal to the flow through the n draining bulkheads,

$$Q \quad = \quad k_s \cdot \left(\frac{z-h}{z}\right) \cdot A_s \quad = \quad n \cdot k_d \left(\frac{h}{L}\right) \cdot A_d$$

Let $K_s . A_s = T_s$ which is the Transmissivity of the fill mass in stope, and
$K_d . A_d = T_d$ which is the Transmissivity of the fill in the access drive

Substituting T_s and T_d in the above equation we get:

$$T_s \cdot \left(\frac{z-h}{z}\right) \quad = \quad n \cdot T_d \left(\frac{h}{L}\right)$$

By simplifying the above equation we get

$$h \quad = \quad \frac{z}{\left[n \cdot \left(\frac{T_d}{T_s}\right)\left(\frac{z}{L}\right) + 1\right]} \quad (meters) \qquad (1)$$

Hence the hydraulic head at the entry to access drive could be calculated from the values of Z, n, T_s, T_d, and L. The following general observation can be made from the above equation for the hydraulic head h acting at the access drive entry.

- h will decrease a n increase, that is if we increase the number of bulkheads for a stope we can reduce the hydraulic head acting in the drive
- h will decrease as (T_d / T_s) increase, that is by increasing the transmissivity of the drive by incorporating the drainage systems we can reduce the hydraulic head acting in the drive
- h will decrease as L decrease, that is by locating the bulkhead closer to the stope we can reduce the hydraulic head acting in the drive

From the theory presented in the drainage model, the water flow rate per day through the bulkhead is given by

$$Q = 24.n.\frac{h}{L}.T_d = \frac{24.n.Z.T_d}{L.\left[n.\left(\frac{T_d}{T_s}\right)\left(\frac{Z}{L}\right)+1\right]} \quad tpd \qquad (2)$$

Where T_d is the transmissivity of the fill in the drive in m^3/h.

But the excess water inflow rate is given earlier as $T_1 . R .W = I$ tpd

Conditions for Water table to Rise, Fall or Stay constant

Hence if the excess water inflow rate is greater than the drainage rate (I >Q) then the water table in the stope will rise and if the excess water inflow rate is less than the drainage rate (I < Q) then the water table will fall. If I = Q then the water table will stabilise at constant height.

From the time a stope filling starts, the water table will continue to rise until the excess water inflow rate matches the stope drainage rate. The height of the water table at which the inflow matches the drainage is the maximum height for the water table.

$$\frac{24.n.Z.T_d}{L.\left[n.\left(\frac{T_d}{T_s}\right)\left(\frac{Z}{L}\right)+1\right].} = T_1.R.W \qquad ((3))$$

$$24.n.k_d.Z.A_d = T_1.R.W.L.n.\left(\left(\frac{T_d}{T_s}\right)\left(\frac{Z}{L}\right)\right) + T_1.R.W.L$$

$$Z.\left[24.n.k_d.A_d - T_1.R.W.n.\left(\frac{T_d}{T_s}\right)\right] = T_1.R.W.L$$

$$Z = \frac{T_1.R.W.L}{24.n.T_d - \dot{Y}.A_s.\gamma_d.W.n.\left(\frac{T_d}{T_s}\right)}$$

$$Z = \frac{\dot{Y}.A_s.\gamma_d.W.L}{24.n.T_d - \dot{Y}.A_s.\gamma_d.W.n.\left(\frac{T_d}{T_s}\right)} \qquad (4)$$

Where $\dot{Y}$ *is the vertical filling rate in* m/day

A_s *is the stope plan area in* m^2

L *is the bulkhead offset distance in m*

$T_d = k_d.A_d$

k_d *is the permeability of the fill in drive* (m/h)

The Equation (1) can be rewritten as:-

$$Z = \frac{T_1.R.L.W}{24.n.T_d - T_1.R.n.\left(\frac{T_d}{T_s}\right).W} \qquad (5)$$

in which the filling rate R, and the filling time T_1 could be used to calculate the final equilibrium height of the water table.

The following examples have been worked out to illustrate the effectiveness of the above formulas.

Case 1

A narrow and long stope with dimensions 100m long, 15m wide, is being filled with hydraulic fill at 175 dtph at 75% solids concentration. The filling is carried out for 12 hours followed by a resting time of 12 hours. The drained moisture content of the fill mass is 20%. The stope is provided with only one bulkhead at 15m off set at the lowest level (draw point). Assume the permeability for the fill in the stope and in the drive as 30mm/h, and estimate the height of water table in the stope.

First calculate T_d and T_s as follows:

T_d = (30mm/h)* (1m/1000mm) * 5m x 5m = 0.75 m^3/h

T_s = (30mm/h)* (1m/1000mm) * 15m x 100m = 45 m^3/h

Use equation (5) and substitute the values for T_d and T_s as follows:

$$Z = \frac{12 * 175 * 15 * \left(\frac{25}{75} - \frac{20}{100}\right)}{24 * 1 * .75 - 12 * 175 * \left(\frac{.75}{45}\right) * \left(\frac{25}{75} - \frac{20}{100}\right)} = 313.95\ m$$

Since the height of the water table Z = 313.95 meters is greater than the height of the stope, which is 50 meters, the water table will be always above the fill surface during the filling campaign as per the rates assumed (that is 12 hours filling daily at 175 dtph rate).

Case 2

We will consider a similar case to the previous one, but with the bulkhead is located at 3m off set, and the filling time is 6 hours in a 24 hour period in this case. All the other filling parameters are same as in the case 1.

The height of the water table Z is given by equation (5) as,

$$Z = \frac{6*175*3*\left(\frac{25}{75}-\frac{20}{100}\right)}{24*1*.75-6*175*\left(\frac{.75}{45}\right)*\left(\frac{25}{75}-\frac{20}{100}\right)} = 26.73m$$

Hence the equilibrium height of the water table in the stope is 23.73meters, if we provide a bulkhead at 3m away and reduce the filling time to 6 hours only.

The Bulkhead Pressure Model (MIM)

The lateral stresses acting on the bulkhead can be calculated in the following manner: Let the pore water pressure at x = 0 is U_0, at the entry to drive, the total fill and water pressure σ_x at x = 0 is σ_0, and the effective stress σ'_x at x = 0 is (σ_0 - U_0). Using equation (1)for the hydraulic head in the drive and multiplying by γ_w, we get,

$$u_0 = h.\gamma_w = \frac{Z.\gamma_w}{\left[n.\left(\frac{T_d}{T_s}\right).\left(\frac{Z}{L}\right)+1\right]} \qquad (6)$$

The Stressess acting in the Fill in the Access Drive

Figure 2

Assume the same permeability for the fill along the drive. In practice this may not be true. A compaction or accumulation (of fines) zone of 0.5 to 1.0m of fill will form near the bulkhead, and the pore water will develop steeper gradients in the compaction zone.

However, for the purpose of developing the present model, we have to assume the same permeability for the fill in the access drive from x = 0 to x = L. This will result in a linear pore water pressure distribution as shown in the above diagram.

Let U_x be the pore water pressure at distance x from the stope in the drive.
Hence,

$$U_x = \frac{U_0}{L}(L - x) \qquad (7)$$

Assume the lateral earth pressure coefficient for the fill in the access drive is K_0. Hence the mobilised shear strength S_x of the fill at the rock walls in the drive is given by,

$$S_x = \sigma'_y.\tan\phi + C \qquad (8)$$

$$but\ \sigma'_y = K_0 . \sigma'_x = K_0 . (\sigma_x - U_x) \qquad (9)$$

$$Therefore,\ S_x = K_0.(\sigma_x - U_x).\tan\phi + C \qquad (10)$$

$$Substituting\ U_x = \frac{U_0}{L}.(L-x)\quad in\quad equation(2)\ gives$$

$$S_x = K_0.\left(\sigma_x - \frac{U_0}{L}.(L-x)\right).\tan\phi + C \qquad (11)$$

Considering a slice of fill dx thick, and resolving the forces horizontally in X-X direction we get the following:

$$\frac{d\sigma_x}{dx} + \frac{P.K_0.\tan\phi.\sigma_x}{A} = \frac{P.K_0.\tan\phi.U_0.(L-x)}{A.L} - \frac{P.C}{A} \qquad (12)$$

Let $b = \frac{P.K_0.\tan\phi}{A}$, *the equation* (3) *can be rewritten as*

$$\frac{d\sigma_x}{dx} + b\sigma_x = \frac{b.U_0.(L-x)}{L} - \frac{P.C}{A} \qquad (13)$$

Upon integrating equation (13) we get

$$\sigma_x = U_0 - \frac{U_0 x}{L} + \frac{U_0}{bL} - \frac{P.C}{A.b} + d.e^{-bx} \qquad (14)$$

This is the formula to calculate the lateral stress at any section in the access drive, where d is a constant to be evaluated through the boundary conditions. By using the boundary condition that at x = 0, $\sigma_x = \sigma_0$, this is the total lateral stress acting at the stope boundary, U_0 is the pore water pressure at the stope boundary obtained from the drainage model, and the σ'_0 obtained by using Terzaghi's arching theory for the main fill mass in the stope, the value of the constant d is given by,

$$d = \sigma_0 - u_0\left(1 + \frac{1}{bL}\right) + \frac{P.C}{A.b} \qquad (15)$$

By substituting this in the equation (14), we get

$$\sigma_x = u_0 - \frac{u_0.x}{L} + \frac{u_0}{bL} - \frac{P.C}{A.b} + \left\{\sigma_0 - u_0\left(1 + \frac{1}{bL}\right) + \frac{P.C}{A.b}\right\}.e^{-bx} \qquad (16)$$

This is the final form of the bulkhead pressure model (formula). To find how much lateral pressure is transferred to the bulkhead, we substitute x = L, and get

$$\sigma_b = \sigma'_0.e^{-bL} + \frac{u_0}{bL}.\left(1 - e^{-bL}\right) - \frac{P.C}{A.b}.\left(1 - e^{-bL}\right) \qquad (17)$$

Where the first term is the contribution to the final bulkhead pressure through the tailings solids, and this quantity is decreasing as the L increases, the second term is the contribution from the seepage forces to the final bulkhead pressure, and the final term is accounting for the resistance provided by the cohesion of the fill.

A Recommended Procedure to Design a Hydraulic Fill Bulkhead

Seven Step Procedure

Step 1
Choose appropriate filling rate to control the height of the water table.

Step 2
Provide adequate number of bulkheads or drainage system to achieve adequate drainage rate. Step 1 and step 2 may be iterated few times to achieve the most optimum condition for fill drainage, at a specified site.

Step 3
Estimate the maximum water head h acting at the stope boundary using the drainage model presented in the paper.

Step 4
Using Terzaghi's arching theory estimate the vertical and horizontal fill pressures at the stope boundary at the bulkhead level.

Step 5
Use the bulkhead pressure model presented in this paper to estimate the expected maximum lateral stress that will act on the bulkhead.

Step 6
Use a factor of safety of 1.5 to 2 to get the design pressure for the bulkhead structure.

Step 7
Design the bulkhead structure to stand this pressure. The structural design of the bulkhead is not covered in this paper.

Example 1 – Bulkhead pressure calculation –Case A
Consider a case where, the stope dimensions are 40m x 40m x 120m, and provided with three bulkheads at the draw point level. The hydraulic fill is placed at 250dtph rate, at 70% solids concentration, 12 hours per day. The final drained moisture content of the fill mass is 25%, and the permeability of the fill is 50mm/h both in the stope and in the drive. The bulkheads are placed at 4m off set distance from the stope boundary, and the drives are of 5m x 5m size. Estimate the expected fill pressure for the bulkhead design.

Solution:

Filling time T_1 = 12 hrs,
Fill solids concentration S = 70%,
Fill permeability k_s = 50mm/h
Bulkhead off set L = 4m
Area of the stope A_s = 1600m^2

Filling rate R = 250dtph
Number of bulkheads n = 3
Fill permeability k_d = 50mm/h
Area of the drive A_d = 25m^2

The transmissivity of the drive $T_d = k_d \cdot A_d = 25 * .05 = 1.25$ m^3/h
The transmissivity of the stope $T_s = k_s \cdot A_s = 1600 * .05 = 80$m^3/h

$$z = \frac{12*250*4*\left(\frac{30}{70}-\frac{25}{100}\right)}{3*24*.05*25-12*250*3*\frac{1.25}{80}*\left(\frac{30}{70}-\frac{25}{100}\right)}$$

$$= 33.02\,m$$

Hence the equilibrium water table height is 33 meters
The hydraulic head at the stope boundary h is calculated as follows:

$$h = \frac{z}{n\left(\frac{T_d}{T_s}\right).\left(\frac{z}{L}\right)+1} = \frac{33.02}{3*\left(\frac{1.25}{80}\right)*\left(\frac{33}{4}\right)+1} = 23.81m$$

Hence the hydraulic head acting at the entry to the access drive is around 238 kPa.

The Calculation for the bulkhead pressure is carried out as follows:
The bulkhead pressure σ_b is calculated as follows:

$$\sigma_b = \sigma_0^{'} \cdot e^{-bL} + \frac{u_0}{bL} \cdot \left(1 - e^{-bL}\right)$$

$$b = \frac{p_d \cdot k_0 \cdot \tan\phi}{A_d} = \frac{20*.4*\tan 20}{25} = .1164$$

$$e^{-bL} = e^{-.1164*4} = .6275$$

$$\sigma_0^{'} = 339kPa \text{ from Terzaghi's } 3-D \text{ analysis, Hence } \sigma_b \text{ is given by}$$

$$\sigma_b = 339*e^{-.4656} + \frac{238.1*\left(1-e^{-.4656}\right)}{.4656} = 212.8+190.35 = 403.2kPa$$

This is the maximum bulkhead pressure that should be expected under the specified filling conditions. If the rock forming the stope void is jointed then the water may find easy passages through the rock, and it is not necessary to consider such a case for the design.

If the fill and water pressures in the stope and on the bulkheads experienced in the past are lower than the above values, we should thank Mother Nature for such a mercy. However, this will not allow us to design the bulkheads for lower pressures than the above-calculated values.

Hence the expected bulkhead pressure is around 400kPa, under the filling conditions considered.

For the design of bulkhead choose a factor safety of at least 2 and design the bulkhead to withstand a pressure not less than 800kPa. Lower factor of safety of 1.5 could be used if deep drainage systems installed.

Figure 3 The filling time, height of water table, and the water head in the access drive – Case A

Example 2 – Bulkhead pressure calculation –Case B

Consider a case where, the stope dimensions are 60m x 20m x 60m, and provided with one bulkhead at the draw point level. The hydraulic fill is placed at 200dtph rate, at 75% solids concentration. The final drained moisture content of the fill mass is 18%, and the permeability of the fill is 30mm/h both in the stope and in the drive. The bulkheads are placed at 15m off set distance from the stope boundary, and the drives are of 5m x 5m size. Estimate the expected fill pressure for the bulkhead design.

Solution:

Filling time $T_1 = 12$ hrs,
Fill solids concentration $S = 75\%$,
Fill permeability $k_s = 30$mm/h
Bulkhead off set $L = 15$m
Area of the stope $A_s = 1200$m^2

Filling rate $R = 200$dtph
Number of bulkheads $n = 1$
Fill permeability $k_d = 30$mm/h
Area of the drive $A_d = 25$m^2

The transmissivity of the drive $T_d = k_d \cdot A_d = 25 * .03 = .75$ m^3/h
The transmissivity of the stope $T_s = k_s \cdot A_s = 1200 * .03 = 36$m^3/h

$$z = \frac{12*200*15*\left(\frac{25}{75}-\frac{18}{100}\right)}{1*24*.03*25-12*200*3*\frac{.75}{36}*\left(\frac{25}{75}-\frac{18}{100}\right)}$$

$$= 534\,m$$

Hence the equilibrium water table height is the fill height, which is 60m

The hydraulic head at the stope boundary h is calculated as follows:

$$h = \frac{z}{n\left(\frac{T_d}{T_s}\right).\left(\frac{z}{L}\right)+1} = \frac{60}{1*\left(\frac{.75}{36}\right)*\left(\frac{60}{15}\right)+1} = 55.38m$$

Hence the hydraulic head acting at the entry to the access drive is around 554kPa

Calculation of the bulkhead pressure is carried out as follows:
The bulkhead pressure σ_b is calculated as follows:

$$\sigma_b = \sigma_0^{'}.e^{-bL}+\frac{u_0}{bL}.\left(1-e^{-bL}\right)$$

$$b=\frac{p_d.k_0.\tan\phi}{A_d} = \frac{20*.4*\tan 15}{25} = .0857$$

$$e^{-bL} = e^{-.0857*15} = .2763$$

$$\sigma_0^{'} = 150kPa \text{ from Terzaghi's } 3-D \text{ analysis, Hence } \sigma_b \text{ is given by}$$

$$\sigma_b = 150*e^{-1.285}+\frac{554*\left(1-e^{-1.285}\right)}{1.285} = 41.4+400.9=442kPa$$

Hence the expected bulkhead pressure is around 442kPa, under the filling conditions considered.

For the design of bulkhead choose a factor safety of at least 2 and design the bulkhead to withstand a pressure not less than 880kPa, which will be a massive structure.

The major component of the bulkhead pressure is from the hydraulic head and this is 400kPa. The bulkhead pressure can be easily reduced to a value less than 200kPa by using deep drains. It is much safer to handle the reduced bulkhead pressure than designing a massive structure to withstand the design pressure of 880kPa .

Figure 4 The filling time, height of water table, and the water head in the access drive – Case B

Example 3 – Bulkhead pressure calculation – Case C

Consider a case where, the stope dimensions are 50m x 20m x 80m, and provided with one bulkhead at the draw point level. The hydraulic fill is placed at 200dtph rate, at 70% solids concentration. The final drained moisture content of the fill mass is 25%, and the permeability of the fill is 30mm/h both in the stope and in the drive. The bulkheads are placed at 7.5m off set distance from the stope boundary, and the drives are of 5m x 5m size. Estimate the expected fill pressure for the bulkhead design.

Solution:

Filling time $T_1 = 12$ hrs,
Fill solids concentration S = 70%,
Fill permeability $k_s = 30$mm/h
Bulkhead off set L = 7.5m
Area of the stope $A_s = 1000$m^2

Filling rate R = 200dtph
Number of bulkheads n = 1
Fill permeability $k_d = 30$mm/h
Area of the drive $A_d = 25$m^2

The transmissivity of the drive $T_d = k_d \,.\, A_d = 25 * .03 = .75$ m^3/h
The transmissivity of the stope $T_s = k_s \,.\, A_s = 1000 * .03 = 30$m^3/h

$$z = \frac{12*200*7.5*\left(\frac{30}{70}-\frac{25}{100}\right)}{1*24*.03*25-12*200*3*\frac{.75}{30}*\left(\frac{30}{70}-\frac{25}{100}\right)}$$

$$= 441\,m$$

Hence the equilibrium water table height is the fill height, which is 70m

The hydraulic head at the stope boundary h is calculated as follows:

$$h = \frac{z}{n\cdot\left(\frac{T_d}{T_s}\right)\cdot\left(\frac{z}{L}\right)+1} = \frac{70}{1*\left(\frac{.75}{30}\right)*\left(\frac{70}{7.5}\right)+1} = 56.75m$$

Hence the hydraulic head acting at the entry to the access drive is around 568kPa

Calculation of the bulkhead pressure is carried out as follows:
The bulkhead pressure σ_b is calculated as follows:

$$\sigma_b = \sigma_0^{'}\cdot e^{-bL} + \frac{u_0}{bL}\cdot\left(1-e^{-bL}\right)$$

$$b = \frac{p_d\cdot k_0\cdot\tan\phi}{A_d} = \frac{20*.4*\tan 20}{25} \quad .1164$$

$$e^{-bL} = e^{-.1164*7.5} = .4174$$

$$\sigma_0^{'} = 150kPa \text{ from Terzaghi's } 3-D \text{ analysis, Hence } \sigma_b \text{ is given by}$$

$$\sigma_b = 150*e^{-.873} + \frac{568*\left(1-e^{-.873}\right)}{.873} = 62.6+379 = 441kPa$$

Hence the expected bulkhead pressure is around 441kPa, under the filling conditions considered.

For the design of bulkhead choose a factor safety of at least 2 and design the bulkhead to withstand a pressure not less than 880kPa, which will be a massive structure.

The major component of the bulkhead pressure is from the hydraulic head and this is 400kPa. The bulkhead pressure can be easily reduced to a value less than 200kPa by using deep drains. It is much safer to handle the reduced bulkhead pressure than designing a massive structure to withstand the design pressure of 880kPa .

Figure 5 The filling time, height of water table, and the water head in the access drive – Case C

Conclusions

In this paper a rational approach to determining the bulkhead pressures has been presented. It is now possible to control the bulkhead pressures through the methods presented in this paper. Installing proper drainage systems will increase stope drainage by many times faster. Also installing deep drains in the drive will reduce the bulkhead pressures to easily manageable level. Bulkheads should then be designed to withstand the reduced pressures only. Most of the bulkhead failures are caused by the combined effect of the fill and seepage forces, and the model presented in this paper clearly identifies this.

By improving the drainage through engineered drainage systems, the bulkhead pressures are reduced and the safety in automatically increased could only achieve safety in hydraulic filling.

There is no rule of thumb for the safety of hydraulic filling. The free draining bulkheads on their own accord do not provide any improved safety, if not engineered drainage systems are incorporated with them. If the drainage is properly taken care of, then the type of bulkhead (porous brick or shotcrete) does not matter.

Paste backfill bulkhead failures and pressure monitoring at Cayeli Mine

M. Yumlu, AMC Consultants Pty Ltd., Melbourne, Australia, and
M. Guresci, Inmet Mining Corporation (Cayeli Bakir Isletmeleri A.S.), Rize, Turkey

ABSTRACT The stability of bulkheads forms an integral part of a successful paste backfill system. Bulkheads are constructed at the draw points of open stopes to contain paste fill while the initial pour cures and forms a consolidated plug. Mobilization of uncured paste fill as a result of a bulkhead failure can lead to significant consequences, including endangering the safety of personnel, property damage and production losses and delays. This paper presents details of three paste fill bulkhead failures that have occurred during the late stage of tight filling transverse blind uphole retreat stopes in an underground base metal mine; the results of an in-situ instrumentation and monitoring program to ascertain the paste fill pressure loads acting on the bulkheads and to understand the pressure development mechanism within paste fill mass; and the subsequent changes made to the bulkhead design and paste fill placement sequence in order to prevent reoccurrence of bulkhead failures in the future.

The revised bulkhead design and fill placement management has been successful because, to date, Cayeli has filled more than 50 blind stopes without any failure. A significant outcome of this study is that it has been shown that only a combination of properly engineered bulkhead design, bulkhead construction, and better management of fill placement can provide safe and efficient filling practices. Furthermore, bulkhead pressures are very site-specific and any bulkhead design should be based on field pressure monitoring results carried out at the actual mine site.

INTRODUCTION

The Cayeli underground mine, operated by Cayeli Bakir Isletmeleri A.S., is a wholly owned subsidiary of Inmet Mining Corporation. Cayeli is located 8 km inland from the Black Sea coast and approximately 75 km to the east of the city of Trabzon (Fig. 1).

Construction of the mine started in 1992 and ore production began in 1994. The Cayeli Mine is the largest fully mechanized underground base metal mine in Turkey. The mine extracts about 1.0 Mt of ore per year, to produce a combined total of about 220,000 t of copper and zinc concentrates.

Fig. 1. Location map of Cayeli Mine.

DESCRIPTION OF THE MINING METHOD

The orebody is a steeply dipping volcanogenic massive sulphide deposit. The Cayeli Mine is accessed by a decline and serviced by a hoisting shaft.

The mining method applied at Cayeli has been designed for 100% recovery with complete pillar recovery. The mining method is transverse and longitudinal longhole, open and blind stoping with post-backfill. The mining method includes: driving sills for stope development; slotting and ring blasting; remote mucking; and bulkhead construction and filling (Fig. 2).

Fig. 2. Mining method at Cayeli Mine.

Cayeli stopes are small, averaging 6,000 t each with about 100 stopes being mined and backfilled each year. The stopes are generally 7.0 m to 10.0 m wide with stope lengths varying between 15.0 m and 30.0 m. The stopes are mined in single lifts between 15.0 m and 20.0 m high sublevels.

Backfill is an integral part of the mining method at Cayeli Mine. There are currently three types of backfill in use at Cayeli. These are waste fill using development waste rock, cemented waste fill, and paste fill. On average, Cayeli places about 250,000 m^3 of backfill annually. Paste fill constitutes about 150,000 m^3 per year.

PASTE FILL PROPERTIES

Cayeli uses full mill tailings to make paste fill. The tailings are very fine with a P90 of 63 microns. Depending on the mill feed rate and the ore blend, the material passing 20 microns can be 50% to 60%. Cayeli uses cement as a binder and fills primary stopes at an average cement content of 7% and secondary and tertiary stopes at 5% cement content. The slump varies between 175 mm and 190 mm, and the target design strength for vertical exposures is 1.0 MPa after 28 days curing using a safety factor of two.

BULKHEAD PROPERTIES AND FILL MANAGEMENT

Cayeli uses shotcrete bulkheads to contain freshly placed paste fill in open stopes. The bulkheads are large measuring 7 m wide and 5 m high. The bulkheads are made up of 300 mm thick shotcrete reinforced with 28 mm diameter rebars, which are tied to the 20 mm diameter rebar bolts.

There are limitations to the application of an arched shotcrete bulkhead at Cayeli due to the constraints imposed by the access geometry. The location of the sublevel haulage at the footwall/hangingwall contact provides a restricted area for the construction of a shotcrete arch. As a consequence, a planar, flat shotcrete bulkhead is required.

The original Cayeli shotcrete bulkheads were only designed for a maximum working pressure of 32 kPa. Fill placement was continuous and was managed by a restricting rate of fill rise to a maximum of 0.43 m per hour.

Subsequent to bulkhead failures that will be described later in this paper, significant changes were made to the barricade design and management of fill placement in order to ensure safe and efficient filling practices.

PASTE FILL BULKHEAD FAILURES

Since the start of paste backfill application, Cayeli Mine has built several hundred shotcrete bulkheads to retain paste fill in open stopes. To date, there have not been any shotcrete bulkhead failures in open stopes. In blind stopes, however, there have been a total of five bulkhead failures between 2003 and 2004. All of these failures were in relatively small blind stopes, i.e. stopes with no access at the top.

The first two failures occurred as a result of stope wall failure during filling. There was no injury, damage to property, or production loss.

The remaining three failures occurred during the late stage filling of blind stopes while they were being tight filled. The following sections will provide details of the last three failures.

BULKHEAD FAILURE 1

On December 28, 2003, a reinforced shotcrete bulkhead failed in stope S880 S07 (Fig. 3). Fortunately, there was no injury as there was nobody working in the vicinity when the failure occurred. The failure was very violent and resulted in severe damage to equipment and caused significant production delays.

The stope was a blind primary stope filled in two stages. The reinforced shotcrete bulkhead was constructed as per mine standards. The first stage was the plug containing about 347 m^3 of paste fill filled at a restricted rate of 31.4 m^3/h in order to limit height rise to 0.43 m/h (10 m/day). After two days of plug fill curing, the remaining 971 m^3 of paste was placed into the stope over 20 h of continuous filling at a rate of 45 m^3/h (0.62 m/h). The average cement content was 7.0% and the average slump

Fig. 3. Picture of bulkhead failure 1: a) looking into draw point; b) bulkhead remnants.

Fig. 4. Property damage caused by bulkhead failure 1: a) transformer; b) Fargo truck; c) Solomatic.

was 185 mm. The failure occurred at the final stage of tight filling. Filling was through a 102 mm diameter cased hole with no provision for a separate air breather hole.

Paste fill plant records showed that the stope was 'overfilled' by about 12%, based on a cavity monitoring survey (CMS), and adjusted production figures (it is normally difficult to reconcile excavated volumes and paste plant volumes). Furthermore, an increase in pipeline pressure was reported, indicating the likely presence of overpressure conditions during the tight filling stage.

The paste fill outflow caused major damage to a longhole drill parked 14 m away, in front of the S05 sill drift, to a pickup truck parked 35 m away, inside the S02 sill drift, and to a transformer located 50 m away, at the end of the 880 level cross-cut (Fig. 4).

Fig. 5. Picture of the bulkhead failure 2: a) failed bulkhead b) truck caught up in paste fill inrush.

Post failure investigation concluded that the most likely cause of failure was overloading the bulkhead by 'overfilling' as a result of lack of a breather hole during tight filling of the stope.

BULKHEAD FAILURE 2

A paste fill bulkhead failed on January 3, 2004, in stope S900 CDN07E (Fig. 5). No people were injured but an ore truck was damaged and production delays occurred. The stope was a small blind primary stope with dimensions of 20 m long x 13 m high x 4 m wide. The bulkhead was constructed from a waste rock pile with shotcrete applied at the top and along the drift perimeter to prevent leakage.

A total of 1,370 m^3 of paste fill was pumped continuously into the stope with filling being completed in 30 h at an average fill rise rate of 0.56 m/h. The average cement content of the fill was 7.0% and the average slump was 185 mm.

Failure occurred at the final stage of tight filling. Paste returned from the breather hole indicating tight filling conditions.

Paste fill plant records showed that the stope was 'overfilled' by about 13%, based on CMS, and adjusted production figures. Also, an increase in

Fig. 6. Picture of the bulkhead failure 3: a) failed bulkhead b) height of paste fill inrush after cleaning.

pipeline pressure was reported, indicating likely overpressure conditions during the tight filling stage.

Post failure investigation concluded that the most likely cause of this failure was overpressure resulting from 'overfilling' due to a blocked air breather hole during the final stage of tight filling.

After these two consecutive failures, the filling strategy was changed to a safer practice. Filling is now staged, with the first stage being 2 m above the brow height (or to a 7 m fill height from the stope floor). Two days of curing time is required before the start of the second stage. The first stage plug acts as a bulkhead for the remainder of the fill and is intended to replace the bulkhead. A 127 mm diameter air relief hole cased with a 102 mm diameter steel pipe is drilled for blind stopes.

As well, the numbers of hitching rebars of the reinforced shotcrete bulkhead were increased. For waste muck pile bulkheads, the apex length was standardized to a minimum of 7 m with the face being shotcreted.

The strike access drifts were fenced off 50 m away from the bulkhead with a warning sign indicating ongoing paste filling.

BULKHEAD FAILURE 3

A shotcrete bulkhead failed on November 11, 2004, in blind secondary stope S880 S06 (Fig. 6). About two hours prior to failure, a roof bolter operator heard cracking noises from the bulkhead. He evacuated and fenced off the area and informed the shift engineer, but filling was continued and the bulkhead failed violently causing a major paste fill inrush. Nobody was injured but a roof bolter parked about 30 m away was dragged with the paste fill causing some minor damage. The inrush resulted in production delays due to blocked access to nearby active stope S860 S15.

The stope being filled was a relatively small blind secondary stope with a total volume of 1,393 m^3. The stope dimensions were 15 m long x 15 m height x 7.5 m wide. The filling was to be completed in three parts. The average paste fill rise rate was 0.43 m/h. Two 10 m long by 125 mm diameter holes were drilled for filling and air relief. First-stage filling was 700 m^3 for the 7 m high plug fill. Second-stage filling started after two days of plug fill curing. Final-stage filling started after two days of stage two curing. The average cement content of the fill was 5.4% and the average slump was 185 mm.

Post failure investigation revealed that the stope sidewalls and the stope brow were intact with some rebar anchors sticking out. The entire shotcrete bulkhead was ripped apart. The majority of the paste fill contained in the plug was not mobilized and was free-standing.

The air-breathing hole was choked with paste at about two metres away from the collar, indicating overpressure conditions. Paste fill plant records showed that the stope was 'overfilled' by about 9%, based on CMS and adjusted production figures.

It was concluded that the bulkhead was overloaded due to 'overfilling' during the tight filling stage. The observations indicated that the failure process was such that paste fill contained in the plug fill immediately adjacent to the bulkhead was progressively compressed during filling and was eventually squeezed out of the stope, subsequently pushing and ripping the bulkhead apart causing a sudden inrush of uncured paste fill.

Safety measures of filling procedures were firmed after that failure and a third stage was added to the fill placement sequence for the blind stopes. In order to eliminate the risk of over-pressurizing, the second stage was stopped at 90% of the stope volume and left for three weeks of curing before tight filling the stope at the third stage. The number of breather holes was increased to two.

More consideration is now given to monitoring the bulkhead and breather holes for the blind stopes. The bulkhead is monitored from the paste plant with a camera in addition to the one monitoring the draw point. A watchman was assigned to keep an eye on the air holes of blind stopes at the third stage.

Paste plant operators are instructed to stop when: there is a leakage from the bulkhead; paste comes out the air holes; 40 bar pipe pressure is observed; or when a 10 bar pipe pressure increase is monitored at the paste plant.

CAUSE OF BULKHEAD FAILURES

Bulkhead failure investigations revealed that in all cases, failure occurred in small and blind stopes during last stage of filling while tight filling. Furthermore, stopes were overfilled by about 10% and there were problems with air relief holes.

These bulkhead failures were attributed to one or a combination of the following factors: fast filling rate; continuous filling or inadequate plug fill cure time; 'overfilling' during the tight filling stage due to the absence, blockage, or inadequate use of air breather holes; lack of adequate fill management and fill monitoring controls; and inadequate bulkhead design.

PASTE FILL PRESSURE MONITORING TESTS

The Cayeli Mine initiated a paste fill instrumentation program after the bulkhead failures in order to ascertain bulkhead loads and to monitor the evolution of internal stresses in cemented paste fill during and after stope filling.

Three stopes were instrumented using total pressure cells and piezometers. The pressures induced in the paste fill (horizontal and vertical) and on the bulkhead (horizontal) were recorded during and after placement of paste fill.

DESCRIPTION OF PASTE FILL PRESSURE INSTRUMENTS

Instruments used for the tests consisted of total pressure cells, contact pressure cells, piezometers and a data logger. Total pressure cells were used to monitor stress change in the paste fill while the contact pressure cell was used to monitor load on the bulkheads. Piezometers were used to monitor pore water pressure in the paste fill.

The piezometers used for these tests were Geokon Model 4500S units. These piezometers had a filter head of 50 micron size and the pressure capacity was 350 kPa with an accuracy of ± 0.1% of full scale. The instrument had a built-in thermistor for measuring the temperature in the fill.

The total pressure cells used were Geokon Model 4800 units. The capacity of the total pressure cells used was 350 kPa with ± 0.1% of the full scale. They had built in thermistors for measuring the temperature during pressure recording.

These cells are designed to measure soil and backfill pressures on structures. The back plate of the cell, which bears against the external surface of the structure, is thick enough to prevent the cell from warping. The other plate is thin and is welded to the back plate in a manner that creates a flexible hinge to provide maximum sensitivity to changing soil or backfill pressures.

The contact pressure cells used were Geokon Model 4810 units. The capacity of the contact pressure cells used was 350 kPa ± 0.1% of full scale. They had built-in thermistors for measuring the temperature during pressure recording.

All of the instruments were connected to an eight-channel Canary Data Logging System for real-time recording. The sampling rate was set at five minutes and the readings were periodically downloaded to a lap top computer.

INSTRUMENTATION SETUP AND BULKHEAD CONSTRUCTION

In all tests, a 300 mm thick rebar-reinforced planar shotcrete bulkhead was constructed at the base of the open stopes. Figure 7 shows the instrumentation setup and Figure 8 shows the sequence for placement of instruments and construction of shotcrete bulkheads.

The pressure cells were placed at two locations within the stope—in the centre of the stope and behind the shotcrete bulkhead. Only horizontal pressure was monitored at the bulkhead. In the stope, vertical pressure and horizontal pressure along the length of the stope were monitored.

For pressure measurements in the stope, instruments were mounted on a rigid steel frame attached to a heavy metal box to prevent it from floating. The instrument frame was 1.2 m long, 0.60 m wide, and 0.60 m high.

A contact pressure cell was mounted at the back of a large steel plate (1 m wide, 1 m high, and 5 mm thick) in order to protect it from damage during shot-

Fig. 7. Paste fill pressure instrumentation setup.

Fig, 8. Placement of instrumentation frame and construction of shotcrete bulkheads.

creting. The contact cell was installed in the centre of the shotcrete bulkhead at 0.5 m from the floor of the stope. No piezometer was installed at the bulkhead.

The stope floor was leveled and the frame was pushed into the stope in a bucket of a remote controlled LHD. All instrument lead wires were protected using 25 mm plastic hoses.

Table 1 lists summary information for the first three tests described in this paper.

TEST 1

The first instrumented stope was S860 S15, a primary transverse open stope exposing ore pillars on the north and south sidewalls. The stope was vertical in shape and was accessible from the overcut sill drift. The stope had an average width of 6.2 m, length of 19.5 m, and height of 19.5 m. About 5,000 t of ore were mucked from this stope in a period of 12 days.

TEST 2

Test 2 was conducted in stope S820 N07, a small blind secondary stope exposing paste fill at the back and on the sidewalls. The stope width was 8 m, the height was 17 m, and the length was 13.6 m. The total CMS stope volume was 2,185 m^3. Stope production was completed in eight days and about 3,000 t of ore were mined.

TEST 3

The third instrumented stope was S880 S13-P2, which is a part two primary transverse blind stope exposing ore pillars on the north and south sidewalls and paste fill on the footwall side. The stope had an average width of 7.0 m, length of 14.9 m, and height of 20.0 m.

PRESSURE MONITORING RESULTS

PRESSURE MEASUREMENTS

Table 2 lists a comparison of key parameters measured during all three tests. The peak pressure values were normalized maximum values recorded during the plug filling. In all three tests the filling rate was set at 0.35 m/h for direct comparison.

Table 1. Description of pressure monitoring tests

Description of the Tests	Test 1	Test 2	Test 3
Stope name	S860 S15	S820 N07	S880 S13P2
Stope type	Primary, open	Secondary, blind	Primary, blind
Average stope size	19.5 m L x 6.2 m W x 19.5 m H	13.6 m L x 8.0 m W x 17.0 m H	14.9 m L x 7.0 m W x 20.0 m H
Stope volume, CMS	2,185 m^3	1,862 m^3	1,546 m^3
Pressure instruments	Inside stope-middle	Inside stope-middle	Inside stope-3 m away
	Vertical cell @0.5 m	Vertical cell @0.7 m	Vertical cell @0.45 m
	Horizontal @0.8 m	Horizontal @0.45 m	Horizontal @0.45 m
	Piezometer @0.8 m	Piezometer @0.2 m	Bulkhead
	Bulkhead	Bulkhead	Contact cell @0.45 m
	Contact cell @1.8 m	Contact cell @0.45 m	Piezometer @0.45 m
Bulkhead size	7 m W x 5 m H	7 m W x 5m H	7 m W x 5m H
Bulkhead offset from brow	None	1 m	None
Bulkhead type	Shotcrete	Shotcrete	Shotcrete
Total paste fill pumped	2,500 m^3	2,044 m^3	1,778 m^3
Filling sequence	Single stage	Two stage	Two stage
		Two days plug cure	Seven days plug cure
Fill pausing time	8 hours	15 hours	1.5 hours
Total filling time	58 hours	54 hours	49 hours
Fill completion after	2.8 days	5 days	9 days
Average fill rate	42 m^3/h	37 m^3/h	36 m^3/h
Average fill rise rate	0.35 m/h	0.35 m/h	0.35 m/h
Slump	192 mm	192 mm	195 mm
Cement	7.43%	7.40%	7.05%

Table 2. Summary of pressure monitoring test results.

Measured Parameters	Test 1	Test 2	Test 3
Stope name	S860 S15	S820 N07	S880S13-P2
Stope type	Open	Blind	Blind
Peak bulkhead pressure	98 kPa	50 kPa	72 kPa
Peak vertical pressure	Not measured	90 kPa	90 kPa
Peak horizontal pressure	Not measured	75 kPa	90 kPa
Peak pore water pressure	100 kPa	53 kPa	53 kPa
Peak temp. - bulkhead	24-39°C (+15°C)	22-33°C (+11°C)	25-36°C (+11°C)
Peak temp. - stope	20-37°C (+17 °C)	21-37°C (+16 °C)	25-41°C (+16°C)
End of geostatic loading	10 hours (3.5 m)	6 hours (2.1 m)	4 hours (1.4 m)
Start of arching	20 hours (7.0 m)	12 hours (4.2 m)	18 hours (6.3 m)

Fig. 9. Paste fill pressure results for test 1.

Fig. 10. Paste fill pressure results for test 2.

Fig. 11. Paste fill pressure results for test 3.

Fig. 12. Comparison of pressure results for all three tests.

Normalized bulkhead pressures for all three tests are plotted in Figures 9 to 12. Although the tailings, the slump, the cement content, and the vertical fill rise rates were the same for all three tests the measured bulkhead pressures were significantly different for each test.

From the three tests, the following common pressure development process can be noted:

- Initially measured paste fill pressures are equal and correspond to geostatic overburden load. This is observed during the first 4 h to 10 h corresponding to fill heights of 1.4 m to 3.5 m.
- Later pressures deviate from the geostatic pressures in response to dissipation of pore water pressure and continued cement hydration. This is through development of cohesive shear strength with time due to cement hydration.
- Continued filling pushes solids together creating effective stresses, which generates fill arching.
- Development of full arching starts after 12 h to 20 h corresponding to 4.2 m to 7.0 m fill height.

The bulkhead pressure in test 3 is lower than test 1 but higher than test 2. The marked difference could be due to a number of factors including different stope boundary conditions (primary or secondary), stope size and shape (stope height to width/length ratio), and geometry (bulkhead setback distance) and stope filling sequence.

Based on the test results, the following conclusions can be made:

- The filling regime has a significant effect on the bulkhead pressures.
- Continued single-stage filling generates higher bulkhead pressures.
- Staged filling with plug fill cure times generates lower bulkhead pressures.
- The longer the plug cure time, the lower the bulkhead pressures.
- Stope size has an effect on the bulkhead pressures.
