Pseudokirchneriella subcapitata Summary Sheet

Client: Lorax/Pretium Exploration
Start Date: Nov 2/17
Work Order No.: 171295
Set up by: MG

Sample Information:

Sample ID: Weir at 3.10 spiked with Sb and As.
Sample Date: Oct 30/17
Date Received: Nov 1/17
Sample Volume: 1x20L

Test Organism Information:

Culture Date: Oct 27/17
Age of culture (Day 0): 6d

Zinc Reference Toxicant Results:

Reference Toxicant ID: SC162
Stock Solution ID: 17Zn03
Date Initiated: Oct 25/17

72-h IC50 (95% CL): 28.6 (22.8-34.9) ug/L Zn

72-h IC50 Reference Toxicant Mean and Range: 32.8 (26.5-40.6) ug/L Zn CV (%): 11

Test Results:

ug/L Sb	Algal Growth
IC25 ~~%(v/v)~~ mg (95% CL)	54.3 (42.6-60.7)
IC50 ~~%(v/v)~~ mg (95% CL)	95.2 (85.6-101.5)
ug/L Sb NOEC	14.1
LOEC	23.2

72-h Algal Growth Inhibition Toxicity Test
Water Quality Measurements

Client: Lorax / Pretium Setup by: MG

Sample ID: Weir at 3.10 spiked with Sb and As Test Date/Time: Nov 2/17 @ 1910h

Work Order No.: 171295 CER #: 4

Test Species: *Pseudokirchneriella subcapitata*

Culture Date: Oct 27/17 Age of Culture: 6d Culture Health: Good

Culture Count: 1 560 2 530 Average: 515 Culture Cell Density (c1): 515 x 10^4 cells/mL

v1 = 220,000 cells/ml x 100 ml / (c1) 515 x 10^4 cells/ml = 4.27 mL

Time Zero Counts: 1 20 2 22 Average: 21

No. of Cells/mL: 21 x 10^4 Initial Density: # cells/mL ÷ 220 µL x 10 µL = 9545 cells/mL

Pseudokirchneriella subcapitata Summary Sheet

Client: LorGx / Pretium Exploration
Start Date: Nov 2/17
Work Order No.: 171295
Set up by: MG

Sample Information:

Sample ID: Weir at 3.10 spiked with Sb and As.
Sample Date: Oct 30/17
Date Received: Nov 1/17
Sample Volume: 1x20L

Test Organism Information:

Culture Date: Oct 27/17
Age of culture (Day 0): 6d

Zinc Reference Toxicant Results:

Reference Toxicant ID: SC162
Stock Solution ID: 17Zn03
Date Initiated: Oct 25/17

72-h IC50 (95% CL): 28.6 (22.8 - 34.9) µg/L Zn

72-h IC50 Reference Toxicant Mean and Range: 32.8 (26.5 - 40.6) µg/L Zn CV (%): 11

Test Results:

µg/L As	Algal Growth
IC25 ~~%(v/v)~~ mg (95% CL)	42.7 (33.3 - 48.0)
IC50 ~~%(v/v)~~ mg (95% CL)	74.1 (67.5 - 81.7)
µg/L As. NOEC	11.4
LOEC	18.7

Reviewed by: JOL
Date reviewed: Dec. 8/17

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L2018129-1, -10, -11, -12, -13, -14, -15, -16, -17, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Dissolved	MS-B	L2018129-1, -10, -11, -12, -13, -14, -15, -16, -17, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Dissolved	MS-B	L2018129-1, -10, -11, -12, -13, -14, -15, -16, -17, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Magnesium (Mg)-Total	MS-B	L2018129-1, -10, -11, -12, -13, -14, -15, -16, -17, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Manganese (Mn)-Total	MS-B	L2018129-1, -10, -11, -12, -13, -14, -15, -16, -17, -2, -3, -4, -5, -6, -7, -8, -9
Matrix Spike	Sodium (Na)-Total	MS-B	L2018129-1, -10, -11, -12, -13, -14, -15, -16, -17, -2, -3, -4, -5, -6, -7, -8, -9

Qualifiers for Individual Parameters Listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-VA	Water	Alkalinity Species by Titration	APHA 2320 Alkalinity

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

CL-IC-N-VA	Water	Chloride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

EC-PCT-VA	Water	Conductivity (Automated)	APHA 2510 Auto. Conduc.

This analysis is carried out using procedures adapted from APHA Method 2510 "Conductivity". Conductivity is determined using a conductivity electrode.

EC-SCREEN-VA	Water	Conductivity Screen (Internal Use Only)	APHA 2510

Qualitative analysis of conductivity where required during preparation of other tests - e.g. TDS, metals, etc.

HARDNESS-CALC-VA	Water	Hardness	APHA 2340B

Hardness (also known as Total Hardness) is calculated from the sum of Calcium and Magnesium concentrations, expressed in CaCO3 equivalents. Dissolved Calcium and Magnesium concentrations are preferentially used for the hardness calculation.

MET-D-CCMS-VA	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-VA	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-F-VA	Water	Ammonia in Water by Fluorescence	J. ENVIRON. MONIT., 2005, 7, 37-42, RSC

This analysis is carried out, on sulfuric acid preserved samples, using procedures modified from J. Environ. Monit., 2005, 7, 37 - 42, The Royal Society of Chemistry, "Flow-injection analysis with fluorescence detection for the determination of trace levels of ammonium in seawater", Roslyn J. Waston et al.

NO2-L-IC-N-VA	Water	Nitrite in Water by IC (Low Level)	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-L-IC-N-VA	Water	Nitrate in Water by IC (Low Level)	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-PRES-COL-VA	Water	Total P in Water by Colour	APHA 4500-P Phosphorus

This analysis is carried out using procedures adapted from APHA Method 4500-P "Phosphorus". Total Phosphorus is determined colourimetrically after persulphate digestion of the sample.
Samples with very high dissolved solids (i.e. seawaters, brackish waters) may produce a negative bias by this method. Alternate methods are available for these types of samples.

Reference Information

Arsenic (5+), at elevated levels, is a positive interference on colourimetric phosphate analysis.

SO4-IC-N-VA	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogate - A compound that is similar in behaviour to target analyte(s), but that does not occur naturally in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery.
mg/kg - milligrams per kilogram based on dry weight of sample.
mg/kg wwt - milligrams per kilogram based on wet weight of sample.
mg/kg lwt - milligrams per kilogram based on lipid-adjusted weight of sample.
mg/L - milligrams per litre.
< - Less than.
D.L. - The reported Detection Limit, also known as the Limit of Reporting (LOR).
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Appendix 5-6: Discharge Authorization Amendment Forms

Ministry of Environment and Climate Change Strategy

FINAL Application Form for an Authorization AMENDMENT

for authorization to discharge waste under the *Environmental Management Act*

Permit, Approval, or Operational Certificate

FORM REFERENCE CODE: EPD-EMA-05.2

INSTRUCTIONS:

The amendment application process comprises of multi-steps that requires submission of a preliminary application and fee, followed by meetings with Ministry staff, and submission of a final application. **This form may be used for submission of a Final Application to amend a Permit, Approval or Operational Certificate.**

Before completing this application form, please review the following:

- Waste Discharge Regulation under the *Environmental Management Act* at www.bclaws.ca; and,
- Ministry information and guidance documents that will assist in understanding the registration process and any other documents that may be required at http://www2.gov.bc.ca/gov/content?id=0876E90DA4744A449423D35EB4E09785.

It is preferred that this form is completed using a computer or typewriter. If completing this form by hand, please PRINT clearly.

Mandatory fields are marked with an asterisk (*). Please ensure all required fields are completed or the application form may not be accepted.

Once the Final Application has been submitted, the application will be screened for completeness before proceeding through the Screening Phase.

A Tracking Number has been assigned to your request. Both the Authorization number and the Tracking Number should be referenced on all further documents submitted to support the amendment application request.

Under *Environmental Management Act, a* person is prohibited from introducing waste into the environment without authorization. Submitting an application to discharge is NOT an authorization to discharge.

This application form can be submitted to the Ministry by email (preferred), mail or by courier.

Section 2: Declaration and Signature

Please carefully read the following before placing your signature.

By completing this Application for an authorization, the Applicant understands and agrees with the following terms and conditions:

1. In this section:

   "Applicant" means the applicant as identified in section 2 of this application form;

   "Authorization" means the permit, approval, operational certificate, or amended permit, approval, operational certificate, sought pursuant to this application;

   "Director" means any statutory decision maker under EMA;

   "EMA" means the *Environmental Management Act*, S.B.C. 2003, c. 53, as amended or replaced from time to time;

   "FOIPPA" means the Freedom of Information and Protection of Privacy Act, R.S.B.C. 1996, c. 165, as amended or replaced from time to time;

   "Province" means Her Majesty the Queen in Right of British Columbia;

   "Regulatory Document" means:

   a) this application form,
   b) any document that the Applicant submits or causes to be provided submitted to the Province or the Director in support of this application, and
   c) any document that the Applicant submitted or causes to be submitted to the Director or the Province pursuant to
      i. the Authorization;
      ii. any regulation made under EMA that regulates the facility described above or the discharge of waste from that facility; or
      iii. any order issued under EMA directed against the Applicant that is related to the facility described above or the discharge of waste from that facility.

2. In consideration of the Province receiving this application, subject to paragraph 3, the Applicant hereby irrevocably authorizes the Province to publish on the B.C. government website the entirety of any Regulatory Document.

3. Despite paragraph 2, if the Applicant clearly identifies on the face of a Regulatory Document that the Regulatory Document, or clearly identified portions of it, are confidential and provides in writing with the document a rationale for why the document or portion thereof could not be disclosed under FOIPPA, the Applicant does not consent to the Province publishing the document or any portion of it if, in the opinion of the Director, the document or portion could not be disclosed under FOIPPA, if it were subject to a request under section 5 of FOIPPA.

4. In consideration of the Province receiving this application, the Applicant agrees that it will indemnify and save harmless the Province and the Province's employees and agents from any claim for infringement of copyright or other intellectual property rights that the Province or any of the Province's employees or agents may sustain, incur, suffer or be put to at any time that arise from the publication of a Regulatory Document.

5. The Applicant certifies that the information provided in this registration form is true, complete and accurate, and acknowledges that the submission of insufficient information may result in this registration being returned causing delays in the registration review process.

Ministry of Environment and Climate Change Strategy

Clause Amendment Form

for authorization to discharge waste under the *Environmental Management Act*

AMENDMENT to Permit, Approval, or Operational Certificate

FORM REFERENCE CODE: EPD-EMA-07.2

INSTRUCTIONS:

The amendment application process is comprised of multiple steps that requires submission of a preliminary application and fee, followed by meetings with Ministry staff, and submission of a final application. **This form may be used in conjunction with the submission of a Preliminary Application to amend a Permit, Approval or Operational Certificate.**

Before completing this application form, please review the following:

- Waste Discharge Regulation under the *Environmental Management Act* at www.bclaws.ca; and,
- Ministry information and guidance documents that will assist in understanding the registration process and any other documents that may be required at http://www2.gov.bc.ca/gov/content?id=0876E90DA4744A449423D35EB4E09785.

It is preferred that this form is completed using a computer or typewriter. If completing this form by hand, please PRINT clearly.

Mandatory fields are marked with an asterisk (*). Please ensure all required fields are completed or the application form may not be accepted.

Once the final application has been submitted, the application will be proceed through the Screening Phase to verify administrative and technical completeness.

A Tracking Number will be assigned to your request. Both the Authorization Number and Tracking Number should be referenced on all further documents submitted to support the amendment application request.

Under *Environmental Management Act, a* person is prohibited from introducing waste into the environment without authorization. Submitting an application to discharge is NOT an authorization to discharge.

This application form can be submitted to the Ministry by email (preferred), mail or by courier.

Mail or Email	Courier
Environmental Protection Division Business Services PO Box 9377 Stn Prov Govt Victoria, BC V8W 9M6 **Email:** PermitAdministration.VictoriaEPD@gov.bc.ca	Ministry of Environment & Climate Change Strategy Environmental Protection Division Business Services 3rd Floor, 525 Superior Street Victoria, BC V8V 0C5

Section 1: Application Information

***Authorization Number**	107835	1
***Tracking Number**	418137	2
***Applicant Name**	Pretium Resources Inc.	3
***Facility Name**	Brucejack Mine	4
***Name of person completing this form**	Sylvia Van Zalingen	5
***This person completing this form is:**	☒ The Applicant, as named on the Preliminary Application for Amendment Form, Section 2 ☐ The Agent, as named on the Preliminary Application for Amendment Form, Section 4	6
***Number of clause changes requested**	2	7

A copy of Section 2 must be completed for each clause amendment. I.e. If there are three clauses that changes are being requested to, there should be three versions of Section 2 completed and submitted.

Section 2: Clause change details

***Clause number**	1.5.3	1
***Existing clause language**	The discharge is authorized from Authorized Works, which are Brucejack Lake and three Filterboxx C75 treatment units, or an equivalent unit(s) approved by the director, and related appurtenances including a deep lake outfall.	2
***Proposed changes** Please highlight changes to the clause using bold and/or colour to ensure clarity.	The discharge is authorized from Authorized Works, which are Brucejack Lake and **four** Filterboxx C75 treatment units, or an equivalent unit(s) approved by the director, and related appurtenances including a deep lake outfall.	3
***Rationale**	To provide redundancy by maintaining one unit as entirely redundant - this clause change request is only to change the number of authorized Filterboxx C75 treatment units. No requested change to the authorized rate of discharge (Clause 1.5.1), the characteristics of the treated effluent (Clause 1.5.2), or the location (Clause 1.5.4).	4

Ministry of Environment and Climate Change Strategy

Clause Amendment Form

for authorization to discharge waste under the *Environmental Management Act*

AMENDMENT to Permit, Approval, or Operational Certificate

FORM REFERENCE CODE: EPD-EMA-07.2

INSTRUCTIONS:

The amendment application process is comprised of multiple steps that requires submission of a preliminary application and fee, followed by meetings with Ministry staff, and submission of a final application. **This form may be used in conjunction with the submission of a Preliminary Application to amend a Permit, Approval or Operational Certificate.**

Before completing this application form, please review the following:

- Waste Discharge Regulation under the *Environmental Management Act* at www.bclaws.ca; and,
- Ministry information and guidance documents that will assist in understanding the registration process and any other documents that may be required at http://www2.gov.bc.ca/gov/content?id=0876E90DA4744A449423D35EB4E09785.

It is preferred that this form is completed using a computer or typewriter. If completing this form by hand, please PRINT clearly.

Mandatory fields are marked with an asterisk (*). Please ensure all required fields are completed or the application form may not be accepted.

Once the final application has been submitted, the application will be proceed through the Screening Phase to verify administrative and technical completeness.

A Tracking Number will be assigned to your request. Both the Authorization Number and Tracking Number should be referenced on all further documents submitted to support the amendment application request.

Under *Environmental Management Act, a* person is prohibited from introducing waste into the environment without authorization. Submitting an application to discharge is NOT an authorization to discharge.

This application form can be submitted to the Ministry by email (preferred), mail or by courier.

Mail or Email	Courier
Environmental Protection Division Business Services PO Box 9377 Stn Prov Govt Victoria, BC V8W 9M6 **Email:** PermitAdministration.VictoriaEPD@gov.bc.ca	Ministry of Environment & Climate Change Strategy Environmental Protection Division Business Services 3rd Floor, 525 Superior Street Victoria, BC V8V 0C5

Section 1: Application Information

***Authorization Number**	107835	1
***Tracking Number**	418137	2
***Applicant Name**	Pretium Resources Inc.	3
***Facility Name**	Brucejack Mine	4
***Name of person completing this form**	Sylvia Van Zalingen	5
***This person completing this form is:**	☒ The Applicant, as named on the Preliminary Application for Amendment Form, Section 2 ☐ The Agent, as named on the Preliminary Application for Amendment Form, Section 4	6
***Number of clause changes requested**	2	7

A copy of Section 2 must be completed for each clause amendment. I.e. If there are three clauses that changes are being requested to, there should be three versions of Section 2 completed and submitted.

Section 2: Clause change details

***Clause number**	1.1.1	1
***Existing clause language**	The characteristics of the Brucejack Lake Outlet (BJ3.10) water quality must not exceed the following: Nitrate: 11.5 mg/L as N Total Arsenic: 10 µg/L	2
***Proposed changes** Please highlight changes to the clause using bold and/or colour to ensure clarity.	The characteristics of the Brucejack Lake Outlet (BJ3.10) water quality must not exceed the following: Nitrate: **20** mg/L as N Total Arsenic: **26** µg/L **Dissolved Copper: 0.9 µg/L** **Total Selenium: 6.2 µg/L**	3
***Rationale**	The results of water quality modeling for the 4950 tpd mine plan indicate the potential for nitrate and T-As concentrations at BJ 3.10 to exceed their current discharge limits, and for D-Cu and T-Se levels at BJ 3.10 to be greater than their long-term water quality guidelines for protection of aquatic life. Pretium is requesting an amendment to its effluent discharge permit to reflect the updated water quality model results as well as results of an effects assessment of the modelled concentrations of these four parameters, and the results of a Best Achievable Technology assessment.	4

Ministry of Environment and Climate Change Strategy

Discharge Factor Amendment Form

for an Authorization to discharge waste under the *Environmental Management Act*

AMENDMENT to Permit, Approval, or Operational Certificate

FORM REFERENCE CODE: EPD-EMA-06.2

INSTRUCTIONS:

The amendment application process is comprised of multiple steps that requires submission of a preliminary application and fee, followed by meetings with Ministry staff, and submission of a final application. **This form may be used in conjunction with the submission of a Preliminary Application to amend a Permit, Approval or Operational Certificate.**

Before completing this application form, please review the following:

- Waste Discharge Regulation under the *Environmental Management Act* at www.bclaws.ca; and,
- Ministry information and guidance documents that will assist in understanding the registration process and any other documents that may be required at http://www2.gov.bc.ca/gov/content?id=0876E90DA4744A449423D35EB4E09785.

It is preferred that this form is completed using a computer or typewriter. If completing this form by hand, please PRINT clearly.

Mandatory fields are marked with an asterisk (*). Please ensure all required fields are completed or the application form may not be accepted.

Once the final application has been submitted, the application will be proceed through the Screening Phase to verify administrative and technical completeness.

A Tracking Number will be assigned to your request. Both the Authorization Number and Tracking Number should be referenced on all further documents submitted to support the amendment application request.

Under *Environmental Management Act, a* person is prohibited from introducing waste into the environment without authorization. Submitting an application to discharge is NOT an authorization to discharge.

This application form can be submitted to the Ministry by email (preferred), mail or by courier.

Mail or Email	Courier
Environmental Protection Division Business Services PO Box 9377 Stn Prov Govt Victoria, BC V8W 9M6 **Email:** PermitAdministration.VictoriaEPD@gov.bc.ca	Ministry of Environment & Climate Change Strategy Environmental Protection Division Business Services 3rd Floor, 525 Superior Street Victoria, BC V8V 0C5

Section 1: Application Information

***Authorization Number**	107835	1
***Tracking Number**	418137	2
***Applicant Name**	Pretium Resources Inc.	3
***Facility Name**	Brucejack Mine	4
***Number of discharge points**	1	7

A copy of Section 2 must be completed for each discharge point. I.e. If there are three points of discharge, there should be three copies of Section 2 completed and submitted.

Section 2: Discharge Details

***Discharge Name** e.g. Planer Mill Cyclone #2	Brucejack Lake Outflow (BJ3.10)		1
***This discharge point is**	☒ Existing point of discharge ☐ New point of discharge		2
***Discharge Type**	☐ Air ☒ Effluent ☐ Refuse		3
***EMS ID** (existing) **OR Site ID** (new as referenced on Site Map[1]) e.g. Site A	E298312		4
Additional description (if needed)	Weir at Brucejack Lake (waste rock and tailings storage facility - WRTSF) Outlet - Final discharge point		5
Proposed treatment method and equipment to be used e.g. UV Disinfection, baghouse	N/A		6
Discharge location description e.g. end of pipe, landfill, stack #1, etc	Low-level weir at the WRTSF outlet, discharging to Brucejack Creek.		7
***Discharge location position** i.e. end of pipe coordinates *must be in decimal degree format to 4 decimal places*	Latitude (e.g., 49.8952) N 56.4696	Longitude (e.g., 116.8177) W 130.1878	8
***Source of Data**	☐ GPS ☐ Survey ☐ Google Earth ☒ Other (specify): BC EMS Surface Water Quality Monitoring Sites website		9
If the Legal Land Description for the facility location is different than this discharge location			
Legal Land Description (Lot/Block/Plan) OR PID/PIN/Crown File No.			10

[1] For each point of discharge, there must be a corresponding point displayed on a map using the Site Form (Form EPD-EMA-09).

*Table A: Proposed Flows

INSTRUCTIONS: Complete the maximum rate of discharge, and if applicable, the minimum, and/or average rate. Typically, only a maximum is needed. Include the duration of the discharge (e.g., hours/day) and the frequency of the discharge (e.g., days/week, days/month or days/year). Typically, a discharge may start when the authorization is issued and continues until the authorization is cancelled. If this discharge is to be time limited, this should be discussed at your pre-application meeting. All units are to be in System International (SI) metric units.

	Minimum Discharge Rate	Average Discharge Rate	Maximum Discharge Rate	Units (e.g. m^3/day)	Duration	Duration Units (e.g. hrs/day)	Frequency	Frequency units (days/weeks)
Existing Authorized Limit		50,000		m3/day	24	hrs/day	7	days/week
Change requested		None		None	None	None	None	None

*Table B: Proposed Contaminant Concentrations

INSTRUCTIONS: The contaminant data should be the characteristics of the waste when it enters the environment. Guidance on acceptable discharge quality may be found in applicable Provincial and Federal Regulations, Objectives, Guidelines, Criteria, Policies, Codes of Practice, Best Achievable Control Technology (BACT), Best Management Practices and, in some cases, draft documents.

Enter the contaminant and its maximum concentration and if applicable, the minimum, and/or average concentrations. All units are to be SI metric units. If the contaminant is to be discharged for a period less than the life of the authorization, enter the start and/or end dates. All air discharge rates are to be corrected to 20ºC, 1 atmosphere pressure, and zero water vapour.

Parameter or Contaminant Name	EXISTING Authorized Limit and Units	AMENDMENT REQUESTED Limit and Units

1 INTRODUCTION

Pretium Resources Inc. (Pretivm or the Holder) intends to manage and operate the Brucejack Gold Mine (the Mine). This document sets out Pretivm's plan for consultation with Aboriginal groups during the Operation and Closure phases of the Project.

This Aboriginal Consultation Plan (ACP) has been developed in accordance with the Environmental Assessment Certificate (EAC) #M15-01 (BC EAO 2015) which was granted by the BC Environmental Assessment Office (BC EAO) on March 26, 2015.

Condition No. 5 of the EAC's Schedule B Table of Conditions (BC EAO 2015) requires the development of an ACP which indicates how Pretivm will share information and consult with Aboriginal groups including the Tsetsaut/Skii km Lax Ha (TSKLH), Nisga'a Lisims Government (NLG), and the Tahltan Central Government (TCG)[1]. The EAC Condition No. 5 (BC EAO 2015) states:

> *The Holder must prepare an ACP to identify how the Holder will share information and consult with Aboriginal Groups related to mitigation measures, monitoring, adaptive management and compensation programs.*
>
> *The Holder must consult with NLG, Tahltan and TSKLH on the content and implementation of the ACP.*
>
> *The Holder must submit the updated ACP to EAO no later than 30 days prior to the commencement of Construction.*
>
> *The Holder must implement the ACP prior to commencement of Construction. The ACP applies to Construction, Operation, and Closure Project Phases.*

Consultation outlined in this ACP is complementary to consultation activities outlined in Condition No. 2 of the EAC, which states that "*The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5*" (Appendix A).[2]

As required by the EAC Condition No. 5, Pretivm provided an initial draft of the ACP to the NLG, TCG, and TSKLH on June 8, 2015 and requested input on its content and implementation by June 26, 2015. A response was provided by the TSKLH on June 19, 2015.

TSKLH's comments related to:

---

[1] Tahltan Central Government was formerly referred to as Tahltan Central Council.

[2] Consultation associated with the Component Plans was conducted primarily through a Mine Review Committee. The NLG, TCG, and TSKLH were members of the Mine Review Committee and participated in the review of all Component Plans with Relevant Regulatory Authorities. Through the Committee, Aboriginal group members had the opportunity to review application information and propose accommodation and mitigation, including but not limited to receiving and sharing information, and, where appropriate, contribute to the development of proposed mitigation measures for potential adverse environmental effects. Any additional consultation activities undertaken in the development of the Component Plans will be reported separately and as needed in accordance to the specifications outlined by each Component Plan. Separate and direct engagement is being conducted for Component Plans for which the BC EAO is the Relevant Regulatory Authority.

- level of consultation;
- role in consultation;
- consultation and reporting timelines;
- wording (e.g., “where required, or appropriate”; “in consultation with”; “consideration of input”);
- Aboriginal consultation principles and objectives; and
- information distribution and consultation.

In accordance with the proposed approach for modifications to the ACP, a draft Pre-Operations Phase ACP was provided to NLG, TCG, and TSKLH on August 5, 2016, with a request for comments by September 9, 2016. No comments were received by September 14, 2016. This updated version of the Pre-Operations ACP was provided to NLG, TCG, and TSKLH on March 26, 2021.

This document is organized as follows:

- Chapter 2 provides a brief overview of the Mine.
- Chapter 3 introduces the principles and objectives for consultation with Aboriginal groups.
- Chapter 4 outlines the consultation approaches and main activities that will be implemented during the Operation, and Closure phases of the Mine.
- Chapter 5 describes the process of revision of the ACP, during the life of the Mine.
- Chapter 6 outlines the consultation reporting framework of the ACP.
- Chapter 7 provides the designated representatives from Pretivm, NLG, TCG, and TSKLH with respect to this Plan.

2 BRUCEJACK MINE OVERVIEW

Pretivm is developing an underground gold and silver mine. Over an estimated 18-year mine life, the mine will produce approximately 19 Mt of ore at a rate of approximately 3,800 tonnes per day. The Brucejack property is located at 56°28′20″ N latitude by 130°11′31″ W longitude, approximately 950 km northwest of Vancouver, and 65 km north-northwest of Stewart (Figure 2-1). The Mine is located within the Kitimat-Stikine Regional District. Portions of the Mine lie within the asserted traditional territories of the Tsetsaut /Skii km Lax Ha and Tahltan First Nation, and the Nass Area of Nisga'a Nation as defined in the Nisga'a Final Agreement (NFA; Government of Canada, Government of BC, and Nisga'a Nation 2000; Figures 2-2 to 2-4).[3]

The mine site area is located near Brucejack Lake. The Mine is accessed by a 73.5 km road connecting with Highway 37 about 30 km south of Bell II. The road will be used year-round to mobilize personnel, equipment and supplies to the mine site and to truck concentrate to rail facilities along the Highway 16 corridor. A transmission line will connect the mine site to the provincial power grid near Stewart.

Construction of the Mine will occur over a two-year period, from 2015 into 2017. Operations are planned to commence in 2017 for an expected duration of 18 years of mine life. Closure is expected to occur over a minimum of five years and will include decommissioning, abandonment, reclamation activities, and monitoring.

The Mine is expected to provide positive economic benefits to local communities as a result of direct training and employment opportunities generated by the Mine; the Mine will support an estimated 500 person-years of employment during Construction and at least 4,800 person-years of employment during Operations. Indirect employment opportunities (e.g., goods and services contract providers to the mining industry) will also increase, creating positive spin-off effects in the local, regional, and provincial economies. The Mine will also generate annual revenues (e.g., property tax, licensing fees, royalties, and income tax) for local, provincial, and federal governments.

[3] Tsetsaut / Skii km Lax Ha asserted traditional territory extends from the north side of the Cranberry River to Ningunsaw Pass, along the Nass and Bell-Irving rivers, and overlaps with the location of proposed Project infrastructure (Figure 2-2).
The asserted traditional territory of the Tahltan Nation lies to the north of the Project (Figure 2-3). The territory includes the areas surrounding the Stikine River drainage basin in the Coast and Cassiar mountains. The southern boundary of the territory follows the Unuk River drainage from the BC/Alaska border and a portion of Treaty Creek and the Nass River.
Nisga'a Nation is a treaty nation with a constitutionally recognized government and specific rights and interests set out in the NFA, which came into effect in May 2000. Proposed Project infrastructure is located within the Nass Area as defined in the Nisga'a Final Agreement (NFA; Figure 2-4).

3 ABORIGINAL CONSULTATION PRINCIPLES AND OBJECTIVES

The core principles for Aboriginal consultation are guided by Pretivm's Social Responsibility Policy, which at a high level defines the company's policy standard for its relationship with communities. The Social Responsibility Policy (Pretium Resources Inc. n.d.) includes the recognition of the importance of building and maintaining relationships with Aboriginal groups.

Pretivm will consult with TSKLH, NLG, and the TCG on the content and implementation of the ACP. The approach to communication and consultation is guided by the following principles:

- share information and consult on mitigation measures, monitoring, adaptive management and compensation programs in a mutually agreeable way;
- distribute Mine information regularly and provide regular opportunities for consultation;
- make Mine information readily available, using both hardcopy and digital formats; and provide for a variety of dissemination platforms, including physical mailings and distribution, as well as web and email;
- conduct communication with respect for the style and frequency preferences of particular communities;
- consideration of and, wherever practicable, incorporation of input received by Aboriginal groups into decisions made concerning Mine activities;
- implement the updated consultation approach (as outlined in this ACP) prior to commencement of Operation and Closure phases of the Mine;
- economic participation in all phases of the Mine by First Nations; and
- foster long-term relationships and establish a positive community presence.

Chapters 4, 5, and 6 provide details on the practical application of these principles and on the consultation and communication processes.

4 CONSULTATION APPROACH AND ACTIVITIES

4.1 CONSULTATION MANAGEMENT

Pretivm's Community Relations Group is responsible for managing consultation activities with Aboriginal groups throughout the Construction, Operation, and Closure phases of the Mine. The Corporate Relations Group will report on these consultation activities to the BC EAO or respective provincial authority pursuant to the conditions in Environmental Assessment Certificate #M15-01. Members of the Aboriginal leadership for the TSKLH, NLG, and TCG are the main points of contact; however, consultation activities will include the broader community members.

The Corporate Relations Group will be responsible for the implementation and adherence to the ACP, including: the publication of Mine information; the coordination of information distribution; the planning of consultation activities (including processes and schedules); the collection, receipt of and response to input received by Aboriginal groups; and the tracking and reporting on consultation activities.

Pretivm tracks all correspondence and engagement with Aboriginal groups using an internal database management system. This system is intended to provide for a thorough record of engagement for reporting purposes, enable Pretivm to record, track and resolve issues of community concern, and support a coordinated approach to responding to feedback and information gathered for adaptive management purposes.

Pretivm has established a permanent community liaison role for the life of the Mine. The community liaison is the designated point of first contact for Aboriginal members, and provides information about the Mine, including employment opportunities. The community liaison is responsible for addressing comments, questions and concerns from Aboriginal members. In the event that in-depth consultation is required, the Mine General Manager and/or Vice President, Corporate participate through a process coordinated by the Corporate Relations Group.

The primary contacts for the Corporate Relations Group are included in the document (Chapter 7).

4.2 INFORMATION SHARING AND CONSULTATION

4.2.1 Information Sharing

Pretivm will develop outreach materials to effectively convey information on Operations and Closure activities to Aboriginal groups, including mitigation measures, monitoring, adaptive management, and compensation programs.

Throughout all phases of the Mine, Pretivm will continue to produce and disseminate an annual newsletter which describes Mine activities including but not limited to: construction, development and operations highlights; descriptions of technical processes for a non-technical audience; the effectiveness of environmental mitigation; and highlights of Pretivm's involvement with communities in the area. Contact information will continue to be included for community members to provide comment and feedback on the newsletters. The newsletter will continue to be distributed via email to members of Aboriginal leadership for the TSKLH, NLG, and TCG and community members who sign up for Pretivm's distribution list (maintained by Pretivm's community liaison). The newsletter will also be

made available in hard copy format and distributed in desired quantity to points designated by members of the Aboriginal leadership, as well as at community events and meetings. The newsletter will also be available on the company website, with a link for sign-up.

During the Construction phase, Pretivm provided Mine construction updates on its web site as construction progressed. The Mine update feature on the web site will be maintained after the Construction phase, however Pretivm anticipates fewer updates throughout the Operations and Closure phases when Mine activity is at steady-state.

Pretivm will continue to produce an annual sustainability report which will be distributed via email to the leadership for the TSKLH, NLG, and TCG and to members of the community liaison distribution list. The sustainability reports will be available on Pretivm's web site (http://www.pretivm.com).

A repository of general Mine information about the Mine is and will continue to be maintained on the Mine website (https://pretivm.com/home/default.aspx). Mine and information about Pretivm will include:

- annual reports (e.g., sustainability report and other public reports filed with regulatory agencies);
- technical reports including documents and maps;
- presentations;
- investment information (e.g., presentations, events and factsheets);
- news and announcements; and
- photo gallery.

Pretivm will regularly consult with Aboriginal groups about the communication platforms to assess the effectiveness of content and frequency of communication. The approach will be modified on the basis of feedback received. Additionally, the newsletter will include a request for feedback or input.[4]

Pretivm has and will continue to host Mine site visits for delegations of Aboriginal communities. Scheduled Mine site visits will be programmed in consultation with the leadership of the TSKLH, NLG, and TCG.

In addition, Pretivm will communicate the occurrence of and information on reportable spills with potential for downstream impacts to the First Nations downstream of the Bowser, Bell-Irving, and Nass Rivers (Tsetsaut Skii km Lax Ha, Nisga'a Nation, Gitanyow First Nation, Tahltan Nation) pursuant to the Brucejack Mine Spill Response Plan (SRP, Pretivm 2021 or more recent).

4.2.2 Consultation Framework

Consultation between Pretivm and Aboriginal communities is intended to be flexible to address the individual communication preferences of each community, as well as the respective intensity of their involvement with the Mine. Consultation is expected to incorporate individual and group interactions with formal and regularly occurring face-to-face meetings, written correspondence via letters and email, and verbal dialogue both formal and informal. Pretivm will conduct formal consultation in

[4] At the time of drafting the Operation Phase ACP, Pretivm has not received input regarding the effectiveness of content or frequency of communication through Aboriginal engagement or communication methods.

accordance with any established communication protocols agreed upon (see Chapter 4.4 of this ACP). For NLG the confidential Cooperation and Benefits Agreement provides for communication, collaboration and a consultation process. For other Aboriginal communities Pretivm is committed to continuing development of Communications Protocols and/or Agreements which will include consultation protocols. Pretivm remains open to suggested engagement approaches and to foster continuous dialogue about the Mine.

Consultation and engagement activities with Aboriginal communities throughout the life of the Mine include, but are not limited to:

- responding to appointments or inquires made at Pretivm's Smithers or Vancouver offices whenever they may be requested;
- participation in community events (e.g., career fair or education and training events) to which Pretivm has been invited;
- hosting workshops and information sessions in local communities about the Mine as well as about employment and contracting opportunities. These workshops and information sessions also provide an opportunity to solicit and respond to questions or comments about the Mine;
- in accordance with the Terms of Reference of the Mine Permit Review Committee, consulting on the development of EAC Component Plans (see Chapter 4.3 of this ACP);
- consulting as outlined in agreements developed between Pretivm and Aboriginal communities (see Chapter 4.4 of this ACP);
- consulting and reporting on modifications to this ACP (see Chapter 5 of this ACP);
- reporting on consultation activities (see Chapter 6 of this ACP); and
- other consultation activities including activities suggested by Aboriginal groups.

As part of the Wildlife Management Plan, Pretivm will continue to chair a Wildlife Committee (active since the fall of 2015). NLG, TCG, and TSKLH will continue to be invited to participate on the Wildlife Committee. The Wildlife Committee has developed terms of reference that will include processes for addressing comments raised by committee members.

Pretivm will continue to host annual open houses within the local communities over the course of the life of the Mine. During Operations and Closure, the annual open houses will provide information about the Mine, including employment opportunities, and will continue to facilitate questions and comments from attendees. Notification about these open houses will be provided by email to Aboriginal leadership to the TSKLH, NLG and TCG, to members of the community liaison distribution list, and will be posted in local newspapers at least 30 days in advance of the event.

Pretivm is responsible for the conduct of Mine activities in accordance with the terms of EA Certificate #M15-01 and related conditions and bears sole liability for safe and environmentally sound operation of the Mine. Pretivm will consider and incorporate input from Aboriginal communities in order to satisfy these requirements or, the requirements for mitigation measures, monitoring, adaptive management and compensation programs as part of it adaptive management process. Input from Aboriginal communities will be responded to in accordance with the steps described under the Consultation Management section (Chapter 4.1). Pretivm will respond to input or suggestions regarding the conduct of its activities with a response acknowledging whether and how the input will be incorporated. In the case that changes are not implemented the response will outline the reason (e.g., the suggestion may inhibit Pretivm from meeting regulatory obligations). Pretivm aims to provide a response within 30 days of receiving the

comment or suggestion, however in the case that multiple departments are involved in addressing the response, more time may be required. Table 4.2-1 provides a summary of the communication and consultation activities.

Table 4.2-1. Communication and Consultation Implementation

Method	Implementation	Timing / Frequency
Website	Content provided on Pretivm's website will include employment and contracting opportunities, Mine milestones and updates, and other information or announcements.	Ongoing
Head Office/ Regional Office	Pretivm's Smithers-based Community Relations Manager is responsible for outreach to local communities including TSKLH, NLG, and TCG communities regarding Mine information and employment and training opportunities.	Ongoing
Newsletter	Pretivm will produce an annual newsletter describing Mine highlights. The newsletter will summarize Mine information including employment, procurement, training, Aboriginal group and stakeholder engagement, and contributions to local economic development. It will also provide up-to-date contact information for the company. A PDF of the newsletter will be posted to Pretivm's website, and emailed to community and/or Aboriginal contacts; hard copies available at the regional office and may be provided upon request.	Annual
Open Houses	Pretivm will host open houses to provide Mine updates to local communities. Notification of these open houses/presentations will be provided at least 30 days in advance of the event. When invited and appropriate, Pretivm will participate in community events such as open houses or career fairs.	Annually
Site Visits	Pretivm will host site visits for delegations of Aboriginal communities Scheduled site visits will be programmed in consultation with the leadership of the TSKLH, NLG, and TCG.	As programmed
Response to Aboriginal group or Aboriginal community member	In the case of formal input or feedback (i.e., submitted by email or letter), Pretivm will provide a response outlining the how the company is addressing the input. Pretivm aims to provide a response within 30 days of receiving the comment or suggestion, however in the case that multiple departments are involved in developing the response, more time may be required.	Based on submission of comments and feedback
Meetings. Formal (e.g., face to face meetings) and Informal (Regional Office drop in).	Pretivm will consult with Aboriginal groups about the effectiveness of the communication platforms and will modify its approaches on the basis of this feedback. Additionally, the newsletter will include a request for feedback or input.	Ongoing

4.3 MANAGEMENT PLANS

The Condition No. 5 of the EAC Schedule B – Table of Conditions requires consultation related to mitigation measures, monitoring, adaptive management and compensation programs. Additionally, as indicated in Condition No. 2, Pretivm will consult with the TSKLH, NLG, and Tahltan Nation with respect to Component Plans (Appendix A).

The development of most of the Component Plans was managed by a Mine Review Committee ("Committee").[5] The Committee was established by the Province and chaired by the Ministry of Forests, Lands and Natural Resource Operations (BC FLNRO). TSKLH, NLG, and Tahltan Nation

[5] The Health Services Monitoring Plan Economic (HSMP), Social Effect Mitigation Plan (ESEMP), and this ACP were not reviewed by the Committee, but included consultation with Aboriginal groups on the individual plans.

were members of the Committee. The Committee provided a forum for authorization processes related to the construction, development, operations, reclamation and closure of mines including the *Mines Act* permit (mine infrastructure, reclamation, bonding), *Environmental Management Act* permits (waste management), and others. The Committee facilitated a harmonized review by Aboriginal groups and multiple natural resource agencies. Through the Committee, Aboriginal group members had an opportunity to review application information and propose accommodation and mitigation, including but not limited to receiving and sharing information, and, where appropriate, contribute to the development of proposed mitigation measures for potential adverse environmental effects. The Terms of Reference of the Committee outlined an approach to tracking and responding to comments received by Committee members. Component Plans are listed in Appendix A.

Component Plans are "living documents". If a Component Plan requires updating, the relevant regulatory authority is involved in the review and approval of the Component Plan. For those Component Plans that apply to the Mine Site (under the *Mines Act* Permit) in the case of any revision, Pretivm will abide by the consultation requirements outlined in the Plan and according to the *Mines Act* Permit.

Where annual updating for a Component Plan may be required (i.e., Economic and Social Effect Mitigation Plan (ESEMP), due no later than April 1 each year), Pretivm will provide the draft reports to TSKLH, NLG, and Tahltan Nation for input a minimum of 30 days prior to submission to the appropriate regulatory agency. Input received on the draft reports will be considered in the development of the final reports and a response will be provided outlining how input was addressed.

In accordance with the *Mines Act* (1996) and *Environmental Management Act* (2003), management plans have been developed for the Mine. Appendix A presents the management plans outlined in the EAC, and describes where required, the information sharing, reporting and consultation activities with the TSKLH, NLG, and Tahltan Nation as contained in Pretivm's joint application for *Mines Act* and *Environmental Management Act* permits (Pretium Resources Inc. 2015a).

The Aboriginal Consultation Plan does not cover information sharing committed to as per individual management plans or as required per conditions for other authorizations or permits.

4.4 MINE AGREEMENTS AND ABORIGINAL ECONOMIC PARTICIPATION

Pretivm will enter into Mine agreements with Aboriginal groups to provide economic and other benefits associated with the Mine. Pretivm will work with each Aboriginal group to determine the best approach to providing them with long-term benefits that reflect their particular circumstances.

An example of this is the April 2015 comprehensive and long-term *Cooperation and Benefits Agreement* signed between Pretivm and the Nisga'a Nation in respect of the Mine (Pretium Resources Inc. 2015b). As stated in the press release, "Under the terms of the agreement, the Nisga'a Nation will provide ongoing support for the development and operation of Brucejack as a safe, environmentally sound mine with participation in its economic benefits, and Pretivm will honour commitments to the Nisga'a Nation regarding jobs and contracting opportunities at the Mine, education and training and financial payments." This agreement provides for communication, collaboration and cooperation between Pretivm and the Nisga'a Nation.

Pretivm is in the process of developing agreements with the TSKLH and Tahltan Nation that will provide for communication, collaboration, and cooperation related to the Mine.

5 MODIFICATIONS TO THE ABORIGINAL CONSULTATION PLAN

The Brucejack Gold Mine is anticipated to have an approximately 18 year mine life. Pretivm will consult with the TSKLH, NLG, and the TCG about necessary modifications to the ACP to address the distinct nature of the Mine during Construction, Operation, and Closure phases. The following outlines the proposed minimum schedule for consultation on the ACP that may lead to modifications:

- Pre-Construction Phase: The draft ACP provided to the BC EAO prior to Construction was developed in consultation with Aboriginal groups. As outlined in Chapter 1, Pretivm provided an initial draft of this ACP to the NLG, TCG, and TSKLH on June 8, 2015 and requested input on its content and implementation by June 26, 2015. A response was provided by the TSKLH on June 19, 2015 and Pretivm revised the ACP in consideration of the feedback received. The revised ACP was submitted to the BC EAO on July 13, 2015, and was also provided to the TSKLH, TCG, and NLG at this time. On October 7, 2015, TCG provided comments to Pretivm regarding the July 15 2015 draft ACP, and these comments were incorporated in the October 2015 version.
- Pre-Operation Phase: No later than six (6) months prior to the start of the Operations phase, Pretivm will consult with Aboriginal leadership on suggested modifications to the ACP. Pretivm provided an initial draft of this ACP to the NLG, TCG, and TSKLH on August 5, 2016 and requested input on its content and implementation. No comments were received by September 14, 2016. A digital version of this Operations ACP was submitted to the BC EAO and the Aboriginal groups in September 2016.
- Pre-Closure Phase: Prior to the Closure phase, Pretivm will consult with Aboriginal leadership on suggested modifications to the ACP. The same review process outlined for the Pre-Operation phase will be implemented, unless feedback or comments provided by Aboriginal groups result in modifications to this approach.

Pretivm will provide the BC EAO with a letter indicating what updates, if any, are made to the ACP.

6 REPORTING

Pretivm will provide the following ACP reports to Aboriginal groups and the BC EAO according to the timeline outlined below:

- The Holder will submit the ACP to BC EAO no later than 30 days prior to the commencement of Construction (i.e., October 2015 version of the ACP).
- If modifications are made to the ACP throughout the lifespan of the Mine, a letter will be provided to Aboriginal groups and the BC EAO outlining the ACP modifications made and reason for any changes based on input received from Aboriginal groups (see Chapter 5 for approach to consultation and schedule of ACP review).

As required by Condition No. 2 of the EAC, Pretivm will consult with the NLG, Tahltan Nation, and TSKLH on the content and implementation of Component Plans by way of the Mine Permit Review Committee. As noted in Chapter 4.3 of this ACP, where annual updates for a Component Plan may be required no later than April 1 each year (i.e., Economic and Social Effect Mitigation Plan), Pretivm will provide the draft reports to TSKLH, NLG, and Tahltan Nation for input at least 30 days prior to submission to the BC EAO. Annual reports due January 31 will be submitted to the Aboriginal groups at the same time as they are submitted to the BC EAO for concurrent review. Pretivm will provide a response to input received by Aboriginal groups outlining how that input has been addressed.

7 KEY CONTACTS

Comments or questions on this plan are welcome and may be directed to the following individuals.

Pretium Resources Inc.:

Greg Norton, Vice President, Environment & Regulatory Affairs
Email: gnorton@pretivm.com
Phone: 778 357 0806

GLOSSARY AND ABBREVIATIONS

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

Air Quality Standards	Objectives for maximum concentrations air contaminants in the atmosphere developed to ensure long-term protection of public health and the environment.
Ambient Air Quality	The outdoor air quality at a particular site.
BC	British Columbia
BJAR	Brucejack Access Road
CAAQS	Canadian Ambient Air Quality Standards
CWS	Canada-wide Standards
Dioxins	Polychlorinated dibenzodioxins (PCDDs), or simply dioxins, are a group of polyhalogenated organic compounds that can act as environmental pollutants. They are commonly referred to as dioxins for simplicity in scientific publications because every PCDD molecule contains a dioxin skeletal structure. Members of the PCDD family have been shown to bioaccumulate in humans and wildlife due to their lipophilic properties.
ERM	Environmental Resource Management Group, Inc.
Fugitive Dust	Particulate matter, often sand or mineral dust, released to the atmosphere by mechanical disruption of soil or by wind scouring.
Furans	Polychlorinated dibenzofurans (PCDFs), or simply furans, are a group of halogenated organic compounds which are toxic environmental pollutants. PCDFs tend to co-occur with polychlorinated dibenzodioxins (PCDDs). PCDFs can be formed by pyrolysis or incineration at temperatures below 1,200 °C of chlorine containing products, such as polyvinyl chloride (PVC), polychlorinated biphenyls (PCBs), and other organochlorides, or of non-chlorine containing products in the presence of chlorine donors.
GHG	Greenhouse gas
m	Metre
Mercury	Mercury is a natural and persistent bioaccumulative element which can be transported many kilometers in the atmosphere. Mercury can be deposited to waterbodies from anthropogenic emissions and poses a threat to human and ecosystem health. Mercury also enters the environment through the disposal (e.g., land filling, incineration) of certain products. Products containing mercury include: auto parts, batteries, fluorescent bulbs, medical products, thermometers, and thermostats.
NAAQO	National Ambient Air Quality Objectives

NLG	Nisga'a Lisims Government
NPRI	National Pollutant Release Inventory
Oxides of Nitrogen (NO_x)	NO_x gas primarily consists of nitrogen oxide (NO) and nitrogen dioxide (NO_2). The gases are emitted with exhaust from combustion engines and are by-products of blasting operations. NO_x can be converted to nitric acid in the atmosphere and thus contribute to acid deposition.
PASS	Passive Air Sampling System
PCDD	Polychlorinated dibenzodioxins
PM_{10}	Inhalable particulate matter. PM_{10} particles are airborne particles that have a diameter of 10 µm or less. The majority of PM_{10} particles are from fugitive dust sources. PM_{10} can enter the respiratory system and has been linked to respiratory problems.
$PM_{2.5}$	Respirable particulate matter ($PM_{2.5}$) is a subset of PM_{10} and defined as particles with a diameter less than 2.5 µm. These particles are small enough to enter deep into the respiratory system. Most of particulate matter emitted in diesel engine exhaust is $PM_{2.5}$.
Pretivm	Pretium Resources Inc.
s	Second
SOP	Standard operating procedure
Sulphur Dioxide (SO_2)	Fossil fuel contains a small amount of sulphur-containing organic compounds. During fuel combustion, the sulphur is oxidized and emitted as SO_2 gas with the engine exhaust. In the atmosphere, SO_2 can further oxidize to sulphate, which contributes to acid deposition.
US EPA	United States Environmental Protection Agency The US EPA has promulgated a variety of guidelines, objectives, emission factors, air dispersion modelling procedures and statutes for the protection of ambient air quality.
VOK	Valley of the Kings

1 PURPOSE

The purpose of the Air Quality Management Plan is to discuss the mitigation measures that are implemented to manage and reduce air emissions resulting from the Operations of Brucejack Mine (the Mine) and to outline the continual assessment, monitoring, and reporting of emissions that will take place throughout the mine life.

2 PERFORMANCE OBJECTIVES

The objective of the Air Quality Management Plan is to mitigate for, monitor, and report on air emissions resulting from Mine related activities, and to comply with required conditions in Permit 107025.

3 SCOPE

The Air Quality Management Plan applies to the Brucejack Mine Site, the Brucejack Access Road (BJAR), the Knipple Transfer Area and the Bowser Aerodrome during Mine Operations.

4 RELEVANT LEGISLATION, REGULATIONS, AND AEC CONDITIONS

4.1 AIR QUALITY

The federal government has set National Ambient Air Quality Objectives (NAAQOs) and Canada-wide Standards (CWSs) under the *Canadian Environmental Protection Act, 1999* (1999). CWSs are intended to be achievable targets that will reduce health and environmental risks within a specific timeframe, whereas NAAQOs identify benchmark levels of protection for people and the environment. The new Canadian Ambient Air Quality Standards (CAAQS), adopted in 2013, are in effect since 2020, and supersede the CWSs. There are also several federal regulations relating to specific emission sources, such as incinerators, off-road engines, and open burning. In addition to federal legislation, British Columbia (BC) has also developed air quality objectives for some contaminants. Previously established criteria for NO_2 and SO_2 were developed in the 1970s. New CAAQS for NO_2 and SO_2 were adopted in 2017; however, new provincial criteria are not yet available and interim criteria (2014 and 2016) are still in use. Table 4.1-1 summarizes the federal and provincial ambient air quality criteria.

The applicable standards, objectives, legislation, and regulations relevant to the Mine include:

- NAAQOs (CCME 1999);
- CAAQS (CCME 2020);
- *British Columbia Ambient Air Quality Objectives* (BC MOE 2018);
- *Interim Ambient Air Quality Objectives* (BC MOE 2018);
- *Pollution Control Objectives for the Mining, Smelting, and Related Industries* (BC MOE 1979);
- CWS for dioxins and furans (CCME 2009);
- CWS for mercury emissions (CCME 2010);
- Sulphur in Diesel Fuel Regulation (SOR/2002-254);
- Code of Practice for the Concrete and Concrete Products Industry (BC Reg. 329/2007); and
- Open Burning Smoke Control Regulation (BC Reg. 145/93).

Pretium Resources Inc. (Pretivm) is currently authorized to discharge emissions of air contaminants from underground ventilation, a dust collection system, smelting furnace, assay labs, refuse incinerators, open burning of clean wood waste as well as fugitive dust associated with the Mine as per Permit 107025 issued under the provisions of the *Environmental Management Act* (2003) on January 9, 2014 and most recently amended on July 8, 2021.

Table 4.1-1. Federal and Provincial Ambient Air Quality Criteria

Pollutant	Averaging Period	Concentrations (µg/m^3) and Acid Deposition (eq/ha/year)	
		Air Quality Criteria	
		Canada	BC
NO_2	1-hour	113 (2020) [a] and 79 (2025)	188[c]
	Annual	32 (2020) [b] and 23 (2025)	60[d]
SO_2	1-hour	183 (2020) [e] and 170 (2025)	*
	Annual	13(2020) [f] and 10 (2025)	*
PM_{10}	24-hour	-	50
$PM_{2.5}$	24-hour	27[g]	25[h]
	Annual	8.8[i]	8[j]

Notes:
Dash (-) indicates information not available or applicable. Bold indicates exceedance over criteria.
(2020) and (2025) indicate the criteria will come into effect in 2020 and 2025, respectively.
a The 3-year average of the annual 98th percentile of the daily maximum 1-hour average concentrations.
c Based on annual 98th percentile of daily 1-hour maximum , over one year
b, d, f Average over a single calendar year of all 1-hour average concentrations.
e The 3-year average of the annual 99th percentile of the daily maximum 1-hour average concentrations.
g The 3-year average of the annual 98th percentile of the daily 24-hour average concentrations.
h The 3-year average of the annual average of all 1-hour average concentrations.
i Based on annual 98th percentile of daily average, over one year.
j Annual average over one year.
** Superseded by CAAQS, effective January 1, 2020.*

In addition to established air quality standards and objectives, there are also reporting requirements. Under the authority of the *Canadian Environmental Protection Act, 1999* (1999), owners or operators of facilities that meet published reporting requirements are required to report to Environment Canada's National Pollutant Release Inventory (NPRI; Environment Canada 2014a). Details about NPRI reporting are described in Section 7.1.1.2.

4.2 GREENHOUSE GAS

There is currently no national or provincial legislation in place regarding greenhouse gas (GHG) emission limits at the project level. There are, however, provincial and national reporting requirements regarding the emission of GHGs.

In support of Canada's GHG mitigation targets, since 2010, facilities emitting over 10,000 tonnes CO_2e have been required to report emissions to Environment Canada for the Greenhouse Gas Emissions Reporting Program (Environment Canada 2014b), under the jurisdiction of Section 46 of the *Canadian Environmental Protection Act, 1999* (1999).

In BC, since January 1, 2010, facilities emitting over 10,000 tonnes CO_2e must report to the BC Ministry of Environment, and those emitting over 25,000 tonnes CO_2 must also have their emissions verified by an independent and accredited third party under the BC Reporting Regulation (BC Reg. 272/2009) of the *Greenhouse Gas Reduction (Cap and Trade) Act* (2008).

4.3 RELEVANT EAC CONDITIONS

Pretivm was granted an Environmental Assessment Certificate (#M15-01) on March 26, 2015 that included a series of conditions associated with the Certificate. This management plan fulfills Condition #2, in relation to a Component Plan for air quality management, presented within Schedule B of the Certificate and copied below.

Condition 2

"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.

Component Plans, at minimum, must include the following information:

- *Purpose of Component Plan;*
- *Performance objectives;*
- *Effects mitigation measures;*
- *Monitoring programs;*
- *Monitoring schedules; and*
- *Reporting requirements.*

The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.

The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."

5 ENVIRONMENTAL PROTECTION AND MANAGEMENT

5.1 MITIGATION MEASURES AND BEST MANAGEMENT PRACTICES

Air emissions are/will be generated during the Mine's Operations and Closure phases from the following sources/activities.

- Diesel exhaust from:
  - mining equipment and vehicles operating both underground and on surface; and
  - diesel generators operating as back-up power sources.
- Fugitive dust generated from:
  - surface blasting and earthworks at the Brucejack Mine Site;
  - upgrades to the BJAR during Operations;
  - underground blasting and mining activities;
  - ore handling both underground and at surface; and
  - use of the BJAR, Knipple Transfer Area, Bowser Aerodrome, and Brucejack Mine Site roads (unpaved surfaces).
- Emissions from the smelting furnace and from the assay laboratory located at the Brucejack Mine Site.
- Emissions resulting from incineration of:
  - inorganic and organic wastes in the incinerators located at the Brucejack Mine Site and Knipple Transfer Area; and
  - non-hazardous organic wastes (i.e., clean wood waste, paper packaging) from four open burn pits located at the Brucejack Mine Site, Knipple Transfer Area, Bowser Aerodrome, and Wildfire Camp.

The following sections describe the environmental protection measures that are implemented to effectively manage air emissions.

5.1.1 Mine Equipment and Vehicles

Poorly maintained engines can use up to 50% more fuel than those that are properly maintained (D. Cope Enterprises 2004). Studies have also shown that 1995 model-year and older vehicles produce smog-causing pollutants at a rate up to 19 times greater than a new vehicle (Summerhill 2013). Equipment and vehicles are scheduled for regular maintenance to optimize operating conditions and, at that time, parts showing signs of excessive wear that indicate near-term failure are promptly replaced. Additionally, equipment and vehicles purchased by Pretivm are newer model-years than 1995. Diesel fuel purchased will have a sulphur content of 0.0015% (15 milligrams/kilogram) or less, as regulated by the Sulphur in Diesel Fuel Regulation (SOR/2002-254) for off-road engines and on-road vehicles. Idling of vehicles is to be avoided as much as feasible.

5.1.2 Generators and Incinerators

Generators were used during the Construction phase before the transmission line was completed. Currently generators are only used as a source of backup power.

Through proper operation of the incinerators, in addition to proper waste segregation and following manufacturer maintenance/inspection suggestions, emissions from the incinerators are expected to comply with the CWS for dioxins and furans (CCME 2009) and the CWS for mercury emissions (CCME 2010).

5.1.3 Burn Pits

Open burn pits are managed as per the conditions outlined in Pretivm's existing Permit 107025 for the open burn pit at the Brucejack Mine Site. Additional burn pits located at the Wildfire and Knipple camps, and at the Bowser Aerodrome, are operated periodically throughout the year. Acceptable materials for open burning include only dry, unpainted, untreated demolition and construction wood wastes, broken lumber and pallets, slabs, log ends and branches, brush and miscellaneous, non-recyclable cardboard and paper products. Excluded open burning materials include nuisance-causing combustibles such as painted and treated wood, sawdust, mulch, wood chips, stumps, rubber, plastics, tars, insulation, etc.

All reasonable alternatives for reducing, reusing, or recycling wood are pursued to minimize the amount of material open burned. The burn piles have been constructed in a manner to minimize smoke emissions and open burning is conducted in accordance with the Open Burning Smoke Control Regulation (BC Reg. 145/93). The closest ventilation index publicly available is from Stewart, approximately 65 kilometres south of the Brucejack Mine Site. Open burning will not be initiated unless the ventilation index is forecast as "good" for the day the open burning is to be started, and "good" or "fair" on the second day the debris is anticipated to release smoke. If the ventilation index is not available, a small test burn (maximum 60 minutes duration) constructed of a material like what will be burned may be completed. A full-scale burn will follow if the test burn shows the weather conditions are adequate to provide good smoke dispersion.

Ash from burn pits and incinerators are to be sent offsite to an approved landfill facility or buried and covered at designated locations. At the end of mine life, burn pits will be buried.

5.1.4 Fugitive Dust from Ore Processing and Concrete Batch Plant

Crushing is the first step in ore processing. Crushing of low- and high-moisture ore produces significantly different amounts of particulate matter. Primary crushing of ore at the Mine will take place underground, thereby minimizing dust emissions to the environment. Moreover, the ore is wet, resulting in minimal dust generation during primary crushing.

The crushed ore is transported to the mill through the conveyor decline where the ore is further handled. A high differential air velocity between the conveyor and air flowing through the decline will lead to the suspension of dust. The differential air velocity was considered in the design to minimize fugitive dust. When the drift velocity and the conveyed material are moving in opposition, a reduced drift velocity is required. Given the planned conveyor speed of 1.0 m/second (s) and the designed maximum air velocity of 5.5 m/s, the drift velocity in the conveyor decline should be less than 4.5 m/s.

Dust generated from ore handling, plus dust generated from the cement hoppers in the concrete batch plant, is managed by dust collectors at transfer points, surge bins, and hoppers. Fabric filters generally collect particles with sizes ranging from submicron to several hundred microns in diameter at efficiencies more than 99% (US EPA 2002). The dust collectors are operated and maintained per manufacturer recommendations.

5.1.5 Fugitive Dust from Unpaved Surfaces

Fugitive dust generated from use of the unpaved BJAR and other site roads, as well as unpaved surfaces at the Knipple Transfer Area and Bowser Aerodrome, are managed through the application of water. Watering increases the moisture content and conglomerates particles, effectively reducing the likelihood of them becoming re-suspended. Additionally, a dust suppression agent (e.g., Ca/Mg brine mixture) may be applied to roadways and some unpaved surface areas annually, or as needed, to help reduce dust generation. Roadways are also properly graded, compacted, and maintained to reduce silt content, and topped with gravel during upgrades.

5.1.6 Smelting Furnace and Assay Laboratory

In the gold refining process, gold-silver concentrate recovered by gravity concentration is smelted at the Brucejack Mine Site into gold and silver doré. During the smelting process, sulphur from the gravity concentration may be released to the air, producing SO_2. Exhaust from the assay laboratory may contain acidic moisture and particulate matter resulting from sample preparation. Scrubbers are equipped to these exhaust points to mitigate SO_2 emissions. The scrubbers use lime solutions or other alkane solutions such as NaOH or Na_2CO_3. The scrubbers are operated and maintained per manufacturer recommendations.

5.2 STANDARD OPERATING PROCEDURE, POLICIES, ETC.

The following Standard Operating Procedure (SOP) has been developed to support this plan:

- Dustfall Setup SOP (Appendix A);
- Dustfall Swap SOP (Appendix B); and
- Passive Air Sampling System (PASS) SOP (Appendix C).

Additional SOPs and/or policies will be added to this plan on an as-needed basis.

6 ENVIRONMENTAL MONITORING

The air quality monitoring program consists of the following components:

- meteorological monitoring;
- dustfall monitoring of particulates, anions, cations and metals; and
- passive air quality monitoring of NO_2 and SO_2.

6.1 PERFORMANCE MONITORING

Monitoring is a mechanism to gauge the effectiveness of site wide mitigation measures.

6.1.1 Meteorology

There are currently three meteorology stations operating as part of the Mine, which will continue to be monitored during the life of mine. These stations include the Bowser Station used to advise on flying conditions, Scott Pass Station used to advise on conditions along the BJAR, and the Valley of the Kings (VOK) Station used to provide meteorological conditions at the Brucejack Mine Site. The current locations of the meteorological stations are shown in Figure 6.1-1.

Each of the stations consists of a standard 10-m meteorological tower with instrumentations to measure the following parameters:

- wind speed and wind direction;
- air temperature;
- barometric pressure;
- relative humidity;
- snow depth;
- net radiation;
- solar radiation; and
- precipitation (as rainfall and total precipitation).

The meteorological monitoring program was initially designed to monitor meteorological conditions in the area to support mine infrastructure design and management and is not considered a necessary component of the air quality monitoring program; however, data obtained from the meteorological monitoring stations such as wind speeds and directions are informative when considering results of the dustfall and PASS monitoring described below.

Figure 6.1-1. Meteorological Monitoring Stations

6.1.2 Air Quality

Site-specific air quality monitoring consists of dustfall monitoring of particulates; anions; cations; total metals, and a Passive Air Sampling System (PASS) for NO_2 and SO_2..

6.1.2.1 Dustfall

Dustfall monitoring is completed in accordance with sampling method ASTM D1739-98 (ASTM 2010). Each station monitors consecutive 30-day periods during the summer and early fall (essentially months when it is not below freezing). The dustfall monitoring stations collect particulates small enough to pass through a 1-millimetre screen and large enough to settle by virtue of their own weight. This requires containers of a standard size and shape, which are partially filled with deionised water and algaecide to prevent the growth of algae in the canisters. Each station consists of two canisters each surrounded by a wind screen and mounted on a 2-metre pole. Windscreens are erected around the sample containers to improve the dustfall collection efficiency, and bird spikes are used to minimize contaminants from bird faeces. One of the canisters is analyzed for particulates (total, soluble, and insoluble) and anions (sulphate, nitrate, chloride, and ammonia) and the other for total metals and various cations.

Monitoring is conducted at two dustfall monitoring stations at the Brucejack Mine Site: one downwind of the Crusher Air Raise (DF7) and one located between the VOK Raise 1 and the VOK Raise 4 (DF8). An existing background station (DF5) continues to monitor to provide background conditions (Figure 6.1-2). However, this station may be relocated farther from the access road if results indicate influence from road traffic.

6.1.2.2 Passive Air Sampling System (PASS)

Emissions of NO_2 and SO_2 resulting from fuel combustion monitored during Operations with a PASS. The PASS monitors gas or vapour pollutants through the process of diffusion through a static air layer or permeation through a membrane. The sample media is installed in the field and exposed in protective shelters that are mounted to a support pole for a period of 30 days. Following the exposure period, the sample media is to be retrieved, replaced, and sent to the laboratory for analysis along with meteorological data including air temperature, wind speed, and relative humidity, to allow the ambient concentration of the compound over the sampling period to be determined.

One PASS is located at the Brucejack Mine Site between the VOK Raise 1 and the VOK Raise 4 (PASS3). An existing background station (PASS2) monitors background conditions. However, this station may be relocated farther from the access road if results indicate influence from road traffic. The PASS monitoring stations will be collected with the dustfall monitoring stations and are shown in Figure 6.1-2.

Sampling frequency will provide a 1-month average ground-level concentration for each contaminant.

6.2 WORK PLANNING AND SCHEDULE

During the Operations phase, meteorological monitoring is continuous, and dustfall and PASS monitoring is conducted monthly. Dustfall monitoring takes place only during the summer months of July through September, as the dustfall canisters may freeze during the winter and snow accumulation in the canister prevents accurate dustfall monitoring. Summer months will capture the period during which the highest emissions would be expected to occur.

Figure 6.1-2. Dustfall and PASS Monitoring Stations

7 REPORTING AND RECORDING

7.1 REPORTING

7.1.1 Compliance Reporting

7.1.1.1 ***Environmental Management Act*** **Permit Reporting**

Results from PASS monitoring, and non-compliances will be reported to the BC Ministry of Environment and Climate Change Strategy (ENV) at a frequency and in a format defined by the following conditions in permit PA 107025: *5.8 Non-Compliance Reporting* and *5.9 Annual Reporting*.

7.1.1.2 National Pollutant Release Inventory Reporting

If the amounts of any pollutant released are above the reporting threshold, reporting to the NPRI is undertaken. Emissions are estimated annually based on fuel usage and equipment activity levels. Results are compared to the NPRI reporting threshold.

7.1.1.3 Greenhouse Gas Emission Reporting

Greenhouse gas emissions are calculated annually based on fuel usage. Annual emissions are compared to the federal reporting requirements (10,000 tonnes) and provincial reporting requirements (10,000 tonnes). If the facility-level GHG emissions surpass the federal and provincial reporting requirements, GHG emissions are assessed and reported to the federal and provincial reporting systems and verified (if over 25,000 tonnes) by an independent third party for the provincial reporting.

The provincial and national reporting regulations specified Greenhouse Gas Emissions Reporting Program (Environment Canada 2014b) and *Greenhouse Gas Reduction (Cap and Trade) Act* (2008) only pertain to facility-level emissions, and do not include indirect emissions.

7.1.2 External / Internal Reporting

A copy of the report of the results from dustfall and PASS monitoring (7.1.1.1 above) is submitted to the Nisga'a Lisims Government (NLG).

7.2 RECORD KEEPING / TRACKING

7.2.1 Fuel Usage and Activity Levels

In order to determine if reporting of GHGs and other contaminant emissions is required, fuel usage from power, mobile, and stationary equipment is tracked. Equipment and vehicle activities such as distance travelled and grading are tracked to a feasible extent.

7.2.2 Monitoring Results

Pretivm assumes the responsibility of data management and record keeping of monitoring results. Data are entered into suitable electronic databases and have quality control checks completed upon

receipt of results. Data are entered in a format and program that allows for comparison between years, and stored in a single file format for each type of survey or monitoring activity. Monitoring data is stored for the life of the mine, and is made available for review upon request.

7.2.3 Continuous Improvement, Follow-up, and Adaptive Management

If monitoring data are out of compliance with permit conditions or are showing an increasing trend in contaminant concentrations, adaptive management options are assessed. The need for any corrective actions to reduce on-site emissions or install additional control measures will is determined on a case-by-case basis.

Monitoring data are also used to provide feedback to modify the dust management measures implemented at the site, if required. This plan is designed to be adaptive, effective, and achievable in both the short and long term. Components of the Air Quality Management Plan may need to be revised over the life of the Mine, based on regulatory changes and/or technological advances. Any modifications made to the overall Plan is communicated to regulatory authorities where applicable.

7.2.4 Incident Response Records

Incident response records is stored for a minimum of five years and made available for review upon request.

7.2.5 Permit Database and Amendments

The following permits related to air quality are currently held for the Mine:

- *Environmental Management Act* (2003) - Air Discharge Permit 107025.

Additional permit and permit amendments will be added on an as-needed basis.

Appendix A

Standard Operating Procedure: Dustfall Setup Instructions

APPENDIX A. STANDARD OPERATING PROCEDURE: DUSTFALL COLLECTION SITE SET UP

Equipment Required: Hand auger, shovel, screw driver and/or drill, zip ties, screws, felt marker

***Material Required*:** 5-foot pole (x2), wind shield, bird spikes, dustfall container, long bolts, washers, nuts.

The dustfall collection site should be placed in an open area, free of structures higher than 1 m within a 20-m radius of the container. It should be placed away from objects that could affect the settling of particulate matter such as nearby trees and local sources of pollution. Site accessibility should also be taken into consideration in the selection of a site.

The dustfall container is housed inside the wind shield which is mounted on the dustfall pole (Plate 1). The orifice of the dustfall bottle should not be lower than 6 feet from the ground. Dustfall sites typically consist of two dustfall collectors approximately 15 feet apart (Plate 2).

Plate 1. Dustfall container inside wind shield housing.

Plate 2. Typical dustfall collection site.

Installing and setting up a Dustfall collector site is a straight forward process that should take approximately 20 minutes to complete. The following are instructions on how-to set up the dustfall site once an appropriate location has been selected:

1. Assemble the pipe stand by coupling the two lengths of 5-foot pipe together with long bolts and nuts.
2. Connect the metal flange and treated wood block to the top of the stand with screws.

3. Attach the wind shield (Figure 1) to the dustfall stand by screwing the base of the shield to the wooden block at the top of the pole. There should be four holes predrilled in the base of the plastic shield where the screws can be placed.

Figure 1. Wind Shield for Dustfall Container

4. Use zip ties to install the bird spikes at the top of the wind shield. Typically two sets are bird spikes are required to cover the circumference of the wind shield. Three evenly spaced zip ties should be used for each set of bird spike to ensure it does not slip down.
5. Use the hand auger to remove a column of soil at least 1.5 feet to 2 feet deep. If the ground is too hard, large rocks can be used to assist in propping up the dustfall pole. Do not use snow to hold the pole in place as it is prone to shifting and melting.

   (NOTE): Rather than using the hand auger, it may be easier to pound in the lower portion of the stand by placing a piece of scrap wood (2x4) on lower portion (to protect the threads) and using a medium sized sledge hammer to pound the lower portion in AND THEN attach the rest of the pole.

6. Place the bottom of the dustfall pole into the hole and ensure that it is able to stand freely. The stand should be stable enough to withstand strong gusts of wind.
7. By writing on a piece of flagging with sharpie or on the dustfall screen with a white marker, write **Total Metals (TM**) on one dustfall stand and **Total Particulate (TP)** on the other stand.
8. Retrieve the dustfall containers and use the felt marker to label the following information:
   a. Site Name (i.e., DF-1).
   b. Write Total Metals (TM) on one canister and Total Particulate (TP) on the other canister.

c. Project Name.

d. Date and Time Installed.

9. Remove the protective plastic wrap around the top of the collection containers.
10. Gently unscrew the white plastic lids on the collection containers.
11. Place the open dustfall container labeled Total Metals (TM) in the dustfall stand labeled Total Metals (TM) by placing it in the white PVC pipe that resides in the wind shield while ensuring not to touch the inside of the collection vessel (Figure 2).

Figure 2. Plan view of wind shield.

12. Place the open dustfall container labeled Total Particulate (TP) in the dustfall stand labeled Total Particulate (TP) by placing it in the white PVC pipe that resides in the wind shield while ensuring not to touch the inside of the collection vessel (Figure 2).
13. Place all the lids in a ziplock bag to ensure the lids will not be contaminated. These lids will not be used again till the final demobilization in the fall, and they should be kept in a location where they will be found again.
14. Take photos of the apparatus, ensuring that in the photos it can be discerned which stand is **Total Particulate (TP)** and **Total Metals (TM)**.

Appendix B

Standard Operating Procedure: Dustfall Swap Instructions

APPENDIX B. STANDARD OPERATING PROCEDURES: DUSTFALL SWAP INSTRUCTIONS

1. There will be two dustfall stands at each dustfall station. One will be labeled by white marker or with sharpie on flagging, **Total Particulate (TP)** and the other will be labeled **Total Metals (TM)**.
2. The dustfall sample bottles are to be swapped at 30 day intervals, ± 1 or 2 days is fine.
3. On the new dustfall containers, use the felt marker to label the following information:
   a. Site Name (i.e., DF-1) on both canisters.
   b. Write **Total Metals (TM)** on one canister and **Total Particulate (TP)** on the other canister corresponding to the labels on the stand from which each canister was retrieved.
   c. Project Name on both canisters.
   d. Date and Time Installed on both canisters.
4. Remove the lid from the fresh bottle and put it on the bottle being recovered. **Write the date and time on the bottle being recovered**.
5. If the sample has been overfilled with rain or snow it should be noted during collection and sample may be voided. Bugs are fine to send to the lab. Make note if there is bird feces in the sample (**this would void the sample and it should not be sent to the lab**). Make a note of anything else which may impact the results, including if the sample was found on the ground, if there was anything else within the container or if there was anything surrounding the container which may have influence the results e.g. construction activities nearby. If there is anything else in the canister other than bugs (birds have been found) it will more than likely void the sample.
6. Put the canister labeled **Total Metals (TM)** in the stand labeled **Total Metals (TM)**. Put the other canister labeled **Total Particulate (TP)** in the stand labeled **Total Particulate (TP)**.
7. Take photos, ensuring that in the photos it can be discerned which stand is **Total Particulate (TP)** and **Total Metals (TM)**.
8. Fill out the Chain of Custody form. Examples have been provided. If anything noteworthy occurred then put this in the chain of custody form clearly marking which container was affected. Examples of noteworthy items are, if the stand was damaged by wildlife, if the sample canister was found on the ground, whether the sample canister had bird feces or had anything else that may have contaminated the sample. If one of the two samples at a site is void, clearly state that the sample which is being sent to the laboratory should be analyzed for <u>both</u> **Total Particulate (TP)** and **Total Metals (TM)**.
9. Bring the bottles back to camp and ship the two coolers to ALS Environmental in Burnaby. You can fit 8 bottles per cooler, maybe split the 10 bottles up between two coolers and add some stuffing in the coolers to ensure the bottles don't tip over during shipping.

10. Ship to:

ALS Environmental
8081 Lougheed Highway
Burnaby, BC
V5A 1W9
Attn: Amber Springer
Phone: (604) 253-4188

Appendix C

Standard Operating Procedure: Pass Installation and Swaps

APPENDIX C. STANDARD OPERATING PROCEDURE: PASS INSTALLATION AND SWAPS

Equipment and Materials Required: PASS rain shelter (Plate 1), hose clamps, mounting pole, passive filter medium.

Plate 1. SO_2, NO_2, and O_3 sample filters attached to the rain shelter.

Site Selection Requirements: The PASS collection site should not be located near pollution sources that can cause inappropriately high measurement. Monitoring sites should not be close to roadways. There should be a distance of more than 10 m between the site and a roadway. The site should be selected to represent a typical air pollution concentration. The site should be flat, and located away from nearby obstructions such as buildings or trees. The site should be more than 20 m from the nearest tree canopy defined by the drip line. Be aware that the last requirement may be very difficult to meet in many sampling locations.

Installation: It is recommended to at least duplicate samplers for each monitoring location. To validate results, travel blanks must be included. The requirements for Alberta Environment are as follows:

- Rain shelter should be 1 – 3 m above ground;
- Election angle should be less than 30° from the rain shelter to the top of any obstacle (Figure 1); and
- The distance from the obstacle to the rain shelter should be greater than 10 times the obstacle height.

Figure 1. PASS Rain Shelter Installation Recommendations (as per Alberta Environment)

The rain shelter should be installed to prevent interference from animals/humans or the surroundings. More than 1 shelter in one location can be installed together. The exposure start and end times should be recorded on a field sampling sheet.

Typically the PASS shelter is mounted on the dustfall pole (Plates 2 and 3).

Plate 2. Pass Filters in Rain shelter attached to wood dustfall stand.

Plate 3. Pass filters in rain shelter attached to metal dustfall stand.

One side of the PASS shelter has a slot to insert a hose clamp or strapping to attaché the shelter to a metal pole or a wooden one.

A set of travel blanks must be taken when the samples are recovered and sent to the laboratory for analysis.

Instructions for Swapping PASS sample filters:

1. Take a set of filters labeled blanks and a new set of filters to be deployed.
2. On the filters to be deployed, write the station ID and installation date on the plastic on the back of the filter (not on the removable plastic cap or on the filter paper).
3. Remove the current set of filters from the rain shelter and write down the removal date, then replace with the new round of filters. Be sure to remove the white plastic cap on the new filter.
4. Put the old filter in the container that the new filter came in.
5. Take photos.
6. Fill out the CoC form and ship to:

VERSION CONTROL

Version #	Date Released	Approved By	Amendment/Details
1	May 2015	M. Holtby, S. van Zalingen	Chapter 5, submitted as part of the Brucejack MAEMA Application
2	December 15, 2018	Pretium Resources Inc.	Revised from proposed infrastructure to current ancillary facilities

ACKNOWLEDGEMENTS

The Ancillary Infrastructure Decommissioning and Reclamation Plan was originally prepared by ERM for Pretium Resources Inc. and formed part of the **Ancillary Infrastructure Decommissioning and Reclamation Plan, Reclamation and Closure Plan, and Soils Management Plan**, the content of which was comprised of parts of Chapter 5: Reclamation Planning and Effective Mine Closure of the joint *Mines Act* and *Environmental Management Act* permit application submitted in May 2015.

This version of the Ancillary Infrastructure Decommissioning and Reclamation Plan is updated by Pretivm to reflect the progression from proposed facilities to constructed facilities and to separate those facilities where reclamation obligations are under *Mines Act* Permit M-243 from facilities where reclamation obligations fall under other licensing, permits and Acts.

1 PURPOSE, SCOPE, AND PERFORMANCE OBJECTIVES

The purpose of the Ancillary Infrastructure Decommissioning and Reclamation Plan for the Brucejack Gold Mine is to provide a reclamation and closure plan for all ancillary mine infrastructure built in support of the Brucejack Gold Mine but not included under auspices of the *Mines Act* Permit M-243. The Plan specifically takes into account the conditions of the Licenses of Occupation Management Plans, MFLNRORD Engineering Manual road deactivation techniques and general reclamation performance objectives of Environmental Assessment Certificate M#15-01. The plan is applicable during the Operations and Closure phases of the mine.

The scope of this reclamation plan includes the Special Use Permit area (access road) and Licenses of Occupation areas: Knipple Transfer Area, Bowser Aerodrome and beacons, Bowser Camp, Wildfire Camp, southern 36 km of the Brucejack Transmission Line, explosive storage areas, communications towers, avalanche control systems, and meteorological stations.

2 RELEVANT LEGISLATION, REGULATIONS, AND EAC CONDITIONS

2.1 RELEVANT LEGISLATION AND REGULATIONS

The access road Special Use Permit is subject to the regulations and standards of the *Forest Act, Forest Practices Code of British Columbia Act, Forest and Range Practices Act, Mining Right of Way Act, Nisga'a Final Agreement* and the *Wildfire Act*. Licenses of Occupation are subject to each specific license and management plan, the *Land Act* and the *Heritage Conservation Act*. The ancillary facilities reclamation and closure are subject to conditions of the *Environmental Assessment Act* Environmental Assessment Certificate # M15-01 and acts and regulations pertaining to silviculture practices.

2.2 RELEVANT EAC CONDITIONS

Pretivm was granted an Environmental Assessment Certificate (#M15-01) on March 26, 2015, that included a series of conditions associated with the Certificate. This management plan is in support of Condition #2, in relation to a Component Plan for Ancillary Infrastructure Decommissioning and Reclamation, presented within Schedule B of the Certificate and copied below.

> *Condition 2*
>
> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*
> - *Effects mitigation measures;*
> - *Monitoring programs;*
> - *Monitoring schedules; and*
> - *Reporting requirements.*
>
> *The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.*
>
> *The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."*

2.3 RELEVANT PERMIT CONDITIONS

The Licenses of Occupation and associated Management Plans require that each site be returned in a safe, clean and sanitary condition, and that any improvements the tenure holder wishes to remove or the Ministry of Forests, Lands, Natural Resource Operations and Rural Development require to be removed within 90 days of termination of the license. The surface of the site is to be returned to the condition that the land was in at the time of license issuance unless an improvement is to remain.

The road under Special Use Permit S25923 is to be deactivated to the satisfaction of the Ministry of Forests, Lands, Natural Resource Operations and Rural Development District Manager. Future use by others will preclude the need for permanent deactivation.

3 ANCILLARY FACILITES & ENVIRONMENTAL PROTECTION

3.1 INTRODUCTION

The Ancillary Infrastructure Decommissioning and Reclamation Plan follows the structure outlined by the FLNRORD Licenses of Occupation Management Plans and Engineering Manual for road deactivation. Major topics include end land use and capability objectives, reclamation approaches, and a conceptual final reclamation plan. The content while building on the conceptual plan provided in the Application for an Environmental Assessment Certificate/Environmental Impact Statement (Application/EIS; ERM Rescan 2014) is modified for conditions and structures built on the LOOs.

Reclamation and closure planning of the mine has been integrated with overall mine planning and design. The mine and its support facilities have been planned and designed to minimize the terrestrial development footprint and to prevent significant adverse effects on the environment.

The duration of the mine itself Closure phase is estimated at three years. A monitoring period of five years has been planned for the beginning of the Post-closure phase. Ancillary Infrastructure will be decommissioned at a rate commensurate with manpower and equipment requirements at the mine site and the need for transmission line power and for road access to the mine site. Individual facilities will be reclaimed as their need or extent becomes unnecessary.

The Ancillary Infrastructure Decommissioning and Reclamation Plan addresses infrastructure components authorized under Licences of Occupation (LOOs) and the Special Use Permit (SUP), as follows:

- Brucejack access road (Special Use Permit);
- Licenses of Occupation (LOO):
    1. Bowser Aerodrome with beacons;
    2. Bowser Camp;
    3. Knipple Transfer Area;
    4. Wildfire Camp;
    5. Explosives Staging areas;
    6. Communications towers;
    7. Avalanche control systems;
    8. Meteorological stations; and
    9. Southern 38 km of the Brucejack Transmission Line, extending north from the tie-in with the Long Lake Hydro substation.

Surface disturbance areas are generally quite small compared to the entire area of the Licenses of Occupation and Special Use Permit, particularly for non-camp licenses. Table 3.1-1 lists the licensed

areas and disturbance areas (i.e., areas involving surficial soil/overburden disturbance) and in the case of the transmission line primarily the area of tree cutting. See Figure 1 for locations. The total disturbance areas for ancillary infrastructure is approximately 313.3 ha, one-half that being solely tree clearing for the transmission line.

Table 3.1-1. Ancillary Facilities Licensed Areas and Disturbed Areas

Ancillary Component	License Area (ha) [1]	Disturbed Area (ha) [1]
Avalanche Control Sites (3)	18.16	0.30
Explosive Storage Sites (2)	14.86	2.10
Bowser Camp	18.23	10.78
Bowser Aerodrome and beacons	106.68	27.25
Communication Towers	3.28	0.09
Knipple Transfer Area	27.77	7.79
Wildfire Camp and Laydown	4.06	0.61
SUP Access Road (km 0-59)	1,168.44	104.83
Weather Station	0.25	0.02
Transmission Line – southern 38 km	2941.182	159.55
TOTAL	**4,299.382**	**313.32**

[1] *LOO disturbances are exclusive of overlapping Special Use Permit areas.*

3.2 FACILITIES

3.2.1 Access Road

Road access to the Mine Site is via the 73-km Brucejack Access Road from km 215 on Highway 37 (Figure 2). The road comprises a 58-km all-weather gravel surfaced segment extending from Highway 37 to the Knipple Glacier; a 12 km segment across the glacier; and a 3-km all-weather gravel surfaced segment (Lakeshore Drive) from the upper exit off Knipple Glacier to the Mine Site. The Lakeshore Drive segment is included in the Mine Site Area and is not subject to this management plan.

The access road includes a 2.5 km side road to Bowser Lake, 23 bridges, 5 toad tunnels, 1 modified bridge for toad access, about 310 culverts and the intersection with Highway 37. Included within the road permit SUP are gravel pits and rock quarries where materials are sources for road construction/ maintenance.

3.2.2 Wildfire Camp

Wildfire Camp is located at km 1 on the access road. Included in the infrastructure of Wildfire Camp is the gate and gatehouse at the intersection with Highway 37, a security building and gate on the east side of the camp, bunkhouses, kitchen facilities, septic field, potable water well with a pipeline and treatment facilities, storage facilities, parking and laydown areas (Figure 3). The camp occupies approximately 0.6 ha with all other disturbance within the road SUP.

3.2.3 *Scott Pass Weather Station*

Scott Pass weather station is located at km 18 on the access road, Plate 3.2-1. It is located in a small clearing on the north side of the road and comprises a 10-m tower with instruments and a battery with solar panels for a power source, and a 3-m tower with a precipitation gauge.

Plate 3.2-1. Scott Pass weather station.

3.2.4 *Bowser Explosives Storage Area*

Located at km 48, this explosives storage area is one of two LOO licensed for the purposes of temporary storage of bulk explosives should immediate delivery to the mine not be feasible due to weather or other causes. Also, magazines for storage of explosives for avalanche control or quarry purposes are kept at this location. The site comprises a fenced and gated clearing in the forest with an access road and berms between the magazine storage areas (Figure 4).

3.2.5 *Bowser Camp and Aerodrome*

Bowser Camp is located at 51 km on the access road. The site has undergone several iterations from an early exploration camp to a construction and road maintenance station with extensive laydown areas for construction materials. The old camps (original Bowser Camp and the temporary construction camp) have been abandoned due the discovery of a potential landslide hazard on a mountain side along a tributary creek south of Bowser River. At the time of this management plan revision the older camps are partially dismantled and are actively undergoing reclamation.

To avoid the landslide hazard a new camp, Bowser West, was established on the north side of the access road in the northwestern corner of Bowser LOO. Bowser West Camp is used by regional exploration crews not connected with mine operations. The camp has bunkhouses, a kitchen, a water well with a pipeline and treatment facility, offices, and drill core logging and sampling facilities. Also located within Bowser LOO are a soils with hydrocarbon contamination treatment facility, drill core storage, storage facilities and laydown yards.

Tsetsaut Skii km Lax Ha have a cabin at Bowser West.

Bowser Aerodrome is located in a separate LOO along the north side of Bowser LOO. A 5,395-foot long by 75-foot wide gravel surfaced runway has been constructed with cleared areas along the sides and ends (Figure 5). Included within the Aerodrome LOO are 6 aviation beacon sites on hills to the east, west and northeast of the runway. The airstrip is in the early stages of use with further facilities to be added as per the original design.

3.2.6 Knipple Transfer Area

Knipple Transfer is located at 55 km on the access road. It is the camp for road maintenance crews and logistical personnel associated with transport of materials to the mine. Materials are trucked in to Knipple Transfer by highway transport vehicles and then transferred to vehicles for delivery to the mine. Cold storage is provided for food stores, silos for storage of cement binder used in paste backfill operations at the mine, a laboratory for testing mill processes and acid rock drainage potential of mined material and tailings, an electric substation where the transmission line voltage of 138 kW is reduced to 69 kW before transmission to the mine, a camp for personnel, bulk storage of fuels required at the mine, a truck maintenance shop, an emergency vehicle storage building and a waste handling facility with an incinerator (Figure 6).

The fuel dispensing system with facilities for diesel, gasoline, and aviation fuel includes double-walled tanks and an HDPE lined retention pad under the refueling area that is equipped with an oil/water separator.

3.2.7 Transmission Line

Beginning near the Long Lake Hydroelectric Substation in the south, this area extends approximately 57 km to the mine. The LOO only comprises the southern 38 km of the transmission line as the northern 19 km is permitted under *Mines Act* permit M-243. While this Ancillary Infrastructure Decommissioning and Reclamation Plan is intended to inform about those facilities off the *Mines Act* permit similar reclamation activities to those described herein apply to the northern 19 km of the transmission line. The transmission line is a 138 kW hydroelectric line connected to the BC grid via the Long Lake Hydroelectric line. The line consists of 135 towers, primarily monopoles but also 13 four-leg poles (Plates 3.2-2 and 3.2-3). There is a control station located about 1 km north of the Long Lake substation and a substation at Knipple Transfer Area where line wattage is stepped down to 69 kW for transmission to the mine (Figure 7). The substation was sited at Knipple Transfer Area following determination that grounding of the 138 kW line at the mine would not be safe for underground operations. BC Hydro control of power transmission extends to the control station 1 km north of the Long Lake substation.

3.2.8 Communication Towers

Communication towers are located on mountain sides or ridges where line-of-sight microwave distribution is possible from Brucejack to Stewart via a tower overlooking Stewart and between Wildfire, Bowser and Brucejack. Five LOO are shown on Figure 1; Plate 3.2-4 shows a typical communication system. They comprise a tower with Microwave reflector, radio repeater, electronics container and power source.

Plate 3.2-4. Typical communications site.

3.2.9 Miscellaneous Sites Used during Construction

During construction of the transmission line 3 sites along the Granduc Mine road were used for camp or laydown and materials mobilization. These were Troy Flats, Redeye and Tide Staging, locations are shown on Figure 8.

3.2.9.1 Troy Flats

Troy Flats was used as a laydown for a short period during construction of the southern portion of the transmission line. Troy Flats was the site of a construction camp during Granduc Mine access road construction in the early 1960s and there are remnants of old mine workings that appear to date from the early 20th Century. It consists of four distinct pads: the northern area is a rocky prepared laydown without vegetation cover, and three southern laydown areas with vegetation are on the periphery of each area (Figure 9). There is evidence of repeated use by various mineral exploration crews.

The site was abandoned on orders of EAO and became an active reclamation site soon after. An appropriately qualified R. P. Bio. prepared a reclamation plan which was forwarded to EAO for comment and approval. The objective of the reclamation is to bring disturbed areas to a stable condition vis-a-vis erosion and re-establish vegetation on those areas that were previously vegetated.

3.2.9.2 Redeye

Redeye was a construction camp developed in agreement with the private landowner. It is located immediately east of the Granduc Mine road at the eastern margin of Granduc Mine site (Figure 10). Following the end of construction of the transmission line south of Knipple Transfer Area the camp was removed and the site cleaned.

Unfortunately, site preparation for the camp was undertaken in the early winter with the result that the camp pad included snow mixed with rock and soil. This mixture of snow with soil and rock resulted in an unstable mixture that has slumped off the northern edge of the pad. Reclamation began with northern slope stabilization and exposing entrained snow in 2017 followed in 2018 by initiation of a program to reduce the northern slope angle. In 2019 these reclamation efforts will continue by further cutting back the slope and reduction in angle of the pad's northern slope, removal of entrained snow and stabilization of the pad materials.

The private land owner has an agreement with the local heli-skiing company whereby helicopters refuel at a tank located on the pad. Reclamation efforts will not interfere with the heli-skiing company's ability to refuel helicopters at the site.

3.2.9.3 Tide Staging

Tide Staging is located at the northern end of the Granduc road system on the east side of Bowser River (Figure 11). The site is located on a Pretivm mineral claim and was permitted and prepared as a staging/camp location for mineral exploration on Pretivm mineral claim holdings south of Bowser Camp and as a staging location for equipment and personnel transport to Brucejack during early underground exploration efforts. In 2012 the facility was permitted under *Mines Act* permit MX-1-881 and was used for staging of equipment and crews to Brucejack and as a base for exploration crews working elsewhere on Pretivm mineral claims. It was used as a staging area for construction of the transmission line between Granduc and Knipple Transfer Area. The site has reverted to its original purpose as a staging area for mineral exploration on Pretivm mineral claims, and remains permitted for such activity. For the foreseeable future it will only be reclaimed to the extent of surface stabilization and water protection measures similar to any mineral exploration site. Should any of the site not be required for exploration purposes reclamation will follow requirements of the *Mines Act* permit and Health, Safety and Reclamation Code for Mines in British Columbia.

4 END LAND USE AND CAPABILITY OBJECTIVES

4.1 INTRODUCTION

Pre-development land use and conditions generally form the basis for identifying the end land use and capability objectives. End land use and capability objectives have been integrated with planning and design to optimize successful reclamation and closure.

This Ancillary Infrastructure Decommissioning and Reclamation Plan provides the plan of how end land use and land capability objectives will be achieved to the extent feasible by the end of the Closure period. The following subsections describe existing conditions and end land use and land capability objectives for the various components. Biophysical information for the components has been obtained from the environmental baseline studies presented in the Project's Application/EIS (ERM Rescan 2014) and from additional site updates as relevant.

4.2 SITES ALONG THE ACCESS ROAD FROM HIGHWAY 37 TO KNIPPLE GLACIER

Lower elevation portions at the eastern end of the access road occur at approximately 500 masl, predominantly in forested ecosystems, with minor areas of wetlands and floodplain ecosystems (Plate 4.2-1). Most of the forests are mature. Shrub-dominated and young seral forests occur in areas that were recently harvested or are in younger stages due to recent wildfire disturbance.

Plate 4.2-1. Mature forested ecosystems close to Highway 37, along the Brucejack Access Road.

At higher elevations, including through Scott Pass, the road traverses upland ecosystems within the Very Wet Cold Interior Cedar Hemlock (ICHvc) subzone. This subzone is typified by a dense cover of hybrid white spruce and western hemlock trees. Subalpine-fir becomes the dominant tree species at higher elevations and in areas where colder air persists. Subalpine-fir (*Abies lasiocarpa*) is also the dominant tree species within the floodplain ecosystems of the ICHvc subzone, along with black cottonwood (*Populus balsamifera*) and some hybrid white spruce (*Picea glauca* × *engelmannii*).

The access road descends southwest from Scott Pass to the Bowser River. The road then follows the Bowser River westward to approximately road km 55, traversing early seral ecosystems on fluvial deposits. Floodplain ecosystems present in this area along the Bowser River include low, medium, and high bench ecosystems. The low bench ecosystems are often dominated by willows (*Salix* spp.) including variable willow (*Salix commutata*) and Barclay's willow (*Salix barclayii*). Medium and high bench floodplain ecosystems typically occur on soils with relatively xeric to submesic moisture regimes with edaphic indicator species such as smooth-leaved mountain-avens (*Dryas integrifolia*), soopolallie (*Shepherdia canadensis*), and various species of lichens. Near Knipple Lake, the road continues along the high bench floodplain, bounded by steep colluvial slopes to the north, and the outflow to the south. Forested ecosystems are less common in this area due to recent deglaciation and soils are either poorly developed or absent. The edaphic climatic influence of the existing glaciers reduces the length of the growing season in this area.

Along Bowser River treed ecosystems often occur as elevated islands within braided stream systems; very common in the Bowser River delta and between Bowser and Knipple lakes (road segment between road kms 35 and 55). The Bowser Aerodrome is located near road km 50 on a lower bench of the Bowser River floodplain; this is an area of immature (mostly less than 30 years), deciduous tree cover, much of it located on coarse cobble substrates in the Engelmann Spruce-Subalpine Fir Wet Very Cold subzone (ESSFwv) BEC subzone. Review of historical air photographs indicates that all but about 6 ha in the northwestern corner of Bowser Aerodrome was scoured clear of trees and soils during the various floods from the 1850s to 1930 when Tide Lake discharged down Bowser River after the ice dam at Frank Mackie Glacier was breached. Vegetation did not begin to re-establish until the early 1970s because of the very limited soil remaining after the flood scouring. The area along this segment of the lower Brucejack Access Road is vegetated with deciduous shrubs and trees including willow, hybrid spruce, subalpine fir, soopolallie (*Shepherdia canadensis*), and dryas (*Dryas drummondii;* Plate 4.2-2).

The main wildlife habitat values along the lower elevation portions of Brucejack Access Road and at the various adjacent infrastructure areas are moose and bear habitat.

Two end land use objectives for the lower elevation infrastructure components are for wildlife habitat (early seral moose and bear) and to ensure an unhampered access for Indigenous traditional activities, both for Treaty and non-treaty nations. Reclamation methods will include spreading any salvaged soils or woody debris, woody species planting, and seeding with native grass and to plant native forest species; it is anticipated that vegetation establishment will be sparse in many areas due to the limited soil development. Re-vegetation will concentrate on establishment of alder, willow and cottonwood with grasses providing an early ground cover. Unhampered access for First Nations/Treaty Nations activities means that traditional access routes, by trails or water, will not be blocked by fallen timber or road reclamation activities; it does not refer to access via the Brucejack Access Road after mine closure.

Plate 4.2-2. Vegetation common in the Bowser Aerodrome area.

4.3 BRUCEJACK TRANSMISSION LINE

The Brucejack Transmission Line overlaps the greatest number of BEC units and grades from old forest in the south to early seral ecosystems and non-vegetated areas, such as barren rock and snowfields in the north. Beginning near the Long Lake Hydroelectric Substation in the south, this area extends approximately 53 km to the top of the Knipple Glacier (southeast of the Brucejack Camp). The southern reaches are comprised of shallow colluvial veneers over bedrock and steep slopes, often exceeding 60% (Plate 4.3-1). Ecosystems in this area are transitional; within this transition area there is a marked and observable difference in vegetation communities between site series. As the corridor proceeds north, western hemlock becomes a minor component of the canopy, eventually being replaced by mountain hemlock (*Tsuga mertensiana*). The understory becomes less vigorous and diverse as the climate becomes colder and wetter. Colluvium, moraine, rock, and ice are the dominant surficial materials mapped.

Much of the Brucejack Transmission Line route is located either above tree line or in high elevation subalpine areas. Brucejack Transmission Line construction was helicopter supported, with road-based support limited to use of existing roads. Transmission Line towers are sited on bedrock as much as possible with monopole towers where feasible. Surface disturbance is the result of tower bases and anchor installation and effects on vegetation as a result of the Brucejack Transmission Line are limited with the primary effect being tree falling and fallen trees left in place to inhibit access along the transmission line.

Plate 4.3-1. Forests along the south end of the Brucejack Transmission Line.

The Brucejack Transmission Line infrastructure will be removed during final reclamation. There is generally minimal surface disturbance associated with the Brucejack Transmission Line construction and use, and therefore vegetation cover will have essentially the same extent at Closure as it did pre-development, with the exception of the small areas of the tower bases. Within forested sections of the Brucejack Transmission Line right-of-way (ROW), tree and other woody species heights will have been controlled during mine Operations.

Wildlife occurs along the Transmission Line ROW. The open alpine areas of exposed rock are used as matrix habitat (movement areas) by mountain goat and grizzly to travel between areas of better quality, vegetated habitat. Construction did not materially alter or change these areas of matrix habitat. At Closure, the end land use objective will be to provide matrix habitat for goat and grizzly bear. Structures will be removed to maintain the matrix habitat as movement area for wildlife. No active reclamation beyond seeding grasses is proposed.

Below treeline, the forested area is used by moose and grizzly bear. During Operations, the ROW will regrow naturally to a low, shrub community which will be managed for height; this is anticipated to provide good quality habitat for moose and bear. At Closure, the end land use objective will be moose and grizzly bear habitat. The vegetation cover will be allowed to grow, uninhibited; no active reclamation is planned. During the early years of Post-closure, the ROW will continue to provide a shrub community for bears and moose. Over time, the ROW will undergo succession to a forested vegetation community which will provide moderate quality habitat for moose and grizzly bears, similar to or the same as what was present pre-mine.

5 RECLAMATION APPROACHES

The general reclamation approaches are to:

- conserve as much soil (or growth media, where soil is not present) as feasible in areas that will be disturbed, for use in reclamation when the mine is closed; and
- following mine infrastructure removal and site re-contouring, re-vegetate growth media that are present or have been placed on facility areas as part of reclamation, with native species including grasses, shrubs, and tree seedlings suited to the various areas.

An additional approach will be to carry out as much progressive reclamation as feasible to allow the opportunity for ecosystem development and progression during the course of mine life. Opportunities for progressive reclamation are, however, very limited, for infrastructure must remain in place to the end of mine life and sufficient facilities to support any ongoing monitoring/water treatment at the mine. Pretivm will, however, undertake what limited progressive reclamation is feasible.

5.1 SOIL MANAGEMENT STRATEGY

Soils in all Ancillary Facility Sites are generally developed on gravelly; glaciofluvial deposits. Due to the coarse texture, these soils generally have poor productivity. Soils will be windrowed or piled adjacent to cleared areas along with any entrained vegetation or woody debris. At closure these materials will be spread out to the extent possible by bulldozer. Any stockpiles will be placed outside riparian zones and surface erosion will be limited by such techniques as sediment fencing where necessary.

5.2 RE-VEGETATION STRATEGY

The Knipple Transfer Area site is located in the Mountain Hemlock-Leeward Moist Maritime Variant (MHmm2) BEC subzone and had a cover of immature, deciduous trees (Plate 4.2-2).

Bowser Aerodrome, Bowser and Wildfire Camps and the Explosive Storage Sites occur in the Engelmann Spruce-Subalpine Fir Wet Very Cold subzone (ESSFwv). Bowser is currently subject to occasional flooding.

The areas will be planted with willow, cottonwood and alder which are suited to the area. The sites will also be lightly seeded with a native grass mixture such as the following:

- alpine bluegrass (*Poa alpina*);
- spike trisetum (T*risetum spicatum*); and
- blue wildrye (*Elymus glaucus*).

The seed will be certified weed free and will be applied at 40 kg/ha to allow for successful establishment of the shrubs and tree seedlings. As the soils will have a low organic matter content and low fertility, fertilizer (16-16-16 NPK) will be applied at 40 kg/ha to promote plant establishment. The

seed is suitable for erosion control and will provide surface coverage but should allow for the establishment of tree seedlings due to the relatively low seeding rate. The planting of the shrubs, tree seedlings, and grasses will provide early seral moose and bear habitat.

The re-vegetation strategy is to reclaim disturbed areas with native species, including grasses, shrubs, and tree seedlings suited to the various infrastructure development areas and site specific conditions. For example, those areas above the tree line will not subject to tree planting. There disturbed areas will be seeded with native grasses when appropriate.

The general re-vegetation strategy is to accelerate re-vegetation of growth media that are present or have been placed on facility areas as part of reclamation. As the components are located in relatively isolated locations with variable natural settings, the general strategy is to reclaim with native plants such that the reclaimed areas will develop into more complex ecosystems that will support the range of wildlife endemic to these sites. Seeding or planting with palatable and locally adapted native vegetation species will support wildlife use of the reclaimed areas and accelerate the reclaimed areas to a more natural condition. The variety of species will be able to accommodate variation in site conditions which will provide for more successful re-vegetation across an area. Some grasses will become better established than others depending on site conditions. Monitoring will indicate where plant materials may not be suitable to niche conditions and require different species composition. Soils and other growth media will be salvaged to the extent feasible; these reclamation materials will be used to achieve plant establishment and growth.

The re-vegetation strategy in lower elevation areas will be to plant native grasses at a rate that will allow for the trees and shrubs to become established. That is, the seeding rate will be controlled to reduce excessive competition for nutrients and moisture with the tree seedlings and shrubs, thereby resulting in a more rapid development of a complex forested ecosystem. As the planted areas mature, the shrubs and trees affect soil moisture and temperature regimes below their canopy which will affect the plant species occurring as some species will be shaded out, for example, and other shade tolerant plants will become established. Wildlife and wind will carry seed to the areas as they pass through or use them, increasing the complexity of the ecosystem. Further, the development of a complex ecosystem will provide with time, shelter, browse, and lower air temperatures as the vegetative community matures.

Implementation of the above strategies is expected to result in accelerating the establishment of post-mine ecosystems resembling and functioning as natural ecosystems.

5.3 RECLAMATION PLAN

This section describes the approaches for final reclamation of ancillary infrastructure. Final closure of the mine is anticipated to take approximately three years and will be designed to provide for long-term stable landforms and site conditions. The ancillary areas to be reclaimed will be closed and reclaimed when reclamation of the Brucejack Mine Site is sufficiently complete that treatment of discharge waters is unlikely due to achievement of objectives for post mine closure. Access for monitoring is unlikely to require road access or transmission line power.

Reclamation of all LOO sites will follow the same basic principles. Facilities at each site include modular sleeping and kitchen buildings, fuel dispensing systems, helipads, water wells and potable water distribution systems, laydown areas and septic fields. Additional facilities at Knipple Transfer Station include an incinerator/waste sorting area, laboratory, oil/water separator system, electrical substation.

All facilities at LOO sites will be dismantled:

- all hydrocarbons will be drained from stationary equipment and sent to a designated facility for disposal;
- stationary equipment will be removed for resale, recycling or scrapping;
- any frame built buildings will be dismantled, metal cladding recycled, unpainted wood burnt, painted wood and plywood disposed at a waste disposal facility;
- oil/water separators will be drained, hydrocarbons disposed of at a designated facility, HDPE liners removed and recycled if possible or sent to a waste disposal facility;
- the electric substation will be dismantled, transformer oils removed and disposed of at a designated facility, equipment either sold , recycled, or scrapped;
- modular camp and other buildings will be sold, recycled or scrapped;
- concrete foundations will be covered with site subsoil/soil (predominantly glacial gravels with minor vegetation debris and soil);
- water wells will be closed as per regulations to prevent any potential contamination of groundwater; and
- all mobile equipment will be removed and sold.

Reclamation will be carried out in most areas and will include spreading of any retained soils/surficial materials and re-vegetation with suitable native plant species.

5.3.1 Wildfire Camp

The existing Wildfire Camp and laydown area are located in a previously logged area near the junction with Highway 37. The Wildfire Camp occupies approximately 0.6 ha and the laydown area within the SUP also occupies approximately 3 ha. Timber debris and soils were salvaged at the time of camp development and placed in windrows at several locations around the camp. The soils were mixed with gravel. They will be loosely spread over the site once the camp facilities have been removed. Care will be taken to not compact the soils.

Beyond the reclamation steps common to all Ancillary Infrastructure sites there are gravel borrow sites along the SUP in the Wildfire Camp area that will require grading and tree planting.

The security building at the camp and the gate and gatehouse at the highway will be dismantled once reclamation of the road is complete and the Bell Irving Bridge is removed.

5.3.2 Knipple Transfer Area

The facility is located on glacial gravel deposits which have been compacted where necessary to provide pads for structures and occupies approximately 8 ha.

Initially it was estimated 25,730 m^3 of gravelly, coarse-textured soil would be stockpiled adjacent to the Knipple Transfer Area pad for reclamation. However, the expected gravelly soil was in fact mainly gravel similar to Bowser site and less could be stockpiled. Minor quantities are stockpiled on the southern side of the site. What was stockpiled will be spread across the site during reclamation.

Following building and electrical substation removal the site will require decompaction before soil and woody debris spreading and tree/grass planting.

5.3.3 Bowser Aerodrome and Bowser West Camp

At Bowser LOO the aerodrome, camps and laydown areas all occur on gravel till deposits with minimal soil development. Review of historical air photographs indicates that all but about 6 ha in the northwestern corner of Bowser was scoured clear of trees and soils during the various floods when Tide Lake was released. Soils salvaged are minimal and are stored along the northern edge of the aerodrome. All the Bowser site infrastructure is highly compacted, either for the aerodrome runway or vehicle usage and building pads. Reclamation of the original Bowser camp site, construction laydown and temporary camp location will be completed in the first few years of mining, once these areas are no longer required.

Reclamation of Bowser sites will include decompaction by ripping to allow for root penetration. Alder and willow shrubs along with native grass seeds will be broadcasted over the disturbed areas. Reclamation success can be expected to be a slow process given the general lack of soils for redistribution across the site. The Bowser Aerodrome currently comprises a 5,392-foot long by 75-foot wide runway in a 100 m wide clearing with an apron for aircraft parking just north of Bowser West Camp. In the future the full infrastructure as outlined in the original document filings will be completed and that infrastructure will be removed at the time of decommissioning and reclamation.

The existing Bowser West Camp is located on the north side of the Brucejack Access Road. It includes several cabins, an office, kitchen, a dry and washrooms, fuel tanks for aviation and trucks, and two power generators, as well as a burn pit, pump house, a well house, a core storage area, septic field, and water line.

The aerodrome will be closed when it is no longer required. The aviation lighting will be disconnected from the power source and taken off site to be sold. The aerodrome building will be dismantled. This will include removing all furniture and equipment, wiring, and insulation. These components will be taken off site for reuse, disposal in a regulated facility, or recycled. The foundations will be left in place and covered with the gravelly material stored at the aerodrome.

5.3.4 Brucejack Transmission Line

The Brucejack Transmission Line will remain in operation until this power supply is no longer required at the Mine Site; this is anticipated to be when the Operations WTP is no longer required.

There may be some disturbance in the areas around the towers during the dismantling of the towers. Soils that are disturbed will be seeded with the same native seed mixture as other LOO. Such seeding will re-establish vegetation in disturbed areas and reduce the potential for erosion.

The Brucejack Transmission Line will be dismantled when no longer required. The towers will be de-strung and the towers, conductors, and lines will be removed. Helicopters will be used to remove the lines and towers from along the route. The tower foundations will be mostly constructed of concrete and are limited in size. These will be left in place.

In the alpine areas, the transmission line ROW will continue to be used for goats and grizzly bears, as matrix habitat between areas of better quality vegetation. For areas below treeline, vegetation above 1 to 1.5 m in height remained in place during Construction. During Operations, the ROW will regrow naturally to a low shrub community which will be managed for height and will be good quality habitat for moose and bears. At Closure, the vegetation will be allowed to grow uninhibited. During the early stages of Post-closure, the vegetation will continue to provide a shrub community for bears and moose. With time, the ROW will undergo succession to a forested vegetation community which will be moderate quality habitat for moose and grizzly bears, who currently use the area.

5.3.5 Access Road

Road access will be required for as long as water treatment is required at the Mine Site. Once the WTP is no longer required, the Brucejack Access Road will be decommissioned and reclaimed. Access or monitoring in the Post-closure phase will be via helicopter.

Road decommissioning will require the removal of 23 bridges and 310 culverts to restore natural drainage. The bridges are mainly constructed of a steel frame with wood or concrete decking. The culverts are generally corrugated steel pipe. Erosion prevention and sediment control measures will be implemented to prevent sediment entering waterways during the removal of these structures.

Larger bridges will be dismantled and lifted out using a crane. Bridge structures will be hauled out and taken for recycling or reuse as appropriate. Culverts will be taken off site for disposal, recycling, or reuse. The road surface will be reclaimed as the bridges and culverts are removed. Natural drainage will be restored. The gate at Highway 37 will be removed and public access discouraged by the construction of physical barriers and removal of the Bell Irving Bridge.

The Brucejack Access Road includes gravel/borrow sources, laydown areas, quarries, and spoil areas. The laydown and spoil areas and the road surface will require decompaction. These areas will be ripped to allow for surface infiltration of water which will reduce the potential for slumping and erosion. This material may be suitable for reclamation and will be assessed for its suitability at Closure, if required. The plan is to use the material salvaged for reclamation, and potentially the spoil material, to reclaim the road surface in areas as close as possible to the areas where it is stockpiled. Stockpiles

are sited to not erode into waterways and are not used for road maintenance. Spoil along the road is often a mix of poor soils, gravels, woody debris and plants that are stored along the road verge. These stored materials have been seeded with appropriate weed and clover-free seeds; they will also be used for the reclamation of the road, laydown and spoil areas.

The grasses and the shrubs and trees that will re-colonize the reclaimed road alignment will provide early seral moose and bear habitat.

There are and may be additional gravel/borrow sources and quarries along the lower Brucejack Access Road.

The gravel borrow area will be sloped at closure to maximum 2:1 slopes, and quarries will configured to ensure that they are stable and allow for escape by wildlife. Where necessary compacted areas on the floors of gravel borrow areas will be ripped to provide decompaction. Any soil/overburden that was feasible to salvage pre-development will be spread over the gravel source area and quarry floors. Soil/overburden areas and other areas with soil sized material at surface will be seeded with native grasses and planted with native shrubs such as willows. The quarries are developed in rock and so, with the exception of quarries where it has been feasible to salvage some soil/overburden, these sites will not be re-vegetated.

6 CLOSURE AND POST-CLOSURE MONITORING

Monitoring is required to demonstrate that reclamation and environmental protection objectives including land use, productivity, water quality, and stability of structures are being achieved. The results of the monitoring program are to be included in Annual Reports. The following is a description of conceptual Post-closure monitoring proposed. Monitoring is planned for five years following Closure, however, the length of time required for monitoring will depend upon the results of reclamation.

Access for monitoring in the Post-closure phase will be via helicopter.

Monitoring will be carried out on the following:

- landform stability,;
- surface stability (absence of erosion; effectiveness of erosion control and sediment protection measures); and
- re-vegetation establishment;

6.1 SURFACE STABILITY

The surface of the reclaimed and decommissioned sites will be checked bi-annually (high precipitation periods in spring and fall) for erosion, and remediated as appropriate. This will include the presence of rills, gullies, cracking, and signs of slumping, particularly around removed bridges, culverts and road fill areas.

6.2 RECLAMATION MONITORING

The areas which have been reclaimed will be checked annually for vegetation establishment and growth. Bare areas may indicate that the soils are compacted and roughing the surface soils may be required before reseeding. Areas with sparse vegetation will be reseeded if they are not rock exposures. The planted species may be changed to reflect individual site conditions. For example, plants on coarse-textured soils may be affected by insufficient moisture and may indicate that areas need to be reseeded with a more drought resistant species. As well, fertilizer may be required to promote plant establishment where vegetation is sparse. Reclaimed sites will also be checked for noxious weeds.

6.3 INDIGENOUS ACCESS FOR TRADITIONAL ACTIVITIES

Tsetsaut Skii km Lax Ha, Nisga'a Lisims and Tahltan will be informed through their respective governments of reclamation monitoring results and discussions will be held to assess their ability to access the area for traditional activities or potential impingements on rights.

1 PURPOSE

The Brucejack Mine (the Mine) has been designed to minimize, mitigate, and/or manage potential adverse effects on the environment. The Aquatic Effects Monitoring Plan (AEMP) is one component of the overall Environmental Management System (EMS), with the specific purpose to provide information on the aquatic receiving environment necessary to achieve the following goals:

- detect mine-related effects on the aquatic ecosystem components, including water quality, aquatic resources, and sediment quality;
- evaluate the predictions of the environmental assessment (EA);
- meet permit and regulatory requirements for effluent and receiving environment quality;
- assess the performance of mitigation and management measures; and
- provide the necessary feedback and information for the adaptive management of potential mine-related effects.

2 PERFORMANCE OBJECTIVES

The AEMP is intended to ensure that mitigation and management measures related to potential aquatic ecosystem effects are effective, and the requirements of relevant laws and regulations are met. To meet these goals, the AEMP is designed to generate data needed to accomplish the following objectives:

1. determine the short- and long-term effects in the aquatic environment resulting from the mine;
2. evaluate the accuracy of mine effect predictions;
3. assess the effectiveness of mitigation and management measures;
4. identify additional mitigation measures as appropriate to avert or reduce environmental effects due to mine activities (adaptive management); and
5. comply with regulatory and permit requirements.

The first objective is met by monitoring the receiving environment in the short term (on an annual basis) and the long term (across all phases of the mine), augmented by more frequent effluent and receiving environment water quality monitoring. Physical, chemical, and biological characteristics of the aquatic environment are monitored to detect mine effects, and to determine the pathways and the magnitude of the effects.

The accuracy of mine effect predictions (Objective 2) are evaluated based on the results of the monitoring plan addressed in Objective 1, and are evaluated as part of the regular reporting process.

The AEMP allows for an assessment of the effectiveness of mitigation and management measures designed to eliminate or reduce potential mine effects (Objective 3) by comparing the conditions in the receiving environment to baseline conditions and to a reference site, prior to and throughout the mine. The effectiveness of mitigation measures are determined by identifying changes in the receiving environment, and communicating those changes to mine management. The results of the AEMP are analysed and reported in the Annual Report for *Mines Act* Permit M-243 and *Environmental Management Act* Permits PE-107835 and PA-107025 (the Annual Report).

The development of additional mitigation and management measures (Objective 4) will follow the identification of unanticipated effects or poor performance of existing measures. These additional mitigation and management strategies will be described in the annual AEMP reports, which includes the Annual Report, along with the relevant environmental monitoring information.

The monitoring plan provides the required information to demonstrate compliance with the provincial *Environmental Management Act* (EMA) effluent discharge permit (#107835). Section 4.5 of the EMA permit stipulates the requirements for an AEMP. These environmental components are evaluated for effects by the methods outlined in the AEMP, which conform to the methods outlined in guidance documents (BCMOE 2016b; Environment Canada 2012c; ENV 2013). Further, sampling follows the requirements outlined in Section 4 of the EMA permit. Specifically, as specified in Section 5.5 of the EMA permit, the AEMP annual report includes results and interpretation of toxicity testing (acute and chronic), sediment

and biological monitoring, key water quality trends, environmental effects, and an assessment of the protectiveness of the discharge limits. As such, the AEMP focuses on WRTSF discharge and the receiving environment monitoring requirements listed in the EMA permit, and does not include the required EMA permit monitoring for the characterization of inputs to the WRTSF. These components are reported separately from the AEMP. The MDMER study design and results are also reported separately from the AEMP.

3 SCOPE

This document presents the proposed components of the AEMP; it is intended to be a "living document" and may be updated based on regulatory changes, changes in the mine, or changes to mitigation and management measures. The document is divided into three sections:

- Section 4 describes the components of the monitoring plan.
- Section 5 outlines triggers for additional monitoring and/or data review.
- Section 6 describes the reporting and record keeping components.

These components were developed within the broader framework of the Mine's EMS as well as applicable legislation, regulations, permits, and EA conditions.

Implementation of the AEMP is intended to monitor components of the aquatic environment in the Mine Site Area and the downstream receiving environment, as well as a reference monitoring environment. The original version of the AEMP was created in 2015. This 2022 update will be in place at the Brucejack Mine through the phases of operations and closure.

3.1 APPLICABLE ENVIRONMENTAL MANAGEMENT PLANS

The AEMP is the monitoring plan for detecting mine-related effects on the aquatic receiving environment. The mine has the potential to interact with the aquatic environment through a number of pathways. The EMS (Section 6.2) describes the overall framework. Mitigation and management measures are implemented to reduce or eliminate mine effects on the aquatic environment. Mitigation and management measures have been drawn from knowledge and experience contained in guidelines and research documents, and the adaptive management strategy includes seeking new knowledge and strategies to minimize mine effects on the aquatic environment. The mitigation and management measures relevant to the aquatic environment are detailed in specific pathway-associated management plans that include:

- Metal Leaching and Acid Rock Drainage Management Plan;
- Surface Erosion Prevention and Sediment Control Management Plan
- Spill Response Plan;
- Tailings and Waste Rock Subaqueous Deposition Management Plan;
- Water Management Plan;
- Nitrogen Management Plan;
- Chromium Management Plan; and
- Closure Underground Water Quality Adaptive Management Plan.

3.2 APPLICABLE LEGISLATION, REGULATIONS, AND ENVIRONMENTAL ASSESSMENT CERTIFICATE CONDITIONS

3.2.1 Applicable Legislation and Regulations

This AEMP has been designed to comply with existing regulations and follow the available guidelines provided by the federal government and the government of British Columbia (BC). Relevant legislation and regulations include:

- *Environmental ManagementAct* (2003);
- MDMER (SOR/2002-222) under the *Fisheries Act* (1985); and
- *Mines Act* (1996a).

Note that while MDMER (SOR/2002-222) is relevant to the AEMP, the AEMP focuses on the provincial legislation and regulations. Further details on the MDMER monitoring requirements are provided in MDMER (SOR/2002-222) under the *Fisheries Act* (1985).

Relevant guidelines for the monitoring plans presented in the AEMP include:

- *British Columbia Approved and Working Water Quality Guidelines*;
- *Canadian Environmental Quality Guidelines* (CCME guidelines);
- *Federal Environmental Quality Guidelines* (Ministry of Environment and Climate Change);
- *British Columbia Field Sampling Manual Part A: Quality Control and Quality Assurance* and *Part E: Water and Wastewater Sampling* (ENV 2013);
- *Metal Mining Technical Guidance for Environmental Effects Monitoring* (Environment Canada 2012c);
- *Water and Air Baseline Monitoring Guidance Document for Mine Proponents and Operators* version 2 (BCMOE 2016a); and
- *Annual Reporting Under the Environmental Management Act: A Guide for Mines in British Columbia* (BCMOE 2016b).

3.2.2 Relevant EAC Conditions

Pretivm was granted an Environmental Assessment Certificate (#M15-01) on March 26, 2015 that included a series of conditions. This management plan fulfills Condition #2, in relation to a Component Plan for aquatic effects monitoring, presented within Schedule B of the Certificate and copied below.

<u>Condition 2</u>

> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*

- *Purpose of Component Plan;*
- *Performance objectives;*
- *Effects mitigation measures;*
- *Monitoring programs;*
- *Monitoring schedules; and*
- *Reporting requirements.*

The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.

The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."

4 AQUATIC EFFECTS MONITORING PLAN

4.1 STUDY AREA AND SAMPLING LOCATIONS

4.1.1 Mine Site Area and Downstream Receiving Environment

The AEMP study area comprises those areas potentially influenced by mine activities in the Mine Site Area (exposure) and areas beyond potential Mine influences (reference). The primary Mine-related activities that could affect the aquatic environment, and thus were considered in the AEMP design, include:

- discharge of water from the WRTSF, which is the location of subaqueous disposal of waste rock and tailings, as well as the discharge point for effluent from the mine water treatment plant and the sewage treatment plant. The WRTSF outflow is the mine's discharge point into the Brucejack Creek receiving environment, and is the point of compliance for the EMA permit and MDMER;
- runoff from mine infrastructure, including pads, stockpiles, and roads; and
- changes in streamflow related to mine water management and discharges.

Potential effects on the aquatic receiving environment are anticipated to be restricted primarily to the Mine Site Area and Brucejack Creek. The suite of sampling sites is designed to monitor the receiving environment along the downstream gradient from the WRTSF to the inflow to Sulphurets Lake (Table 4.1-1 and Figure 4.1-1).

Table 4.1-1. AEMP Sampling Locations, Descriptions, and Purposes

Site	EMS ID	Location[a]		Description	Purpose
		Easting	Northing		
Mine Site Area					
BJ 3.10 (Weir)	E298312	426,820	6,258,983	WRTSF outflow	Mine discharge location; final discharge point for MDMER and effluent compliance conditions for EMA Permit
CC 0.87[b]	E298331	426,951	6,258,242	Headwaters of Camp Creek	Upstream control site
CC 0.01[b]	E298334	426,601	6,258,868	Mouth of Camp Creek	Site to estimate non-contact water contributions from Camp Creek to Brucejack Creek.
BJ 2.62[b]	E298332	426,330	6,258,959	Brucejack Creek, immediately downstream of cascades	Monitor the receiving environment on Brucejack Creek approximately 0.5 km downstream of WRTSF outflow and downstream of Camp Creek.
BJ 1.74[b]	E298333	425,773	6,259,026	Brucejack Creek, downstream of VOK Creek	Monitor the receiving environment on Brucejack Creek approximately 1.4 km downstream of WRTSF outflow
SC0[b]	E303050	422,038	6,261,659	Sulphurets Creek, downstream of Sulphurets Glacier, inflow to Sulphurets Lake	Far-field exposure site.
Access Road					
KG 0.4	-	439,360	6,251,460	Creek flowing from Knipple Glacier, upstream of bridge	Hydrocarbon monitoring location; not included in EMA permit
Reference Areas					
L3 Outflow[b]	E303051	413,622	6,270,435	Reference stream; lake-headed high alpine reference stream comparable to Brucejack Creek, located 17 km northwest of Brucejack Lake	Brucejack Creek reference stream site
T2 0.09	-	427,106	6,259,483	Catear Creek; northern tributary to Brucejack Lake	Applicable to MDMER sampling only. Upstream reference site for Brucejack Creek; downstream of historical Catear Mine site; Environment and Climate Change Canada recommended MDMER biological reference site

[a] *UTM Zone 9, NAD83*

[b] *Sampling schedule may be adjusted during the winter months depending on conditions (i.e., flying, creek frozen to ground) and avalanche hazard.*

Figure 4.1-1. AEMP Sampling Locations

4.1.2 Ancillary Infrastructure Areas

Areas with potential effects on the aquatic environment from infrastructure outside of the Mine Site Area include the Brucejack Access Road. A monitoring location (KG 0.4) for petroleum hydrocarbons is maintained on the creek downstream of Knipple Glacier to identify unanticipated effects from the operation of vehicles and the transport of fuels on the glacier.

4.2 SAMPLING DESIGN

The sampling design for the AEMP is conceived to provide information for a statistical analysis incorporating a Before-After/Control-Impact (BACI) design on aquatic receiving environment indicators. Baseline information for the sampling locations (Table 4.1-1) is available from 1987 to 2014 (see Sections 13.3 and 14.3 in Chapters 13 and 14 of the *Application for an Environmental Assessment Certificate/Environmental Impact Statement*, ERM Rescan 2014), and are the basis for the "Before" category in AEMP statistical analyses. Monitoring for the "After" category commenced in 2015, when the Construction Phase of the mine was initiated, with commercial production achieved on July 1, 2017.

The monitoring components, with their respective sampling frequency and replication are provided in Table 4.2-1. The number of replicate samples for each monitored component is informed by guidance documents and by a statistical power simulation. As a starting point, the sampling design considered five replicates (BCMOE 2016a), which also follows the Environment Canada recommendation for one-factor ANOVA EEM designs for benthic invertebrates to control for equal false-positive and false-negative probabilities ($\alpha = \beta = 0.1$; Environment Canada 2012c). To corroborate these suggested sample sizes, a simulation model was constructed (see Appendix A for details). The simulation model used baseline data from the reference site and a candidate monitoring site as input parameters, along with a critical effect size (CES) of 2x standard deviation (SD) to simulate a hypothetic effect at the monitoring site. The simulation model estimated that five replicate sediment samples would be sufficient to detect a 2 SD change with a 0.90 power (i.e., $\beta = 0.1$) in sediment quality, based on the observed sample variation in the baseline program (Table 4.2-2). The number of replicates for periphyton biomass (as chlorophyll *a* [chl *a*]) was determined to be six, based on the power analysis and the BC MOE guidance document (Table 4.2-2; BCMOE 2106). The number of replicates for periphyton taxonomy analyses is five, based on the recommendations of Biggs and Kilroy (2000) that stated the variation in richness indices reaches a plateau between three and nine replicates.

The BACI analysis considers the effects of period (i.e., "Before" and "After" the start of construction), natural differences between monitored and reference sites, and the interaction between the period effects and the site effects. This site-specific change between the "Before" and "After" periods is the crucial question in a BACI design. A significant mine-related effect would be observed as a site-specific change at a monitored site than is not observed at the reference site over time. If a change is observed at both sites, then it is most likely attributable to natural phenomena unrelated to mine activities. Data analysis use established methods and assumptions are detailed and examined using graphical techniques, statistical analysis, and best professional judgment as part of the analytical process.

Table 4.2-1. Physical, Chemical, and Biological Components in the AEMP Sampling Program

Component	Frequency	Monitoring Location (EMS ID)							
		BJ 3.10 (E298312)	CC 0.87 (E298331)	CC 0.01 (E298334)	BJ 2.62 (E298332)	BJ 1.74 (E298333)	SC0 (E303050)	L3 OF (E303051)	KG 0.4 -

4.3 MONITORING COMPONENTS

Each of the monitoring components summarized in Table 4.1-1 are described in the following sections. Several components, including sediment quality, periphyton, and benthic invertebrates are collected concurrently during early fall low flow, as per EMA permit specifications and as the most biologically relevant period. Required water quality sampling will also be collected concurrently with these samples, when feasible.

4.3.1 Flow

4.3.1.1 Description

A weir at site BJ 3.10 (the outflow from the WRTSF) provides continuous flow gauging (see Water Management Plan for details on flow monitoring), which is checked manually on a quarterly basis. Manual measurements are also recorded at BJ 1.74 four times during the summer, when no recent precipitation has occurred.

4.3.1.2 Quality Assurance/Quality Control

Flow monitoring follows recommendations in the *Manual of British Columbia Hydrometric Standards* (RISC 2018).

4.3.2 Water Quality

4.3.2.1 Description

Table 4.3-1 provides a list of the parameters to be monitored under the AEMP, including the parameters required for the EMA permit. Other water quality monitoring components are described in the ML/ARD Management Plan and MDMER EEM regulations, and include components such as water treatment plant effluent monitoring, quarry runoff monitoring, and post-closure monitoring of seepage from any adit plug.

Stream water quality samples are collected monthly, except for sampling at the far-field SC0 and reference sites that are sampled quarterly (see Section 4.2). Due to potential access and avalanche hazards at BJ 1.74, sampling is shifted to quarterly during the winter months (November to April).

Table 4.3-1. Water Quality Parameters

Water Quality Parameters			
Field	**Nutrients**	**Total and Dissolved Metals**	
pH	Ammonia (as N)	Aluminum (Al)	Magnesium (Mg)
Temperature	Nitrate (as N)	Antimony (Sb)	Manganese (Mn)
Turbidity	Nitrite	Arsenic (As)	Mercury (Hg)
Conductivity	Total Phosphorus	Barium (Ba)	Molybdenum (Mo)
Dissolved Oxygen	Dissolved Ortho-phosphate	Beryllium (Be)	Nickel (Ni)
Physical and Chemical Parameters	Total Organic Carbon	Bismuth (Bi)	Selenium (Se)
pH	**Anions**	Calcium (Ca)	Silver (Ag)
Conductivity	Chloride (Cl)	Cadmium (Cd)	Sodium (S)
Total Hardness	Fluoride (F)	Chromium (Cr)	Strontium (Sr)
Total Alkalinity	Sulphate (SO_4)	Cobalt (Co	Thallium (Tl)
Total Suspended Solids		Copper (Cu)	Tin (Sn)
Total Dissolved Solids		Iron (Fe)	Uranium (U)
Turbidity		Lead (Pb)	Vanadium (V)
		Lithium (Li)	Zinc (Zn)

The site KG 0.4 was originally sampled monthly, until June 2019 when sampling frequency was updated to a quarterly schedule. Weekly water sampling is conducted at BJ 3.10 as required for effluent monitoring (Table 4.2-1). The timing of quarterly sampling is designed to capture representative periods during winter low-flow conditions, freshet, summer low flow, and the increased streamflow in fall. Quarterly sampling is conducted within the same shifted quarters used for the water quality modeling and described in Appendix B of the EMA permit. Finally, 5-in-30 samples are collected during freshet and fall at SC0 and L3 OF every three years to characterize the variability in water quality during these peak flow periods. Dissolved oxygen, temperature, turbidity, conductivity, and pH measurements are collected in the field to characterize the physical and chemical environment of the stream sites.

Water samples from the KG 0.4 hydrocarbon monitoring site are collected quarterly along the shifted quarter schedule and analyzed for petroleum volatile organic compounds and hydrocarbons, which includes the following compounds and classes of compounds:

- BTEX (benzene-toluene-ethylbenzene-xylenes);
- VPH (volatile petroleum hydrocarbons); and
- MTBE (Methyl t-butyl ether).

The hydrocarbon water sampling at the KG 0.4 site is designed as a surveillance program and will not be incorporated into the Before-After-Control-Impact analysis. If a chemical or reagent spill for another substance occurs on the glacier monitoring will include analysis for that substance.

4.3.2.2 Quality Assurance/Quality Control

Field replicate samples are collected from a subset (10%) of all samples collected to quantify environmental variability and analytical consistency. Travel and field blanks are collected to detect potential sources of contamination. Field instruments are calibrated regularly according to the manufacturer's specifications and ENV (2013), and calibration logs are maintained.

Quality assurance/quality control (QA/QC) principles follow those outlined in guidance documents throughout the field sample collection and laboratory analysis phases (BCMOE 2016a; Environment Canada 2012c; ENV 2013). All water quality samples are collected by qualified personnel using suitable sampling equipment. Samples are preserved (where applicable) in appropriate containers, and transported and stored following accepted procedures. Chain-of-Custody forms are used to track the samples and analyses are conducted by an accredited laboratory.

4.3.3 Sediment Quality

4.3.3.1 Description

Sediment quality samples are collected annually at sites BJ 3.10, BJ 2.62, and KG 0.4 and every three years at the remaining sites. These samples are collected in conjunction with the periphyton and benthic macroinvertebrate surveys to assess for potential mine effects on aquatic sediments, and by extension to the aquatic community. Sediment quality samples measure the total organic carbon and metals concentrations as well as particle size distribution at each site, to provide contextual information for the benthic macroinvertebrate community analysis. Sediment samples destined for metals analysis (Table 4.3-2) are collected with a plastic spoon and bowl. Metal and total organic carbon concentrations are measured on the <63 µm fraction, as recommended by BCMOE (2016a) and specified in the EMA permit.

Table 4.3-2. Sediment Quality Parameters

Physical and Chemical Parameters	Total Metals		
% Moisture	Aluminum (Al)	Copper (Cu)	Silver (Ag)
pH	Antimony (Sb)	Iron (Fe)	Strontium (Sr)
% Gravel (> 2 mm)	Arsenic (As)	Lead (Pb)	Thallium (Tl)
% Sand (0.063 to 2 mm)	Barium (Ba)	Lithium (Li)	Tin (Sn)
% Silt (4 to 63 µm)	Beryllium (Be)	Manganese (Mn)	Uranium (U)
% Clay (< 4 µm)	Bismuth (Bi)	Mercury (Hg)	Vanadium (V)
Total Organic Carbon	Cadmium (Cd)	Molybdenum (Mo)	Zinc (Zn)
	Chromium (Cr)	Nickel (Ni)	
	Cobalt (Co)	Selenium (Se)	

Sediment samples from the KG 0.4 hydrocarbon monitoring site are analyzed for petroleum organic compounds and hydrocarbons, which includes the following compounds and classes of compounds:

- BTEX;

- VPH;
- MTBE;
- EPH (Extractable petroleum hydrocarbons);
- LEPH (Light extractable petroleum hydrocarbons); and
- HEPH (Heavy extractable petroleum hydrocarbons).

Sediment samples destined for hydrocarbon analysis are collected with a metal spoon and bowl. The hydrocarbon sediment sampling at the KG 0.4 site is designed as a surveillance program and will not be incorporated into the Before-After-Control-Impact analysis.

The statistical analysis for mine effects on sediment quality requires estimation of the size of the effects on the quantitative measures of metal concentrations, organic carbon concentrations, and particle size composition. Adequate sample size was determined using power analysis and estimates of parameter variability from the baseline and historical sampling programs. Five replicates per site are collected.

4.3.3.2 Quality Assurance/Quality Control

QA/QC principles follow those outlined in guidance documents during sample collection and laboratory analyses (BCMOE 2016a; Environment Canada 2012c; ENV 2013). Field splits are conducted for approximately 25% of the replicates. All sediment quality samples are collected by qualified personnel using suitable sampling equipment. Samples are stored in appropriate containers and transported following accepted procedures. Chain-of-Custody forms are used, and the analyses are conducted by an accredited external laboratory.

4.3.4 Primary Producers

4.3.4.1 Description

Primary producer (periphyton) biomass and taxonomy samples are collected annually at sites in Brucejack Creek (BJ 3.10, BJ 2.62, and BJ 1.74) and every three years at far-field and reference sites (SC0 and L3 OF). Primary producer biomass (as chlorophyll *a*) is also the criterion for phosphorus management in BC streams. Primary producers are monitored by collecting periphyton biomass samples following established protocols using a scraping template (ENV 2013). Primary producer biomass is estimated by measuring the concentration of chlorophyll *a*, a pigment associated with photosynthesis.

Periphyton samples for enumeration and taxonomic identification are collected to measure changes in the abundance and composition of the primary producer community. Samples are collected using the same template protocol as used for the chlorophyll *a* sampling (ENV 2013). The periphyton samples are preserved, kept cool, and transported to a qualified taxonomist for identification and enumeration. The periphyton taxonomic data are analyzed using the following effects indicators: density, Simpson's evenness index, and taxonomic richness.

4.3.4.2 Quality Assurance/Quality Control

QA/QC principles for periphyton biomass sampling follow those outlined in the *British Columbia Field Sampling Manual* (ENV 2013). Samples are stored in appropriate containers and transported following accepted procedures. Chain-of-Custody forms are used. The analysis of chlorophyll *a* concentration is conducted by an accredited laboratory. A qualified taxonomist conducts the identification and enumeration of the periphyton samples and follows standard protocols for subsampling, reference collections, and data quality assurance.

4.3.5 Benthic Invertebrate Community

4.3.5.1 Description

Benthic macroinvertebrate surveys are conducted annually at Brucejack Creek sites (BJ 3.10, BJ 2.62, and BJ 1.74) and every three years at far-field and reference sites (SC0 and L3 OF) to measure the effects of mine activities on the lower trophic levels of the aquatic environment. As per Section 4.1 of the EMA permit, benthic invertebrate sampling at BJ 2.62 and BJ 1.74 is done annually over three years (i.e., 2019, 2020, and 2021), after which the sampling frequency may be re-evaluated to every three years. The benthic macroinvertebrate community is sampled and analyzed using the reference condition approach (RCA) following the CABIN protocol (Environment Canada 2012b, 2012a) for the EMA permit.

Samples are collected from erosional zones, according to CABIN methods (Environment Canada, 2012a), to allow use of the RCA and comparison to previous surveys. Benthic macroinvertebrate surveys are planned for mid-August to mid-September, which is the time of year typically recommended for baseline surveys (BCMOE 2016a), and recommended by CABIN (Environment Canada, 2012a). Benthic macroinvertebrate surveys coincide with water quality, primary producer (periphyton), and sediment sample collections.

4.3.5.2 Quality Assurance/Quality Control

QA/QC principles follow those outlined in the EEM guidance documents for the collection of samples and subsequent laboratory analyses (BCMOE 2016a; Environment Canada 2012c; ENV 2013). Samples are collected by qualified personnel using suitable sampling equipment. Samples are uniformly pre-sieved and preserved in appropriate containers. Samples are stored and transported using accepted procedures.

All laboratory processing and taxonomic identification is conducted by expert taxonomists and appropriate sub-sampling and random re-sorting techniques are used. Data quality is verified by screening for potential data entry errors. All samples are stored for six years following analysis and a reference collection is maintained.

4.3.6 Toxicity Testing

4.3.6.1 Description

Toxicity testing of effluent is conducted quarterly on water collected at at BJ 3.10 following the procedures described in the *British Columbia Field Sampling Manual Part E: Water and Wastewater Sampling* (ENV 2013), as per Section 4.3 and 4.4 of the EMA permit. Testing is completed for a single concentration of 100% effluent, with effluent grab samples collected and processed without delay at an accredited facility. All test reports are recorded and reported according to the schedule outlined in Section 5.1 of this document. Additional toxicity testing is required as per the MDMER requirements which are not included in the AEMP.

Toxicity Testing

- 48-hour acute lethality assay *Daphnia magna* (EPS 1/RM/14; Environment Canada 2000).
- 72-hour growth inhibition test using a freshwater algae (EPS 1/RM/25; Environment Canada 2007).

Long-Term Trend Toxicity Testing

- Survival and growth of the freshwater midge *Chironomus dilutus* (EPS 1/RM/32; Environment Canada 1996).

Results of the long-term toxicity testing are examined for trends in survival and growth, compared to previous tests, and placed into ecological context.

4.3.6.2 Quality Assurance/Quality Control

QA/QC principles follow those outlined in the *British Columbia Field Sampling Manual Part A: Quality Control and Quality Assurance* (ENV 2013), the EEM guidance document (Environment Canada 2012c), and the reference methods for the collection of samples and subsequent laboratory analyses (Environment Canada 1996, 2000, 2007). Samples are collected by qualified personnel using suitable sampling equipment and are stored and transported using accepted procedures. Chain-of-Custody forms are used.

All laboratory processing and assays are conducted by accredited facilities. Data quality is verified by screening for potential data entry errors.

4.3.7 MDMER Monitoring Components

As previously mentioned, the MDMER monitoring components are not included in the AEMP and can be found in MDMER (SOR/2002-222) under the *Fisheries Act* (1985). Monitoring components of MDMER include:

- Effluent quality monitoring;
- Volume of effluent deposited;

- Acute toxicity testing using rainbow trout and *Daphnia magna* monitoring tests;
- Environmental Effect Monitoring (EEM) Studies;
    - Effluent and water quality monitoring studies;
        - Water quality monitoring;
        - Sublethal toxicity testing;
    - Biological monitoring studies;
        - Benthic invertebrate community;
        - Fish population; and
        - Fish tissues.

4.4 QUALITY ASSURANCE AND QUALITY CONTROL

The QA/QC for the AEMP includes the processes already identified for each component (as discussed in Section 4.3) as well as EMS processes related to data management and documentation. Recordkeeping is conducted by Pretium Resources Inc. and its consultants. Standard operating procedures (SOPs) are in place for environmental data collection and will be updated as needed. Sampling personnel have necessary training and accreditations.

SOPs cover all aspects of data collection, data processing, data QA/QC, and data management. SOPs include duplicate sampling, relevant blanks, chain-of-custody procedures, and recordkeeping. SOPs are reassessed and updated when necessary, as part of the iterative QA/QC process.

Data analysis is conducted using established and standardized workflows, and analytical results are cross-checked and validated. Data are entered into suitable electronic databases, checked for quality control, and stored for at least the life of mine. Data are entered in a format and program that allow for comparison between years and storage in a single file format for each type of survey or monitoring activity. Data that have undergone QA/QC are appended to the annual AEMP report and the compilation of all cumulative data is transferred for storage to the appropriate agency.

Internal quality audits are conducted to record and analyze quality issues and are subjected to quality assurance procedures for documenting, tracking, and resolving QA/QC issues. The Annual Report includes detailed descriptions of the analytical methods, such as the relevant validation and QC procedures.

All formal documents and reports follow version-control procedures with revision tracking and version numbers. Version control information are required for all documents and data that are issued, and approval will be given and tracked before issue. Designated personnel coordinates preparation, review, and distribution, as appropriate, of the data and reports required for regulatory purposes.

The iterative QA/QC procedures continuously improve the effectiveness of the AEMP to detect mine-related effects in the aquatic environment. These QA/QC processes are important in the overall adaptive management of mine effects, and support the goals of the mine to minimize, mitigate, and/or manage potential adverse effects on the environment.

5 TRIGGERS

Triggers for additional mitigation and management measures are required by the EMA permit. If unanticipated effects or poor performance of existing measures are identified, additional mitigation and management strategies will be described in the Annual Report. In addition, the need for zinc concentration triggers at BJ 3.10 and WTP effluent were identified following review of potential effects to water quality due to use of a corrosion inhibitor in ore processing. A summary of AEMP triggers is presented in Table 5-1.

Table 5-1: Summary of Triggers

Component	Trigger	Action
Water Quality	BJ 3.10 greater than limits in Condition 1.1.1 of effluent permit	As per Sections 5.3 and 5.4 of the EMA permit, if an effluent concentration limit is exceeded, notification of the exceedance will be made within 24 hours of receiving water quality results from the laboratory, an investigation into the cause of the exceedance will be conducted, and actions will be identified and implemented to prevent similar exceedances from occurring. A non-compliance report will be submitted within 30 days of the non-compliance notification.
	BJ 3.10 greater than permit limits or WQGs	As per Section 4.8 of the EMA permit, exceedance of permit limits or British Columbia Water Quality Guidelines at BJ 3.10 may trigger the direction to require additional information. This may include, but is not limited to, additional sampling and monitoring, a risk assessment, and an environmental management plan.
	BJ 3.10 T-Zn >6 µg/L or WTP Effluent T-Zn >16 µg/L	Review continued use of CT788 corrosion inhibitor in gland water supply. Compare observed concentrations to water quality model predictions. If observed zinc concentrations are confirmed to be related to the use of CT788, use of the reagent will be suspended, and alternative options will be investigated.
Toxicity Testing	Failure of 48 hour acute lethality assay *Daphnia magna* Failure of 72 hour growth inhibition test using a freshwater algae	Failure of either toxicity test, as defined by the EMA permit, will require the notification of the Ministry and an immediate repeat of the failed toxicity test (EMA permit Section 5.3). For an acute toxicity 48 hour *Daphnia magna* failure, the repeated test will include multiple concentrations to determine the lethal concentration to 50% of the test population (LC_{50}).

6 REPORTING AND RECORDING

6.1 REPORTING

The core report is the Annual Report which describes the status of the aquatic environment and any observed trends associated with mine operations.

Reporting of environmental monitoring data is conducted in accordance with all permits and approvals. Regulatory requirements are anticipated to entail formal annual reports, including discussion of issues of non-conformance (Table 5-1). The Annual Report includes the following:

- a description of mine activities during the monitoring interval;
- a compilation of AEMP monitoring data obtained during the most recent reporting period;
- description of the methods used for sample and data collection;
- an evaluation of the impacts of effluent discharge on the receiving environment, adequacy of monitoring, and recommendations;
- results from the evaluation of effects, in text and figures;
- conclusions from the evaluation of effects;
- description of mitigation measures in place, and a discussion of effectiveness; and
- identification of additional mitigation measures as required.

Annual reports are issued in a standardized format and are kept on file and made available upon request.

6.1.1 Compliance and Permit Reporting

The Annual Report contains the information to comply with conditions listed in Section 5.5 of the EMA permit. The AEMP includes the methods, results, and interpretation for:

- Analyses of key water quality trends;
- Sediment and biological monitoring;
- Acute and chronic toxicity testing;
- Environmental effects; and
- Assessment of the protectiveness of the discharge limits.

The MDMER EEM studies are reported separately from the Annual Report.

6.1.2 External Reporting

As part of environmental reporting, Pretivm distributes copies of the annual AEMP report to relevant entities.

Appendix A

Statistical Power Modeling for BACI ANOVA

APPENDIX A. STATISTICAL POWER MODELING FOR BACI ANOVA

Simulations are an established method for estimating statistical power in the absence of analytical solutions (Bolker 2008). Although analytical estimates are available for simple statistical designs, such as linear regression or one-factor ANOVA, these methods are not applicable to the two-factor ANOVA required for BACI analyses (Environment Canada 2012c). The design of this power modeling analysis follows from the basic principles of frequentist statistics, where the false-positive rate (Type I error, a) and the false-negative rate (Type II error, β) describe the acceptable levels of uncertainty in the statistical analysis (in a narrow sense). The standard ANOVA approach is design to control the false-positive rate, whereas the false-negative rate is determined by a number of factors, including sample size and experimental design.

For this power analysis, the effect is fixed to a minimum critical effect size (CES) of 2 standard deviations (SD). With this known effect size, the model simulates the results of a monitoring plan comparing observations of a component of the aquatic ecosystem at an exposure site and a reference site. Observations are drawn as random values from a normal distribution determined by baseline sampling, and including the +2 SD effect at the exposure site. For each run of the simulation, these modeled observations are analyzed with a two-factor BACI model, and the significance of the interaction term between *period* (Before-After) and *treatment* (Control-Impact) was compared against an a = 0.1 (as suggested in the *Metal Mining Technical Guidance for Environmental Effects Monitoring*). If the simulation run did not identify the change in the monitoring parameter to be significant, even though the value increased by 2 SD, then the run was flagged as a false-negative. The simulation was repeated for 1,000 iterations, and the frequency of false-negative flags was used to estimate the power of the statistical test under those simulated conditions. The simulation was the run across a series of sampling sizes to determine the replication necessary to results in a power of 0.9 (or β = 0.1).

Table A-1 describes the source data and specific model characteristics used in the simulations. The R (http://www.r-project.org/) code for the model, which includes a tool for presenting the simulation results, is included below.

Table A-1. BACI ANOVA Power Analysis Model Inputs and Settings

Parameter	Site	*n*	Mean	SD	Model Characteristics
Sediment Arsenic	BJ 1.74	3	253 mg/kg	42 mg/kg	Model uses log_{10}-transformed data to stabilize variances.
	L3 OF	3	12.6 mg/kg	0.1 mg/kg	
Periphyton Biomass (chl. *a*)	BJ 1.74	3	3.23 µg/L	1.29 µg/L	Model uses non-transformed chlorophyll *a* concentrations
	L3 OF	3	1.14 µg/L	0.65 µg/L

2022.0	March 2022	Pretivm's Mountain Safety, Health & Safety and Environment & Regulatory Affairs Departments	Minor updates to Sections 5 (Organizational Structure and Personnel) and 7 (Equipment and Infrastructure)

DISCLAIMER AND ACKNOWLEDGEMENTS

The Avalanche Safety Plan (ASP) provides an overview of operations for the Brucejack Mine, managed and operated by Pretivm Resources Inc (Pretivm). The ASP intent is to provide a comprehensive guide to all the individual components of the avalanche safety program, which is managed by the Mountain Safety Department of Pretivm Resources Inc. This ASP is a living document and will be reviewed annually to reflect improvements and changes implemented into the avalanche safety program.

Avalanches are a chaotic natural phenomenon, and consequently have a varying degree of unpredictability and uncertainty. This creates a level of risk for anyone working in or travelling through avalanche terrain. The avalanche hazard at a workplace may range from nil (outside of avalanche paths) to extreme (workplace is exposed to multiple avalanche paths with very poor snow stability). This risk may not be eliminated but is kept as low as reasonably practical by following the mitigation measures outlined in this ASP. These measures follow industry best practices for the reduction of avalanche hazards and risk.

The history of previous avalanche occurrences within and surrounding the Mine area has been collected and added into a database for the past ten years. Long-term experience and observation in a specific area improves understanding of local avalanche phenomena and increases forecasting accuracy. Regular snowpack, weather and avalanche occurrence observations by qualified personnel are important components of the ASP implementation.

Although other geo-hazards exist in the region, risk reduction measures in this ASP are limited exclusively to snow avalanches and cornice fall. In addition, any artificial or natural alteration of the landscape or terrain due to earthworks, forest fire, deforestation, landslides, or other geological events may change the nature of avalanche hazard, necessitating a reassessment for the area affected.

Each workplace within an avalanche risk zone requires site specific risk management strategies determined by a qualified Mountain Safety Technician. Qualified personnel will provide Pretivm management, employees, and contractors an avalanche hazard evaluation, related recommendations, and other services as required, whenever a workplace requires ASP implementation. The subsequent actions or inactions of any Pretivm personnel are not the responsibility of the Mountain Safety department.

The Mountain Safety Department of Pretivm will provide ongoing recommendations and services to manage avalanche hazards on the Mine. The authority and final decision to implement any recommendations resides with the Pretivm General Manager or designate.

This ASP provides all Pretivm Brucejack Mine workers, contractors and authorized industrial road users with safe working and driving conditions. However, if specific information is required and it is not addressed in this document, it is the responsibility of every manager, supervisor, and worker involved to seek out that information immediately.

The Pretivm Mountain Safety Department has prepared this document for the Brucejack Mine. The material included in this document reflects their best judgement considering the information available at the time of preparation. Any use of this plan by a third party, or any reliance on or decisions to be made based on it, is the responsibility of such third parties. Pretivm accepts no responsibilities for damages, if any, suffered by any third party resulting from decisions made or actions taken, based on this plan.

GLOSSARY AND ABBREVIATIONS

ASP	Avalanche Safety Plan
ATES	Avalanche Terrain Exposure Scale
BC	British Columbia
Brucejack Access Road	Access road connecting from ~km 215 of Highway 37 to the Brucejack Mine
CAA	Canadian Avalanche Association
ERT	Emergency Response Team
HSRC	Health, Safety and Reclamation Code for Mines in BC (2017)
km	Kilometre
MEMLCI	BC Ministry of Energy, Mines and Low Carbon Innovation
Mine Site	Infrastructure area at the southwest end of Brucejack Lake
Mine Site Area	Infrastructure area west of upper Knipple Glacier
PPE	Avalanche personal protective equipment
Pretivm	Pretium Resources Inc.
SOP	Standard Operating Procedures
TVL	Tsetsaut Ventures Ltd.
WSBC	WorkSafeBC – Workers' Compensation Board of British Columbia

DEFINITIONS AND TERMS

Avalanche risk zone: A workplace or part of a workplace where an avalanche risk assessment determines that avalanches pose a risk to any person working at the workplace or infrastructure of the Mine site and risk control measures are required to make the area for work safe to be conducted (WorkSafe BC, 2014).

Avalanche hazard: The potential for an avalanche to cause damage to something of value. It is a function of the likelihood of triggering or frequency, and the avalanche size or magnitude (CAA, 2016a).

*Note – hazard and danger may be used synonymously when referring to avalanche hazard ratings used for Mine work in this ASP.

Acceptable risk: Describes the likelihood of an event where the probability of occurrence is small, the consequences are so slight, or the benefits (perceived or real) are so great, that the individuals or groups in society are willing to take or be subjected to the risk that the event might occur (Encyclopedia of Public Health).

Workplace: Any place where a worker is, or is likely to be, engaged in any work and includes any vessel, vehicle or mobile equipment used by a worker in work (BC Workers Compensation Act – Section 106, Definitions (Part 3)).

Note: For purposes of this ASP, reference to "workplace" also includes ground and air access routes to workplace locations.

1 INTRODUCTION

This document is the Avalanche Safety Plan (ASP) for the Pretivm Resources Inc. (Pretivm) Brucejack Mine.

An Avalanche Risk Assessment and Avalanche Hazard Zoning have been completed for the Brucejack Mine (Appendix A) as well as detailed Avalanche Hazard Zoning for the Mine Site Area (infrastructure area west of the Knipple Glacier; Appendix B). These documents should be referenced in consideration of appropriate avalanche mitigation measures prior to placement and construction of temporary or permanent infrastructure within the Mine Site Area. Infrastructure placed outside of the Mine Site Area should initially reference the Avalanche Risk Assessment and Avalanche Hazard Zoning documents; however, it will require detailed avalanche mapping to be completed in the planning stages to provide a higher degree of certainty regarding potential avalanche hazard (WSBC 2009).

The Mountain Safety Department is responsible for providing operational avalanche safety services to implement the ASP. This team of professional Avalanche Technicians provide 24-hour avalanche risk management for workers, haul road traffic and infrastructure on the Brucejack Mine.

The team use a network of remote telemetry and manual weather stations, assess reports of regional avalanche conditions, observe avalanche occurrences, and investigate the structure of the snowpack. When the conditions warrant, road or worksite closures are initiated to ensure the safety of all Mine workers. Efforts are made to ensure that closures are as short as possible, and that road and worksites are reopened as soon as the avalanche risk is reduced to an acceptable level.

During closures, explosives may be used to trigger avalanches. Traditional means of explosives control is by case and hand charging, and the deployment of explosives from a helicopter.

At two critical locations on the lower access road, Pretium has invested in avalanche control devices that can be remotely triggered. The Remote Avalanche Control System (RACS) provides reliable deployment of explosive control devices in any type of weather.

In several locations, the team builds snow catchments along the access road and in Brucejack camp to reduce or eliminate the effect of avalanches.

This ASP establishes on-going avalanche safety procedures. These are developed to meet or exceed Health, Safety and Reclamation Code for Mines in British Columbia (HSRC), WorkSafeBC, and Canadian Avalanche Association's (CAA) regulations, guidelines, and avalanche industry best practices.

Risk mitigation measures outlined in this ASP include but are not limited to:

- Avalanche education and rescue training, including use of avalanche personal protective equipment (PPE)
- Preparation and maintenance of avalanche rescue equipment

- Worksite risk classification planning tools
- Avalanche-related Standard Operating Procedures (SOPs), including communication standards check in / check-out procedures
- Assessment and communication of current and forecast avalanche hazards
- Worksite Avalanche Assessments, including hazard identification, signage, and closures
- Daily snowpack, weather, and avalanche observations
- Avalanche control using explosives and other means
- Emergency response and avalanche rescue

2 REGULATORY FRAMEWORK

The health and safety of workers at the Brucejack Mine falls under two different jurisdictions. The Mine site, km 71.6 and up on the haul road is under the jurisdiction of The Ministry of Energy and Mines. The remaining camps and haul road from km 0 to km 71.6 and all further exploration areas fall under the jurisdiction of WorkSafeBC.

This ASP is in accordance with all requirements of the following applicable regulations and guidelines:

- Health, Safety and Reclamation Code for Mines in British Columbia (MEM, 2017);
- Workers Compensation Act. Occupational Health and Safety Regulation. B.C. Reg. 296/97 (WCB, 2020);
- Technical Aspects of Snow Avalanche Risk Management (TASARM): Resources and guidelines for Avalanche Practitioners in Canada (CAA, 2016a); and
- Recommended Generic Table of Contents -Avalanche Safety Plan (CAA, 2009)

The latter two guidelines are recognized by WorkSafeBC and accepted as industry standards for ASP development for operations in avalanche terrain in British Columbia.

Workplaces are typically assessed for avalanche return periods in the range of less than 30 to 100 years, depending on the permanence of occupation of the work site, with a critical avalanche Size 2 or greater (Table 2-1). An ASP is implemented when the return period at a workplace is within this range.

Recommended avalanche risk mitigation measures in this ASP are based on these WorkSafeBC and Canadian Avalanche Association guidelines.

Table 23.1-1. Risk Assessment & Mitigation Guidelines – Industrial Mines (CAA, 2016a)

Land Use	Typical Return Period (years)	Typical Avalanche Size	Typical Action or Planning	Typical Maps
Work sites (e.g. 9,400 m2, Laydown, Portal)	≤30	≥1	• Operational avalanche safety plan • Avalanche Forecast and control program	Locator or avalanche atlas mapping
Occupied Structures (e.g. Camp, Office)	≤300	≥1 or an impact load of ≥1 kPa	• Location Panning • Structural protection • Short-term operational measures including a comprehensive avalanche control program, closures, and evacuations	Site specific mapping
Resource Road	≤30	≥2	• Operational avalanche safety plan • Avalanche forecast and control	Locator or avalanche atlas mapping

3 DESCRIPTION

3.1 LOCATION OVERVIEW

The Brucejack Mine lies within the Boundary Ranges of the Coast Mountains of Northern British Columbia (Figure 3.1-1). The closest communities, approximately 60 km south, are Stewart, British Columbia and Hyder, Alaska.

The Mine Site Area is in the alpine eco-region, at an elevation of 1435m. It is situated on the south shore of Brucejack Lake, at the head of the Knipple Glacier, 56°27′56″ north latitude, 130°11′08″ west longitude.

The Brucejack Access Road begins at km 215 of Highway 37, near the confluence of Wildfire Creek and the Bell Irving River. It follows the Wildfire Creek, Scott Creek, and Bowser River valleys, then ascends the Knipple Glacier to the Mine Site (infrastructure located at the southwest end of Brucejack Lake) (Figure 3.1-2).

The operational area intersects several distinct geographic and climate zones. For practical purposes they have been divided into 7 distinct Avalanche hazard forecast zones, further subdivided based on the regular three elevation-based hazard zones (Alpine, Treeline, and Below Treeline).

The hazard zones are:

- Zone A – Brucejack Mine Site (including Brucejack Camp);
- Zone B – Lakeshore Drive Km 71.6-74;
- Zone C – VOK Road and Control Roads;
- Zone F – Knipple Corner Exit Km 56-59.5;
- Zone G – Scott Creek to Bowser Km 37-56;
- Zone H – Wildfire to Scott Creek Km 3-37; and,
- Wildfire Hill Km 2-3.

Figure 3.1-3 depicts the avalanche hazard zones relative to Brucejack Mine and Access Road infrastructure.

Figure 3.1-1. Location of the Brucejack Mine Relative to British Columbia

Figure 3.1-2. Brucejack Mine Operating Area

Figure 3.1-3 Mine Site Area and Access Road Area Map Relative to Avalanche Hazard Zones

3.2 MINE PHYSIOGRAPHY AND SNOW AVALANCHE CLIMATE

The terrain surrounding the Brucejack Mine is rugged and mountainous. Mine avalanche terrain includes Alpine, Treeline and Below treeline vegetation zones (Table 3.2-1). The land is glaciated in all directions surrounding the Mine site and the glaciers descend to elevations below treeline. Winter weather in the area is historically severe. This is largely due to the height of the mountains and proximity to the ocean. The mountains cause rapid orographic lifting of prevailing weather systems from the western quadrant.

The Mine Site, including the Brucejack Camp, is in a mountain pass that creates a localized microclimate of variable strong winds which compounds the effects of regional weather systems, often contrary to prevailing winds.

The combination of rugged glaciated topography, latitude, and coastal weather systems creates severe winter conditions. The region receives some of the heaviest snowfall in North America, with settled seasonal snowpack depths ranging from 3 to 6 metres. Local drifting snow creates highly variable snow deposition, often to depths much greater than the regional average. Although there are obvious conditions favorable for avalanches throughout the winter, the potential also extends into summer; therefore, avalanche season ranges from October to June.

Table 3.2-1. Brucejack Mine Reference Elevations (CAA, 2016b)

Feature	Approximate Elevation(m)	Description / Notes
Ridgetop	1600	Height of land in project area.
Alpine	Above 1400	Upper mountain elevations where trees are very sparse to nonexistent*
Tree line	1200-1400	Elevation band describing the transitional area between closed forest below and open treeless areas above.*
Below Teeline	Sea level (0) to 1200	Terrain from valley bottom to where the mountain side forest begins to thin*
Stewart BC	0	

3.3 AVALANCHE MAGNITUDE AND FREQUENCY

The relation between the frequency and magnitude of an avalanche is complex, encompassing several variables such as the number and type of snowfalls, effects of wind transported snow, snowpack structure, and terrain. Regularly occurring large storms often, but not always, cause avalanches. Important terrain characteristics are slope shape, size, and incline. Snow structure can also affect the magnitude and frequency of avalanches. For example, a weak layer buried deeply in the snowpack can result in large avalanches.

Avalanche frequency (avalanche return period) is typically given a range from 1 to 300 years. An avalanche reaching a location every year is considered high frequency, whereas an avalanche reaching

a location every 300 years has a very low frequency. In general, it is expected that lower frequency avalanches will reach further down the path in the runout zone. The annual probability of the avalanche is the reciprocal of the return period. The annual probability of a 100-year return period avalanche is 0.01 (1%, or 1:100 annually).

The magnitude of avalanches is described by the Canadian Avalanche Size Classification (Table 3.3-1). Typically, a size 1 or 2 avalanche will not damage conventional structures. A size 3 may damage or destroy a typical wood frame structure. A size 4 or 5 avalanche can destroy multiple typical wood frame, steel, and concrete structures.

Avalanche magnitude is also related to frequency in that large destructive avalanches will occur less frequently than smaller ones in each avalanche path. The frequency of reaching a specific location in an avalanche path decreases with the locations distance from a start zone.

Table 3.3-1. Canadian Avalanche Size Classifications (CAA, 2016b)

Size	Destructive Potential	Typical Mass (t)	Typical Path Length (m)	Typical Impact Pressure (kPa)
1	Relatively harmless to people	<10	10	1
2	Could bury, injure, or kill a person	100	100	10
3	Could bury and destroy a car, damage a truck, destroy a wood framed house, or destroy a few trees	1,000	1,000	100
4	Could destroy a railway car, large truck, several buildings, or forest area of approx. 4 ha	10,000	2,000	500
5	Largest snow avalanche known. Could destroy a village or a forest area of approx. 40 ha	100,00	3,00	1,00

3.4 AVALANCHE TERRAIN CLASSIFICATION

Avalanche terrain within the study area is categorized into four separate classes, based on the level of potential avalanche exposure as determined by terrain variables, using an industry standard terrain classification scheme (Table 3.4-1)

The terrain classes used in some of the mapping are identified for field work planning and general navigation only. To navigate safe routes through avalanche terrain the ability to recognize specific avalanche prone terrain features is necessary. These features include:

- Slope angle – any open slope greater than 25° has the potential to produce avalanches.
- Slope shape – convex shaped slopes are more prone to avalanches than concave shaped slopes.

- Wind exposure – leeward slopes near ridge crests are often more prone to avalanches, especially in the afternoon.
- Terrain traps – trees, cliffs, open water, abrupt transitions, etc. can increase the consequence of being caught in an avalanche.

Table 3.4-1. Avalanche Terrain Exposure Scale (ATES).

	Class 0	Class 1	Class 2	Class 3
Slope angle	Angles< 20°	Angles generally < 30°	***Mostly low angle, isolated slopes > 35°***	***Variable with large % > 35°***
Slope shape	Uniform of concave	Uniform	Some convexities	Convoluted
Forest Density	Densely Forested or low-angle openings	Primarily treed with some forest openings	Mixed trees and open terrain	Large expanses of open terrain. Isolated tree bands
Terrain Traps	None	Minimal, some creek slopes or cutbanks	Some depressions, gullies and/or overhead avalanche terrain	***Many depressions, gullies, cliffs, hidden slopes above gullies, cornices***
Avalanche frequency (events: years)	No avalanches > size 1	1:30 ≥ size 2	1:1 for < size 2 ***1:3 for ≥ size 2***	1:1 for < size 3 ***1:3 for ≥ size 3***
Start zone density	No open terrain > 15°	Limited open terrain	Some open terrain, isolated avalanche paths leading to valley bottom	Large expanses of open terrain. Multiple avalanche paths leading to valley bottom
Runout zone characteristics	No exposure to runouts	Solitary, well defined areas, smooth transitions, spread deposits	Abrupt transitions or depressions with deep deposits	Multiple converging runout zones, confined deposition area, steep tracks overhead
Interaction with avalanche paths	None	Runout zones only	Single path or paths with separation	***Numerous and overlapping paths***
Route options	Unlimited	Numerous terrains allows multiple choices	A selection of choices of varying exposure, options to avoid avalanche paths	***Limited chances to reduce exposure, avoidance not possible***
Exposure time	None	None, or limited exposure crossing runouts only	***Isolated exposure to start zones and tracks***	***Frequent exposure to start zones and tracks***

Parameters in bold type default assessed locations into that class (Parks Canada, 2017; Statham et al, 2006)

4 OPERATIONAL OBJECTIVES

The primary objective of this Avalanche Safety Plan is to protect workers and infrastructure from avalanche hazards while maintaining a safe and productive operation.

Secondary objectives include:

- protecting equipment and infrastructure from damage and loss;
- minimizing road closures and operational disruptions;
- ensuring all work and travel meets regulations and best practices as prescribed and maintained by Health, Safety and Reclamation Code for Mines in British Columbia (HSRC), WorksafeBC (WSBC), and The Canadian Avalanche Association (CAA); and
- planning for incident response.

Complexity is present in any safety plan; however, by focusing on areas such as Early Planning, Hazard avoidance, Hazard Reduction, Risk reduction, Defense Structures, Hazard Monitoring and Training, this ASP is intended to minimize operational impacts while maintaining a high degree of safety.

5 ORGANIZATIONAL STRUCTURE AND PERSONNEL

5.1 MOUNTAIN SAFETY DEPARTMENT

The department is an integral member of the Brucejack Surface Operations Department. Up to nine Mountain Safety Avalanche Technicians are on duty at the Brucejack Mine and lower access road at any time during the avalanche season. Technician teams operate out of two camp locations (Brucejack and Knipple Camps). They provide 24-hour management of avalanche risk to workers at Brucejack and its supporting infrastructure. A supervisor covers both camps, and up to two dayshift and two nightshift technicians at each camp.

5.1.1 Mountain Safety Supervisor

Reports to Health, Safety and Security Manager. Oversees the Mountain Safety Department and Avalanche Technicians. Responsible for scheduling, training, planning, logistics, and quality assurance. Makes recommendations to management for implementation of ASP. Liaises with management and other departments for all operations.

5.1.2 Mountain Safety Lead Hands

Report to the Mountain Safety Supervisor. In the absence of the Mountain Safety Supervisors, they oversee the Mountain Safety Department. Oversee Avalanche technicians under their direct supervision. They are responsible for collecting snow and avalanche information, assessing avalanche hazard at worksites, and disseminating snow and avalanche information in a daily avalanche hazard bulletin. Conduct routine snow stability tests and hazard reduction work. Liaise with management and other departments for all Brucejack daily avalanche safety operations. Provides input into Procedures and plans.

5.1.3 Mountain Safety Technicians

Report to the Mountain Safety Supervisor and Lead Hands. They are responsible for collecting snow and avalanche information, assessing avalanche hazard at worksites, and disseminating snow and avalanche information in a daily avalanche hazard bulletin. Conduct routine snow stability tests and hazard reduction work. Liaise with management and other departments for all Brucejack daily avalanche safety operations.

6 TRAINING

6.1 WORKERS REGULARLY EXPOSED TO AVALANCHE HAZARD

6.1.1 Mountain Safety Technicians

All technicians will hold at a minimum a Canadian Avalanche Association (CAA) Level 2 certificate, Transportation of Dangerous Goods (TDG), Advanced First aid, BC Worker Compensation Board (WCB) and Mines blasting certificates as well as a current professional membership to the Canadian Avalanche Association. Further certification is desirable and encouraged, such as Level 3 CAA certificate, Association of Canadian Mountain Guides (ACMG) Ski or Mountain Guide status, Incident Command System certification and advanced first aid.

The technician's skills and training are commensurate with the responsibilities of their current position; however, the technician is encouraged to improve their skills and training levels to facilitate continued professional development.

Technicians require continued exposure to training opportunities to remain current, capable, and qualified for their duties. Avalanche knowledge and standards are constantly improving. Therefore, providing continued support for improvement of employee skills is integral to the effectiveness of the avalanche program.

The CAA has established training guidelines for avalanche safety workers. Workers and the managers overseeing avalanche programs can review these guidelines and strive to ensure that the work performed on behalf of Pretivm is undertaken by skilled, competent, and engaged workers.

Formal training courses aligned with on-the-job training of the technician's skill development will benefit Pretivm. Courses include advanced weather forecasting; avalanche search and rescue; applied avalanche risk management; and numerous seminars and conferences focused on avalanche research, education, and safety.

The Mountain Safety Department conducts annual training throughout the avalanche season. All training is documented on a digital tracking sheet. Training includes:

- annual reviews of all SOPs;
- avalanche rescue;
- first aid and triage;
- field work best practices such as route selection, travel techniques, and snow profile procedures; and
- a minimum of 8 hours of explosives training.

6.1.2 Equipment Operators and Environmental Scientists

All Equipment Operators, Environmental Scientists, Personnel and Contractors who have been designated as having higher avalanche terrain exposure or higher vulnerability are required to complete annual avalanche safety training delivered by the Mountain Safety Department.

Department and Contractor Supervisors are responsible for ensuring all workers who need Avalanche Safety Training are trained prior to being exposed to hazard.

The avalanche risk potential for equipment operators and environmental scientists is much higher than that of general road users; therefore, a higher level of training is provided to these groups.

Pretivm's customized avalanche safety training course includes classroom and outdoor sessions. The sessions cover theoretical and practical aspects of avalanche safety including, but not limited to:

- Formation of avalanches
- Hazard Rating Safe Work Procedures
- Standard Operating Procedures
- Worksite Avalanche Assessment and associated procedures
- Use of avalanche companion rescue equipment (Avalanche PPE)
- Check-in/Check-out procedures
- Avalanche signage
- Encountering unexploded ordinance
- Avalanche and weather observation reporting
- Familiarity with identified avalanche zones within the Mine
- Mountain hazards awareness and recognition
- Best practices if caught in or witness to an avalanche.
- Avalanche rescue, including practice basic rescue scenario

Avalanche PPE is provided to designated workers, including all Equipment Operators working in avalanche terrain during daily work.

The Safety Department maintains worker avalanche safety training and exam records.

6.2 ALL OTHER PERSONNEL AND CONTRACTORS

Most Mine workers travel through identified avalanche zones to and from Mine worksites/camp locations; therefore, all workers are required to annually attend an introductory avalanche safety seminar. The training session focus on Safe Work Procedures including hazard communication, signage, and introduces avalanche phenomena, basic safety measures, Mine avalanche hazard

warning and closure system, with the emphasis being on safe road travel procedures. This course is developed by the Mountain Safety Department and delivered by the Safety Department during the site orientation seminar.

At times, personnel will need to conduct work within avalanche areas. In this case, the need to undertake the work will be established with the Mountain Safety Department who will identify the appropriate level of instruction, supervision and use of personal protective equipment.

6.3 EMERGENCY RESPONSE TEAM

The Emergency Response Team (ERT) is on 24-hour standby to assist with rescue response in the event of an avalanche incident. Therefore, they require a higher level of training, acquired from two distinct training courses. The first course provides knowledge on advanced companion rescue skills including avalanche transceiver use, probing, and shovelling techniques. The second course explores organized avalanche response training including communications, command structure and scope, with a focus on second party tasks (Recco use, search strategies, spot probing, and deep burials.) Practice field scenarios occur regularly to ensure the ERT teams are competent in avalanche rescue. These courses are based on the CAA's current best practices, adjusted to the appropriate skill levels and experience of the ERT team.

6.4 DISPATCH

Dispatch plays an integral role in emergency response on the Brucejack Mine. They receive an annual review of the avalanche emergency response plan (Appendix D) and participate in mock avalanche rescue scenarios to allow for familiarization with response procedures, as well as providing feedback for ongoing improvements.

7 EQUIPMENT AND INFRASTRUCTURE

7.1 SNOW AND WEATHER

Manual and remote telemetry weather stations as well as snow study plots have been established in the Mine area. Weather telemetry is hosted on software (Aquarius Webportal v.2020.1) which graphs and stores all relevant data including: wind speed and direction, humidity, temperature, and atmospheric pressure. Snowpack telemetry includes snowpack height and hourly precipitation amounts. Mountain Safety personnel collect twice daily weather observations alongside regular snowpack observations and update the CAA Infoex database with all relevant observations.

7.2 RADIOS AND COMMUNICATIONS

Radios are the most effective means of communication on the Brucejack Mine. Pretivm has licensed several radio frequencies, including both simplex (line of sight) channels and three repeater frequencies (Appendix E).

All Brucejack Mine workers operate on designated Pretivm frequencies to maintain a direct line of communications with the Mine Manager, Dispatch, Surface Operations Supervisor, Equipment Operators, Mountain Safety, Yellowhead Helicopter pilots and each other.

Radio communication along the Mine haul roads follows the Pretivm Standard Road Procedures SOP.

7.3 AVALANCHE CONTROL

Pretivm has purchased and installed 2 separate systems for remote firing of charges to trigger avalanches:

- A series of 6 Gazex exploders installed at km 44.5 and
- A set of 12 Wyssen towers mounted at km 60.

If any person comes upon undetonated explosives, they are instructed not to touch the explosive, to stop in a safe area and call Dispatch immediately, relaying the location of the explosive. Dispatch will notify the Mountain Safety Department who will guard the area until the explosive can be detonated.

A wildlife management plan is in place to ensure all regulations and best practices are followed for igniting explosives in a mountain environment that may be habitat for various sensitive animal species including mountain goats, moose, wolverine, and bear. Pre-control wildlife surveys are performed and recorded digitally

7.4 EXPLOSIVES STORAGE, TRANSPORTATION AND USE

Mountain Safety staff are certified to purchase, handle, store, transport, and fire explosives in BC in accordance with all federal and provincial regulations. These regulations are overseen by the following bodies:

Transportation of Explosives - Transport Canada, Transportation of Dangerous Goods Directorate is the federal body responsible for the Transportation of Dangerous Goods Regulation.

Vehicles transporting explosives are in proper running condition, have 4 orange TDG diamond shaped placards placed on the front, rear and sides, have a separate compartment for the explosives and detonators and are equipped with suitable fire extinguishers.

Explosives are delivered directly by the explosive supplier to the Mine. Explosives are stored in licensed magazines, where only authorized and trained persons are permitted access. Authorization includes holding current BC and HSRC blasting permits; approved clearance letters from Natural Resources Canada (NRCAN) Explosives Regulatory Division; and sign-off on the key management plan, site safety plan and fire safety plan for the magazine they are accessing.

Storage of Explosives - Natural Resources Canada, Explosive Safety and Security Branch, is responsible for administering the federal Explosives Act and regulations. Through the Explosives Regulatory Division (ERD), the Branch provides services and support to the explosives industry.

Explosive Use off the Mine site - WorkSafeBC regulation dictates how explosives are used in BC. They also examine and certify individual blasters for specific types of blasting operations. WorkSafeBC regulation also describes the conditions under which explosives are transported or stored.

Magazines for the storage of explosives used in avalanche control (1 x type 4 and 1 x Type 9 magazine at km 48, 1 x Type 4 and 1 x Type 9 magazines at Brucejack Camp), are maintained in full compliance with the Health Safety and Reclamation in Mines in British Columbia Act Part 8 and NRCAN regulations.

Explosive Use on the Mine site – Blasters on the Mine site are examined and certified for specific blasting procedures as defined in the Health, Safety and Reclamation Code for Mines in BC (2017).

Explosives used shall be licensed as per the Explosives Act (Canada),and shall be used in accordance with the manufacturer's recommendations. All avalanche control blasting procedures are approved by WorkSafeBC.

7.4.1 Blasting Procedures

The use of explosives for avalanche control is detailed in the Pretivm Avalanche Blasting Procedures (Appendix F), which follows all Ministry of Energy and Mines, and Low Carbon Innovation (MEMLCI) and WorkSafeBC procedures.

In addition to avalanche closure procedures, other considerations prior to commencing avalanche control with the use of explosives are covered in SOP's. Mountain Safety will provide communication, either through an avalanche control flash email, the Daily Advisory Bulletin (Appendix G), or over the radio about location and timing of blasts.

Blasting Procedures, like the ASP, are living documents requiring continual (annual at a minimum) review. Upon recognizing a situation where procedural changes could increase worker safety and/or reduce avalanche or other hazards, the Mountain Safety Department will conduct an internal review and any updates will be submitted to WorkSafeBC and MEMLCI for approval before implementation.

7.4.2 Avalanche Control in Proximity to Structures and Equipment

Mountain Safety will pre plan with the Surface Operations Supervisor and provide further communication about probable timing for the buildings to be cleared of personnel. A physical sweep is done in all buildings and roadways/parking areas to ensure all workers and vehicles are out of the danger area prior to the blast. Guards remain in place until after the blast and are removed when instructed by Mountain Safety that it is safe to open the area.

Explosive quantity is restricted to minimize damage to structures, as referenced in the Pre-blast Checklist (Appendix H) in the Pre-Blast Procedures SOP.

7.4.3 Emergency Response Assistance Plan

Mountain Safety Technicians will be required to respond in the event of an explosive spill occurring during transportation. A copy of the Emergency Response Assistance Plan is placed in the vehicles used for transporting explosives. The Mountain Safety technicians use Dyno Nobel's Emergency Response and Assistance Plan (ERAP #2-1037) as a procedural response to an explosive-related emergency (Appendix I). Technicians are required to carry out an annual refresher on the Emergency Response Assistance Plan.

7.5 SIGNS AND NOTICES

Avalanche signage is located at key locations at the Brucejack Mine. The signage provides awareness of the potential of avalanche hazard (Plate 7.5.1).

Plate 7.5-1. Avalanche sign

Standardized road signs (Plate 7.5-2) warn road users when they are entering and exiting identified avalanche zones. NO STOPPING AVALANCHE AREA signs indicate that an avalanche hazard exists and stopping is prohibited. END AVALANCHE AREA indicates the end of the avalanche area.

Plate 7.5-2. Standardized road signs identifying avalanche zones.

Warning signage notifies workers of the explosive avalanche control program and alerts to procedures for encountering unexploded charges (Plate 7.5-3, see below). These signs are placed at key traffic locations throughout the Brucejack Mine. Signage warning of unexploded avalanche control devices are posted year-round to inform of the possibility of encountering an unexploded device.

Plate 7.5-3. Warning signage instructing caution around explosives.

Barriers may be used to control traffic and ensure they are safely stopped outside of avalanche areas. They are placed at strategic locations around camp and on access roads. They present a physical barrier with a closed sign to warn personnel that an area is closed for high avalanche hazard or avalanche control work (Plate 7.5-4).

Plate 7.5-4. Road closure. Physical barrier and closed sign.

Portable signs and fixed closure points may be used to keep traffic or personnel out of avalanche areas. When an area is CLOSED the barrier will be put across the road and "CLOSED AVALANCHE DANGER" will be displayed (Plate 7.5-5).

Plate 7.5-5. Fixed closure point sign warning either caution or danger as determined by traffic control personnel.

Avalanche Rescue Equipment locations are identified by signs that will help rescue personnel rapidly access the avalanche rescue equipment (Plate 7.5-6).

Plate 7.5-6. Avalanche Rescue Equipment cache location sign.

Explosives magazine signs are posted at each usual approach to the magazines. They are posted so that they do not attract unwanted attention (Plate 7.5.7).

Plate 7.5-7. Explosives Magazine Signage

7.6 VEHICLES, OFFICE AND STORAGE, INFORMATION AND DATA MANAGEMENT

The Mountain Safety department is provided exclusive use of the following vehicles:

- Two – 4x4 pickup trucks, customized to meet all regulatory requirements from Transport Canada, WorkSafeBC and the Mines Act for transporting explosives. These trucks are equipped with base radios, beacons, chains, spotlights, and spill kits. Vehicles that are carrying explosives also carry a copy of the Emergency Response Plan 2-1037
- One 4x4 truck to assist logistics between camps and efficient use of manpower.
- Three – Mountain Snowmobiles
- One – Trooper snowcat

The following vehicles are available to assist Mountain Operations as required:

- Several snowcats for over snow transfer of personnel, road construction and maintenance
- Helicopter for explosive control and field support
- A variety of heavy equipment to support catchment construction and debris clearing. (Loaders, excavators, bobcats, rock trucks, grader, and bulldozer)

Two dedicated office spaces exist for the mountain safety department – one in Knipple camp and one in Brucejack camp. Within or nearby these offices are lockers, drying and storage areas, work benches and training facilities.

All data collected, including snowpack and avalanche observations, are stored digitally and backed up either by Pretivm's internal IT department or the CAA's InfoEx platform.

7.7 FIRST AID AND MEDICAL EQUIPMENT

Advanced medical treatment centres are in the Brucejack, Knipple and Wildfire camps. These facilities include Automated External Defibrillators (AEDs), oxygen and extensive specialized first aid equipment. Mobile Treatment Centre vehicles are located at all three camps for road evacuation. There is also a Trooper snow cat located at Brucejack camp that is prepared and dedicated for over snow medical evacuation.

7.8 COMPANION RESCUE EQUIPMENT (PPE) AND RESCUE CACHE LOCATIONS

7.8.1 Companion Rescue Equipment

Avalanche personal protective equipment (PPE) has no protective properties and in the avalanche industry is referred to as companion rescue equipment. However, for better integration with resource industry personnel, in this document and on the jobsite, it is referred to as avalanche PPE.

At the beginning of each avalanche season, personnel who are designated to have a higher exposure or higher vulnerability are issued avalanche PPE packs. Each pack includes an avalanche transceiver,

probe, and shovel. It is the responsibility of supervisors to ensure that all designated personnel are always trained and carry their gear when working in or traveling through rated Avalanche Hazard Zones during the winter season. This training is provided by the Mountain Safety department. It is the responsibility of the personnel to look after their PPE and contact their Supervisor or the Mountain Safety Department immediately in the event of breakage or malfunction.

Supervisors are responsible for collecting all avalanche PPE and returning it to Mountain Safety Department for bench testing at the end of each winter avalanche season. If the gear is not returned and tested the Supervisor assumes sole responsibility for the liability of potentially faulty equipment. The Mountain Safety Department checks and documents all PPE to ensure it is in proper working order. Avalanche transceivers are tested annually and software is updated with the most up to date version. If the equipment is not functioning properly, it is sent back to the manufacturer for further testing and calibration.

Daily function checks must be carried out by all workers using avalanche PPE in avalanche terrain. Functionality in both Transmit and Receive modes must be tested. Replace batteries if battery life displays below 40%.

Mountain Safety carry personal avalanche PPE / rescue packs in the field, which include equipment needed to conduct avalanche hazard assessments and small party self-rescue. These generally include a portable radio, avalanche transceiver, snow shovel, avalanche probe, snow saw, basic first aid, snow study kit, field notebook, head lamp, winter survival equipment, and crevasse rescue gear (if glacier travel is required).

7.8.2 Rescue Cache Contents and Storage Locations

ERT Avalanche Rescue Caches are kept in clean, dry conditions in designated locations at either Knipple or Brucejack camp Firehall building. The location of each rescue cache is well marked by signs and access to the cache is never locked during the avalanche season. Knowledge of the exact locations of the rescue cache locations and their contents is reviewed annually with trained emergency response personnel. See (Appendix J) for current rescue cache locations and contents.

Other rescue caches/packs, each consisting of 6 shovels and 6 probes, are located hung on posts at 73.3km magazine, 71.6km turnaround, 58.5km lay down and at 44.4km. Additionally, rescue packs are stored in both Knipple and Brucejack Surface Operations Supervisors and Mountain Safety trucks.

The Mountain Safety department is responsible for the safe and secure storage of the Avalanche Rescue Cache equipment. At a minimum, monthly checks are carried out on the Rescue cache contents. Avalanche technicians are responsible to ensure that all rescue equipment which requires batteries is checked for condition and function, and the batteries replaced with new batteries annually prior to the avalanche season. Batteries are removed from the equipment at the end of the avalanche season.

8 OPERATIONAL PROCEDURES

The avalanche advisory scale (Plate 8.5-1) and Standard Operating Procedures (Appendix C) identify procedures that must be followed throughout the avalanche season.

The avalanche advisory scale and associated standard operating procedures (SOPs) are designed specifically for the Brucejack Mine. The procedures assigned to each of the three status levels are intended to provide safe road and worksite procedures. Worksite and travel procedures alongside risk levels, expected avalanche activity, and potential avalanche control and closures are intended to safeguard travel and maintenance work on the Brucejack Mine. All other travel on the access road can maintain an acceptable level of safety by moving through the avalanche areas without stopping.

The avalanche advisory scale provides simple, effective operational communication of forecast avalanche activity and clearly identifies the specific safety measures workers are required to follow for each level

The timing of the avalanche season is highly variable but generally begins in October and lasts until June. Operational procedures become active for a specific Hazard Zone the day that it becomes rated. De-rated Hazard Zones are deemed to be below threshold for avalanche hazards.

8.1 PRE-SEASON TASKS AND CHECKLISTS

Before winter, a management-level meeting is held with the Mountain Safety Department and other Mine stakeholders. The ASP and general winter operational safety are discussed, necessary revisions to the ASP are addressed. The attendees sign off on the ASP and their organizational responsibilities.

8.2 DATA COLLECTION

All weather, snowpack, and avalanche activity data are recorded by Mountain Safety and stored digitally for easy reference. Weather telemetry is hosted and stored by a software program (Aquarius Webportal v.2020.1), all avalanche and snowpack information is stored on InfoEx, and a manual Time Profile summary is kept current on the wall of each office for backup and ease of use.

8.3 DAILY AGENDA

The Mountain Safety Department follows industry best practices for forecasting avalanche hazard and communicating risk. The department uses the CAA's InfoEx platform which is based on the conceptual model of avalanche hazard, which then informs a list for all avalanche zones. Finally, an Avalanche Advisory Scale is populated for all the avalanche zones and emailed out to communicate the risk level for travel and worksites. A copy of these procedures is available to all workers and is posted on the main camp bulletin board adjacent to the Daily Hazard Bulletin.

8.4 AVALANCHE HAZARD AND RISK EVALUATION

Mountain Safety staff collect data and information from various sources and analyze them to evaluate and forecast avalanche hazard using the CAA's Conceptual Model for Avalanche Hazard (Appendix M). These data are recorded twice at Brucejack and Knipple camps and archived on the CAA Infoex. The resulting avalanche hazard rating dictates potential avalanche control requirements, road and terrain use guidelines, and specific Standard Operating Procedures to be followed. An area that has been de-rated has been deemed to be below threshold for avalanche hazards to the road or worksite in question.

8.5 AVALANCHE ADVISORY RATING AND HAZARD BULLETIN

Mountain Safety issues an Avalanche Hazard Bulletin daily, updated as conditions dictate (Appendix G). The internal Pretivm Avalanche Advisory Bulletin includes a rating of the current and forecast avalanche risk for the 7 distinct Avalanche Hazard Forecast Zones using Pretivm's 3-level Avalanche Advisory Scale for clear, simple messaging to workers (Plate 8.5-1). Each zone is subdivided into main paths for clarity. Areas where regular operations are carried out are identified and emailed to a group of supervisors and operators who may be working in those zones. This allows for clear communication and serves as a planning tool for all affected departments. These are posted at designated locations and e-mailed directly to relevant personnel for dissemination to workers. These steps are described in the SOP Avalanche Hazard Communication.

PRETIVM AVALANCHE ADVISORY SCALE

STATUS	RISK	AVALANCHE CONTROL AND CLOSURES	FORECAST AVALANCHE ACTIVITY	WORKSITE AND TRAVEL PROCEDURES
GREEN	LOW	• No control planned • No closures anticipated	Avalanche debris: Unlikely to reach the worksite or road	**Worksite** • Standard worksite procedures apply • Work permitted with avalanche PPE and training • Consultation with Mountain Safety is required for stationary work in or outside vehicles **Travel** • No stopping in avalanche zones
YELLOW	MEDIUM	• Control and closures possible	Avalanche debris: Possible to Likely to reach the worksite or road	**Worksite** • Consultation with Mountain Safety is required for stationary work in or outside vehicles **Travel** • No stopping in avalanche zones • 300m convoy spacing mandatory
RED	HIGH	• Ongoing control likely • Closures imminent and/or ongoing	Substantial avalanche debris: Likely to reach the worksite or road	**Worksite** • Essential work to support Mountain Safety as required • Basic road maintenance only **Travel** • Essential travel only • No stopping in avalanche zones • 300m convoy spacing mandatory

Adhere to Avalanche Safety Plan, Standard Operating Procedures and Site-Specific Work Procedures

Plate 8.5-1. – Pretivm Avalanche Advisory Scale

Supervisors are responsible to ensure that all personnel working in avalanche terrain are aware of the current avalanche hazard and the associated Standard Operating Procedures; however, workers remain responsible for their personal safety.

Hazard updates are broadcast on Repeater 1 and Ladd 2 at Brucejack Camp and Repeater 2 and Pretivm Road channel at Knipple camp by Mountain Safety and recorded and repeated by Dispatch on the Repeater channel. When practical the hazard bulletins are emailed with the updated status. Supervisors must ensure that workers adjust their work to comply with the relevant Standard Operating Procedures.

8.6 WORKSITE AVALANCHE ASSESSMENT

Worksite hazard assessments (Appendix K) are performed when a new, temporary project encroaches into or near avalanche terrain. The Work Hazard Assessments should be used as a pre-planning tool for Site Maintenance. These are evolving documents updated frequently throughout the life of the Mine, in contrast to updating the ASP and/or creating Standard Operating Procedures which will be done for long-term projects, permanent projects, or infrastructure changes (Appendix C).

The worksite hazard assessments are designed to work in tandem with the Avalanche Standard Operating Procedures.

When contemplating a new project or development, management and planners will first consult the engineering document 'Avalanche Risk Assessment and Avalanche Hazard Zoning completed for the Brucejack Mine' (Appendix A) as well as the detailed 'Avalanche Hazard Zoning for Mine Site Area' (Appendix B) and determine if the project falls within, or is exposed to avalanche terrain. If it is exposed, or if there is uncertainty, a Mountain Safety Technician will be contacted to perform a Worksite Avalanche Hazard Assessment before any worker is exposed.

Under no circumstances will any new structure or project be allowed to be started or built in avalanche terrain without the approval of the General Manager.

It is the responsibility of the contractor or supervisor, before beginning a new project to reference the Avalanche Hazard Zoning Map (located at key points across the camp as well as in a shared computer drive) and determine if the project falls within or is exposed to avalanche terrain. If it is exposed, or there is uncertainty, Mountain Safety will be contacted to perform a Worksite Avalanche Hazard Assessment Prior to any worker being exposed.

During site introduction training and avalanche awareness training, workers are provided with a basic ability to identify avalanche terrain. If a worker or supervisor recognizes that they are to be exposed to avalanche terrain, they must request that Mountain Safety perform an assessment.

As a final preventative measure, Mountain Safety perform routine patrols around the worksite. If they notice a new project encroaching into avalanche terrain they will inquire as to the details of the project, speak with the supervisor as to the potential need for an assessment, and perform one if necessary.

8.7 ROAD TRAFFIC

Workers and contractors with no avalanche training can travel safely through the Mine transportation corridor, without any specific avalanche training, if their travel is monitored/supervised, and avalanche risk is actively reduced to an acceptable level by the Mountain Safety department.

Workers and contractors signed off on "SOP Standard Road Procedures" are permitted to travel through the transportation corridor on their own each day. They must understand the Avalanche Advisory Ratings and associated Safe Work Procedures (Plate 8-5.1, Appendix C).

In the event an untrained person must unexpectedly stop or work within an avalanche area (e.g., a vehicle breakdown), they must stay in their vehicle and immediately contact Dispatch who will contact the Mountain Safety Department on the corresponding repeater channel. Mountain Safety will assess and provide the appropriate level of instruction, supervision and PPE to conduct the work safely.

8.8 MAINTENANCE ACTIVITIES

Any work in avalanche terrain will take place at the discretion of the Mountain Safety Department.

All operators must follow relevant SOP's for the type of work being undertaken. If any Operator is unsure if they are working in a safe location, they will contact Mountain Safety immediately.

Operators must pass any avalanche observations onto Dispatch and/or Mountain Safety.

Mountain Safety will provide a Worksite Avalanche Assessment for any work activities that fall outside of the regular road maintenance regime.

8.9 RISK MITIGATIONS

8.9.1 Avalanche Hazard Closures

Temporary road and worksite closures are important avalanche risk reduction tools during times of elevated hazard or during avalanche control. Worker access is restricted until the hazard is reduced, either by natural snow stabilization or by artificial means (which may include the use of explosives, ski or snowmobile slope cutting, cornice control, or heavy equipment). The Mountain Safety Department has developed robust Standard Operating Procedures for closing areas and for operating in and around avalanche closures.

8.9.2 Berm and Catchment Construction

Where practical, snow mounds or berms will be constructed to reduce impact forces and/or the volume of avalanche debris on roadways. The berms allow for a reduction in road closures and increase the safety of workers in the event of a low likelihood, high consequence natural avalanche.

8.10 COMMUNICATIONS

8.10.1 Event Reporting

Pretivm has a system in place to ensure all notable near misses, accidents and property damage are reported and analysed to allow for improvements. Mountain Safety takes an active role in embracing this approach to risk management. Furthermore, Mountain Safety will ensure any external regulatory

requirements for incident reporting are also met. Outside agencies may include WorkSafeBC, Natural Resources Canada ERD, BC Ministry of Mines, Energy and Low Carbon Innovation, and the CAA.

8.10.2 Information Sharing

Conference calls are held twice daily between the 2 camps, to seek advice or feedback or simply communicate operational plans and forecast hazards.

Nearest neighbours such as highway forecasting operations, public avalanche bulletin writers and heliskiing operations in the greater area have access to Pretivm's InfoEx data as avalanche professionals.

8.10.3 Check in Procedures

Pretivm uses a system of Check-in/Check-out procedures to continually monitor workers in avalanche terrain. This system includes a timed-out component of regular radio check-ins, expediting incident identification, and response in the event of a failed Check-in. The Check-ins also help Dispatch monitor worker locations, hazard updates, and avalanche explosive control updates.

These Procedures are encapsulated into Standard Operating Procedures that are maintained and reviewed annually.

8.10.4 Post Season Summary

Season summaries are compiled at the end of each winter, including a list of improvements for the following season. Equipment and gear are collected, tested, inventoried, and replaced as needed.

8.11 STANDARD OPERATING PROCEDURES

In addition to Safe Work Procedures, there are multiple Standard Operating Procedures (SOPs) in place that govern specific tasks or day-to-day operations of the Mine. These procedures establish a systematic approach to minimize avalanche risk to personnel traveling and working in avalanche terrain. Additional Standard Operating Procedures pertaining to travel and working in avalanche terrain shall be added to this document as they are required and developed. Following is a list of SOPs in place.

- BJ-AVL-SOP-001 – Worksite Avalanche Assessment
- BJ-AVL-SOP-002 – Snowmobile Operation
- BJ-AVL-SOP-003 – Ski Cutting
- BJ-AVL-SOP-004 – Night Time Avalanche Control
- BJ-AVL-SOP-005 – Guarding and Sweeping
- BJ-AVL-SOP-006 – Field Trip on Skis
- BJ-AVL-SOP-007 – Avalanche Debris Clearing

- BJ-AVL-SOP-008 – Avalanche Hazard Communication
- BJ-AVL-SOP-009 – Pre-Blast Considerations
- BJ-AVL-SOP-010 – Avalanche Closure Procedures
- BJ-AVL-SOP-011 – Communications for Snow Removal and Road Maintenance in Avalanche Areas
- BJ-AVL-SOP-012 – Repeater Egress on Skis
- BJ-AVL-SOP-013 – Tower Climbing
- BJ-AVL-SOP-015 – Terrain Assessment Management Plan
- BJ-AVL-SOP-018 – Avalanche Related Road Closure Sustainability Plan
- BJ-AVL-SOP-024 – Wyssen Helicopter Operations
- BJ-AVL-SOP-026A – Wyssen Charge Construction
- BJ-AVL-SOP-026B – Wyssen Charge Priming
- BJ-AVL-SOP-026C – Wyssen Box Loading Procedure
- BJ-AVL-SOP-027 – Wyssen Accidental Ignition
- BJ-AVL-SOP-028 – Helicopter Flight Ops During ILI Hazards
- BJ-AVL-SOP-029 – Wildfire Weather Observations
- BJ-AVL-SOP-031 – Crevasse Rescue
- BJ-AVL-SOP-035 – Transceiver Maintenance
- BJ-AVL-SOP-039 – Gazex Lockout Tagout
- BJ-AVL-SOP-041 – Gazex Firing Procedures
- BJ-AVL-SOP-042 – Magazine Checks
- BJ-OHS-PLN-001 – Mine Emergency Resposne Plan (MERP)
- BJ-OHS-SOP-002 – Code One Call Out & Response
- BJ-OHS-SOP-015 – Extreme Weather Conditions
- BJ-OHS-SOP-007 – Working Alone or in High Risk Remote Locations

8.12 ACCIDENT/INCIDENT REPORTING

All avalanche incidents or near misses are immediately reported to the Mountain Safety Department, Health Safety and Security Manager, Mine Manager, and Surface Operations Supervisor.

Mountain Safety staff must complete an Initial Incident Report which the Mine Manager will forward to appropriate authorities (Mines Inspector, WorkSafeBC, CAA) as dictated by HSRC and WorkSafeBC regulations. Incident analysis and report forms are provided in Appendix L.

9 AVALANCHE SEARCH AND RESCUE

The Pretivm Avalanche Emergency Response Plan (Section 6 of the Mine Emergency Response Plan) was developed by the Mountain Safety Department in conjunction with the Mine Emergency Response Team Coordinator and the Health, Safety and Security Manager. The document outlines emergency action plans, guidelines, and organizational structure in the event of an emergency. It is kept in key locations around the Mine and available on a shared internal drive. The plan is reviewed and updated annually or more frequently when changes are required.

Avalanche Risk Assessment and Avalanche Hazard Zoning

PRETIUM RESOURCES INC.

BRUCEJACK PROJECT

AVALANCHE HAZARD ZONING FOR MINE SITE AREA

DRAFT

PROJECT NO:	1204-006	DISTRIBUTION:	
DATE:	October 8, 2015	CLIENT:	2 copies
DOCUMENT NO:	NA	ASAS:	2 copies

EXECUTIVE SUMMARY

This report provides supporting documentation for the development of an avalanche hazard zone map for the Brucejack mine site area. The zone map was requested by Pretium in order to plan the development of permanent and temporary occupied structures, and related facilities, in and around the mine site area. Avalanche hazard zone mapping for occupied structures is a requirement for development in several mountain based regional districts, and their application is supported by regulatory agencies that issue permits for commercial and/or industrial development. Further information on the development and use of these maps is described in CAA (2002).

The analysis undertaken for the mine site avalanche hazard zone map builds on previous avalanche hazard assessment work completed for Pretium by Alpine Solutions. Additional work required to create the zone map included:

- analysis of terrain from maps, imagery, and field study,
- review of avalanche occurrence information provided by mine site avalanche technicians,
- review of an a recent destructive avalanche occurrence which damaged and moved a building at the mine site,
- review of snow climate records, and
- application of topographical-statistical and dynamic models.

The avalanche hazard zone map is included as an attachment and the following recommendations are provided:

1. Pretium should provide this report and attached hazard zone map to all departments and stakeholders involved with planning construction of both permanent and temporary buildings, as well as managing worker safety at the mine site area.
2. All new building construction or placement should follow guidelines indicated in CAA (2002) and recommendations presented in Section 3.4. Any existing buildings or structures in the Blue or Red zones should be incorporated into the site wide avalanche risk management program.
3. Although avalanches large enough to damage a wood frame building are captured in the hazard zoning map, small avalanches (≤ Size 2) still may occur in the White (low hazard) zone, including Size 1 avalanches that may runout into terrain traps (e.g. gullies or ditches). In addition, cut slopes may be created during the course of construction. It is recommended that these small slopes continue to be assessed and monitored as a work site (or access route), within the scope of the site wide avalanche risk management program.

AVALANCHE HAZARD ZONE MAP 16

1.0 INTRODUCTION

1.1. General

This report summarizes a detailed analysis of avalanche hazards in and around the planned Brucejack Project mine site, which was completed for the purposes of developing an avalanche hazard zone map. The zone map was requested by Pretium Resources Inc. (Pretium) in order to plan the development of both temporary and permanent facilities in and around the mine site area.

The analysis undertaken for the mine site avalanche hazard zone map builds on work completed previously for Pretium including Alpine Solutions (2013 & 2015a) in which several avalanche paths are identified, and avalanche hazard to specific proposed infrastructure for the mine was determined. The hazard zone map is included as an attachment and recommendations of its use are included.

1.2. Background

Over the past few years, Pretium has been advancing the Brucejack Project from an exploration phase to a physical development phase. During this process numerous temporary bunkhouses, offices, workshops, maintenance facilities, and other related infrastructure have been built in and around the project mine site (Photograph 1-1). Within the mine site area several avalanche paths and slopes that affect proposed infrastructure and roads have been identified and mapped (Alpine Solutions, 2013 & 2015).

As the development at the mine site area has been expanding, these slopes have been managed using short term mitigation methods that mainly involve evacuation of hazard zones, and avalanche explosive control to release avalanches. In the course of development at the site, at least one building was placed in an avalanche path, and it was recently damaged and moved off of its foundations by a controlled avalanche (no people were involved as the building was evacuated).

Photograph 1-1: Brucejack Project mine site area as viewed from the northeast.

Options for the placement of buildings and structures at the mine site are becoming limited, and the planned construction of the mine over the next few years is expected to require several more facilities, resulting in the need to use available space efficiently, while ensuring risk to people and facilities remains low. As a result, there is a need for a longer term strategy for placement of permanent and temporary infrastructure in the mine site area. Normally this type of need is resolved by incorporating an avalanche hazard zone map into the planning of all facilities.

2.0 LIMITATIONS

The analysis completed for the hazard zone map included in this report is based on modern methods, which includes:

- analysis of terrain from maps, imagery, and field study,
- review of avalanche occurrence information provided by mine site avalanche technicians,
- analysis and review of an a recent destructive avalanche occurrence which damaged and moved a building at the mine site,
- review of snow climate records, and
- application of topographical-statistical and dynamic models.

There is uncertainty in runout extent and avalanche magnitude and frequency estimates due to limited extent of avalanche occurrence records for the paths studied, non-existent vegetative indicators that are typically only found at lower elevations, and wide variation of results from the avalanche models used. As a result, hazard zone boundaries have been drawn conservatively where uncertainty is greatest.

Zoning boundaries illustrated on the attached hazard zone map are based on a snapshot in time of the terrain. Artificial or natural alteration of the landscape or terrain due to landslides, construction earthworks, glacial advance or retreat may change the location and extent of avalanche runout, necessitating a re-assessment of avalanche hazard zones. Construction earthworks specifically intended to retard or redirect avalanche flow may change avalanche hazard zone boundaries but temporary defecting structures, such as seasonal berms made from snow, would not.

The hazard zone map included with this report is intended as a planning tool for buildings and structures. Smaller avalanche slopes that may pose a risk to workers or vulnerable equipment are still present (or may be created during course of constructdion) in zones designated as low hazard (white zone), and as a result will still require assessment and management from on-site avalanche technicians.

Although other geohazards exist in the area, the scope of the hazard zoning is limited exclusively to snow avalanche hazards.

3.0 Avalanche Hazard Zone Mapping

3.1. Background on Avalanche Hazard Zone Maps

Avalanche hazard zone maps for occupied structures are a requirement in many mountain based regional districts, and their application is supported by regulatory agencies that issue permits for commercial and/or industrial development. The *Guidelines for Snow Avalanche Risk Determination and Mapping in Canada* (CAA, 2002) are the generally accepted guidelines for land development and operations located in avalanche terrain. According to CAA (2002), recommended zones for land use planning include:

1. **White Zone** – an area with an estimated avalanche return period of greater than 300 years, or impact pressures less than 1 kPa and a return period greater than 30 years.

2. **Red Zone** – an area where the return period is less than 30 years and/or impact pressures are greater than or equal to 30 kPa, or where the product of impact pressure (kPa) and the reciprocal of the return period (years) exceeds 0.1 for return periods between 30 and 300 years.

3. **Blue Zone** – an area in between the Red and White Zones, for return periods between 30 and 300 years, the product of impact pressure and frequency is less than 0.1 kPa/years and the impact pressure is greater than or equal to 1 kPa.

A graphical representation of the expected magnitude and frequency in these zones are provided in Figure 3-1.

Figure 3-1: Definition of avalanche zones for land-use planning

The blue zone represents an area where minor damage could be expected infrequently (30 to 300 year return period) and include broken tree branches, broken windows, and blowing snow inside buildings.

Recommended activities according to zone color in Canada are indicated in Table 3-1.

Table 3-1. Recommended activities according to Zone (CAA, 2002)

Hazard[1] Zone	Recommended Activities
White Zone (low hazard)	Construction of new buildings, including permanently occupied structures, normally permitted.
Blue Zone (moderate hazard)	Construction of new buildings such as industrial plants and temporarily occupied structures possibly permitted with specified conditions. Conditions may include structures reinforced for avalanche forces, construction of avalanche defenses, and requirement for evacuation plans (or a combination of these).
Red Zone (high hazard)	Construction of new buildings not normally permitted.

3.2. Methods

Information regarding avalanche hazards affecting the Brucejack project has been provided previously in Alpine Solutions (2013, 2015a & 2015b); general project, terrain, and snow climate information is provided in these documents. For the hazard zoning analysis, the following methods were used:

- Analysis of terrain using contours generated from LiDAR data.
- Field identification of the extent of locations of large avalanche occurrences observed by site avalanche technicians in the past few years.
- Review of snow climate patterns from winter photographs of the area from various sources.
- Analysis of a destructive avalanche which damaged and moved a building from its foundation on March 13, 2015 (Soucie Construction, 2015)
- Application of topographical-statistical models for short slopes including
    - Alpha-regression model (Jones and Jamieson, 2004)
    - Runout ratio method (McClung & Mears, 1991; Jones and Jamieson, 2004)
- Application of dynamic models including:
    - PCM (Perla, et.al., 1982)
    - LEM (McClung and Mears, 1995; Jones and Jamieson, 2003).

[1] Although CAA (2002) refers to these zones as 'risk zones', they are now more commonly referred to as 'hazard zones'; this will be reflected in a soon-to-be-published update of CAA (2002)

3.3. Analysis

The analysis of avalanche hazard extent focused on avalanche paths MS2, MS3, MS5, and MS8, which are described and mapped in Alpine Solutions (2013 & 2015a). All of these paths are less than 300 m in vertical elevation, and as a result are considered 'short slopes' from an avalanche path modelling perspective. All paths are located above tree-line elevation, and as a result there are no vegetative indications of past events.

Winter photographs taken by Alpine Solutions in 2012 & 2013, as well as by site avalanche technicians provided information regarding snow and wind patterns, as well as a few notable avalanche occurrences (example in Photograph 3-1).

Photograph 3-1: Path MS8 (Camp Creep Path) notable avalanche occurrence (looking south).

A large explosives controlled avalanche in Path MS5 on March 13, 2015 impacted an office building creating damage and moving it off of its foundations (Photograph 3-2). The estimated runout distance of destructive flow was incorporated into the analysis.

Photograph 3-2: Path MS5 - Approximate direction (blue arrow) and extent of deposit (red dashed line) of avalanche impacting building on March 13, 2015 (looking southwest).

Both topographical-statistical and dynamic avalanche models (indicated in Section 3.2) were applied to several potential flows in order to model avalanche runout and estimate speed and impact pressure at various points along the path. Results varied considerably depending on input parameters used. Combined with other methods of analysis, as well as judgement, models could be calibrated to provide realistic speeds and impact pressures in order to determine values for a determination of Red and Blue Zone boundaries (CAA, 2002). Assumptions for avalanche flow models are included in Appendix A.

Once the avalanche hazard zone map was complete, it was reviewed by Soucie Construction (site avalanche operations team) to ensure consensus of zoning boundaries with avalanche technicians who have been monitoring and controlling avalanches at the mine site for the past three winters.

3.4. Use of the Avalanche Hazard Zone Map

According to Section 3.1, construction of new buildings would normally only be permitted in the white zone, and this is recommended for all bunkhouse facilities, and or buildings where large numbers of people may gather. Industrial facilities including maintenance facilities and plants may be constructed in a blue zone, but they either require reinforcement for avalanche forces, construction of mitigation measures such as temporary snow berms, or an

acceptance of potential damage to the structure. In addition, an evacuation plan would be required for periods of high hazard, or during avalanche explosive control.

Normally no new buildings should be constructed in the red zone, unless there is a specific requirement that outweighs the normal accepted risk to a standard non-reinforced wood frame building. Construction of a building in a red zone would need to be examined on a case by case basis, and similar to the blue zone, normally the building would either be reinforced, or the risk of damage is accepted. In addition, the building would be treated as a worksite in avalanche terrain, and incorporated into the site wide avalanche management program (the slopes above would be regularly monitored, and the building and area evacuated during periods of high avalanche hazard).

Currently there are existing structures in the red zone including a ‘core shack’, and a few other small buildings that are presently not occupied. Avalanche hazard to these facilities should continue to be assessed on an ongoing basis in the context of the site wide operational avalanche management plan. If at any point these structures are occupied on a regular basis, it must be clearly understood that the buildings are in a high hazard zone, and may need to be evacuated at any time during winter or spring.

As indicated in Section 2.0, there are limitations of the hazard zone map which must be understood. Although avalanches large enough to damage a wood frame building are captured, small avalanches (≤ Size 2) still may occur in the White (low hazard) zone, including Size 1 avalanches with terrain traps (e.g. gullies or ditches). In addition, cut slopes may be created during the course of construction. These small slopes still need to be assessed and monitored as a work site (or access route) from a worker safety perspective, within the scope of the site wide avalanche risk management program.

4.0 Conclusions and Recommendations

An avalanche hazard zoning map has been developed for the Brucejack mine site area, and is attached to this report. Alpine Solutions provides the following recommendations:

1. Pretium should provide this report and attached hazard zone map to all departments and stakeholders involved with planning construction of both permanent and temporary buildings, as well as managing worker safety at the mine site area.
2. All new building construction or placement should follow guidelines indicated in CAA (2002) and recommendations presented in Section 3.4. Any existing buildings or structures in the Blue or Red zones should be incorporated into the site wide avalanche risk management program.
3. Although avalanches large enough to damage a wood frame building are captured in the hazard zoning map, small avalanches (≤ Size 2) still may occur in the White (low hazard) zone, including Size 1 avalanches that may runout into terrain traps (e.g. gullies or ditches). In addition, cut slopes may be created during the course of construction. It is recommended that these small slopes continue to be assessed and monitored as a work site (or access route), within the scope of the site wide avalanche risk management program.

5.0 CLOSURE

This document was prepared by Alpine Solutions Avalanche Services (Alpine Solutions) for the account of Pretium Resources Inc. The material in it reflects Alpine Solutions' best judgment in light of the information available to Alpine Solutions at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, is the responsibility of such third parties. Alpine Solutions accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions, based on this report.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending Alpine Solutions' written approval. MEMORANDUM

Date: February 29, 2012
To: Norma Jean Adzich, OH&S Coordinator, Pretium Resources Inc.
From: Brian Gould, P. Eng.; Senior Avalanche Specialist; Rod Gee, Avalanche Technician; Cam Campbell, M.Sc. Avalanche Specialist;
Re: Wildfire Access and Brucejack Site Workplace Avalanche Risk Assessment

1.0 Introduction

Alpine Solutions recently completed workplace avalanche risk assessments for the Wildfire drill site access route and Brucejack site area. The purpose of these assessments were to identify avalanche terrain with potential to affect worksites and access routes, and then to determine the current risk to workers transiting or working in that terrain based on usage (exposure, vulnerability), and site snowpack conditions. This memorandum provides an overview summary of both assessments. Comments regarding current concerns, and recommendations are provided.

Further assessment is required to provide a complete risk assessment for proposed (future) mine operations (provided at a later date).

2.0 Wildfire Access Road

The Wildfire Area was visited by Rod Gee on February 19. 2012. The Wildfire Camp is located approximately 500 m west of Highway 37, and approximately 32 km south of Bell 2. A potential hazard area was identified previously (by Pretium) approximately 2 km along the access road to a drill site (Figure 1 and Photograph 1).

Figure 1 – Google Earth screenshot of Wildfire Camp and Potential Hazard area

Photograph 1 – Potential Hazard area near Wildfire Camp (Access Road orange)

The hazard area is a relatively steep cut slope above the access road. The road crosses the avalanche path from an approximate elevation of 475 m elevation to 500 m elevation, over a linear road distance of approximately 300 m. The potential exists for avalanche activity to occur

on the small and more moderately inclined slopes below the mature forest cover in the upper left of Photograph 1. The small size of the slope limits avalanche activity to a maximum of Size 2 (See Table 1), and the frequency of avalanches this size is estimated to be once per year on average.

2.1 Wildfire Snowpack Assessment

Valley elevation snowpack water equivalent data is unavailable for this region. However, long-term local area knowledge, combined with snow pillow data for Granduc mine, suggests valley elevation snowpacks are at or slightly above normal, while alpine snowpacks are at near-record levels. The Wildfire site was near or slightly above normal at the time of observation.

A brief mid-January Arctic air outbreak resulted in a rapid air temperature drop in the Wildfire area. This created an extremely strong temperature gradient in near-surface snowpack layers that had previously been relatively warm. The development of a weakened 7cm thick layer of faceted grains at the snowpack surface was the result.

Snowfall in late January and early February buried and preserved the faceted layer. This weakness was gradually overloaded by steady snowfall, reaching a very fine strength/stress balance that was overcome by vehicles loading the base of the slope when travelling across the road cut. This final loading triggered the soft slab failure at the top of the slope, stopping just above and on the road.

The overall risk assessment included a snow profile observation adjacent to the path's starting zone. The facet layer was gaining strength but remained easily observed and capable of testing to moderate and hard sudden planar failure. No other significant weaknesses were noted in the 150 cm deep snowpack.

There is currently little load on this slowly strengthening layer, as virtually the entire path's starting zone has already failed and there has been little snowfall since the avalanche activity occurred. Therefore, there is virtually no risk to workers unless snow stability markedly deteriorates.

2.2 Worker Risk from Avalanches at Wildfire

Considering the estimated size and frequency of avalanches at this site, the limited exposure time due to workers transiting through the area, and the current snowpack conditions, this site is determined to be very low risk. However, recent natural slab avalanche activity, likely failing on the same faceted layer as discussed above, was observed on slopes of similar aspect and incline in the area, including in the creek valley upstream of Wildfire Camp, above where road construction is taking place on the opposite side of the creek. The construction is occurring in low-risk terrain, but all workers should avoid travelling off established routes for work or recreational purposes.

3.0 Brucejack Site

The Brucejack site was visited by Cam Campbell on February 25-26, 2012. The site is located immediately southwest of Brucejack Lake, approximately 43 km west of the Wildfire Camp. Figure 2 illustrates the general layout of some of the planned drill sites, existing snow-cat roads, and some of the facilities that were observed at site. Avalanche paths and areas in the vicinity of the Brucejack Site are indicated in red in Figure 2.

Figure 2 – Google Earth screenshot of Brucejack Site – avalanche paths in red, snow-cat roads in yellow

3.1 Avalanche Hazard Areas

A number of potential avalanche hazard areas were identified:

- The Geo-offices and the Twin Towers bunk houses are potentially exposed to a large avalanche path directly to the south. It is estimated that avalanches up to Size 3 (See Table 1) may occur in this path.
- Seven separate avalanche paths are estimated to affect current snow-cat and snowmobile roads at site (indicated as yellow lines in Figure 2). It is estimated that avalanches up to Size 2 could occur in most of these paths, except for one path which may produce up to Size 3 avalanches.
- Existing well sites (indicated on the attached BGC drawing, and planned drill sites (indicated by site staff) are not estimated to be in high risk areas. However, some access routes to these sites are exposed. In addition these sites lie on the border of avalanche path areas.

3.2 Avalanche Safety Observations

The following was determined during the visit to site:

- There is no established weather plot
- No avalanche safety gear on site
- The area is a remote location with helicopter access only
- Experienced part-time avalanche safety attendant on staff (James Smids), however no qualified Avalanche Technicians (CAA Professional Members) providing guidance.
- Workers free to roam in surrounding avalanche terrain for skiing/snowboarding/snowmobiling (tracks were noted within identified avalanche terrain)

4.0 Recommendations

Based on the above assessment, we recommend the following:

1. Complete Avalanche Atlas Mapping for the Brucejack site based on data from recent site visits. Establish Avalanche Area warning signs (No stopping) for areas which affect established access routes (snowcat roads).These maps and signs may be used to communicate hazard areas to different work groups as they arrive at site.

2. Limit all work to currently established sites and non-exposed routes at Brucejack site, and restrict any workers from recreational (skiing, snowboarding, etc.) activities in surrounding terrain. If necessary, safe recreation areas close to camp area could be established by an Avalanche Technician.

3. An Active Avalanche Safety Plan should be prepared for the Brucejack site to determine risk management approach for access routes and exposed sites over the next few months. Included in this plan should be procedures for determining risk levels on a daily basis and potential location restrictions based on the daily risk level.

4. All workers that travel the exposed snowcat access roads, or surrounding terrain should wear avalanche PPE (transceivers), and be trained in avalanche rescue. Avalanche rescue packs with lightweight shovels and probes should be carried by workers, or else an avalanche rescue cache should be established at the site.

5. A qualified Avalanche Technician should visit the site on a frequent basis over the next month to assess snowpack, and provide risk management guidance. The avalanche safety attendant on staff at Brucejack could provide assistance with this if available and at site.

6. In consideration of the above recommendation, a weather plot should be established at site with twice-daily manual observations. A remote weather station could be established for long term use.

7. Check in/checkout procedures should be established for workers leaving the camp area for work at site.

Table 1 : *Canadian classification system for avalanche size (McClung & Schaerer, 1993)*

Size	Destructive Potential	Typical Mass	Typical Path Length	Typical Impact Pressures
1	Relatively harmless to people.	<10 tonnes	10 m	1 kPa
2	Could bury, injure or kill a person.	10^2 tonnes	100 m	10 kPa
3	Could bury a car, destroy a small building, or break a few trees.	10^3 tonnes	1000 m	100 kPa
4	Could destroy a large truck, several buildings, or a forest with an area up to 4 hectares.	10^4 tonnes	2000 m	500 kPa
5	Largest snow avalanches known. Could destroy a village or a 40 ha forest.	10^5 tonnes	3000 m	1000 kPa

PROJECT MEMORANDUM

Date: May 31, 2012
To: Pretivm Resources Inc.
Attn: Ian Chang, M.Sc., P. Eng., VP Project Development
From: Brian Gould, P. Eng.
Re: Brucejack Avalanche Hazard Assessment and Risk Analysis- DRAFT

1.0 Introduction

1.1 General

Pretivm Resources Inc. (Pretivm) is proposing to develop a mine in the Coast Range of northwestern British Columbia, approximately 42 km north of Stewart, BC (Figure 1-1). The project includes several minesite facilities, a transmission line, an access road, and minesite trails. Previous studies indicate that the project is in the vicinity of snow avalanche terrain. Pretivm requested that Alpine Solutions undertake a preliminary avalanche hazard assessment and risk analysis to determine the likelihood and potential consequences of avalanches affecting the project. Options for avalanche risk mitigation are provided, and the memorandum concludes with recommendations. The results of this assessment will be used for mine permitting, and operational planning.

Figure 1-1 Brucejack Project Location

1.2 Work Scope

Pretivm provided Alpine Solutions with the following maps and documents:

- Figure 18.11 Brucejack Overall Site Plan GA – Mine and Process Plant
- 3 maps by Cypress Forest Consultants illustrating Access Road General Arrangement (including Glacier Road)
- Figure 8.2-2 Brucejack Project: Alternative Power Line Routes
- Brucejack Road Risk Rating and Inspection Procedure

In addition, numerous aerial photographs (1:20,000 scale), and digital shape-files representing facility layout were provided by BGC Engineering Inc. The proposed transmission line digital shape-files was provided by Vallard Construction Ltd.

The avalanche hazard assessment and risk analysis was completed for the mine site area, one of the proposed transmission line alignments, and the access road from Highway 37. The work included terrain analysis from topographic maps and aerial imagery. A helicopter overview flight was undertaken to confirm the avalanche path locations and terrain characteristics.

This memorandum provides the following information:

- A tabulated summary of avalanche paths and hazard areas that affect proposed facilities and access roads.
- Seventeen drawings illustrating locations of avalanche paths and exposure that affect proposed facilities and access roads.
- An estimate of potential consequences of avalanches, and a discussion of associated exposure and risk.
- Options for mitigation.
- Recommendations for further work.

2.0 Limitations

This document provides an overview of snow[1] avalanche hazards which affect the proposed Brucejack mine project. Estimated magnitudes, frequencies, and areal extent of individual avalanche paths are based on a base climate analysis, map and imagery interpretation, and a helicopter overview flight completed March 19, 2012. Boundaries of avalanche terrain indicated on the accompanying drawings are estimated and have not been confirmed with ground based survey or with numerical analysis.

Although other geohazards exist in the region, the scope of this assessment is limited exclusively to avalanches. In addition, any significant artificial or natural alteration of the landscape or terrain due to forest fire, landslides, may change the nature (magnitude/frequency/intensity/runout) of avalanche hazard, necessitating a re-assessment for the area affected.

[1] The qualifier "snow" will not be included from here on. It was added here to make it clear that there is no mention of "rock avalanches" or "debris avalanches" in this report.

3.0 Physiography

3.1 Location

The Pretivm minesite is located at the head of the Knipple Glacier, approximately 60 km north of Stewart, BC, and 38 km southwest of Bell 2. The proposed transmission line alignment extends from the BC Hydro 230 kV line north of Stewart (adjacent to Highway 37A) to the mine via a route over Mt. Bunting south ridge and across to the Salmon and Knipple Glacier valleys. The access road begins at the intersection of Highway 37 and Wildfire Creek, approximately 30 km south of Bell 2, and extends to the minesite via the Wildfire Creek, Scott Creek, Bowser River, and Knipple Glacier valleys.

3.2 Snow Climate

Snow climate refers to the general character of climate factors that contribute to snowpack and avalanche formation. Historical meteorological records often provide information on the frequency, timing, and sometimes magnitude of future avalanches. In addition, estimates of average and maximum snowpack depth can provide information on how often thresholds for avalanche triggering are exceeded.

Although historical climate and avalanche records for the Brucejack area is limited, BC Government snow pillow and snow survey records in the region were reviewed. In addition, Alpine Solutions has previous experience with this region of BC.

The proposed Brucejack mine area is located in a transition zone between maritime and continental climate zones. As a result, there are significant temperature and moisture fluctuations that occur in an average winter. These fluctuations often contribute to a layered snowpack, which leads to lingering avalanche conditions most winters. In addition, the effects of wind and terrain orientation lead to increased snowpack variability which can contribute to challenging avalanche forecasting conditions.

Avalanche season typically begins in October at the higher elevations (above 1400 m), and often extends until late June or early July. At valley bottom elevations, avalanches can be expected from November to late May though can occur earlier or end later in extreme years.

Typical storm patterns can produce high intensity snowfall with strong winds depositing significant amounts of snow on lee (the side of slopes away from the principal wind direction) aspects. Temperature increases associated with some storms can produce rain-on-snow conditions up to treeline elevations (1200-1400 m), and sometimes above. An average winter will include 10-20 large storm events, most of which can produce widespread avalanche conditions.

4.0 Avalanche Hazard Assessment

4.1 Background on Snow Avalanches

Snow avalanches generally occur in areas where there are steep open slopes or gullies, and deep (>50 cm) mountain snowpacks. Risk associated with avalanches is normally due to exposure to the high forces that occur, as well as the effects of extended burial for any person caught in an avalanche. Impact

forces vary significantly depending on avalanche size. Although the smallest avalanches can be insignificant to a human, larger avalanches may produce impact forces capable of destroying several hectares of mature forest.

Characteristics of Snow Avalanches:

Avalanches may initiate in either *dry* or *wet* snow. Although an avalanche may start in dry snow, it could become *moist* or *wet* during its descent. Terrain features including gullies deflect and often channel wet snow avalanches. Conversely, large, fast-flowing dry avalanches tend to flow in a straighter path, and may overrun terrain features.

Most large, dry avalanches consist of a dense component that flows primarily along the ground, and a less dense powder component that travels above and sometimes ahead of the flowing component. In some cases these components can separate and move independently. The dense-flowing component and powder component may reach speeds up to 60 m/s (200 km/h). Impact pressures from dense flow are much greater than the powder component due to the density of the snow.

Avalanche terrain is usually associated with steep open slopes in the mountains that allow an accumulation of snow before it releases in a destructive event. In addition to the steep slopes that the snow accumulates on, any area exposed to this release of snow is also considered avalanche terrain. Terrain is often subdivided into features that are connected, and generally contain or channel the volume of avalanche events into a common deposition area. These features are called *avalanche paths.*

Avalanche Path:

An avalanche path generally consists of a *starting zone*, a *track*, and a *runout zone*. Avalanches start and accelerate in the starting zone which typically has slope incline greater than 30°. Downslope of the starting zone, most large avalanche paths have a distinct track in which the slope angle is typically in the range of 15° to 30°. Large avalanches decelerate and stop in the runout zone where incline is usually less than 15°. Smaller avalanches may decelerate and even stop on steeper slopes (15° to 24°).

Within forested terrain, larger avalanche paths are often discernible as vertically oriented swaths of open forest terrain bordered by *trim lines* (mature forest on either side of the swath). Smaller avalanches however can occur in more subtle paths, and can occur on large cutbanks in a road cut.

Runout zones generally have vague trim lines, and analysis by an experienced avalanche specialist is required to determine estimates of maximum avalanche extent (often extends into mature forest). Some avalanche paths in terrain around cliffs can be much more subtle to observe, and can be confused with rockfall and or geotechnical events.

Avalanche Frequency:

Avalanche *frequency* is the reciprocal of avalanche *return period* and is typically referred to as an order of magnitude ranging from 1:1 (annual) up to 1:300 (1 in 300) years. Each winter, the probability of an avalanche with a specified return period is constant.

Avalanche frequency is dependent upon *snow supply* and *terrain.* Frequency decreases with distance downslope in the track and runout zone. Snow supply is determined by:

- Frequency of snowfalls and amount of snow; and
- Wind transport of snow into the starting zone.

Snow and weather conditions vary from year to year, and the frequency of avalanches is not uniform.

The primary terrain factors in avalanche formation are incline, slope orientation (aspect) with respect to wind and sun, slope configuration and size, and ground surface roughness. Slope configuration is important because features such as gullies will often have more frequent and larger avalanches than open slopes. Ground roughness determines the threshold snow depth for avalanches to occur. This is particularly important in light snow climates where snow may not exceed threshold depths some winters.

Avalanche Magnitude:

Avalanche *magnitude* relates to the destructive potential of an avalanche and is defined according to the Canadian avalanche size classification system. A general description of destructive potential, magnitude, and typical path length under this classification system is provided in Table 1.

Magnitude is often related to frequency. In general, large destructive avalanches occur less frequency, while smaller ones occur on a more regular basis. Magnitude and frequency of effect are also related to location in the overall path. For example a road location near the toe of an avalanche path will be affected by avalanches on a less frequent basis, but they will be larger avalanches. Both low frequency large avalanches and higher frequency small avalanches may affect a road crossing in the middle of an avalanche path.

Table 1 : *Canadian classification system for avalanche size (McClung & Schaerer, 1993)*

Size	Destructive Potential	Typical Mass	Typical Path Length	Typical Impact Pressures
1	Relatively harmless to people.	<10 tonnes	10 m	1 kPa
2	Could bury, injure or kill a person.	10^2 tonnes	100 m	10 kPa
3	Could bury a car, destroy a small building, or break a few trees.	10^3 tonnes	1000 m	100 kPa
4	Could destroy a large truck, several buildings, or a forest with an area up to 4 hectares.	10^4 tonnes	2000 m	500 kPa
5	Largest snow avalanches known. Could destroy a village or a 40 ha forest.	10^5 tonnes	3000 m	1000 kPa

4.2 Brucejack Avalanche Hazard

Avalanche paths and hazard areas that affect the Brucejack project were identified by reviewing topographic relief and vegetation features on maps and aerial photos, as well as Google Earth ortho-imagery and digital elevation model (DEM). In addition, a field reconnaissance (including helicopter overview flights) was completed March 19, 2012. During this flight numerous photographs were collected and subsequently reviewed.

Forty-three avalanche paths or hazard areas reach project sites or access roads, and some paths are estimated to affect sites on an annual basis. Avalanche paths and hazard areas are summarized in three tables in Appendix A, and illustrated on seventeen drawings in Appendix B. Avalanche Paths referred to in Appendix A and B are labelled according to Table 4-1, referring to the element at risk, with the exception of paths along the Knipple Glacier which affect both the transmission line and access road.

Table 4-1 – Avalanche Path Label and corresponding Element at Risk

Avalanche Path Label	Element at Risk
TL1, TL2, …, TLx	Primarily Transmission Line, with some affecting Access Road
AR1, AR2, …, ARx	Access Road
MS1, MS2, …, MSx	Primarily Minesite facilities as well as Access Road, Transmission line, and trails at minesite
KG1, KG2, …, KGx	Transmission Line and Access Road

The following three sub-sections provide details of avalanche hazard, and potential consequences to each facility.

4.2.1 Minesite

The minesite is located on a broad alpine plateau in undulating terrain on the west side of Brucejack Lake. The area is bounded by the Knipple Glacier to the east and south, the Sulphurets Glacier to the west, and steep alpine slopes to the north. Elevations at the minesite range from 1350 m to over 2000 m. Proposed facilities include the following (Drawing 1):

- Fuel Storage
- 150 person camp
- Warehouse
- Existing camp Portal
- Truckshop/ Mine Dry
- Mill Building
- Helipad
- WZR Air Raise
- VOKR Air Raise
- CAD Fresh Air Raise

- Gossan Hill Pit
- Bridge Zone Pit
- Galena Hill Pit
- Several minesite trails

Avalanches are estimated to affect the Bridge Zone Pit, 150 Person Camp, Gossan Hill Pit, CAD Fresh Air Raise, and several minesite trails northwest of Brucejack Lake. Details regarding avalanche hazard and potential consequences are included in the following five sub-sections.

4.2.1.1 Bridge Zone Pit

The Bridge Zone Pit is located approximately 1.5 km southwest of the west end of Brucejack Lake at approximately 1580 m to 1630 m elevation. Size 2 avalanches are estimate to affect the Bridge Zone Pit on an annual basis, and Size 3 avalanches with 3 to 10 year return. Since the pit is located in the start zone of the path, avalanches may be more frequent due to work activities occurring in the start zone. Construction of the pit is expected to modify the terrain, which may increase or decrease the potential of the slope. Potential consequences include damage to equipment as well as worker injury or fatality.

4.2.1.2 150 Person Camp

The 150 Person Camp is located directly south of the west end of Brucejack Lake. Size 3 avalanches from Path MS2 are estimated to reach the east end of the camp with return frequency of approximately 10 to 30 years. Potential consequences include damage to infrastructure and worker injury or fatality.

4.2.1.3 Gossan Hill Pit

The Gossan Hill Pit is located at the south end of Brucejack Lake. Size 2 avalanches are estimate to affect the Bridge Zone Pit on an annual basis. Since the pit is located in the start zone of the path, avalanches may be more frequent due to work activities occurring in the start zone. Construction of the pit is expected to modify the terrain, which may increase or decrease the potential of the slope. Potential consequences include damage to equipment as well as worker injury or fatality.

4.2.1.4 CAD Fresh Air Raise

The CAD Fresh Air Raise is located approximately 600 m southwest of the southern end of Brucejack Lake. Size 2 avalanches are expected to occur annually, and Size 3 avalanches are expected to occur once in 3 to 10 years. Due to its orientation in the track of the path, avalanche impact pressures may be high. Potential consequences include damage to fixed infrastructure, and worker injury or fatality if workers are on site when the avalanche occurs.

4.2.1.5 Minesite Trails

Several minesite trails traverse steep terrain approximately 2 km northwest of Brucejack Lake (Drawing 1). Size 2 and 3 avalanches are estimated to affect several kilometers of roads on an annual basis. A size 4 avalanche may be expected once in 10 years. Potential consequences include damage to vehicles, occupant injury or fatality, and road delays for avalanche debris cleanup.

4.2.2 Transmission Line

The proposed transmission line alignment begins at Highway 37A, approximately 17 km from Stewart BC. The line ascends steeply from 150 m to over 1750 m elevation to a high alpine ridge just south of Mt. Bunting before descending down to the south end of Long Lake, and the Granduc Road. From here the transmission line extends north primarily along the east side of the Salmon Glacier Valley. During this segment it parallels much of the Granduc access road to Granduc, and then extends north to the toe of the Knipple Glacier. The line then follows a route along the southwest side of the Knipple Glacier to minesite.

Approximately 27 km (accumulated distance) of the alignment is affected by avalanche paths (Table A-2). The estimated frequency of avalanches reaching the alignment varies from annual to once in 30 years. Potential consequences include damage to supporting structures (towers), or the transmission line depending on the height of the line above the avalanche paths. Associated consequences include interruption of service to the mine. In addition, workers may be at risk during the construction phase if the line is built during avalanche season.

4.2.3 Access Road

The proposed mine access road begins at Highway 37 near the confluence of Wildfire Creek and the Bell Irving River, approximately 30 km south of the Bell 2 establishment. The road extends northwest along following the Wildfire Creek drainage for approximately 12 km before heading west to Scott Pass (677 m elevation) and then down Scott Creek drainage to the Bowser River valley (400 m elevation), 35 km from Highway 37. A short (approximately 3 km long) branch road leaves the access road and extends east to reach the west end of Bowser Lake.

The main access continues west along the Bowser River valley before ascending steep slopes to reach the south side of the toe of the Knipple Glacier. From here the road extends up the centre of the Knipple Glacier to the mine site, at an elevation of approximately 1400 m. The last 15 km of the access road is a glacier road at the centre of the Knipple Glacier, and as a result the location may vary depending on crevasse restrictions.

Eleven avalanche paths are estimated to affect the access road, and 2 paths approach to within 100 m. Several avalanche paths on the southwest and northeast side of the Knipple Glacier are expected to affect the road if it was realigned to avoid crevasses. Potential consequences include damage to vehicles, occupant injury or fatality, and road delays for avalanche debris cleanup. Avalanche path characteristics for the Knipple Glacier segment are expected to change with glacial recession, so this segment will need to be reassessed regularly.

5.0 Avalanche Risk Analysis

Guidelines for determining avalanche risk to fixed facilities, worksites and industrial roads within Canada have been developed, and are outlined in the Guidelines for Snow Avalanche Risk Determination and Mapping in Canada (CAA, 2002). Risk determination is not only based on magnitude and frequency of avalanches, but also considers the differences in vulnerability and exposure time of the elements at risk.

Avalanche risk planning for a mining project with a combination of fixed facilities, worksites, and access roads involves the consideration of maximum size avalanches that generally have avalanche return periods of 100 years or more.

The Brucejack project is proposed to operate year round. Elements at risk include fixed facilities, equipment, vehicles, and workers. The vulnerability of each element at risk depends on the ability to sustain the effect of the avalanche. In general avalanches of Size 2 or greater are expected to pose a risk to personnel, and avalanches of Size 3 and greater will pose a risk to fixed facilities, equipment, and medium to large size vehicles. This does not take into account the effect of terrain features which may augment the effect of an avalanche (eg. a worker pushed over a cliff by a Size 1 avalanche; or a vehicle being pushed into a river by a Size 2 avalanche). Fixed infrastructure under development, and specific construction equipment may be damaged (depending on ability to sustain avalanche effects), or lost in avalanche debris or flowing waterways.

Potential consequences of avalanches reaching facilities, worksites and access roads may include:

- damage to facilities, equipment and vehicles;
- worker injury or fatality;
- impact to the environment from any spills associated the avalanche; and
- construction delays due to road and worksite area blockages.

Associated consequences may include economic losses resulting from the above, and impact to company reputation.

A complete risk assessment for each individual scenario involving avalanches cannot be undertaken without further details regarding worksite locations, and timing of exposure. However, considering the baseline details which include:

- proposed year round mining schedule,
- high number of worksites and access roads in avalanche paths, and
- anticipated high number of personnel and vehicles associated with the construction project,

it is estimated that the risk from avalanches to the Brucejack project is high. This estimation assumes no mitigation is utilized.

6.0 Options for Mitigation

Risk reduction strategies typically incorporate location planning (for fixed facilities), avoidance during avalanche season, or the implementation of an active avalanche management plan (generally for access roads and worksites). They type of mitigation depends on the element at risk, and requirement for unhindered access (or not).

For the transmission line, the risk to the towers may be reduced by location planning (locating towers away from the centre of avalanche paths, and spanning avalanche paths. When this is not feasible, risk

to towers may be reduced by constructing splitting wedges or berms (Figure 6-1). Alternatively towers may be reinforced with concrete or steel (Figure 6-2)

Figure 6-1 – Example of Splitting Wedge to protect structure (McClung & Schaerer, 2006)

Figure 6-2 – Example of Steel Reinforced tower

Avalanche mitigation for worksites, access roads, and trails often involve an active avalanche management plan. An active avalanche management plan typically details a daily risk assessment process for worksites and access routes. Avalanche hazard is normally assessed by a combination of daily weather and snowpack analysis accomplished by avalanche technicians. Daily risk is assessed according to nature of the specific worksite project and access requirements (exposure and consequence components). Measures to reduce risk in an avalanche management plan include both active and passive measures. Active measures include temporary evacuation of sites and avalanche control by explosives or other means. Passive measures include:

- limiting exposure or implementing safety measures during high hazard;
- worker safety training sessions;
- Personal Protective Equipment (eg. avalanche transceivers) and rescue equipment; and
- An Avalanche Emergency Response Plan.

Additional measures to reduce risk may include permanent or semi-permanent earthworks to contain or divert avalanches away from worksites, access roads or facilities. Typically this would only be considered for longer term risk management for fixed infrastructure or intensively used access routes.

7.0 Conclusions and Recommendations

An avalanche hazard assessment and risk analysis has been completed for the Brucejack mine project. Facilities and access routes are exposed to approximately forty-three avalanche paths or areas. Avalanche magnitude varies between Size 2 and 4. Avalanche frequency varies between annual and 1:100 years. Potential consequences of avalanches reaching Brucejack mine facilities, transmission line, worksites, and roads include damage to infrastructure, worker injury (or fatality), and project delays. If avalanche mitigation is not employed, there is a high likelihood of the above consequences affecting operations.

A complete risk assessment for each individual scenario involving avalanches cannot be undertaken without further details regarding worksite locations, and timing. However, considering the baseline details which include:

- proposed year round mining schedule,
- high number of worksites and access roads in avalanche paths, and
- anticipated high number of personnel and vehicles associated with the construction project,

it is estimated that the risk from avalanches to the Brucejack project is high.

Alpine Solutions recommends the following:

- Any proposed infrastructure (fixed facilities and semi-permanent worksites) that are exposed to avalanches should be relocated away from avalanche paths or hazard areas.
- If relocation is not feasible, proposed infrastructure exposed to avalanches should be assessed in greater detail to determine potential impact forces and loading. This may include ground survey and numerical modelling of paths. Detailed ground survey should be completed during summer months if possible.
- The segment of the Access Road which transits the Knipple Glacier should be reassessed on a regular basis due to the effects of glacial recession on avalanche runout.
- An avalanche management program which includes options for avalanche explosive control should be developed and implemented for any operations during avalanche season.
- Any changes to layout of facilities and roads should be reassessed for avalanche hazard.

8.0 Closure

This report was prepared by Alpine Solutions Avalanche Services (Alpine Solutions) for the account of Pretivm Resources Inc. The material in it reflects Alpine Solutions' best judgment in light of the information available to Alpine Solutions at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, is the responsibility of such third parties. Alpine Solutions accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions, based on this report.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending Alpine Solutions' written approval. PROJECT MEMORANDUM

Date: May 9, 2013
To: Pretivm Resources Inc.
Attn: Ian Chang, M.Sc., P. Eng., VP Project Development;
From: Brian Gould, P. Eng.
Re: Brucejack Avalanche Hazard Assessment and Risk Analysis – 20130509 DRAFT

1.0 Introduction

1.1 General

Pretivm Resources Inc. (Pretivm) is proposing to develop a mine in the Coast Range of northwestern British Columbia, approximately 42 km north of Stewart, BC (Figure 1-1). The project includes several mine site facilities, a transmission line, and an access road. Previous studies indicate that the project is in the vicinity of snow avalanche terrain. Pretivm requested that Alpine Solutions Avalanche Services (Alpine Solutions) undertake an avalanche hazard assessment and risk analysis to determine the likelihood and potential consequences of avalanches affecting the project. Options for avalanche risk mitigation are provided, and the memorandum concludes with recommendations. The results of this assessment will be used for mine permitting, and operational planning.

Figure 1-1 Brucejack Project Location

1.2 Work Scope

Pretivm initially provided Alpine Solutions with the following maps and documents:

- Figure 18.11 Brucejack Overall Site Plan GA – Mine and Process Plant.
- 3 maps by Cypress Forest Consultants illustrating Access Road General Arrangement (including Glacier Road).
- Figure 8.2-2 Brucejack Project: Alternative Power Line Routes.
- Brucejack Road Risk Rating and Inspection Procedure.

In addition, numerous aerial photographs (1:20,000 scale), and digital shape-files representing facility layout were provided by BGC Engineering Inc. The proposed transmission line digital shape-files were provided by Vallard Construction Ltd.

Subsequent to an initial avalanche hazard memorandum completed by Alpine Solutions (2012), the following drawings were provided:

- Tetratech - Pretivm Feasibility Study Drawings 100000-20-000, 001, 002, 101, 102, 103, 104, 105, 201, 301, 302, 303, 304, 305, 306, 501.

The avalanche hazard assessment and risk analysis was completed for the proposed mine site area, the preferred transmission line alignment, and the access road from Highway 37. The work included terrain analysis from topographic maps and aerial imagery. A helicopter overview flight was undertaken in March 2012 to confirm the avalanche path locations and terrain characteristics. Ground survey was completed April 28-29, 2013.

This memorandum provides the following information:

- Identification and description of avalanche hazard to mine operations.
- An estimate of potential consequences of avalanches, and a discussion of associated exposure and risk.
- A tabulated summary of avalanche paths and hazard areas that affect proposed facilities and access roads.
- Seventeen drawings illustrating locations of avalanche paths that affect proposed facilities and access roads.
- Options for mitigation.
- Recommendations.

Section 4.0 and 7.0 are to be inserted into the Brucejack Mine Feasibility Study, expected to be finalized in July, 2013.

2.0 Limitations

This document provides an overview of snow[1] avalanche hazards which affect the proposed Brucejack mine project. Estimated magnitudes, frequencies, and areal extent of individual avalanche paths are based on a climate analysis, map and imagery interpretation, helicopter overview flights, and ground analysis for specific fixed infrastructure that is potentially affected by avalanches. Analysis of individual avalanche paths was limited to vegetation and overview terrain analysis; no numerical modeling has been completed.

Sources of uncertainty associated with avalanche runout boundaries illustrated on avalanche hazard mapping include:

- limited avalanche occurrence history (data) for the area; and
- lack of vegetation indicators (trim lines) where avalanches runout into non-forested terrain.

Although other geohazards exist in the region, the scope of this assessment is limited exclusively to avalanches. In addition, any significant artificial or natural alteration of the landscape or terrain due to forest fire, landslides, or other geotechnical event may change the nature (magnitude/frequency/intensity/runout) of avalanche hazard, necessitating a re-assessment for the area affected.

[1] The qualifier “snow” will not be included from here on. It was added here to make it clear that there is no mention of “rock avalanches” or “debris avalanches” in this report.

3.0 Physiography

3.1 Location

The Pretivm minesite is located at the head of the Knipple Glacier, approximately 60 km north of Stewart, BC, and 38 km southwest of Bell 2. The access road begins at the intersection of Highway 37 and Wildfire Creek, approximately 30 km south of Bell 2, and extends to the minesite via the Wildfire Creek, Scott Creek, Bowser River, and Knipple Glacier valleys. The preferred transmission line route extends from the Long Lake Hydroelectric Project north of Stewart to the mine via the Salmon Glacier valley and the ridge on the south side of the Knipple Glacier. A second optional route for the transmission line follows the access road corridor.

3.2 Snow Climate

Snow climate refers to the general character of climate factors that contribute to snowpack and avalanche formation. Historical meteorological records often provide information on the frequency, timing, and sometimes magnitude of future avalanches. In addition, estimates of average and maximum snowpack depth can provide information on how often thresholds for avalanche triggering are exceeded.

Although historical climate and avalanche records for the Brucejack area is limited, regional BC Government snow pillow and snow survey records in the region provide baseline snowpack information. In addition, avalanche technicians working on site for the past winter have collected avalanche occurrence records for several avalanche paths in the area.

The proposed Brucejack mine area is located in a transition zone between maritime and continental climate zones. As a result, there are significant temperature and moisture fluctuations that occur in an average winter. These fluctuations often contribute to a layered snowpack, which leads to lingering avalanche conditions most winters. In addition, the effects of wind and terrain orientation lead to increased snowpack variability which can contribute to challenging avalanche forecasting conditions.

Avalanche season typically begins in October at the higher elevations (above 1400 m), and often extends until late June or early July. At valley bottom elevations, avalanches can be expected from November to late May though can occur earlier or end later in extreme years.

Typical storm patterns can produce high intensity snowfall with strong winds depositing significant amounts of snow on lee (the side of slopes away from the principal wind direction) aspects. Temperature increases associated with some storms can produce rain-on-snow conditions up to treeline elevations (1200-1400 m), and sometimes above. An average winter will include 10-20 large storm events, most of which can produce widespread avalanche conditions.

4.0 Avalanche Hazard Assessment

4.1 Background on Snow Avalanches

Snow avalanches generally occur in areas where there are steep open slopes or gullies, and deep (>50 cm) mountain snowpacks. Risk associated with avalanches is normally due to exposure to the high forces that occur, as well as the effects of extended burial for any person caught in an avalanche. Impact forces vary significantly depending on avalanche size. Although the smallest avalanches can be insignificant to a human, larger avalanches may produce impact forces capable of destroying trucks, buildings, or several hectares of mature forest.

Characteristics of Snow Avalanches:

Avalanches may initiate in either *dry* or *wet* snow. Although an avalanche may start in dry snow, it could become *moist* or *wet* during its descent. Terrain features including gullies deflect and often channel wet snow avalanches. Conversely, large, fast-flowing dry avalanches tend to flow in a straighter path, and may overrun terrain features.

Most large, dry avalanches consist of a dense component that flows primarily along the ground, and a less dense powder component that travels above and sometimes ahead of the flowing component. In some cases these components can separate and move independently. The dense-flowing component and powder component may reach speeds up to 60 m/s (200 km/h). Impact pressures from dense flow are much greater than the powder component due to the density of the snow.

Avalanche terrain is usually associated with steep open slopes in the mountains that allow an accumulation of snow before it releases in a destructive event. In addition to the steep slopes that the snow accumulates on, any area exposed to this release of snow is also considered avalanche terrain. Terrain is often subdivided into features that are connected, and generally contain or channel the volume of avalanche events into a common deposition area. These features are called *avalanche paths.*

Avalanche Season is the time of year when avalanches may occur, and is dependent on when the ground roughness in starting zones has been covered by snow, and threshold for avalanches has been exceeded. For the Brucejack area, avalanche season below 1000 m generally occurs between November and May. For higher elevations above 1200 m, avalanche season can extend to include October and June, or even summer months if cool wet conditions persist.

Avalanche Path:

An avalanche path generally consists of a *starting zone*, a *track*, and a *runout zone*. Avalanches start and accelerate in the starting zone which typically has slope incline greater than 30°. Downslope of the starting zone, most large avalanche paths have a distinct track in which the slope angle is typically in the range of 15° to 30°. Large avalanches decelerate and stop in the runout zone where incline is usually less than 15°. Smaller avalanches may decelerate and even stop on steeper slopes (15° to 24°).

Within forested terrain, larger avalanche paths are often discernible as vertically oriented swaths of open forest terrain bordered by *trim lines* (mature forest on either side of the swath). Smaller avalanches however can occur in more subtle paths, and can occur on large cutbanks in a road cut.

Runout zones generally have vague trim lines, and analysis by an experienced avalanche specialist is required to determine estimates of maximum avalanche extent (often extends into mature forest). Some avalanche paths in terrain around cliffs can be much more subtle to observe, and can be confused with rockfall and or geotechnical events.

Avalanche Frequency:

Avalanche *frequency* is the reciprocal of avalanche *return period* and is typically referred to as an order of magnitude ranging from 1:1 (annual) up to 1:300 (1 in 300) years. Each winter, the probability of an avalanche with a specified return period is constant.

Avalanche frequency is dependent upon *snow supply* and *terrain.* Frequency decreases with distance downslope in the track and runout zone. Snow supply is determined by:

- Frequency of snowfalls and amount of snow; and
- Wind transport of snow into the starting zone.

Snow and weather conditions vary from year to year, and the frequency of avalanches is not uniform.

The primary terrain factors in avalanche formation are incline, slope orientation (aspect) with respect to wind and sun, slope configuration and size, and ground surface roughness. Slope configuration is important because features such as gullies will often have more frequent and larger avalanches than open slopes. Ground roughness determines the threshold snow depth for avalanches to occur. This is particularly important in light snow climates where snow may not exceed threshold depths some winters.

Avalanche Magnitude:

Avalanche *magnitude* relates to the destructive potential of an avalanche and is defined according to the Canadian avalanche size classification system. A general description of destructive potential, magnitude, and typical path length under this classification system is provided in Table 1.

Magnitude is often related to frequency. In general, large destructive avalanches occur less frequency, while smaller ones occur on a more regular basis. Magnitude and frequency of effect are also related to location in the overall path. For example a road location near the toe of an avalanche path will be affected by avalanches on a less frequent basis, but they will be larger avalanches. Both low frequency large avalanches and higher frequency small avalanches may affect a road crossing in the middle of an avalanche path.

Table 1 : *Canadian classification system for avalanche size (McClung & Schaerer, 1993)*				
Size	Destructive Potential	Typical Mass	Typical Path Length	Typical Impact Pressures
1	Relatively harmless to people.	<10 tonnes	10 m	1 kPa
2	Could bury, injure or kill a person.	10^2 tonnes	100 m	10 kPa
3	Could bury a car, destroy a small building, or break a few trees.	10^3 tonnes	1000 m	100 kPa
4	Could destroy a large truck, several buildings, or a forest with an area up to 4 hectares.	10^4 tonnes	2000 m	500 kPa
5	Largest snow avalanches known. Could destroy a village or a 40 ha forest.	10^5 tonnes	3000 m	1000 kPa

4.2 Brucejack Avalanche Hazard

Avalanche paths and hazard areas that affect the Brucejack Project were identified by reviewing topographic relief and vegetation features on maps and aerial photos, as well as available Google Earth ortho-imagery and digital elevation models (DEM). In addition, field reconnaissance (helicopter overview flights and ground based survey) was completed March 19, 2012, and April 28-29, 2013.

Forty-one avalanche paths or hazard areas reach project infrastructure or access roads, and many locations are estimated to be affected on an annual basis. Avalanche paths and hazard areas are summarized in three tables in Appendix A, and illustrated on drawings in Appendix B. Avalanche Paths referred to in Appendix A and B are labelled according to Table 4-1, referring to the element at risk, with the exception of paths along the Knipple Glacier which may affect both the transmission line and access road.

Table 4-1 – Avalanche Path Label and corresponding Element at Risk

Avalanche Path Label	**Element at Risk**
TL1, TL2, …, TLx	Preferred transmission line alignment
AR1, AR2, …, ARx	Access road and Knipple Transfer Station
MS1, MS2, …, MSx	Facilities at or near the mine site, access road, and transmission line
KG1, KG2, …, KGx	Access road and transmission line corridor on glacier

The following four sub-sections provide details of avalanche hazard, and potential consequences to each facility.

4.2.1 Minesite

The minesite is located on a broad alpine plateau in undulating terrain on the southwest side of Brucejack Lake. The area is bounded by the Knipple Glacier to the east and south, the Sulphurets Glacier to the west, and rising alpine slopes to the north. Elevations at the minesite area range from 1350 m to

over 2000 m. Proposed facilities assesse in the mine site area near Brucejack Lake include the following (Tetratech Drawing 100000-10-003):

- Explosives and Detonator Storage
- Electrical Substation
- Water Treatment Plant
- Existing Portal
- Portal Fuel Storage
- Garbage and Incinerator area
- Operations Camp Pad
- Pre-production Ore Storage
- Mill Building including Admin, Mine Dry, Truckshop, Warehouse
- Water Reclaim Barge
- Tailings Pipeline
- Batch Plant
- Aviation Fuel Tank
- Scale House
- Water Pumps and Storage Tank
- Truck Portal
- Helipad
- Existing Office
- Four Air Raise Locations.
- Tailings Discharge
- Site Access Roads

The above facilities are all away from avalanche paths with the exception of the Operations Camp Pad, some sections of the site access roads, the existing office location, and the Pre-production Ore Storage. Short slopes (ranging from 20 to 40 m in height) that currently exist, or will be created during construction, may be expected to affect other facility areas however the hazard and consequences would normally be assessed on a site specific basis during construction and operations.

The following four sections describe the nature of the hazard to facilities at the mine site, and a fifth section discusses hazard associated with avalanches reaching Brucejack Lake.

4.2.1.1 Operations Camp Pad

Size 2 avalanches from Path MS8 are estimated to reach the southwest end of the Operations Camp Pad with an annual return frequency. Potential consequences include damage vulnerable infrastructure (e.g. window or non-structural component of building if built within the runout area) and worker injury or fatality if workers are in the runout area when the avalanche occurs.

4.1.2.2 Site Access Roads

Size 2 and 3 avalanches from Path MS5 and Size 2 avalanches from Path MS9 are estimated to reach site access roads annually (Drawing 1). Potential consequences include damage infrastructure, vehicles, and worker injury or fatality if workers are in the runout area when the avalanche occurs.

4.2.1.3 Existing Office

The Existing Office is located in the runout zone of Path MS5. Size 2 to 3 avalanches are expected to reach the facility with return frequency of three years on average. Potential consequences may include damage to infrastructure and worker injury or fatality if workers are in the runout area when the avalanche occurs.

4.2.1.4 Pre-production Ore Storage

The Pre-production Ore Storage, and associated laydown area are exposed to Size 3 avalanches from Path MS2 approximately once every ten years. Potential consequences include damage to any vulnerable materials located in the runout area when the avalanche occurs.

4.2.1.5 Avalanches Reaching Brucejack Lake

Avalanches up to Size 3 may reach Brucejack Lake from Path MS1 and short steep slopes on the north side of Brucejack Lake may produce avalanches to Size 3 reaching the lake. If avalanches reach the lake when the surface is not frozen, waves may develop. However, these waves are not expected to be destructive due to avalanches being either small or slow moving when they reach the lake.

4.2.2 Access Road

The mine access road begins at Highway 37 near the confluence of Wildfire Creek and the Bell Irving River, approximately 30 km south of the Bell 2 establishment. The road extends northwest along following the Wildfire Creek drainage for approximately 12 km before heading west to Scott Pass (677 m elevation) and then down Scott Creek drainage to the Bowser River valley (400 m elevation), 35 km from Highway 37. The access continues west along the Bowser River valley for approximately 15 km to the Knipple Transfer Station (KTS).

From the KTS, the road ascends slopes to the northwest to reach the south side of the toe of the Knipple Glacier, and along a short ramp to the Knipple Glacier. From here the road extends as a glacier road up the center of the Knipple Glacier for approximately 15 km to the mine site at approximately 1400 m. The glacier road is proposed to be near the centre of the Knipple Glacier, although the location may vary depending on crevasse restrictions.

Eleven avalanche paths or areas are estimated to affect the access road, and two paths approach to within 50 m (Table A1 and Drawing 2 to 6). One area is (Path AR8) is affected by large ice blocks falling off bluffs above the road. Several avalanche paths on the southwest and northeast side of the Knipple Glacier could affect the road if it was realigned to avoid crevasses. Potential consequences include damage to vehicles, occupant injury or fatality, and road delays for avalanche debris cleanup. Avalanche path characteristics for the Knipple Glacier segment are expected to change with glacial recession, so this segment will need to be reassessed regularly.

The highest hazard areas include sections of road that are located within Paths AR4, AR8, and KG1 due to their high frequency of avalanches and icefalls reaching the affected areas, and magnitudes large enough to damage vehicles, injure occupants, and delay the flow of traffic during storms when avalanche control is not feasible.

4.2.3 Knipple Transfer Station

The Knipple Transfer Station is located at valley bottom near the confluence of the Salmon and Knipple valleys (Drawings 2 and 3). Extreme avalanches occurring in Path AR6 are estimated to reach the west end of the KTS pad with an estimated return period of at least 100 years. Potential consequences of both mass and powder debris reaching the site include damage to infrastructure and injury or fatality for any personnel located in the runout area (at the west end of the facility footprint).

4.2.4 Transmission Line

4.2.4.1 Avalanche Hazard

The preferred transmission line alignment begins at Long Lake where a hydroelectric generation facility is currently being built, approximately 14 km north of Stewart BC. The line extends north primarily along the east side of the Salmon Glacier Valley. During this segment it parallels much of the Granduc access road to Granduc, and then extends north to the toe of the Knipple Glacier. The line is then proposed to follow a route along a ridge on the southwest side of the Knipple Glacier to minesite, however the exact alignment is uncertain at this time. An optional transmission line route follows the access road alignment from the BC Hydro Northern Transmission Line (NTL) at Highway 37.

Over 20 km (accumulated distance) of the preferred alignment is affected by avalanche paths (Table A-2). The estimated frequency of avalanches reaching the alignment varies from annual to once in 30 years. Potential consequences include damage to supporting structures (towers) if they are built within areas affected by avalanche paths, or to the conductors, depending on the height of the conductors above the avalanche paths. Associated consequences include interruption of service to the mine. In addition, worker injury of fatality may be may occur during the construction phase if the line is built, or if maintenance if undertaken, during avalanche season.

Avalanches that affect the access road are also expected to affect the optional transmission line alignment which parallels the access road from the NTL adjacent to Highway 37. Locations include all avalanche paths indicated that affect the access road. There may also be additional paths that affect the line depending on the extent of deviation of the final alignment from the access road. Potential consequences to the project would be the same as the consequences of avalanches reaching the preferred transmission line alignment.

4.2.4.2 Static Snow Forces

In addition to avalanche hazard, transmission line towers may be subject to forces of snow creep and glide, depending on their location. Although snow creep and glide are not fast moving events, they may generate forces that may exceed the bending strength of the tower or the strength of the foundation. If towers built on slopes are not designed to withstand these forces, potential consequences may include damage to towers and associated impact to conductors resulting in interruption of services to the mine.

5.0 Avalanche Risk Analysis

Guidelines for determining avalanche risk to fixed facilities, worksites and industrial roads within Canada have been developed, and are outlined in the Guidelines for Snow Avalanche Risk Determination and Mapping in Canada (CAA, 2002). Risk determination is not only based on magnitude and frequency of avalanches, but also considers the differences in vulnerability and exposure time of the elements at risk. Avalanche risk planning for a mining project with a combination of fixed facilities, worksites, and access roads involves the consideration of maximum size avalanches that generally have avalanche return periods of 100 years or more.

The Brucejack project is proposed to operate year round. Elements at risk include fixed facilities, equipment, vehicles, and workers. The vulnerability of each element at risk depends on the ability to sustain the effect of the avalanche. In general avalanches of Size 2 or greater are expected to pose a risk to personnel, and avalanches of Size 3 and greater will pose a risk to fixed facilities, equipment, and medium to large size vehicles. This does not take into account the effect of terrain features which may augment the effect of an avalanche (eg. a worker pushed over a cliff by a Size 1 avalanche; or a vehicle being pushed into a river by a Size 2 avalanche). Fixed infrastructure under development, and specific construction equipment may be damaged (depending on ability to sustain avalanche effects), or lost in avalanche debris or flowing waterways.

Potential consequences of avalanches reaching facilities, worksites and access roads may include:

- damage to facilities, equipment and vehicles;
- worker injury or fatality;
- impact to the environment from any spills associated the avalanche; and
- construction delays due to road and worksite area blockages.

Associated consequences may include economic losses resulting from the above, and impact to company reputation.

A complete risk assessment for each individual scenario involving avalanches cannot be undertaken without further details regarding worksite locations, and timing of exposure. However, considering the baseline details which include:

- proposed year round mining schedule,
- high number of worksites and access roads in avalanche paths, and
- anticipated high number of personnel and vehicles associated with the construction project,

it is estimated that the risk from avalanches to the Brucejack project is high. This estimation assumes no mitigation is utilized.

6.0 Options for Mitigation

Mitigation strategies typically incorporate location planning (for fixed facilities), avoidance during avalanche season, or the implementation of an active avalanche management plan (generally for access roads and worksites). They type of mitigation depends on the element at risk, and requirement for un-interrupted access (or not).

For the transmission line, the hazard to the towers may be reduced by location planning (locating towers away from the centre of avalanche paths, and spanning avalanche paths. When this is not feasible, the constructing of splitting wedges (Figure 6-1) or earthworks can reduce or eliminate the hazard. Alternatively towers may be designed (reinforced with concrete or steel) to protect from avalanche impact forces (Figure 6-2) and snow creep and glide forces.

Figure 6-1 – Example of Splitting Wedge to Protect Structure (McClung & Schaerer, 2006)

Figure 6-2 – Example of Reinforced Tower

Avalanche mitigation for worksites and access roads typically involve an active avalanche management plan. An active avalanche management plan normally involves a daily risk assessment process for worksites and access routes. Avalanche hazard is normally assessed by detailed weather and snowpack analysis by avalanche technicians. Daily risk is assessed according to nature of the specific worksite project and access requirements (exposure and consequence components). Measures to reduce risk in an avalanche management plan include both active and passive measures. Active measures include temporary evacuation of sites and avalanche control by explosives or other means. Passive measures include:

- limiting exposure or implementing safety measures during high hazard;
- worker safety training sessions;
- Personal Protective Equipment (eg. avalanche transceivers) and rescue equipment; and
- An Avalanche Emergency Response Plan.

Additional measures to reduce risk to roads and worksites may include permanent or semi-permanent mitigation including:

- earthworks (diversion and catchment berms) to contain or divert avalanches away from worksites, access roads, or facilities;
- snow berms to contain or divert avalanches away from worksites, access roads, or facilities;
- structural walls or snow sheds.

Due to high costs of building structural walls or snow sheds, the feasibility of these are typically evaluated in a business case comparison of options that would balance cost of construction and maintenance versus loss associated with temporary closure of areas during periods of high hazard.

7.0 Summary and Recommendations

7.1 Summary

An avalanche hazard assessment has been completed for the Brucejack mine project. Facilities and access routes are exposed to approximately forty-one avalanche paths or areas. Avalanche magnitude varies between Size 2 and 4. Avalanche frequency varies between annual and 1:100 years. Potential consequences of avalanches reaching Brucejack mine facilities, transmission line, worksites, and roads include damage to infrastructure, worker injury (or fatality), and project delays. Potential consequences of static snow loads on transmission towers include damage to towers and foundations, and potential loss of electrical service to the mine. Without mitigation to the effects of avalanches and static snow loading, there is a high likelihood of some of the above consequences affecting operations on an annual basis.

A complete risk assessment for each individual scenario involving avalanches cannot be undertaken without further details regarding worksite locations, and timing. However, considering the baseline details which include:

- proposed year round mining schedule,
- high number of worksites and access roads in avalanche paths, and
- anticipated high number of personnel and vehicles associated with the construction project,

it is estimated that the unmitigated risk from avalanches to the Brucejack project is high.

7.2 Recommendations

Alpine Solutions recommends the following:

- Operation of the mine during regular avalanche season (October through June) should involve an avalanche management program to reduce risk to project personnel and equipment. The program should include weather and avalanche monitoring to forecast periods of elevated avalanche hazard and closure of hazard areas until hazard us reduced by means of avalanche explosive control or natural settlement. Avalanche explosive control methods may include helicopter explosive control as well as use of an avalauncher.
- Sections of the access road affected by Paths, AR4, AR8 and KG1 are exposed to high frequency events that may have high consequences to traffic. Depending on traffic volume along the access road and the tolerance for extended closures of these sections, consideration should be given to the installation of fixed Remote Control Avalanche Systems (RACS) in the starting zones of these paths. These RACS would facilitate the ability to conduct avalanche control remotely during reduced visibility when helicopters cannot fly (night, and during storms).
- The area affected by icefall hazard at Path AR8 should be monitored throughout the winter, and regularly controlled using explosives to limit the chance of large icefall events impacting a vehicle.
- The segment of the Access Road which transits the Knipple Glacier should be reassessed on a regular basis due to the effects of glacial recession on avalanche runout distance on the glacier.

- Transmission line structures (towers) should be located away from avalanche paths in order to reduce the requirement for avalanche mitigation. If this is not possible, additional analysis should be completed to determine the most optimal mitigation option. Mitigation may include designing towers for avalanche impact, diversion structures, or earthworks upslope of the tower.
- The final design of the transmission line should involve collaboration with an Avalanche Specialist in order to optimize structure (tower) and conductor locations.
- Construction of the transmission line during avalanche season should include an avalanche management program to reduce risk to personnel and infrastructure.
- Any changes to layout of facilities and roads should be reassessed for avalanche hazard

8.0 Closure

This report was prepared by Alpine Solutions Avalanche Services (Alpine Solutions) for the account of Pretivm Resources Inc. The material in it reflects Alpine Solutions' best judgment in light of the information available to Alpine Solutions at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, is the responsibility of such third parties. Alpine Solutions accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions, based on this report.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending Alpine Solutions' written approval. EXECUTIVE SUMMARY

Pretium Resources Inc. (Pretium) is planning to develop a mine in the Coast Range of northwestern British Columbia, approximately 60 km north of Stewart, BC (Figure 1-1). The project includes several mine site facilities, a transmission line, and an access road. Studies that have been completed previously indicate that the project is in the vicinity of snow avalanche terrain. Pretium requested that Alpine Solutions Avalanche Services (Alpine Solutions) undertake an avalanche hazard assessment to determine the locations, likelihood and potential consequences of avalanches affecting the project.

The avalanche hazard assessment identified approximately 15 avalanche paths (or avalanche hazard areas where there are multiple overlapping paths) that affect planned facility locations and access roads, and several of these locations are affected annually. The preferred transmission line route traverses though numerous avalanche hazard areas although avalanche hazard to the line cannot be determined accurately until the alignment and structure (tower) locations are finalized. Potential consequences of avalanches reaching Brucejack mine facilities, transmission line, worksites, and roads include damage to infrastructure, worker injury (or fatality), and project delays. Potential consequences of static snow loads on transmission towers include damage to towers and foundations, and potential loss of electrical service to the mine. Options for avalanche mitigation are provided, and the memorandum concludes with the following recommendations:

- Operation of the mine during regular avalanche season (October through June) should involve an active avalanche management program to reduce risk to project personnel and equipment. The program should include the use of personal protective equipment (PPE) as well as avalanche safety training for all workers exposed to avalanche hazards. In addition, daily hazard and risk assessments by a qualified Avalanche Technician (or team of technicians) to forecast periods of elevated avalanche hazard so that closure of hazard areas can be implemented until hazard is reduced by means of avalanche explosive control or natural settlement. Avalanche explosive control methods may include hand charging, helicopter explosive control, and pneumatic explosive launchers (avalaunchers).
- Sections of the access road affected by Paths AR4, AR8 and KG1 are exposed to high frequency events that may have high consequences to traffic. Depending on traffic volume along the access road and the tolerance for extended closures of these sections, consideration should be given to the installation of fixed Remote Control Avalanche Systems (RACS) in the starting zones of these paths. The RACS would facilitate the ability to conduct avalanche control remotely during reduced visibility when helicopters cannot fly (darkness, and during storms).
- The area affected by icefall hazard at Path AR8 should receive constant monitoring throughout the winter, and regularly controlled using explosives to limit the chance of large icefall events impacting a vehicle.

- The segment of the Access Road which transits the Knipple Glacier should be reassessed on a regular basis due to the effects of glacial recession on avalanche runout distance on the glacier.
- During winter, snow berms should be constructed in areas at the mine site affected by short slopes or avalanches to Size 2, in order to reduce the frequency of small avalanches reaching facilities.
- If possible, transmission line structures (towers) should be located away from avalanche paths in order to reduce the requirement for avalanche mitigation. If this is not possible, additional analysis should be completed to determine the most optimal mitigation option. Mitigation may include designing towers for avalanche impact, diversion structures, or earthworks upslope of the tower.
- The final design of the transmission line should involve collaboration with an Avalanche Specialist/Engineer in order to optimize structure (tower) and conductor locations.
- Construction of the transmission line during avalanche season should include an avalanche management program to reduce risk to personnel and infrastructure.
- Any changes to layout of facilities and roads, in subsequent stages of mine development, should be reassessed for avalanche hazard.

1.0 INTRODUCTION

1.1. General

Pretium Resources Inc. (Pretium) is planning to develop a mine in the Coast Range of northwestern British Columbia, approximately 60 km north of Stewart, BC (Figure 1-1). The project includes several mine site facilities, a transmission line, and an access road. Studies that have been completed previously indicate that the project is in the vicinity of snow avalanche terrain. Pretium requested that Alpine Solutions Avalanche Services (Alpine Solutions) undertake an avalanche hazard assessment to determine the locations, likelihood and potential consequences of avalanches affecting the project. Options for avalanche mitigation are provided, and the memorandum concludes with recommendations. The results of this assessment will be used for mine permitting, and operational planning.

Figure 1-1. Brucejack Project Location

1.2. Scope of Work

The following maps and documents were provided by Pretium:

- Figure 18.11 Brucejack Overall Site Plan GA – Mine and Process Plant.
- Tetratech - Pretium Feasibility Study Drawings 100000-20-000, 001, 002, 101, 102, 103, 104, 105, 201, 301, 302, 303, 304, 305, 306, 501.
- Digital shape-files representing facility layout.
- 3 maps by Cypress Forest Consultants illustrating Access Road General Arrangement (including Glacier Road).
- Figure 8.2-2 Brucejack Project: Alternative Power Line Routes.
- Brucejack Road Risk Rating and Inspection Procedure.

In addition, numerous aerial photographs (1:20,000 scale), were provided by BGC Engineering Inc. Sketches of the preferred transmission line route were provided by Valard Construction Ltd.

The avalanche hazard assessment was completed for the mine site area and the access road from Highway 37. The preferred transmission line route was also reviewed for general avalanche hazard areas. The work included terrain analysis from topographic maps and aerial imagery. A helicopter overview flight was undertaken in March 2012 to confirm the avalanche path locations and terrain characteristics. Ground survey was completed April 28-29, 2013.

This report provides the following information:

- Identification and description of avalanche hazard to facilities and mine operations.
- An estimate of potential consequences of avalanches to facilities and mine operations.
- Fifteen drawings illustrating locations of avalanche paths that affect proposed facilities and access roads.
- Options for mitigation.
- Recommendations.

2.0 LIMITATIONS

This document provides an overview of snow[1] avalanche hazards which affect the proposed Brucejack mine project. Estimated magnitudes, frequencies, and areal extent of individual avalanche paths are based on a climate analysis, map and imagery interpretation, helicopter overview flights, and ground analysis for specific fixed infrastructure that is potentially affected by avalanches. Analysis of individual avalanche paths was limited to terrain and vegetation analysis; no numerical modeling has been completed.

Sources of uncertainty associated with avalanche runout boundaries illustrated on avalanche hazard mapping include:

- limited avalanche occurrence history (data) for the area; and
- lack of vegetation indicators (trim lines) where avalanches runout into non-forested terrain.

Although other geohazards exist in the region, the scope of this assessment is limited exclusively to avalanches. In addition, any significant artificial or natural alteration of the landscape or terrain due to forest fire, landslides, or other geotechnical event may change the nature (magnitude/frequency/intensity/runout) of avalanche hazard, necessitating a re-assessment for the area affected.

[1] The qualifier “snow” will not be included from here on. It was added here to make it clear that there is no mention of “rock avalanches” or “debris avalanches” in this report.

3.0 PHYSIOGRAPHY

3.1. Location

The Pretium mine site is located at the head of the Knipple Glacier, approximately 60 km north of Stewart, BC, and 38 km southwest of Bell II. The access road begins at the intersection of Highway 37 and Wildfire Creek, approximately 30 km south of Bell II, and extends to the mine site via the Wildfire Creek, Scott Creek, Bowser River, and Knipple Glacier valleys. The preferred transmission line route extends from the Long Lake Hydroelectric Project north of Stewart to the mine via the Salmon Glacier valley and the ridge on the south side of the Knipple Glacier. A second optional route for the transmission line follows the access road corridor from a potential connection point to the Northern Transmission Line at Highway 37.

3.2. Snow Climate

Snow climate refers to the general character of climate factors that contribute to snowpack and avalanche formation. Historical meteorological records often provide information on the frequency, timing, and sometimes magnitude of future avalanches. In addition, estimates of average and maximum snowpack depth can provide information on how often thresholds for avalanche triggering are exceeded.

Although historical climate and avalanche records for the Brucejack area is limited, regional BC Government snow pillow and snow survey records in the region provide baseline snowpack information. In addition, avalanche technicians working on site during winter 2012/2013 have collected avalanche occurrence records for several avalanche paths in the area.

The proposed Brucejack mine area is located in a transition zone between maritime and continental climate zones. As a result, there are significant temperature and moisture fluctuations that occur in an average winter. These fluctuations often contribute to a layered snowpack, which leads to lingering avalanche conditions most winters. In addition, the effects of wind and terrain orientation lead to increased snowpack variability which can contribute to challenging avalanche forecasting conditions.

Avalanche season typically begins in October at the higher elevations (above 1400 m), and often extends until late June or early July. At valley bottom elevations, avalanches can be expected from November to late May though can occur earlier or end later in extreme years.

Typical storm patterns can produce high intensity snowfall with strong winds depositing significant amounts of snow on lee (the side of slopes away from the principal wind direction) aspects. Temperature increases associated with some storms can produce rain-on-snow conditions up to treeline elevations (1200-1400 m), and sometimes above. An average winter will include 10-20 large storm events, most of which can produce widespread avalanche conditions.

4.0 AVALANCHE HAZARD ASSESSMENT

4.1. Background on Snow Avalanches

Snow avalanches generally occur in areas where there are steep open slopes or gullies, and deep (more than 50 cm) mountain snow packs. Risks associated with avalanches are normally due to exposure to the high impact forces that occur, as well as the effects of extended burial for any person caught in an avalanche. Impact forces vary significantly depending on avalanche size. Although the smallest avalanches can be insignificant to a human, larger avalanches may produce impact forces capable of destroying trucks, buildings, or several hectares of mature forest.

Characteristics of Snow Avalanches:

Avalanches may initiate in either dry or wet snow. Although an avalanche may start in dry snow, it could become moist or wet during its descent. Wet snow avalanches can be deflected and often channeled by terrain features, including gullies. Conversely, large, fast-flowing dry avalanches tend to flow in a straighter path, and may overrun terrain features.

Most large, dry avalanches consist of a dense component that flows primarily along the ground, and a less dense powder component that travels above and sometimes ahead of the flowing component. In some cases these components can separate and move independently. The dense-flowing component and powder component may reach speeds up to 60 m/s (200 km/h). Impact pressures from dense flows are much greater than the powder component due to the density of the snow.

Avalanche terrain is usually associated with steep, open slopes in the mountains that allow an accumulation of snow before it releases in a destructive event. In addition to the steep slopes that the snow accumulates on, any area exposed to this release of snow is also considered avalanche terrain. Terrain is often subdivided into features that are connected, which generally contain or channel the volume of avalanche events into a common deposition area. These features are called avalanche paths.

Avalanche season is the time of year when avalanches may occur, and is dependent on when the ground roughness in starting zones is covered by snow, and the threshold for avalanches is exceeded. For the Brucejack area, avalanche season below 1,000 m generally occurs between November and May. For elevations above 1,200 m, avalanche season can extend into October and June, or even summer months if cool, wet conditions persist.

Avalanche Path:

An avalanche path generally consists of a starting zone, a track, and a runout zone. Avalanches start and accelerate in the starting zone, which typically has a slope incline greater than 30°. Downslope of the starting zone, most large avalanche paths have a distinct track in which the slope angle is typically in the range of 15 to 30°. Large avalanches

decelerate and stop in the runout zone where incline is usually less than 15°. Smaller avalanches may decelerate and even stop on steeper slopes (15 to 24°).

Within forested terrain, larger avalanche paths are often discernible as vertically oriented swaths of open forest terrain, bordered by trim lines (mature forest on either side of the swath). Smaller avalanches, however, can occur in more subtle paths, and can occur on large cut banks in a road cut.

Runout zones generally have vague trim lines, and analysis is required by an experienced avalanche specialist to determine estimates of maximum avalanche extent (often extends into mature forest). In terrain around cliffs, some avalanche paths can be much more subtle to observe, and can be confused with rock fall and/or geotechnical events.

Avalanche Frequency:

Avalanche frequency is the reciprocal of avalanche return period and is typically referred to as an order of magnitude ranging from 1:1 (annual) up to 1:300 (1 in 300) years. Each winter, the probability of an avalanche with a specified return period is constant.

Avalanche frequency is dependent upon snow supply and terrain. Frequency decreases with distance downslope in the track and runout zone. Snow supply is determined by:

- the frequency of snowfalls and amount of snow; and
- the wind transport of snow into the starting zone.

Snow and weather conditions vary from year to year; therefore, the frequency of avalanches is not uniform.

The primary terrain factors in avalanche formation are incline, slope orientation (aspect) with respect to wind and sun, slope configuration and size, and ground surface roughness. Slope configuration is important because features such as gullies will often have more frequent and larger avalanches than open slopes. Ground roughness determines the threshold snow depth for avalanches to occur, which is particularly important in light snow climates where snow may not exceed threshold depths during some winters.

Avalanche Magnitude:

Avalanche magnitude relates to the destructive potential of an avalanche and is defined according to the Canadian avalanche size classification system. This classification system is summarized in Table 4.1, which provides a general description of destructive potential, magnitude, and typical path length.

Table 4-1. Canadian classification system for avalanche size (McClung & Schaerer, 2006)

Size	Destructive Potential	Typical Mass (t)	Typical Path Length (m)	Typical Impact Pressures (KPa)
1	Relatively harmless to people.	<10	10	1
2	Could bury, injure or kill a person.	10^2	100	10
3	Could bury a car, destroy a small building, or break a few trees.	10^3	1000	100
4	Could destroy a large truck, several buildings, or a forest with an area up to 4 hectares.	10^4	2000	500
5	Largest snow avalanches known. Could destroy a village or a 40 ha forest.	10^5	3000	1000

Magnitude is often related to frequency. In general, large destructive avalanches occur less frequently, while smaller ones occur on a more regular basis. Magnitude and frequency are also co-related to a specific location in an avalanche path. For example, a road location near the toe of an avalanche path will be affected by avalanches on a less frequent basis, but they will be larger avalanches. Both low-frequency large avalanches and higher-frequency small avalanches may affect a road crossing that is higher up in the avalanche path.

4.2. Brucejack Avalanche Hazard

Avalanche paths (and hazard areas where multiple overlapping paths exist) that affect the Project were identified by reviewing topographic relief and vegetation features on maps and aerial photos, as well as available Google Earth ortho-imagery and digital elevation models (DEM). In addition, field reconnaissance (helicopter overview flights and ground based survey) was completed on March 19, 2012, and from April 28 to 29, 2013.

Approximately 15 avalanche paths or hazard areas reach (or potentially reach) project infrastructure or access roads, and many locations are estimated to be affected on an annual basis. Drawings of the avalanche paths and hazard areas are illustrated in Appendix A. Avalanche paths and hazard areas are labeled according to Table 4-1, referring to the element at risk, with the exception of paths along the Knipple Glacier which may affect both the transmission line and access road.

Table 4-1. Avalanche Path Label and corresponding Element at Risk.

Avalanche Path Label	Element at Risk
TL1, TL2, …, TLx	Preferred transmission line route
AR1, AR2, …, ARx	Access road and Knipple Transfer Station
MS1, MS2, …, MSx	Facilities at or near the mine site, access road, and transmission line
KG1, KG2, …, KGx	Access road and transmission line corridor on glacier

Details of avalanche hazards, and potential consequences are outlined in the following sections for the mine site, access road, Knipple Transfer Station, and transmission line.

4.2.1. Mine Site

The mine site is located on a broad alpine plateau in undulating terrain on the southwest side of Brucejack Lake. The area is bounded by the Knipple Glacier to the east and south, the Sulphurets Glacier to the west, and rising alpine slopes to the north. Elevations at the mine site area range from 1350 m to over 2000 m. The proposed facilities assessed include:

- two explosives and storage facilities – preliminary position;
- detonator storage – preliminary position;
- topsoil stockpile;
- substation;
- water treatment plant;
- portal fuel storage;
- conveyor portal and truck portal;
- overhead electrical;
- mill building including administration, mine dry, truck shop and warehouse;

- tailings pipeline;
- helipad;
- upper and lower laydown area;
- batch plant, fuel storage, and aviation fuel tank;
- pre-production ore storage;
- diversion channel;
- waste rock transfer storage;
- garbage and incinerator area;
- operations camp;
- sewage system, water pumps, and storage tank;
- proposed new transmission tower location;
- scale house;
- four air raise locations; and
- site access roads (not including mine access road).

These facilities are all located away from avalanche paths and areas with the exception of the operations camp, some sections of the site access roads, and the pre-production ore storage and diversion channel area. Short slopes that currently exist (ranging from 10 to 40 m in height), or will be created during construction, may be expected to affect other facility areas; however the hazard and consequences would normally be assessed on a site specific basis during construction and operations.

Table 4-2 provides a summary of avalanches reaching the mine site area and Drawing 1 in Appendix A illustrates the approximate hazard locations.

Table 4-2. Mine site avalanche hazards.

Path or Area ID	Avalanche Atlas Polygon Label	Facility Affected	Approximate Elevation of Facility (m)	Facility Position in Path	Length of Facility Affected (m)	Return Frequency		
						Size 2	Size 3	Size 4
Mine Site 2	MS2	Pre-production ore storage and diversion channel	1,390 to 1,370	RZ	300	-	1:10	-
Mine Site 5	MS5	Site access roads	1,460 to 1,420	RZ	800	1:1	1:3	-
Mine Site 8	MS8	Operations camp and site access roads	1,450	RZ	300	1:1	-	-

Notes: RZ = Runout Zone

The nature of the hazards to facilities at the mine site, and the nature of hazards associated with avalanches reaching Brucejack Lake are described in the following sections.

4.2.1.1. Operations Camp

Size 2 avalanches from Path MS8 are estimated to reach the southwest end of the operations camp with an annual return frequency. Potential consequences include damage to vulnerable infrastructure (e.g. windows or non-structural component of building if built within the runout area) and worker injury or fatality if workers are in the runout area when the avalanche occurs.

4.2.1.2. Site Access Roads

Size 2 and 3 avalanches from Path MS5 and Size 2 avalanches from Path MS8 are estimated to reach site access roads annually. Potential consequences include damage to infrastructure and vehicles, and worker injury or fatality if workers are in the runout area when the avalanche occurs.

4.2.1.3. Pre-production Ore Storage and Diversion Channel Area

The pre-production ore storage, and diversion channel area are exposed to Size 3 avalanches from Path MS2 approximately once every ten years. Potential consequences are limited to damage to any vulnerable materials stored in this area during avalanche season, as well as worker injury or fatality if workers are in the runout area when the avalanche occurs. The diversion channel is expected to be buried during avalanche season.

4.2.1.4. Avalanches Reaching Brucejack Lake

Avalanches up to Size 3 may reach Brucejack Lake from Path MS1 as well as short steep slopes on the north side of Brucejack Lake. If avalanches reach the lake when the surface is not frozen, waves may develop. As a result of the small size or slow speed of the avalanches when they reach the lake, these waves are not expected to be destructive.

4.2.2. Access Road

The mine access road begins at Highway 37 near the confluence of Wildfire Creek and the Bell Irving River, approximately 30 km south of Bell II. The road extends northwest following the Wildfire Creek drainage for approximately 12 km before heading west to Scott Pass (677 m elevation) and then down Scott Creek drainage to the Bowser River valley (400 m elevation), 35 km from Highway 37. The access continues west along the Bowser River valley for approximately 15 km to the Knipple Transfer Station.

From the Knipple Transfer Station, the road ascends to the northwest to reach the south side of the toe of the Knipple Glacier, and along a short ramp to the Knipple Glacier. From here a glacier road extends up the center of the Knipple Glacier for approximately 15 km to the mine

site at approximately 1400 m. The glacier road is proposed to be located near the centre of the Knipple Glacier, although the location may vary depending on crevasse restrictions.

Fourteen avalanche paths or areas are estimated to affect the access road, and two paths approach within 50 m (Table 4-3 and Drawing 2 to 6). One area (Path AR8) is affected by large ice blocks falling off bluffs above the road. Several avalanche paths on the southwest and northeast side of the Knipple Glacier could affect the road if it was realigned during the project (to avoid crevasses). Potential consequences include damage to vehicles, occupant injury or fatality, and road delays for avalanche debris cleanup. Avalanche path characteristics for the Knipple Glacier segment are expected to change with glacial recession, so this segment will need to be reassessed regularly.

Areas within Paths AR4, AR8, and KG1 have increased hazard and consequences due to the high frequency of avalanches and ice falls reaching the affected areas, as well as magnitudes large enough to severely damage vehicles, injure occupants, and delay the flow of traffic during storms when helicopter avalanche control is not feasible.

Table 4-3. Access Road Avalanche Hazards (table continues over 2 pages).

Path or Area ID	Avalanche Atlas Polygon Label	Facility Affected	Approximate Elevation of Facility (m)	Facility Position in Path	Approximate Length of Facility Affected (m)	Return Frequency		
						Size 2	Size 3	Size 4
Access Road 1	AR1	Access Road	580	-	-	-	-	P
Access Road 2	AR2	Access Road	580	-	-	-	-	P
Access Road 4	AR4	Access Road	400	RZ	600	1:1	1:3	-
Access Road 5	AR5	Access Road	440	RZ	540	>1:1	1:1	-
Access Road 6	AR6	Access Road	420	RZ	140	>1:1	-	-
Access Road 6.5	AR6.5	Access Road	470	RZ	250	1:1	-	-
Access Road 7	AR7	Access Road	600 to 470	RZ	1,000	-	1:3	1:10
Access Road 7	AR7	Knipple Transfer Station (west end only)	470	RZ	100	-	-	1:100
Access Road 8	AR8	Access Road	730 to 660	RZ	700	1:1	1:3	-
Knipple Glacier 1	KG1	Access Road	730 to 650	RZ	700	1:1	1:3	-

Path or Area ID	Avalanche Atlas Polygon Label	Facility Affected	Approximate Elevation of Facility (m)	Facility Position in Path	Approximate Length of Facility Affected (m)	Return Frequency		
						Size 2	Size 3	Size 4
Mine Site 1	MS1	Access Road	1,440 to 1,370	RZ	2,000	>1:1	1:1	-
Mine Site 2	MS2	Access Road	1,370	RZ	300	1:1	1:10	-

Mine Site 9	MS9	Access Road	1,455	RZ	100	1:3	-	-
Mine Site 10	MS10	Access Road	1,455	RZ	150	1:3	-	-

Notes: RZ = Runout Zone; P = Potential to reach access road or facility

4.2.3. Knipple Transfer Station

The Knipple Transfer Station is located at the valley bottom near the confluence of the Salmon and Knipple valleys (Drawings 2 and 3). Large avalanches occurring in Path AR6 are estimated to reach the west end (approximately 20%) of the Knipple Transfer Station pad with an estimated return period of at least 100 years. Avalanches are not expected to reach the eastern side of the Knipple Lake Transfer Station pad where primary fixed facilities (camp) are located. Potential consequences of avalanches reaching the site include damage to infrastructure and injury or fatality for any personnel located in the runout area.

4.2.4. Transmission Line

4.2.4.1. Avalanche Hazard

The preferred transmission line route begins at Long Lake where a hydroelectric generation facility is currently being built, approximately 14 km north of Stewart BC. Although the exact alignment has not been finalized, the line is proposed to follow a route on the east side of the Salmon Glacier Valley to the proposed Knipple Transfer Station area. The line is then proposed to follow a route along a ridge on the southwest side of the Knipple Glacier to the mine site. The preferred route is illustrated in Drawings 7 to 15 (Appendix A). An optional transmission line route for the project follows the access road alignment from the BC Hydro Northern Transmission Line (NTL) at Highway 37.

Initial analysis indicates that there are approximately 20 to 25 avalanche paths that affect the preferred transmission line route, although they would only pose a hazard if supporting structures (towers) were built in avalanche paths, or conductors were low enough to the ground to be affected by the powder (airbourne) component of the flow. Potential consequences include damage to towers or conductors, and interruption of service to the mine. In addition, worker injury or fatality may occur if the line is built, or if maintenance is undertaken, in avalanche hazard areas during avalanche season. The final alignment of the transmission line (including specific structure locations) is expected to be detailed during the next phase of the Project, and will be assessed further for avalanches at that time.

The optional transmission line alignment parallels the access road from the NTL adjacent to Highway 37, and is potentially affected by the same avalanche paths that affect the access road. There may be additional paths that affect the line depending on the final alignment. Potential consequences to the Project would be the same as the consequences of avalanches reaching the preferred transmission line alignment.

4.2.4.2. Static Snow Forces

In addition to avalanche hazard, transmission line towers may be subject to forces of snow creep and glide, depending on their location. Although snow creep and glide are not fast moving events, they may generate forces that may exceed the bending strength of the tower

or the strength of the foundation. If towers built on slopes are not designed to withstand these forces, potential consequences may include damage to towers and associated impact to conductors resulting in interruption of services to the mine.

5.0 Options for Mitigation

Avalanche mitigation strategies typically incorporate location planning (for fixed facilities), structural or earthworks mitigation, avoidance during avalanche season, or the implementation of an active avalanche management plan (generally for access roads and worksites that can be evacuated). The type of mitigation often depends on the element at risk, and its requirement for un-interrupted access (or not).

The hazard to the structures (towers) along the transmission line may be reduced by location planning which may include locating towers away from the centre of avalanche paths, and spanning avalanche paths as much as possible. If this is not feasible, the construction of splitting wedges (Figure 5-1) or earthworks can reduce or eliminate the hazard to towers. Alternatively towers may be reinforced with concrete and/or steel to protect from avalanche impact forces and snow creep and glide forces (Figure 5-2).

Figure 5-1. – Example of Splitting Wedge to Protect Structure (McClung & Schaerer, 2006)

Figure 5-2. Example of Reinforced Tower.

Measures to reduce risk to roads and worksites may include permanent or semi-permanent mitigation including:

- earthworks (diversion and catchment berms) to contain or divert avalanches away from worksites, access roads, or facilities;
- snow berms (constructed annually) to contain or divert avalanches away from worksites, access roads, or facilities; and
- structural walls or snow sheds.

Due to high costs of building structural walls or snow sheds, the feasibility of these are typically evaluated in a business case comparison of options that would balance cost of construction and maintenance versus costs associated with temporary closure of areas or roads during periods of high hazard.

Avalanche mitigation for worksites and access roads typically involve an active avalanche management plan. An active avalanche management plan normally includes a daily hazard and risk assessment process by Avalanche Technicians for all affected worksites and access routes. When hazard is high, sites are evacuated until hazard is reduced by application of explosives, or natural settlement. Other measures in an avalanche management plan include:

- worker safety training sessions;
- the use of Personal Protective Equipment (e.g. avalanche transceivers) and rescue equipment; and
- an Avalanche Emergency Response Plan.

For avalanche hazard areas that require high reliability (i.e. reduced closure time), Remote Control Avalanche Systems (RACS) can be used. Further details regarding RACS are provided in Section 5.1.

5.1. Remote Avalanche Control Systems

Remote avalanche control systems (RACS) utilize fixed infrastructure installed in or near avalanche starting zones. The systems are designed to deploy explosive charges and trigger avalanches in any weather, and anytime day or night, via a remote communications link. Remote systems generally have high initial cost, but this may be offset by costs savings due to reduced operational delays.

Types of RACS that are currently available include gas exploders, sophisticated remote control mortar systems, and other remote devices which can remotely deliver explosives to starting zones. During times when avalanche control is required, a technician establishes a communications link between the infrastructure and a control computer, and a firing sequence is initiated. This can be accomplished from an office or field computer.

Remote control gas exploders are currently the most prominent type of remote systems in use today. In addition to hundreds of operations in Europe and Asia, several highways, parks, and ski areas in North America, and some mining operations in South America rely on them for effective control in active areas. Other systems that either launch explosives into starting zones, or hang charges above starting zones, may be preferred for some situations.

Examples of three different types of RACS are illustrated in Figure 5-3, 5-4, and 5-5. Figure 5-3 illustrates a single remote control gas exploder and associated control shelter (which would support an array of exploders), Figure 5-4 illustrates a mortar based system, and Figure 5-5 illustrates a tethered (air-blast) explosive system (Wyssen Tower).

Typically a business case study is undertaken prior to installing RACS system. Cost savings from reduced closure time and the efficiency and safety gained in using RACS typically must offset cost of installation and operation.

Figure 5.3 Gas-Exploder (left) and Control Shelter (right).

Figure 5-4. Mortar Based RACS.

6.0 Summary and Recommendations

6.1. Summary

An avalanche hazard assessment has been completed for the Brucejack mine project. Mine facilities and access routes are exposed to 15 avalanche paths (or avalanche hazard areas where there are multiple overlapping paths) that affect planned facility locations and access roads, and several of these locations are affected annually. The preferred transmission line route traverses though 20 to 25 avalanche hazard areas although avalanche hazard to the line cannot be determined accurately until the alignment and structure (tower) locations are finalized. Potential consequences of avalanches reaching Brucejack mine facilities, transmission line, worksites, and roads include damage to infrastructure, worker injury (or fatality), and project delays. Potential consequences of static snow loads on transmission towers include damage to towers and foundations, and potential loss of electrical service to the mine.

6.2. Recommendations

Alpine Solutions recommends the following:

- Operation of the mine during regular avalanche season (October through June) should involve an active avalanche management program to reduce risk to project personnel and equipment. The program should include the use of personal protective equipment (PPE) as well as avalanche safety training for all workers exposed to avalanche hazards. In addition, daily hazard and risk assessments by a qualified Avalanche Technician (or team of technicians) to forecast periods of elevated avalanche hazard so that closure of hazard areas can be implemented until hazard is reduced by means of avalanche explosive control or natural settlement. Avalanche explosive control methods may include hand charging, helicopter explosive control, and pneumatic explosive launchers (avalaunchers).
- Sections of the access road affected by Paths AR4, AR8 and KG1 are exposed to high frequency events that may have high consequences to traffic. Depending on traffic volume along the access road and the tolerance for extended closures of these sections, consideration should be given to the installation of fixed Remote Control Avalanche Systems (RACS) in the starting zones of these paths. The RACS would facilitate the ability to conduct avalanche control remotely during reduced visibility when helicopters cannot fly (darkness, and during storms).
- The area affected by icefall hazard at Path AR8 should receive constant monitoring throughout the winter, and regularly controlled using explosives to limit the chance of large icefall events impacting a vehicle.
- The segment of the Access Road which transits the Knipple Glacier should be reassessed on a regular basis due to the effects of glacial recession on avalanche runout distance on the glacier.

- During winter, snow berms should be constructed in areas at the mine site affected by short slopes or avalanches to Size 2, in order to reduce the frequency of small avalanches reaching facilities.
- If possible, transmission line structures (towers) should be located away from avalanche paths in order to reduce the requirement for avalanche mitigation. If this is not possible, additional analysis should be completed to determine the most optimal mitigation option. Mitigation may include designing towers for avalanche impact, diversion structures, or earthworks upslope of the tower.
- The final design of the transmission line should involve collaboration with an Avalanche Specialist/Engineer in order to optimize structure (tower) and conductor locations.
- Construction of the transmission line during avalanche season should include an avalanche management program to reduce risk to personnel and infrastructure.
- Any changes to layout of facilities and roads, in subsequent stages of mine development, should be reassessed for avalanche hazard.

7.0 CLOSURE

This document was prepared by Alpine Solutions Avalanche Services (Alpine Solutions) for the account of Pretium Resources Inc. The material in it reflects Alpine Solutions' best judgment in light of the information available to Alpine Solutions at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, is the responsibility of such third parties. Alpine Solutions accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions, based on this report.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending Alpine Solutions' written approval. If this document is issued in an electronic format, an original paper copy is on file at Alpine Solutions and that copy is the primary reference with precedence over any electronic copy of the document, or any extracts from our documents published by others.

We trust the above satisfies your requirements at this time. Should you have any questions or comments, please do not hesitate to contact us.

Yours sincerely,

ALPINE SOLUTIONS AVALANCHE SERVICES

AVALANCHE HAZARD ZONING FOR MINE SITE AREA

DRAFT

PROJECT NO:	1204-006	DISTRIBUTION:	
DATE:	October 8, 2015	CLIENT:	2 copies
DOCUMENT NO:	NA	ASAS:	2 copies

EXECUTIVE SUMMARY

This report provides supporting documentation for the development of an avalanche hazard zone map for the Brucejack mine site area. The zone map was requested by Pretium in order to plan the development of permanent and temporary occupied structures, and related facilities, in and around the mine site area. Avalanche hazard zone mapping for occupied structures is a requirement for development in several mountain based regional districts, and their application is supported by regulatory agencies that issue permits for commercial and/or industrial development. Further information on the development and use of these maps is described in CAA (2002).

The analysis undertaken for the mine site avalanche hazard zone map builds on previous avalanche hazard assessment work completed for Pretium by Alpine Solutions. Additional work required to create the zone map included:

- analysis of terrain from maps, imagery, and field study,
- review of avalanche occurrence information provided by mine site avalanche technicians,
- review of an a recent destructive avalanche occurrence which damaged and moved a building at the mine site,
- review of snow climate records, and
- application of topographical-statistical and dynamic models.

The avalanche hazard zone map is included as an attachment and the following recommendations are provided:

1. Pretium should provide this report and attached hazard zone map to all departments and stakeholders involved with planning construction of both permanent and temporary buildings, as well as managing worker safety at the mine site area.
2. All new building construction or placement should follow guidelines indicated in CAA (2002) and recommendations presented in Section 3.4. Any existing buildings or structures in the Blue or Red zones should be incorporated into the site wide avalanche risk management program.
3. Although avalanches large enough to damage a wood frame building are captured in the hazard zoning map, small avalanches (≤ Size 2) still may occur in the White (low hazard) zone, including Size 1 avalanches that may runout into terrain traps (e.g. gullies or ditches). In addition, cut slopes may be created during the course of construction. It is recommended that these small slopes continue to be assessed and monitored as a work site (or access route), within the scope of the site wide avalanche risk management program.

AVALANCHE HAZARD ZONE MAP 16

1.0 INTRODUCTION

1.1. General

This report summarizes a detailed analysis of avalanche hazards in and around the planned Brucejack Project mine site, which was completed for the purposes of developing an avalanche hazard zone map. The zone map was requested by Pretium Resources Inc. (Pretium) in order to plan the development of both temporary and permanent facilities in and around the mine site area.

The analysis undertaken for the mine site avalanche hazard zone map builds on work completed previously for Pretium including Alpine Solutions (2013 & 2015a) in which several avalanche paths are identified, and avalanche hazard to specific proposed infrastructure for the mine was determined. The hazard zone map is included as an attachment and recommendations of its use are included.

1.2. Background

Over the past few years, Pretium has been advancing the Brucejack Project from an exploration phase to a physical development phase. During this process numerous temporary bunkhouses, offices, workshops, maintenance facilities, and other related infrastructure have been built in and around the project mine site (Photograph 1-1). Within the mine site area several avalanche paths and slopes that affect proposed infrastructure and roads have been identified and mapped (Alpine Solutions, 2013 & 2015).

As the development at the mine site area has been expanding, these slopes have been managed using short term mitigation methods that mainly involve evacuation of hazard zones, and avalanche explosive control to release avalanches. In the course of development at the site, at least one building was placed in an avalanche path, and it was recently damaged and moved off of its foundations by a controlled avalanche (no people were involved as the building was evacuated).

Photograph 1-1: Brucejack Project mine site area as viewed from the northeast.

Options for the placement of buildings and structures at the mine site are becoming limited, and the planned construction of the mine over the next few years is expected to require several more facilities, resulting in the need to use available space efficiently, while ensuring risk to people and facilities remains low. As a result, there is a need for a longer term strategy for placement of permanent and temporary infrastructure in the mine site area. Normally this type of need is resolved by incorporating an avalanche hazard zone map into the planning of all facilities.

2.0 LIMITATIONS

The analysis completed for the hazard zone map included in this report is based on modern methods, which includes:

- analysis of terrain from maps, imagery, and field study,
- review of avalanche occurrence information provided by mine site avalanche technicians,
- analysis and review of an a recent destructive avalanche occurrence which damaged and moved a building at the mine site,
- review of snow climate records, and
- application of topographical-statistical and dynamic models.

There is uncertainty in runout extent and avalanche magnitude and frequency estimates due to limited extent of avalanche occurrence records for the paths studied, non-existent vegetative indicators that are typically only found at lower elevations, and wide variation of results from the avalanche models used. As a result, hazard zone boundaries have been drawn conservatively where uncertainty is greatest.

Zoning boundaries illustrated on the attached hazard zone map are based on a snapshot in time of the terrain. Artificial or natural alteration of the landscape or terrain due to landslides, construction earthworks, glacial advance or retreat may change the location and extent of avalanche runout, necessitating a re-assessment of avalanche hazard zones. Construction earthworks specifically intended to retard or redirect avalanche flow may change avalanche hazard zone boundaries but temporary defecting structures, such as seasonal berms made from snow, would not.

The hazard zone map included with this report is intended as a planning tool for buildings and structures. Smaller avalanche slopes that may pose a risk to workers or vulnerable equipment are still present (or may be created during course of constructdion) in zones designated as low hazard (white zone), and as a result will still require assessment and management from on-site avalanche technicians.

Although other geohazards exist in the area, the scope of the hazard zoning is limited exclusively to snow avalanche hazards.

3.0 Avalanche Hazard Zone Mapping

3.1. Background on Avalanche Hazard Zone Maps

Avalanche hazard zone maps for occupied structures are a requirement in many mountain based regional districts, and their application is supported by regulatory agencies that issue permits for commercial and/or industrial development. The *Guidelines for Snow Avalanche Risk Determination and Mapping in Canada* (CAA, 2002) are the generally accepted guidelines for land development and operations located in avalanche terrain. According to CAA (2002), recommended zones for land use planning include:

1. **White Zone** – an area with an estimated avalanche return period of greater than 300 years, or impact pressures less than 1 kPa and a return period greater than 30 years.

2. **Red Zone** – an area where the return period is less than 30 years and/or impact pressures are greater than or equal to 30 kPa, or where the product of impact pressure (kPa) and the reciprocal of the return period (years) exceeds 0.1 for return periods between 30 and 300 years.

3. **Blue Zone** – an area in between the Red and White Zones, for return periods between 30 and 300 years, the product of impact pressure and frequency is less than 0.1 kPa/years and the impact pressure is greater than or equal to 1 kPa.

A graphical representation of the expected magnitude and frequency in these zones are provided in Figure 3-1.

Figure 3-1: Definition of avalanche zones for land-use planning

The blue zone represents an area where minor damage could be expected infrequently (30 to 300 year return period) and include broken tree branches, broken windows, and blowing snow inside buildings.

Recommended activities according to zone color in Canada are indicated in Table 3-1.

Table 3-1. Recommended activities according to Zone (CAA, 2002)

Hazard[1] Zone	Recommended Activities
White Zone (low hazard)	Construction of new buildings, including permanently occupied structures, normally permitted.
Blue Zone (moderate hazard)	Construction of new buildings such as industrial plants and temporarily occupied structures possibly permitted with specified conditions. Conditions may include structures reinforced for avalanche forces, construction of avalanche defenses, and requirement for evacuation plans (or a combination of these).
Red Zone (high hazard)	Construction of new buildings not normally permitted.

3.2. Methods

Information regarding avalanche hazards affecting the Brucejack project has been provided previously in Alpine Solutions (2013, 2015a & 2015b); general project, terrain, and snow climate information is provided in these documents. For the hazard zoning analysis, the following methods were used:

- Analysis of terrain using contours generated from LiDAR data.
- Field identification of the extent of locations of large avalanche occurrences observed by site avalanche technicians in the past few years.
- Review of snow climate patterns from winter photographs of the area from various sources.
- Analysis of a destructive avalanche which damaged and moved a building from its foundation on March 13, 2015 (Soucie Construction, 2015)
- Application of topographical-statistical models for short slopes including
    - Alpha-regression model (Jones and Jamieson, 2004)
    - Runout ratio method (McClung & Mears, 1991; Jones and Jamieson, 2004)
- Application of dynamic models including:
    - PCM (Perla, et.al., 1982)
    - LEM (McClung and Mears, 1995; Jones and Jamieson, 2003).

[1] Although CAA (2002) refers to these zones as 'risk zones', they are now more commonly referred to as 'hazard zones'; this will be reflected in a soon-to-be-published update of CAA (2002)

3.3. Analysis

The analysis of avalanche hazard extent focused on avalanche paths MS2, MS3, MS5, and MS8, which are described and mapped in Alpine Solutions (2013 & 2015a). All of these paths are less than 300 m in vertical elevation, and as a result are considered 'short slopes' from an avalanche path modelling perspective. All paths are located above tree-line elevation, and as a result there are no vegetative indications of past events.

Winter photographs taken by Alpine Solutions in 2012 & 2013, as well as by site avalanche technicians provided information regarding snow and wind patterns, as well as a few notable avalanche occurrences (example in Photograph 3-1).

Photograph 3-1: Path MS8 (Camp Creep Path) notable avalanche occurrence (looking south).

A large explosives controlled avalanche in Path MS5 on March 13, 2015 impacted an office building creating damage and moving it off of its foundations (Photograph 3-2). The estimated runout distance of destructive flow was incorporated into the analysis.

Photograph 3-2: Path MS5 - Approximate direction (blue arrow) and extent of deposit (red dashed line) of avalanche impacting building on March 13, 2015 (looking southwest).

Both topographical-statistical and dynamic avalanche models (indicated in Section 3.2) were applied to several potential flows in order to model avalanche runout and estimate speed and impact pressure at various points along the path. Results varied considerably depending on input parameters used. Combined with other methods of analysis, as well as judgement, models could be calibrated to provide realistic speeds and impact pressures in order to determine values for a determination of Red and Blue Zone boundaries (CAA, 2002). Assumptions for avalanche flow models are included in Appendix A.

Once the avalanche hazard zone map was complete, it was reviewed by Soucie Construction (site avalanche operations team) to ensure consensus of zoning boundaries with avalanche technicians who have been monitoring and controlling avalanches at the mine site for the past three winters.

3.4. Use of the Avalanche Hazard Zone Map

According to Section 3.1, construction of new buildings would normally only be permitted in the white zone, and this is recommended for all bunkhouse facilities, and or buildings where large numbers of people may gather. Industrial facilities including maintenance facilities and plants may be constructed in a blue zone, but they either require reinforcement for avalanche forces, construction of mitigation measures such as temporary snow berms, or an

acceptance of potential damage to the structure. In addition, an evacuation plan would be required for periods of high hazard, or during avalanche explosive control.

Normally no new buildings should be constructed in the red zone, unless there is a specific requirement that outweighs the normal accepted risk to a standard non-reinforced wood frame building. Construction of a building in a red zone would need to be examined on a case by case basis, and similar to the blue zone, normally the building would either be reinforced, or the risk of damage is accepted. In addition, the building would be treated as a worksite in avalanche terrain, and incorporated into the site wide avalanche management program (the slopes above would be regularly monitored, and the building and area evacuated during periods of high avalanche hazard).

Currently there are existing structures in the red zone including a ‘core shack’, and a few other small buildings that are presently not occupied. Avalanche hazard to these facilities should continue to be assessed on an ongoing basis in the context of the site wide operational avalanche management plan. If at any point these structures are occupied on a regular basis, it must be clearly understood that the buildings are in a high hazard zone, and may need to be evacuated at any time during winter or spring.

As indicated in Section 2.0, there are limitations of the hazard zone map which must be understood. Although avalanches large enough to damage a wood frame building are captured, small avalanches (≤ Size 2) still may occur in the White (low hazard) zone, including Size 1 avalanches with terrain traps (e.g. gullies or ditches). In addition, cut slopes may be created during the course of construction. These small slopes still need to be assessed and monitored as a work site (or access route) from a worker safety perspective, within the scope of the site wide avalanche risk management program.

4.0 Conclusions and Recommendations

An avalanche hazard zoning map has been developed for the Brucejack mine site area, and is attached to this report. Alpine Solutions provides the following recommendations:

1. Pretium should provide this report and attached hazard zone map to all departments and stakeholders involved with planning construction of both permanent and temporary buildings, as well as managing worker safety at the mine site area.
2. All new building construction or placement should follow guidelines indicated in CAA (2002) and recommendations presented in Section 3.4. Any existing buildings or structures in the Blue or Red zones should be incorporated into the site wide avalanche risk management program.
3. Although avalanches large enough to damage a wood frame building are captured in the hazard zoning map, small avalanches (≤ Size 2) still may occur in the White (low hazard) zone, including Size 1 avalanches that may runout into terrain traps (e.g. gullies or ditches). In addition, cut slopes may be created during the course of construction. It is recommended that these small slopes continue to be assessed and monitored as a work site (or access route), within the scope of the site wide avalanche risk management program.

5.0 CLOSURE

This document was prepared by Alpine Solutions Avalanche Services (Alpine Solutions) for the account of Pretium Resources Inc. The material in it reflects Alpine Solutions' best judgment in light of the information available to Alpine Solutions at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, is the responsibility of such third parties. Alpine Solutions accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions, based on this report.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending Alpine Solutions' written approval. 1.0 INTRODUCTION

1.1. General

This report summarizes a detailed analysis of avalanche hazards in and around the planned Brucejack Project mine site, which was completed for the purposes of developing an avalanche hazard zone map. The zone map was requested by Pretium Resources Inc. (Pretium) in order to plan the development of both temporary and permanent facilities in and around the mine site area.

The analysis undertaken for the mine site avalanche hazard zone map builds on work completed previously for Pretium including Alpine Solutions (2013 & 2015a) in which several avalanche paths are identified, and avalanche hazard to specific proposed infrastructure for the mine was determined. The hazard zone map is included as an attachment and recommendations of its use are included.

1.2. Background

Over the past few years, Pretium has been advancing the Brucejack Project from an exploration phase to a physical development phase. During this process numerous temporary bunkhouses, offices, workshops, maintenance facilities, and other related infrastructure have been built in and around the project mine site (Photograph 1-1). Within the mine site area several avalanche paths and slopes that affect proposed infrastructure and roads have been identified and mapped (Alpine Solutions, 2013 & 2015).

As the development at the mine site area has been expanding, these slopes have been managed using short term mitigation methods that mainly involve evacuation of hazard zones, and avalanche explosive control to release avalanches. In the course of development at the site, at least one building was placed in an avalanche path, and it was recently damaged and moved off of its foundations by a controlled avalanche (no people were involved as the building was evacuated).

Photograph 1-1: Brucejack Project mine site area as viewed from the northeast.

Options for the placement of buildings and structures at the mine site are becoming limited, and the planned construction of the mine over the next few years is expected to require several more facilities, resulting in the need to use available space efficiently, while ensuring risk to people and facilities remains low. As a result, there is a need for a longer term strategy for placement of permanent and temporary infrastructure in the mine site area. Normally this type of need is resolved by incorporating an avalanche hazard zone map into the planning of all facilities.

2.0 LIMITATIONS

The analysis completed for the hazard zone map included in this report is based on modern methods, which includes:

- analysis of terrain from maps, imagery, and field study,
- review of avalanche occurrence information provided by mine site avalanche technicians,
- analysis and review of an a recent destructive avalanche occurrence which damaged and moved a building at the mine site,
- review of snow climate records, and
- application of topographical-statistical and dynamic models.

There is uncertainty in runout extent and avalanche magnitude and frequency estimates due to limited extent of avalanche occurrence records for the paths studied, non-existent vegetative indicators that are typically only found at lower elevations, and wide variation of results from the avalanche models used. As a result, hazard zone boundaries have been drawn conservatively where uncertainty is greatest.

Zoning boundaries illustrated on the attached hazard zone map are based on a snapshot in time of the terrain. Artificial or natural alteration of the landscape or terrain due to landslides, construction earthworks, glacial advance or retreat may change the location and extent of avalanche runout, necessitating a re-assessment of avalanche hazard zones. Construction earthworks specifically intended to retard or redirect avalanche flow may change avalanche hazard zone boundaries but temporary defecting structures, such as seasonal berms made from snow, would not.

The hazard zone map included with this report is intended as a planning tool for buildings and structures. Smaller avalanche slopes that may pose a risk to workers or vulnerable equipment are still present (or may be created during course of constructdion) in zones designated as low hazard (white zone), and as a result will still require assessment and management from on-site avalanche technicians.

Although other geohazards exist in the area, the scope of the hazard zoning is limited exclusively to snow avalanche hazards.

3.0 Avalanche Hazard Zone Mapping

3.1. Background on Avalanche Hazard Zone Maps

Avalanche hazard zone maps for occupied structures are a requirement in many mountain based regional districts, and their application is supported by regulatory agencies that issue permits for commercial and/or industrial development. The *Guidelines for Snow Avalanche Risk Determination and Mapping in Canada* (CAA, 2002) are the generally accepted guidelines for land development and operations located in avalanche terrain. According to CAA (2002), recommended zones for land use planning include:

1. **White Zone** – an area with an estimated avalanche return period of greater than 300 years, or impact pressures less than 1 kPa and a return period greater than 30 years.

2. **Red Zone** – an area where the return period is less than 30 years and/or impact pressures are greater than or equal to 30 kPa, or where the product of impact pressure (kPa) and the reciprocal of the return period (years) exceeds 0.1 for return periods between 30 and 300 years.

3. **Blue Zone** – an area in between the Red and White Zones, for return periods between 30 and 300 years, the product of impact pressure and frequency is less than 0.1 kPa/years and the impact pressure is greater than or equal to 1 kPa.

A graphical representation of the expected magnitude and frequency in these zones are provided in Figure 3-1.

Figure 3-1: Definition of avalanche zones for land-use planning

The blue zone represents an area where minor damage could be expected infrequently (30 to 300 year return period) and include broken tree branches, broken windows, and blowing snow inside buildings.

Recommended activities according to zone color in Canada are indicated in Table 3-1.

Table 3-1. Recommended activities according to Zone (CAA, 2002)

Hazard[1] Zone	Recommended Activities
White Zone (low hazard)	Construction of new buildings, including permanently occupied structures, normally permitted.
Blue Zone (moderate hazard)	Construction of new buildings such as industrial plants and temporarily occupied structures possibly permitted with specified conditions. Conditions may include structures reinforced for avalanche forces, construction of avalanche defenses, and requirement for evacuation plans (or a combination of these).
Red Zone (high hazard)	Construction of new buildings not normally permitted.

3.2. Methods

Information regarding avalanche hazards affecting the Brucejack project has been provided previously in Alpine Solutions (2013, 2015a & 2015b); general project, terrain, and snow climate information is provided in these documents. For the hazard zoning analysis, the following methods were used:

- Analysis of terrain using contours generated from LiDAR data.
- Field identification of the extent of locations of large avalanche occurrences observed by site avalanche technicians in the past few years.
- Review of snow climate patterns from winter photographs of the area from various sources.
- Analysis of a destructive avalanche which damaged and moved a building from its foundation on March 13, 2015 (Soucie Construction, 2015)
- Application of topographical-statistical models for short slopes including
    - Alpha-regression model (Jones and Jamieson, 2004)
    - Runout ratio method (McClung & Mears, 1991; Jones and Jamieson, 2004)
- Application of dynamic models including:
    - PCM (Perla, et.al., 1982)
    - LEM (McClung and Mears, 1995; Jones and Jamieson, 2003).

[1] Although CAA (2002) refers to these zones as 'risk zones', they are now more commonly referred to as 'hazard zones'; this will be reflected in a soon-to-be-published update of CAA (2002)

3.3. Analysis

The analysis of avalanche hazard extent focused on avalanche paths MS2, MS3, MS5, and MS8, which are described and mapped in Alpine Solutions (2013 & 2015a). All of these paths are less than 300 m in vertical elevation, and as a result are considered 'short slopes' from an avalanche path modelling perspective. All paths are located above tree-line elevation, and as a result there are no vegetative indications of past events.

Winter photographs taken by Alpine Solutions in 2012 & 2013, as well as by site avalanche technicians provided information regarding snow and wind patterns, as well as a few notable avalanche occurrences (example in Photograph 3-1).

Photograph 3-1: Path MS8 (Camp Creep Path) notable avalanche occurrence (looking south).

A large explosives controlled avalanche in Path MS5 on March 13, 2015 impacted an office building creating damage and moving it off of its foundations (Photograph 3-2). The estimated runout distance of destructive flow was incorporated into the analysis.

Photograph 3-2: Path MS5 - Approximate direction (blue arrow) and extent of deposit (red dashed line) of avalanche impacting building on March 13, 2015 (looking southwest).

Both topographical-statistical and dynamic avalanche models (indicated in Section 3.2) were applied to several potential flows in order to model avalanche runout and estimate speed and impact pressure at various points along the path. Results varied considerably depending on input parameters used. Combined with other methods of analysis, as well as judgement, models could be calibrated to provide realistic speeds and impact pressures in order to determine values for a determination of Red and Blue Zone boundaries (CAA, 2002). Assumptions for avalanche flow models are included in Appendix A.

Once the avalanche hazard zone map was complete, it was reviewed by Soucie Construction (site avalanche operations team) to ensure consensus of zoning boundaries with avalanche technicians who have been monitoring and controlling avalanches at the mine site for the past three winters.

3.4. Use of the Avalanche Hazard Zone Map

According to Section 3.1, construction of new buildings would normally only be permitted in the white zone, and this is recommended for all bunkhouse facilities, and or buildings where large numbers of people may gather. Industrial facilities including maintenance facilities and plants may be constructed in a blue zone, but they either require reinforcement for avalanche forces, construction of mitigation measures such as temporary snow berms, or an

acceptance of potential damage to the structure. In addition, an evacuation plan would be required for periods of high hazard, or during avalanche explosive control.

Normally no new buildings should be constructed in the red zone, unless there is a specific requirement that outweighs the normal accepted risk to a standard non-reinforced wood frame building. Construction of a building in a red zone would need to be examined on a case by case basis, and similar to the blue zone, normally the building would either be reinforced, or the risk of damage is accepted. In addition, the building would be treated as a worksite in avalanche terrain, and incorporated into the site wide avalanche management program (the slopes above would be regularly monitored, and the building and area evacuated during periods of high avalanche hazard).

Currently there are existing structures in the red zone including a ‘core shack’, and a few other small buildings that are presently not occupied. Avalanche hazard to these facilities should continue to be assessed on an ongoing basis in the context of the site wide operational avalanche management plan. If at any point these structures are occupied on a regular basis, it must be clearly understood that the buildings are in a high hazard zone, and may need to be evacuated at any time during winter or spring.

As indicated in Section 2.0, there are limitations of the hazard zone map which must be understood. Although avalanches large enough to damage a wood frame building are captured, small avalanches (≤ Size 2) still may occur in the White (low hazard) zone, including Size 1 avalanches with terrain traps (e.g. gullies or ditches). In addition, cut slopes may be created during the course of construction. These small slopes still need to be assessed and monitored as a work site (or access route) from a worker safety perspective, within the scope of the site wide avalanche risk management program.

4.0 Conclusions and Recommendations

An avalanche hazard zoning map has been developed for the Brucejack mine site area, and is attached to this report. Alpine Solutions provides the following recommendations:

1. Pretium should provide this report and attached hazard zone map to all departments and stakeholders involved with planning construction of both permanent and temporary buildings, as well as managing worker safety at the mine site area.
2. All new building construction or placement should follow guidelines indicated in CAA (2002) and recommendations presented in Section 3.4. Any existing buildings or structures in the Blue or Red zones should be incorporated into the site wide avalanche risk management program.
3. Although avalanches large enough to damage a wood frame building are captured in the hazard zoning map, small avalanches (≤ Size 2) still may occur in the White (low hazard) zone, including Size 1 avalanches that may runout into terrain traps (e.g. gullies or ditches). In addition, cut slopes may be created during the course of construction. It is recommended that these small slopes continue to be assessed and monitored as a work site (or access route), within the scope of the site wide avalanche risk management program.

5.0 CLOSURE

This document was prepared by Alpine Solutions Avalanche Services (Alpine Solutions) for the account of Pretium Resources Inc. The material in it reflects Alpine Solutions' best judgment in light of the information available to Alpine Solutions at the time of preparation. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, is the responsibility of such third parties. Alpine Solutions accepts no responsibility for damages, if any, suffered by any third party as a result of decisions made or actions, based on this report.

As a mutual protection to our client, the public, and ourselves, all documents and drawings are submitted for the confidential information of our client for a specific project. Authorization for any use and/or publication of this document or any data, statements, conclusions or abstracts from or regarding our documents and drawings, through any form of print or electronic media, including without limitation, posting or reproduction of same on any website, is reserved pending Alpine Solutions' written approval. If this document is issued in an electronic format, an original paper copy is on file at Alpine Solutions and that copy is the primary reference with precedence over any electronic copy of the document, or any extracts from our documents published by others.

We trust the above satisfies your requirements at this time. Should you have any questions or comments, please do not hesitate to contact us.

Yours sincerely,

BJ-AVL-SOP-001 – Worksite Avalanche Assessment

PRETIVM		BJ-AVL-SOP-001 Worksite Avalanche Assessment	
Owner: Mountain Safety	**Approver**: Ken Black / Jim Franken	**Revision Number**: V2.2	**Creation Date**: 2017-04-08 **Revision Date**: 2020-06-13

Objective

Worksite hazard assessments are performed when a new, temporary project encroaches into or near avalanche terrain.

Individual short-term projects may have specific written procedures while longer term projects will use the Avalanche Safe Work Procedures in tandem with the Daily Avalanche Hazard bulletins

Scope

Any department planning work in potential avalanche terrain outside camp roads and facilities.

Health, Safety & Reclamation Code of BC

- WSBC G4.1.1 Avalanche Assessment, G4.1.2 (c) Avalanche Planning
- HSRC Part 2.2 Hazards, 3.3.1 Hazardous Work, 6.1.1 Qualified Persons

Definitions

- Avalanche Terrain – Any terrain features capable of producing an avalanche given the correct snowpack conditions

Preparation

Hazards

- Avalanches
- Failure to recognize avalanche terrain and/or unstable conditions.

Tools

- Avalanche Companion Rescue Gear

Requirements

- Worksite Avalanche Hazard assessment form
- Avalanche Hazard Safe Work Procedures
- Worker avalanche awareness training

Job Step

- A department requests an Avalanche Hazard Assessment for any work in or exposed to avalanche terrain
- Mtn safety will consult with the requesting department to determine job scope.
- Mountain Safety team will carry out a Worksite Avalanche Hazard Assessment including:
  - Access and egress hazards
  - Terrain description and concerns
  - Mountain hazards and snowpack concerns
  - Risk Management and controls recommendations
  - Requirement for avalanche companion rescue equipment and training
- The technician will first assess the site for their personal safety and implement control measures prior to carrying out the Worksite Avalanche Assessment

- A completed Worksite Hazard Assessment form will be issued to department for procedures to follow until job completion.
- Copies of the Plan will be posted in Mountain Safety office for continuity with all techs until job completion.
- Ongoing projects will be reassessed at regular intervals and site specific procedures may be updated based on overhead hazard changes.

BJ-AVL-SOP-002 – Snowmobile Operation

PRETIVM		BJ-AVL-SOP-002 SNOWMOBILE OPERATION	
Owner: Ken Black/Jim Franken	Approver: Joe Nicholson	Revision Number: 1.1	Creation Date: 17/11/03 Revision Date: 17/12/28

Rational

Snowmobiles are used in a mountain environment to efficiently access terrain, sled ski, recover snowmobiles, perform rescues, deliver supplies and explosives, and for general travel.

Regulations

WSBC OHS G4.1.1 Avalanche, G8.12 Helmets, [16.4, 16.51-55, 16.34 (1)-(3) Vehicle]

Definitions

Tandem operation

- **Side by side** –the practice of riding a snowmobile where two operators each ride standing on one running board while sharing control of the snow machine
- **Two up** – The traditional means for two people ride a snowmobile. One operator drives while the passenger sits on the passenger seat.

Footwell – The fore most part of the running board, usually into the engine cowl

Fogpole – A bamboo marker on a snow road for delineation in poor visibility

Piste – Snowroad

Skiff – trailer for snowmobile

Dry bag – Watertight PVC bag

Hazards

Unqualified operator, Asked to perform tasks beyond skills, Unfamiliar with machine, Getting lost, No one aware of location, Coms Failure, Avalanche hazard, Glacier hazard, Weather hazards, Road Hazards, Buried Hazards, Explosives Hazards, Running out of fuel, Running out of oil, Damaged machine, Snowmobile overheating, Vehicle movement upon starting (stuck throttle), Malfunctioning brakes, Worn Belt, Snowmobile frozen to ground, Ice and snow blown and frozen to machine, Traveling alone, Traveling after dark, Excessive speed, Changing Snow Conditions, Falling off machine, Getting stuck, Run away machine, Strain injuries, Run away sled, Sled breakdown, Unfamiliar terrain, Collision with objects or other road users, Roll over, Foot stuck in footwell, Locking brakes while descending, Skis/Gear on rack interfering with operation/ contacting snow, Flipping over while reversing, being thrown into throttle, Increased fall hazard, Less control, Getting caught in system, Heavy load , Inadequately secured load, Fire, Hitch failure, Trailer rollover, Unsecure load, Excess load, Further damage to machine, Collision between Snowmobiles, Pinch points.

Scope

The following procedures have been developed specifically for safe operation of mountain snowmobiles; characterized by powerful engines, long tracks and single seat design.

Preparation

Training

- Training session with mechanic on vehicle inspection
- Complete training and assessment with supervisor which include but are not limited to:

  - PPE
  - SOP
  - Operating Skills
  - Basic Mechanical
  - Loading and unloading
  - Towing
  - Tandem Operation
- Ongoing mountain sled training with experienced riders in safe terrain
- Operators will not undertake tasks beyond skills

Pre plan

- Plan your route according to conditions
- Is the mission necessary in inclement condition
- Discuss road conditions with cat operators and cross shift
- Check weather forecast
- Consider working in a team
- Consider alternate means of transport
- Discuss Avalanche hazard and plan route to minimize exposure
- Inform dispatch of route
- If weather dictates stick to Fog Pole/Marked Roads
- Establish check in procedures and provide a rough route plan to work partner and dispatch that will includes checking in upon leaving camp, travel route, arrival at destination, hourly check-ins (or less), leaving destination and return to camp

Pre-operation

- Follow pre-operation snowmobile inspection checklist
- Follow recommended vehicle servicing (marked on side of sled)

Requirements

- Snowmobile
- PPE
- Avalanche Travel Kit
- Glacier Gear
- Appropriate clothing, footwear, eye, and ear protection
- Appropriate helmet
- Fully charged radio

Job Step

Snowmobile Travel

- DOT helmet >20kph or irregular terrain (off piste)
- CSA or Ski Helmet for <20kph with no significant risk of rollover is acceptable
- Wear safety tether
- Avoid travel on haul and camp roads where possible
- When in camp or on haul road call your location and destination over appropriate radio channel
- Follow best practices for travel in avalanche terrain

- No snowmobiling on or near avalanche slopes during night shift
- In poor visibility stick to marked roads
- Be aware of the snow conditions you are traveling on (ice, frozen lake, dry roads, deep powder, wet snow and compensate accordingly
- Travel at a speed that is safe for the conditions and your riding ability
- Be aware of possible hazards, both manmade and natural that can develop on cat roads and off piste
- At night use a powerful head lamp to supplement the sled light especially in powder conditions
- Pump brakes and use throttle (to engage clutch) to decelerate when descending steep hills
- Stay seated while reversing
- Take road banks and junctions straight on, not at an angle, especially when there is a height difference from one to another
- Before merging onto KM 71.5 from VOK road announce on LAD2 and R 1 location and check for conflicts (blind spot)
- When practicable use snow road at 71.5-72
- If snowmobile is not running properly, tag out and contact mechanics
- If breakdown occurs, contact heavy shop and arrange transport
- If machine becomes stuck and unmanageable call for assistance
- Monitor engine temperature and dip in to soft snow if getting warm, scratchers down, snow chunks on tunnel or stop to cool machine

Traveling with a load

- Be aware if increased dimensions with gear/skis attached
- Secure load

Tandem Operations

- Side by side tandem operation is only acceptable method on mountain sled
- Two up operation for snowmobiles with passenger seats (environmental)
- Proper speed and operation
- Good communication between operators
- Throttle operator is in charge of steering
- Both feet on the rails

Transporting Explosives

- Attach detonator box with 2 BC fire extinguishers and placards
- Manage speed to load and snow conditions
- Secure load as close to seat as possible
- 2 snowmobiles where possible
- 2 bag MAX limit on tunnel
    - Stacked as close to seat as possible
    - Consider removing rack
- Limit operations to cat roads as much as practicable
- Follow explosive fire safety plan
- Drive to conditions
- Consider skiff
- Dry-bags or box

- Anticipate control work and have snowcat drivers maintain roads
- No transport during an electrical storm
- Consider using snowcat to transport
- No tandem operation while carrying explosives

Towing

- Use back up strap
- Secure load
- Drive at appropriate speeds
- Use limited to conditions
- Consider Snow Cat
- Mechanic
- Tow from control arm
- Remove belt
- Operator on both machines
- Take most direct/flat route to road access
- Call yourself back into camp
- Follow check in plan

Post operation

- Clean snow from machine
- Fuel up (Jerry cans, Spill tray, Spill Kit)
- Add oil if required
- Inside storage or covers
- Lock out, Tag out if not serviceable
- Incident report
- Submit pre-op sheets to Supervisor who will sign and deliver to Maintenance Planners

BJ-AVL-SOP-003 – Ski Cutting

PRETIVM		BJ-AVL-SOP-003 Ski Cutting	
Owner: Mountain Safety	Approver: Joe Nicholson or Ken Black	Revision Number: 1.0	Creation Date: 17/11/04 Revision Date:

Rational

Ski Cutting will be used to test surface instabilities while travelling through avalanche terrain as well as control small, low consequence features where explosive control is not practical.

Regulations

WSBC G4.1.1 Avalanche Assessment, G8.11(2) Helmets

Definitions

Companion Rescue – Immediate, improvised avalanche rescue

Companion Rescue Equipment – Transceiver, Shovel, Probe

Slope History – History of snowpack and previous avalanche control

InReach – Satellite Communications devise

GIS Tools – Geographic Information System software, e.g. Google earth, GPS devices, online maps

Scope

These procedures will apply to all Mountain Safety personnel as well as all workers in the affected terrain below.

Hazards

Potential avalanche involvement; terrain traps; inherent risk of skiing; potential avalanche involvement for both team members; injury; congested radio; failure to locate victim if buried in an avalanche, resulting in inability to perform companion rescue; failing batteries; damaged equipment or injured workers; potential avalanche involvement for single team member; partner loses site of person on the slope; loss of equipment; multi burial; larger than anticipated results with road open.

Preparation

Tools

- PPE
- Radio, (optional InReach as well)
- Skis
- Avalanche Companion Rescue Equipment
- First aid Kit
- Snow Study Kit
- Skins
- Snowmobile/Snowcat
- Helmet (CSA or Ski)
- Rescue Toboggans

Requirements

- Prior assessment of ski skills by Mountain Safety Supervisor/Lead Hand
- Training including review of SOP, practical training and assessment

Job Step

- Determine if ski cutting is the appropriate method of terrain management
  - Minimal risk exposure to achieve objectives.
  - Knowledge of terrain specifics, current avalanche hazard and slope history.
  - Use explosives if high degree of uncertainty, if ski cutting may result in triggering an avalanche size 2 or greater, or if terrain traps present a hazard.
  - Discuss as a team and decide best method of avalanche control.
  - Check weather and conditions
  - Discuss goals and hazards.
  - Ski to conditions.
- Make a plan and communicate with partners and dispatch. Visualize terrain and discuss plan to link safe zones throughout the terrain.
  - Avoid working in the terrain if unfamiliar and the visibility is obscured.
  - Get multiple views of the terrain from different angles to properly assess if safe zones are actually safe.
  - Identify any potential terrain traps and likely spots where avalanches may be triggered.
  - Discuss hazards such as terrain management, shallow snowpack areas, buried rocks and cliffs.
  - Review slope history.
  - Use GIS tools.
  - Build intimacy with the terrain by regularly skiing it during periods of reduced hazard.
  - Potential designated channel.
  - Establish Check in procedure with dispatch and/or team members
- Perform a proper avalanche transceiver check prior to traveling in any avalanche terrain.
  - Buddy check for all equipment prior to leaving office.
  - Daily battery checks ,
  - Training .
- Ensure zone of affect is controlled.
  - Put out closure lines, use guards if required.
  - Follow guarding and sweep JHA .
  - Spotter .
  - Illuminate slope if after dark.
- Ski cut the slope
  - Visualize route from top of the slope.
  - Maintain visual contact with partner at all times.
  - Collect on slope data .
  - Ski from safe spot to safe spot.
  - Use test features.
  - Move through terrain one at a time limiting exposure.
  - If conditions do not match assessment abort plan.

- Use releasable bindings.
- Use qualified individuals to ski cut.
- Frequent equipment inspections.
- Appropriate rescue gear for evacuations.

Appendix C.4

BJ-AVL-SOP-004 – Nighttime Avalanche Control

PRETIVM		BJ-AVL-SOP-004 Night time Avalanche Control	
Owner: Ken Black/Jim Franken	Approver: Joe Nicholson	Revision Number: 1.2	Creation Date: 17/11/06 Revision Date: 17/12/29

Objective/Rational

At times of elevated Avalanche Hazard it is sometimes deemed necessary to perform avalanche control after dark. This is in opposition to closing the road which introduces several alternate hazards such as difficult/lengthy emergency egress from the mine site and the associated work stoppages. This will generally only be achieved by case charging targets on the road or by using Gazex cannons. If overhead hazard is deemed too high or unable to achieve desired results, road closures will be implemented.

Regulations

WSBC G4.1.1 Avalanche assessment and planning; OHSR Part 21 Blasting; Health, Safety and Reclamation Code for Mines in BC Section 8.1-8.6, 8.8-8.10 Blasting

Definitions

- **Night Time** –Civil twilight, the apex of the sun is 6° below the horizon
- **Gazex** – A fixed propane and oxygen exploder for avalanche control
- **SFA** – Safety Fuse Assembly, pre-built fuse and detonator
- **Terrain Trap** – A terrain feature that magnifies consequences of an avalanche
- **Hang-Fire Avalanche** – Snow remaining in an avalanche start zone post release
- **Hang Fire Explosive** – a charge that detonates in unplanned delayed manner

Affected Departments

Mountain Safety, Surface Operations, Logistics, Roof Shovelers

Hazards

Poor visibility due to darkness, snow and/or cloud; underestimating potential avalanche hazard to the site; potential closure of Lakeshore Drive if/when upper targets have not been controlled by day shift or due to snow cat unavailability, major storm or impassable control roads; incoming night time Av-Techs at shift exchange are a subjective hazard due to circadian rhythm offsets; fatigue; logistical delays and slowdowns; excessive radio traffic; cognitive overload, (making mistakes that have been previously identified & avoided); buried electrical lines; proximity to buildings ; damaged equipment, infrastructure or injured workers; overhead hazard; sympathetic avalanches; poor communication between personnel and stakeholders; personnel at risk still in the blast area; darkness and poor visibility; avalanche burial, injury or death for personnel; incorrectly priming the explosive ; mixing up SFA lengths or miscalculating the burn time; avalanche burial in vehicle, injury to personnel; damage to vehicle; slow rescue response due to rescue personnel being off duty/asleep; no Dispatcher or Supervisors at Knipple Camp; terrain traps; slope could fail and bury personnel, the truck, and primed charge; avalanche burial, injury or death for personnel; terrain traps from lack of snow removal on outside edge of road; primed explosives ; miss-lights ; DUDS; burns; flying debris; un-exploded ordnance; hang-fire

Preparation

Tools

- PPE
- Radio
- Harness

- Avalanche Rescue Gear
- Lighting
- Bamboo
- Vehicle (snowmobile, truck, snowcat)
- Gazex tablet, antenna. charger

Requirements

- Licensed Blaster
- Site explosives training including Night Time AC SOP
- Pre blast considerations SOP
- Explosives Checklist
- Snowcat

Job Step

- Blasting in and around camp for **maintenance** purposes will be restricted to between 0300h-0900h and 1500h-2100h
    - Jacks slopes/VOK need to be clear at 0500 and 1700 for underground blast
- LSD upper targets can only be controlled at night with snowcat and competent operator support.
    - Claim cornice 50kg is ideal shot. Summit road targets should not be used.
    - Road is pushed in first
        - Mountain Safety should accompany to assess overhead hazard
    - Early communication with Surface Operations to ensure night shift snowcat driver is available and well rested
    - Only used if absolutely necessary (storm or program gets away from us), day shift should still support upper targets
    - Mandatory discussion with day shift
- Identify the avalanche and weather hazards for the specific terrain above the site at that time
    - Knowledge of current conditions, recorded weather information and forecast
    - Illuminate work area
    - Good information hand off from day shift
    - Good communication with other technician on duty
    - Review slope history and GIS information
    - Day shift prioritizing overhead hazard slopes to allow for safe night time case charging
    - Good planning for cross shift coverage. Possible hotel rooms should be planned to avoid unsafe driving.
    - Abort mission if hazard is undetermined or too high
    - Good self-assessment of fatigue
    - PPE check
- Notify Dispatch and stakeholders (Dispatch, Logistics, Surface Operations, TVL, Operators, and Shuttle Drivers)
- Print and follow Avalanche Control Checklist
    - Adhere to Pretivm Blasting Procedures
    - Appropriate quantity of explosives (see: Pre-Blast Considerations SOP)

    - Review updated cables and pipelines map
- Ensure the Danger Zone and Zone of Effect are closed off to traffic, swept and guarded
    - Follow Sweep and Guarding JHA
    - Ensure closure zone encapsulates possible sympathetic avalanches
- Blaster visually sweeps the Danger Area, confirms closure with guards, and notifies Dispatch by radio that avalanche control is commencing
    - Radio communications must have confirmation between parties
    - Working light plants staged at strategic locations & high power flashlights
- Assemble explosives at pre-determined locations prior to entering exposed section of road
    - Limit exposure time for team in avalanche terrain.
    - Follow Avalanche control blasting procedures.
    - Minimum length of fuse is 2m for case charging.
- Access the area the safest way possible.
    - Stay in vehicle, no unnecessary stopping in avalanche terrain
    - Visualize terrain from safe zone
    - Adequate lighting in place to aid in assessment of the terrain
    - Good communications with Dispatch & frequent check-ins
    - Abort mission if overhead hazard is undetermined or too high
    - Consider placing the vehicle on the outside lane away from the slopes.
    - Ensure Surface Operations consistently builds and maintains snow roads for avalanche control (72km, Claim High, Summit Drive, Jack Slopes summit, VOK bypass, and Pilsner bypass)
    - Adequate catchment clearing and snow removal during periods of LOW hazard.
    - A visual of the slopes should be maintained by the passenger.
- Placement of the explosive in relation to the path being controlled
    - Place the explosives as far from the slope as practicable
    - Consider placing the truck between the slope and the explosives placement/AvTech
    - Only one Av tech will get out of the vehicle if practical. Driver will remain in the vehicle unless needed to hold tripod.
- Initiating explosive
    - Assemble explosives in a safe location as per SOP and safe handling techniques
    - Wear glove on grip hand
    - Have a pre-defined egress route.
    - Take time on stopwatch
    - If DUD or Mislight follow DUD disposal procedure
    - Retreat to magazine side of closure to potentially deal with DUD
- Once blasting mission is complete and Danger Area is clear, Blaster contacts closure personnel and hands road responsibility over to Surface Operations for road-clearing procedures (see Debris and Catchment Clearing SOP). Assess area prior to allowing full entry.
    - Visual inspection of the area to ensure all explosives have discharged
    - Reassess potential overhead hazard
    - More control work
    - If remaining hazard is undetermined or too high close the road

- Consider keeping the road closed longer for post control releases (weather inputs, rain)
- Consider having a loader act as a pilot car with convey spacing behind to flush traffic

Appendix C.5

BJ-AVL-SOP-005 – Guarding and Sweeping

PRETIVM		BJ-AVL-SOP-005 Guarding and Sweeping	
Owner: Ken Black/Jim Franken	Approver: Joe Nicholson	Revision Number: 1.0	Creation Date: 17/11/06 Revision Date:

Objective/Rational

To maintain a safe working environment and access roads, avalanche control will need to be performed on various slopes. It is necessary to control the zone of effect so as to minimize the risk to workers during active blasting or possibly ski cutting. Guards will be used to control access and a sweep vehicle will be employed to make sure the area is clear.

Regulations

WSBC G4.1.1 Avalanche planning, HSRMBC 4.9 Mobile equipment

Definitions

Guard – A worker in a vehicle or equipment used to physically block the road

Ski cutting – a means of testing and breaking up of surface instabilities. It involves having a Mountain Safety Technician skiing on slope

Sweep – Physical check of the danger area

Avalanche Gate – Fixed rope and signage barrier

Danger Area – entire area affected by blasting and subsequent hazards, includes fly rock and avalanches

Natural avalanche – An avalanche that is triggered without human intervention

Affected Departments

Mountain Safety, Safety, Surface Operations, Logistics, all vehicle traffic, Warehouse/Shipping and receiving, Shuttles

Hazards

Untimely length of closure due to communication and resource limitations; untrained staff are used; team not understanding plan; untimely length of closure due to communication and resource limitations; guards in wrong location leading to possible close proximity to explosives and / or potential involvement with avalanche; natural avalanche occurrence blocks the road; guards are potentially taken from important work leading to inefficiency; guards let traffic through; communications failure; natural avalanche occurrence blocks the road or strikes the sweep vehicle; vehicles/people left in blast area; untimely length of closure; explosives; post control release; traffic moving before directed.

Preparation

Tools

- PPE
- Avalanche PPE
- Radio
- Heavy Equipment
- Truck

- Closure Gates
- Closure map
- Binoculars
- Lighting

Requirements

- Pre-Blast Considerations SOP
- Avalanche Control Checklist

Job Step

- When planning a blast, Mountain Safety contacts Surface Operations Supervisor and Dispatch. Mountain Safety will provide estimated timeline and request resources (guards, sweep, and equipment). (Ideally 12h CONTROL FLASH). 0600 and 1700 Night shift
    - Mountain Safety will confirm with Surface Operations Supervisor of safe locations for guards, and time road needs to be closed and swept.
    - Prior training
    - Communication
    - Reference Avalanche Safety Plan (ASP), and closure gate maps (attached).
    - Dispatch will monitor radio for irregularities.
- Supervisor will relay plan to trained closure team
    - Surface Operations Supervisor will complete pre-work safety meeting and JHA with closure personnel prior to work.
    - Supervisor will review steps of the job, locations, gate closure map, closure limitations and communications plan with team.
    - Reference ASP and closure gate maps (attached).
    - Ensure all team members have been trained on SOP
    - Supervisor will ensure workers have been trained in, are wearing, and check avalanche PPE.
- Guards and Sweep will head to their location prior to the closure time (on que of 30 minute Blast warning), close the gates and block the road. All traffic entering the control area will be stopped.
    - Supervisor will review steps of the job, locations, gate closure map and good communications plan with team and ensure understanding.
    - Contact Mountain Safety if any changes to plan are to be made.
    - Once they are in place and the road is blocked they will inform the sweeper on the radio. **"I am in position and the road is blocked"**
- The Sweep will travel from the first guard to the second guard. They will check every possible side road, worksite and building in the closure area, and make sure everyone is out of the Danger Area.
    - Sweep vehicle will not stop in exposed avalanche terrain and will travel on outside edge of the road.
    - Contact Mountain Safety if natural avalanche is observed
    - Sweeper needs to be familiar with all areas and ensure they are empty of staff
    - All staff to follow avalanche training provided in indoctrination
    - Catchments maintained
    - Windows opened

- In times of elevated avalanche hazard Mountain safety will sweep the road.
  - Once they reach the second guard they will call Mountain Safety and inform them that the **"Area has been swept and all guards are in place"**

- Mountain Safety will contact dispatch and avalanche control will commence.
  - Inform dispatch that **"The area has been cleared and swept and guards are in place"** Dispatch will repeat this back to Mountain Safety.
  - Follow Blasting Procedures
- Once avalanche control is complete Mountain Safety will assess hazard and hand over control of the road to surface operations (see avalanche debris and catchment clearing SOP).
  - Mountain Safety to assess results before releasing guards
  - More control work
  - Extended closure
  - Road operators will inform dispatch when road is open and what traffic direction, or both can be released first

Appendix C.6

BJ-AVL-SOP-006 – Field Trip on Skis

PRETIVM		BJ-AVL-SOP-006 Field Trip on Skis	
Owner: Ken Black/Jim Franken	Approver: Joe Nicholson	Revision Number: 1.0	Creation Date: 17/11/07 Revision Date:

Objective/Rational

Often times, travel on skis is the most effective way to collect snowpack information. It is also useful for terrain assessments, terrain familiarization/professional development, supporting the environmental program, and is the accepted avalanche industry standard for moving in the mountains.

Regulations

WSBC G4.1.1 Avalanche Assessment, G8.11 (2) Helmets

Definitions

InReach – Satellite and GPS communication devise

PWL – Persistent Weak Layer in the Snowpack

InfoEx – Online avalanche information exchange platform and hazard assessment tool

Companion rescue PPE – Transceiver, shovel and probe

Affected Departments

Mountain Safety, Safety, Logistics

Preparation

Tools

- PPE
- Companion Rescue PPE
- Radio
- Releasable Bindings
- Skins
- Saw
- Snow Study Kit
- InReach
- First Aid Kit
- Shelter/Tarp
- Rope
- Glacier Gear
- Snowmobile

Requirements

- Min CAA ITP 2 training (consider taking team member with higher level of training [ACMG/IFMGA] to supervise)
- Understand scope and rational for field trip

Hazards

Missing a weather component or poor objective for the conditions; dispatch doesn't receive communication therefore unable to initiate rescue response; equipment is not in working order or not in an organized kit; poor radio communications; avalanche involvement; falling; natural hazards (creeks, rocks, alders, tree wells); inherent risks of skiing; underestimating PWL's and other avalanche problems; lost gear; malfunctioning gear; communications; fail to check in in timely fashion put others at risk; driving home; fatigue.

Job Step

- Check weather and conditions, CAA/Avalanche Hazard Rating, InfoEX nearest neighbours history and hazard rating.
    - Discuss goal, avalanche and mountain hazards and determine best trip objective
- Do a hazard assessment using the InfoEx terrain module
- Fill out route plan and email Field Trip Report to Dispatch and other Av Techs on site
    - Call dispatch or receive email confirmation and confirm with other Av Techs on site.
- Assemble all applicable equipment and companion rescue PPE for the task.
    - Buddy check for all equipment prior to leaving office.
    - Perform safety and operational checks.
    - Spot beacon
- Travel to field trip area and check in with dispatch prior to commencing ski tour
    - Follow SOP Standard Road Procedures, JHA's for snowcat, snowmobile or helicopter.
    - Make sure dispatch copies radio transmission, and establish check in time interval.
    - Turn InReach on and into tracking mode
- Traveling on Skis
    - Gather relevant snowpack info with minimal exposure to hazards.
    - Ski one at a time, in control, with spotter
    - Ski to conditions and ability
    - Avoid working in the terrain if the visibility is obscured.
    - Get multiple views of the terrain from different angles to properly assess safe zones
    - Identify any potential terrain traps and likely spots where avalanches may be triggered.
    - Plan route accordingly
    - Use InReach tracker (dispatch and other team members have access to weblink)
    - Continue to reassess snow and weather conditions in relation to terrain and adjust the route accordingly or abort plan.
    - Follow SOP for Ski cutting
- Check in with dispatch at scheduled intervals and at end of trip
    - Check in with dispatch once arriving back.
    - Half hour after missed check in initiate IRP
    - InReach can be used for OK
    - If communications failure, abort trip and check in
- Concluding field trip
    - Properly put away your PPE.
    - Stretch and rehydrate.

- Debrief
- Drive to conditions

Appendix C.7

BJ-AVL-SOP-007 – Avalanche Debris Clearing

PRETIVM		BJ-AVL-SOP-007 Avalanche Debris Clearing	
Owner: Ken Black/Jim Franken	Approver: Joe Nicholson	Revision Number: 1.0	Creation Date: 17/11/07 Revision Date: 17/11/22

Objective/Rational

After avalanche control is completed or a natural avalanche cycle, avalanche debris will need to be cleared and if safe to do so, the road reopened.

Regulations

WSBC G4.1.1 Avalanche Assessment, HSRC 4.6 Mobile Equipment

Definitions

Companion Rescue PPE – Transceiver, shovel, and probe

Danger Area – Area of potential negative effects from explosives control; includes avalanche and fly rock.

Slope History – a record of all control work and observations for that piece of terrain for the current season.

Affected Departments

Mountain Safety, All

Preparation

Tools

- PPE
- Companion Rescue PPE
- Lighting
- Heavy Equipment

Requirements

- Understanding of SOP

Hazards

Un-exploded ordnance; post control avalanches; underestimating the remaining avalanche hazard; weather factors; lack of radio communications; loss of control zone; vehicle collisions; damaged equipment; injured workers; backed up traffic in avalanche areas; logistical delays and extended closure; cognitive overload, making mistakes that have been previously identified; extended exposure to overhead hazards; getting stuck; collisions; too narrow single lane; improper vehicle spacing; logistical delays, road blockage; vehicles stopped in avalanche areas; contact between snow removal equipment and traffic; vehicle collisions.

Job Step

- Mountain Safety ensure blasting mission is complete and Danger Area is clear of explosives.
  - Visual inspection of the area to ensure all explosives have discharged
  - Previous slope history
  - Further control work
  - Use of trained spotters
- Mountain Safety will assess the remaining avalanche and weather hazards for the road clearing crew.
  - Slope history (explosives use and avalanche occurrences)
  - Determine forecast and current weather influence on hazard trend
    - Use of spotter if deemed necessary
  - Further control work
  - Extended closure if hazard is unmanageable or high degree of uncertainty
  - Lighting
- If required, Mountain Safety will communicate Avalanche hazard update to Dispatch
- Mountain Safety will hand over control of the road to Surface Operations.
  - Road status. Road remains closed for deposit clearing, or open to traffic
  - Approx. time for debris clearing communicated to dispatch
  - Ensure that if equipment operator leaves guard position another guard is designated
  - Gates remain closed
  - Contact Mountain Safety if post control activity is observed
- Surface Operations will provide a **spotter** (watching for further avalanches from a predetermined safe location) or second operator if deemed necessary by AvTechs and ensure road is effectively closed off to traffic.
  - Work in teams of two
  - Maintain closure gates and take over guard duty for clearing if necessary
  - Establish secure radio channel and understand emergency egress paths
  - Spotter will have visual of avalanche terrain above crew clearing debris
  - No spotter will leave before confirming with their team and AvTechs
- Surface Operations will follow site specific check in and out procedures with Dispatch. Dispatch will update stakeholders.
  - Working knowledge and job specific training for working in avalanche terrain
  - Good communications
- Surface Operations will provide competent operators and adhere to safe machinery operating procedures.
  - JHA, SOP's
  - Clearly defined roads
  - Maintain catchments and banks
- Surface Operations will remove enough snow to create a single lane of traffic at a minimum.
  - Operator has control of the road and relays to dispatch road opening plan
  - No stopping in avalanche terrain
  - Widest practicable single lane (outside lane)
- Once the single lane is open the operator will coordinate with dispatch/designate regarding traffic control until adequate clearing is done to allow two way traffic.
  - Radio communication

    - Manage traffic approaching single lane
    - No stopping in avalanche terrain
    - Working knowledge and job specific training for working in avalanche terrain
    - Adequate snow clearing
    - 300m convoy spacing
    - Remain in vehicle and contact Av tech if post control issues prevent passage
    - Close road if post control avalanche activity is unmanageable.
- At times a loader may act as pace car to lead convoy spaced traffic through intermittent closures.
- Operator contacts dispatch to notify when two lanes open. Normal operation resumes as per hazard rating.
    - Monitor slope, weather and hazard
    - Follow SOP Standard Road Procedures
    - No stopping in avalanche terrain
- Mountain Safety Personnel will monitor radio traffic and note clean up times for single lane opening and insert into Pretivm Explosives Summary

Appendix C.8

BJ-AVL-SOP-008 – Avalanche Hazard Communication

PRETIVM		BJ-AVL-SOP-008 Avalanche Hazard Communication	
Owner: Jim Franken/Ken Black	Approver: Joe Nicholson	Revision Number: 1.0	Creation Date: 17/11/08 Revision Date:

Objective

To standardize avalanche hazard communications and how hazard rating changes are passed on for safe work procedures.

Health, Safety & Reclamation Code of BC

WSBC G4.1.1 Avalanche Planning

Definitions

Hazard Boards – Large boards with sliders indicating the hazard in specific zones

Run List – A specific list of terrain features with associated hazard levels, work procedures or work tasks. It is used as an internal form of hazard assessment and communication.

InfoEX – The Canadian Avalanche Association's online hazard assessment tool.

Affected Departments

Mountain Safety, Logistics, All Departments

Preparation

Tools

- Radio
- E-mail
- Hazard Board
- Hazard Bulletin
- Avalanche Bulletin Board next to kitchen

Job Step

- Every morning Mountain Safety produces a Daily Avalanche Hazard Bulletin by using information from various sources and analyzes it to evaluate and forecast avalanche hazard using the Canadian Avalanche Association's Conceptual Model for Avalanche Hazard.
    - Hazard is valid for 24hrs unless a 'Hazard bulletin update' is issued
- Mountain Safety will distribute a 'Run List' to relevant Supervisors and Operators via the InfoEX
- Mountain Safety distributes the Daily Avalanche Hazard Bulletin by email.
    - In the **BCC line** to the email group 'All Users – Brucejack Hazard'
    - From the mountainsafety@pretivm.com email address
    - The NERDS will manage 'ALL' Pretivm email sub-groups
    - Mountain Safety will manage 'Hazard Non-Pretivm' email list
- Supervisors will print off the Hazard bulletin and post it in an area where all workers have access to it.
- The Daily Avalanche Hazard Bulletin form is printed and posted on the Avalanche Bulletin Board in the Surface Operations bootroom, across from the new kitchen in Civeo camp (new camp) at the mine site, and in the boot room in Knipple camp.

- Mountain Safety will update 3 of the large hazard boards to reflect the most up to date rating. Wildfire gate security will update the large Hazard Board at wildfire. Each Board rates the local hazard as well as on the roads between it and the next sign.
    - At the mine site the board is located beneath the mill building conveyer attached to the support structure.
        - Zone A – Camp, Zone B - Lakeshore Drive Km 71.6-74, Zone C - VOK Road and Control Roads, Zone F – Knipple Corner Exit Km 56-59.5
    - Knipple camp has 2 boards, both located across from the fire hall above the incinerator fence. One board is clearly marked for the uphill traffic to Brucejack and the second is for downhill traffic to Wildfire.
        - To Brucejack -, Zone F – Knipple Corner Exit Km 56-59.5, Zone B - Lakeshore Drive Km 71.6-74, Zone A – Brucejack Camp
        - To Wildfire - Zone G – Scott Creek to Bowser Km 37-56, Zone H – Wildfire to Scott Creek Km 3-37,Wildfire Hill Km 2-3
    - Wildfires board is located on the gatehouse as you enter the haul road
        - Zone G – Wildfire Hill Km 2-3, Wildfire to Scott Creek Km 3-37, Zone H –, Scott Creek to Bowser Km 37-56,
- Supervisors are responsible to ensure that all staff working in avalanche terrain are aware of the current avalanche hazard and the associated safe work procedures; however, workers are still responsible for their personal safety.
    - Workers are made aware of how to access avalanche hazard information in Camp orientation and annual avalanche procedures training
    - See SOP - Standard Road Procedures
- Throughout the operational period the hazard may increase or decrease based on the current weather inputs (wind, temperature, snowfall…) or avalanche control being conducted. If a change in hazard level occurs Mountain Safety will make an announcement over the radio on the repeater and the local road channel.
    - "All stations, all stations this is an avalanche hazard update. The avalanche hazard in zone __ has increased/decreased to_____"
    - This is broadcast on Repeater 1 and Ladd2 in Brucejack camp and on Repeater 2 and Pretivm Road Channel in Knipple camp and below
    - Dispatch then repeats the message over the repeater channel
    - Hazards Updates should ideally be made in the business day (no later than 6pm) so that on shift supervisors can plan night duties accordingly
- At the next practicable moment, Mountain Safety will update the Hazard Bulletin with an email titled 'Hazard Update' and also update the Hazard Boards. This may take some time depending on the nature of the hazard and associated workload.
    - Emailed in the **BCC line** to: 'All Users – Brucejack Hazard'
- Supervisors and workers will ensure that they adjust their work to comply with the Avalanche Hazard Safe Work Procedures.
- Supervisors will contact Mountain Safety to request permission to continue working in avalanche terrain in hazard zones rated moderate and considerable.
- In the event that there are IT disruptions, a radio call will be made by Mountain Safety broadcasting the current hazard rating at 0600h and again at 0700h followed up by the email blast once internet connection is regained.
- To have contractor staff added to the Brucejack email lists please contact mountainsafety@pretivm.com

Appendix C.9

BJ-AVL-SOP-009 – Pre-Blast Considerations

PRETIVM		BJ-AVL-SOP-009 Pre-Blast Considerations	
Owner: Ken Black/Jim Franken	Approver: Joe Nicholson	Revision Number: 1.0	Creation Date: 17/10/15 Revision Date: 18/01/09

Objective

To clarify and standardize all pre blasting procedures.

Regulations

WSBC G4.1.1 Avalanche Assessment, G21.66 Control of a blast zone, G21.71Returning to the blast site

Affected Departments

Mountain Safety, Safety, Surface Operations, All Departments

Definitions

- **Danger Area** - the area potentially affected by the blast concussion, resulting avalanche or fly rock.
- **Blaster of Record** - the supervising blaster

Preparation

Hazards

- Avalanche
- Explosives
- Vehicle/Equipment/ Snowcat interactions
- Transmission line

Tools

- Crimpers
- Explosives
- Pull wire igniters
- SFAs
- Truck/Heli/Snowcat
- Gazex Tablet
- Closure Gates
- Lighting

Requirements

- Avalanche Control Checklist for relevant Zone
- Pretivm Blasting Procedures
- SOP Guarding and Sweeping
- SOP Avalanche Closure Procedures
- TDG shipping document
- Blasting ticket
- HSRC of BC Part 8 Blasting
- TDG ticket

- Avalanche Hazards Utilities Map (Avalanche Hazard Zoning for Mine Site Area)

Job Step

- Blasting in and around camp for maintenance purposes will be restricted to between 0300h-0900h and 1500h-2100h
    - Jacks slopes/VOK need to be clear at 0500 and 1700 for underground blast
- Blaster of Record identifies the blasting Danger Area and communicates planned avalanche control with the use of explosives with an "AVALANCHE CONTROL FLASH" email to appropriate email groups.
    - Email from mountainsafety@pretivm.com
    - Email addresses in **BCC** line
    - Estimated time, closure points, zones, expected closure time.
    - If practicable email "AVALANCHE CONTROL FLASH" update at 0600h or 1800h ideally 24hrs before, on the shift prior.
    - Morning Hazard Bulletin will include above information if practicable.
- Ensure NOTAM has been issued and is up to date
    - Process is under Explosives\NOTAM
    - Avalanche Technician Supervisor/Lead Hand to Maintain
- Plan and review control mission, fill out the Avalanche Control Checklist for Avalanche control. If control is within ZONE A Brucejack Camp review the Avalanche Hazards Utilities Map to ensure you are not placing charges on surface utilities.
    - Blast Quantities
        - No more than 12.5kg charge detonating at once near camp structures (think V.O.K., Jack Slopes, Low Grade)
    - Helicopter missions
        - Shots will not be delivered to both sides of the transmission line at once
        - Zone G, H, and F pre sweep for goats – *Reference: Pretivm Goat Management Plan*
            - If hazard is elevated and goats are observed in the control area, inform Mine Manger and Dispatch and leave the area CLOSED until they vacate the area or as instructed by the Mine Manager.
        - Quantity of product (Load/Fuel, Jettison)
        - Guard for product left at heli pad
- Follow Pretivm Blasting Procedures.
    - TDG requirements
        - Placards/Signs
        - Shipping Documents
- Broadcast an estimated one hour blast warning over the appropriate radio channel(s), incl. Repeater, LAD 2, and Pretium, "All stations, all stations this is a one hour blast warning for avalanche control on (***Lakeshore drive).***"
- Supervisors will start to plan to remove workers and vehicles from affected zones 30min prior to blast.
- All workers should be clear of affected area 15min prior to blast.
- When practical, prior to commencing explosive avalanche control, update Dispatch with the number of charges and estimated time of closure.
- Conveyance of explosives must follow TDG regulations under both the Health Safety and Reclamation Code for Mines in British Columbia, WCB and Transport Canada.

- Close, Guard and Sweep all areas as per SOP Guarding and Sweeping, SOP Avalanche Closure Procedures.
- Once the closure is in place, Blaster of Record radio broadcasts to Dispatch, "The road/area at (location) is swept, closed and guards are in place for avalanche control blasting". Receive confirmation from Dispatch that they copy.
- Once control commences, provide a 2.5,5 or 7 minute blast warning (depending on length of fuse) for each blast.
- If controlling above the Contractor offices issue an additional 1 minute warning prior to the charge detonation.

Avalanche Control with Explosives Above / Upslope of Structures

- Guards must sweep all buildings and open windows, ensuring all workers and vehicles are out of the Danger Area during the blast.
- Gates must be closed with guards in place.
- Restrict explosive quantity to minimize damage to structures.
    - Jack Slopes 12.5kg
    - High Grade and Low Grade 12.5kg
    - Face Cut 6kg
- If possible to achieve similar results it is preferable to use several small shots with different timings rather than larger bags.

Appendix C.10

BJ-AVL-SOP-010 – Avalanche Closure Procedures

PRETIVM		BJ-AVL-SOP-010 Avalanche Closure Procedures	
Owner: Ken Black/Jim Franken	Approver: Joe Nicholson	Revision Number: 1.0	Creation Date: 17/10/15 Revision Date: 18/01/08

Objective/Rational

Temporary road and worksite closures are an important avalanche risk reduction tools during times of elevated hazard or during avalanche control. Worker access is restricted until such time as the hazard is reduced, either by natural snow stabilization, or by artificial means (which may include the use of explosives, ski or snowmobile slope cutting, cornice control, or heavy equipment).

Regulations

WSBC G4.1.1, G21.66, G21.71, HSRC 8.6.2

Definitions

See J:\Mountain Safety\Avalanche Safety Plan\Avalanche Definitions.doc for a list of Avalanche Technical Language.

Affected Departments

Mountain Safety, Safety, Surface Operations, Logistics, All Departments

Preparation

Hazards

- Avalanche
- Explosives
- Heavy equipment
- Traffic

Tools

- Closure gates
- Heavy Equipment
- Hazard Bulletin
- Radio

Requirements

- BJ-AVL-SOP-005 Guarding and Sweeping
- Gates Map

Job Step

- Some micro avalanche terrain features are permanently signed with 'avalanche closed' signs
    - Workers wishing to access the slope will contact Mountain Safety for a Worksite Avalanche Assessment
- With as much notice as possible, Avalanche Technicians will communicate the timing and location of worksite or haul road closures.
- All staff are notified of the closure by email Hazard bulletin update and/or by radio communication through Dispatch.
    - Mountain Safety or Designate will close any relevant gates

  - Workers wishing to access snow roads and micro terrain behind gates will contact Mountain Safety
- During active avalanche control, the closure area is swept and guarded as per Guarding and Sweeping SOP and gates may be closed
- Closures for high avalanche hazard without control may be swept or may rely on check out check in procedures as well as worker accounting.
- For blasting operations follow and complete Avalanche Control Checklist
- Operators inform Dispatch when the avalanche debris has been cleared and the road or worksite is open.
- On completion of control Mountain Safety reassess hazard area and will hand over control of the road and worksite to Surface Operations.
- Guards to remove any physical barriers once debris is cleared.
- If extended closures are expected Mountain Safety will advise the Surface Operations Supervisor, TVL, Mine Manger, Road Superintendent, and Dispatch to the specifics so they are able to alter work procedures, update travel plans and positon equipment and resources accordingly for snow clearing.
- Surface Operations and TVL are responsible for providing personnel and equipment to assist with the closure.
- Closure gates will be used during periods of elevated avalanche hazard and typically requires various means of support; guards, sweep vehicles, and standby road clearing equipment.
- Guards may be used in place of, or in conjunction with closure gates.
- The only personnel allowed into avalanche closures are Mountain Safety and equipment operators working under Mountain Safety supervision.
- All personnel working in the closure area need to be under direct Mountain Safety supervision, be wearing and trained how to use companion rescue equipment, and follow relevant SOP (Avalanche Debris Clearing SOP, Guarding and Sweeping SOP).

Special Wildfire Hill Considerations

- Contact Wildfire Camp Supervisor prior to storm events, reminding them to monitor 25cm threshold snow board for potential closure at 2km.
- Knipple Avalanche Technicians will advise of potential closure and should be in contact with Wildfire camp and Dispatch.

Zone A gates map can be found in:

J:\Mountain Safety\Maps and Photos\Camp maps and photos

Closure Points:

Appendix C.11

BJ-AVL-SOP-011 – Communications for Snow Removal and Road Maintenance in Avalanche Areas

PRETIVM		BJ-AVL-SOP-011 Communications for Snow Removal and Road Maintenance in Avalanche Areas	
Owner: Ken Black/ Jim Franken	Approver: Jeff Stewart/ Chris Homister	Revision Number: 1.0	Creation Date: March 5, 2018 Revision Date:

Objective/Rationale

To establish and follow a systematic method of communication and supervision to safely and efficiently maintain snow in avalanche areas on the main access road.

Regulations

- WSBC G4.1.1 Avalanche Assessment, G4.1.2 (c) Avalanche Planning
- HSRC Part 1.11.1 Training, 2.2 Hazards, 3.3.1 Hazardous Work, 6.1.1 Qualified Persons
- WCB 3.12 Refusal of Unsafe Work

Definitions

Qualified Person: means person who, in the opinion of the mine manager, is

(a) Qualified because the persons knowledge, training and experience to design, organize, supervise and perform the duties for which the person is appointed,
(b) Familiar with the provisions of this Act, the code and the regulations that apply to the duties for which the person is appointed, and
(c) Capable of identifying any potential or actual danger to health or safety in the workplace;

Supervisor: means a person who instructs, directs or controls workers in the performance of their duties and who is authorized by the manager to take or recommend disciplinary action against workers;

Worker: a person who is an employee but does not include a supervisor

Workplace: a place where work is carried out in, on or about the mine.

Standard Road Maintenance: Any work in avalanche areas will follow Hazard Specific Safe Work Procedures document.

Normal Winter Operation Procedures: Any work on the access road itself. No work on the uphill side of the access road in avalanche areas without direction from your supervisor in consultation with Mountain Safety.

Hang fire: remaining avalanche hazard on slope after control or uphill maintenance work, potentially causing a secondary avalanche

Workers right to refuse unsafe work: The right to refuse work. The Occupational Health and Safety Act (OHSA) gives a worker the right to refuse work that he or she believes is unsafe to himself/ herself or another worker. A worker who believes that he or she is endangered by workplace violence may also refuse work.

Affected Departments

Mountain Safety, Surface Operations, Road Maintenance Contractor, All other departments travelling the road

Preparation

Hazards

Undetonated explosives; post control avalanches; underestimating the remaining avalanche hazard; triggering an avalanche from below, removing the toe support of the slope (snow cone); rock fall; weather factors; lack of radio communications; unsecure work area; damaged equipment; injured workers; backed up traffic in avalanche areas; logistical delays and extended closure; cognitive overload, making mistakes that have been previously identified; extended exposure to overhead hazards; getting stuck in avalanche terrain; collisions; too narrow single lane; inadequate machine for the task; mechanical failure in avalanche terrain; inadequate vehicle spacing; logistical delays, road blockage; vehicles stopped in avalanche areas; contact between snow removal equipment and traffic; blind corners; vehicle collisions; hang fire.

Tools

- Lighting
- Avalanche Companion Rescue PPE
- Loader
- Excavator
- Snowcat
- Grader
- Radios
- Pylons and hazard identifiers

Requirements

- 17-18 Avalanche Safety Plan
- BJ-AVL-SOP-001 - Worksite Avalanche Assessments
- BJ-AVL-SOP-004 - Night Time Avalanche Control
- BJ-AVL-SOP-005 - Guarding and Sweeping
- BJ-AVL-SOP-007 - Avalanche Debris Removal
- BJ-AVL-SOP-008 - Avalanche Hazard Communication
- BJ-AVL-SOP-010 - Avalanche Closure Procedures
- SOP Standard Road Procedures
- SOP Working Alone or in High Risk Remote Locations
- SOP - Extreme Weather Conditions 2016 01 31
- Hazard Specific Safe Work Procedures
- Preseason Avalanche training and Companion Rescue

Job Step

Attend morning and / or evening tool box meeting with Supervisor and Mountain Safety

- Prior to TVL Operators leaving camp they check in with TVL Supervisor at Brucejack to see if there are any weather advisories or worksite restrictions. If there are any weather advisories in affect a worksite avalanche assessment must be carried out prior to work. The assessment will be carried out when safe to do so.
- TVL Supervisor at Brucejack to review twice daily emails from Mountain Safety outlining site specific requests for maintenance work outside normal winter operations procedures.
- Mountain Safety will communicate a general overview of the current Avalanche Hazard, forecast weather, potential avalanche control and revisit any work tasks outside of normal winter operations procedures with TVL Supervisors at the tool box meetings
- TVL Supervisor at Brucejack will communicate 'line up' to workers ensuring they understand their tasks, ensure workers follow surface operations SOPs and they follow associated Hazard Specific Safe Work Procedures. Work will not commence until hazards to associated tasks have been identified.
- Workers will turn on their avalanche transceivers, carry out a function check and ensure all PPE is in safe working condition.
- Initiate FLHA with current hazard and worksite restrictions

Mountain Safety will:

- Contact Avalanche Supervisor or lead hand prior to directing surface operations supervisor
- Communicate with supervisor who in turn will direct workers
- Provide hazard updates
- Carry out Worksite Avalanche Assessments
- Identify and mark hazards with pylons, snow berms etc.
- Follow SOPs relevant to working in avalanche terrain

TVL Supervisors will ensure Workers are:

- Working under their supervision and following normal winter operation procedures
- Qualified worker and equipment is adequate for the task.
- Signed off on associated surface operations SOPs.
- Wearing appropriate PPE
- Filling out FLHAs and adhering to the necessary control measures
- Checking in when avalanche communication hazard updates and or weather advisories are broadcast. Adjusting work as outline by hazard specific procedures
- Will ensure workers are following hazard specific safe work procedures
- Requesting JHAs be built for tasks outside SOPs
- Calling in any natural avalanche activity that the worker observes and that they are removing themselves from the hazard prior to a reassessment from Mountain Safety

Workers will:

- Meet with TVL supervisor at Brucejack prior to commencing work
- Check in with Dispatch every hour and or as directed.
- Read and sign off on all SOPs prior to working in avalanche terrain. If there is no SOP for the task, workers will contact their supervisor and draft a JHA prior to carrying out the work.
- Sign off on all associated surface operations SOPs pertaining to their job tasks.
- Carry out Pre Ops in designated safe areas.
- Fill out FLHA and update prior to each new task.
- Park pickups and extra equipment in designated safe areas.
- Listen to designated road channel for work area and monitor the repeater.
- Listen for avalanche hazard updates, adjust work as per the Hazard Specific Safe Work Procedures
- Follow all SOPs relevant to working in avalanche terrain
- Ensure parked equipment, potentially affected, will be moved or windows opened during explosive avalanche control.
- Call in any natural avalanche activity that the worker observes and that they move to a designated safe are, away from the hazard. Wait for a reassessment and direction from Mountain Safety and Supervisor prior to commencing work

Work outside Normal Winter Operations Procedures

- Workers will contact TVL supervisor at Brucejack prior to performing any work outside of normal winter operations procedures.
- TVL Supervisors at Brucejack will consult with the Avalanche Supervisor or lead hand prior to preforming any work outside of normal winter operations
- Avalanche Supervisor or lead hand will instruct mountain safety to carry out an avalanche worksite assessment prior to the task being carried out.
- TVL Supervisor at Brucejack will ensure worker is qualified for the task, equipment is adequate and worker is following appropriate surface operations SOP or JHA prior to starting work and sign off on the updated FLHA.

PRETIVM

AVALANCHE FORECASTS AND SAFE WORK PROCEDURES

AVALANCHE FORECAST	DEFINITION	ACTION TAKEN BY CONTRACTOR OR SURFACE OPERATIONS
LOW	Avalanches are unlikely. OR Small avalanches are possible, but are expected to terminate far above the access road	When the Avalanche Forecast is "LOW" the Contractor and or Surface Operations may proceed with normal winter operation procedures. The Contractor or Surface Operations will: • Contact Mountain Safety prior to removing snow from avalanche catchment areas • Avalanche PPE is required for all 'rated' avalanche terrain, including low hazard • Maintain previously announced road closures to allow for avalanche patrols and for the removal of snow and/or deposits from the access roads
MODERATE	Small avalanches are probable but are expected to terminate above the access road. AND/OR Large avalanches are possible, but are expected to terminate far above the access road.	When the Avalanche Forecast is "MODERATE" the Contractor and or Surface Operations will: • Notify Avalanche Technician if there is a change in weather, such as, increased wind speed, rise of temperature and/or increased snowfall intensity • Notify Avalanche Technician immediately after observing NEW avalanche occurrences • Contact Mountain Safety prior to any personnel working outside of vehicles within avalanche areas • Ensure there is no equipment working outside of the access road within avalanche areas • Take interval weather and/or avalanche occurrence observations, as requested by the Avalanche Technician • Be prepared for road closures/delays, as a result of unexpected natural avalanche activity on the access road or explosives avalanche control, as requested by the Avalanche Technician • Maintain previously announced road closures to allow for avalanche patrols and for the removal of snow and/or deposits from the access road (stationary or mobile equipment okay for deposit removal)
CONSIDERABLE	Small avalanches may affect the access road. AND/OR Large avalanches are probable, but are expected to terminate above the access road. AND/OR Snow dust events may affect the access road.	When the Avalanche Forecast is "CONSIDERABLE" the Contractor and or Surface Operations will: • Notify Avalanche Technician if there is a change in weather, such as, increased wind speed, rise of temperature and/or increased snowfall intensity • Notify Avalanche Technician immediately after observing NEW avalanche occurrences • Ensure there are no personnel working outside of vehicles within avalanche areas • Ensure there is no equipment working outside of the access road within avalanche areas • Ensure there is no stationary equipment working within avalanche area • Contact Mountain Safety for HIGH PRIORITY work inside avalanche terrain • Ensure safety of personnel by performing one of the following: o Radio call-in when entering and exiting avalanche areas* o Radio call-in at least every 30 minutes* o Plow in tandem (second vehicle may be a pick-up or another plow truck) * The person receiving the radio call may or may not be working in avalanche areas, but must be available 100% of the forecast time period • Take interval weather and/or avalanche occurrence observations, as requested by the Avalanche Technician • Be prepared for road closures/delays, as a result of unexpected natural avalanche activity on the access road or explosives avalanche control, as requested by the Avalanche Technician • Maintain previously announced road closures to allow for avalanche patrols and for the removal of snow and/or deposits from the access road (mobile equipment only for deposit removal) • Convoy spacing of 300m between vehicles when travelling through avalanche areas.
HIGH	Numerous small avalanches are expected to affect the access road. AND/OR One or more large avalanches are expected to affect the access road.	When the Avalanche Forecast is "HIGH" the Contractor and or Surface Operations will: • Close and sweep the access road between Standard Closure Locations (as determined by the Avalanche Technician) using Standard Closure Procedures • Ensure there is no equipment or personnel working within the avalanche closure area except for: o Sweep vehicles o Avalanche Program vehicles and personnel o Snow maintenance equipment, provided they operate in safe areas and do not enter avalanche hazard areas (as determined by the Avalanche Technician) * * This is possible because many Standard Closure Locations are located outside of avalanche hazard boundary locations • Take interval weather observations from weather stations with safe access, as requested by the Avalanche Technician
EXTREME	Numerous, large avalanches are expected to affect the access road.	When the Avalanche Forecast is "EXTREME" the Contractor and or Surface Operations will: • Close and sweep the access road between Standard Closure Locations (as determined by the Avalanche Technician) using Standard Closure Procedures • Ensure there is no equipment or personnel working within the avalanche closure area • Take interval weather observations from weather stations with safe access, as requested by the Avalanche Technician.

Avalanche Deposit Removal

If the Avalanche Technician determines that conditions are safe, the Contractor may be instructed to commence avalanche deposit removal from specific locations where avalanches have affected the access road, even though adjacent avalanche areas may be rated at different forecast levels.

BJ-AVL-SOP-012 – Repeater Egress on Skis

PRETIVM		BJ-AVL-SOP-012 Repeater Egress on Skis	
Owner: Ken Black	Approver: Joe Nicholson	Revision Number: 1.1	Creation Date: 18/01/15 Revision Date: 18/01/25

Objective

Regular site visits to the repeater stations by Mountain Safety are necessary to maintain and repair project radio communication and internet. Due to the remote mountaintop locations and the unpredictability of local weather it may become necessary to descend on skis to a lower elevation pick up.

Scope

Descending from the repeaters is to be viewed as a last resort measure. It is a response to unforeseen and unpredictable changes in weather. Go/No Go decisions are to be made following the Repeater Access Go/No Go Flow Chart, which will act as a guideline and support tool in the planning stages and execution of the mission.

This SOP covers the safest egress routes on skis from each repeater site. They have been developed using the avalanche industry's best practices for travelling through mountain terrain.

Health, Safety & Reclamation Code of BC

- WSBC G4.1.1 Avalanche Assessment, G8.11 (2) Helmets

Definitions

- Avalanche Terrain Exposure Scale (ATES) Definitions:
  - SIMPLE: Exposure to low angle or primarily forested terrain. Some forest openings may involve the runout zones of infrequent avalanches. Many options to reduce or eliminate exposure. No glacier travel.
  - CHALLENGING: Exposure to well defined avalanche paths, starting zones or terrain traps; options exist to reduce or eliminate exposure with careful route-finding. Glacier travel is straightforward but crevasse hazards may exist.
  - COMPLEX: Exposure to multiple overlapping avalanche paths or large expanses of steep, open terrain; multiple avalanche starting zones and terrain traps below; minimal options to reduce exposure. Complicated glacier travel with extensive crevasse bands or icefalls.

Preparation

Hazards

- Potential avalanche involvement; terrain traps; inherent risk of skiing (injury); crevasses; severe weather exposure/ hypothermia; loss of communication; dehydration; lack of adequate food supply; wild animal encounters; risks of helicopter use ; overnighting at lower elevations without proper gear.

Tools

- Avalanche PPE/Rescue equipment (Transceiver with batteries >50%, shovel, probe, backpack, helmet)
- Outdoor clothing, spare gloves and mid layers
- Radio, InReach satellite communication device with charged battery
- Minimum one external USB battery charger
- Cell phone with preloaded mapping applications
- Skis, ski boots, poles, climbing skins
- Glacier Rescue gear (harness, rope, rope grab/ascension device, carabiners)
- Saw

- Gas Detector
- First Aid kit
- Emergency tarp/rescue toboggan
- Bamboo markers
- Helicopter landing stakes

Requirements

- Knowledge of route by all members of the party; on-the-ground familiarity of the route by the route leader
- Communication with pilot of possible pickup locations and methods of communication if no or limited radio contact (VIH, Dispatch relay, email Dispatch with InReach)
- Route marked with high pickup(s) staked
- Route studied and discussed before landing at repeater site
- Avalanche conditions favorable for selected route
- Training, including review of SOP, practical training and assessment

Repeaters

JABBA (BRUCEJACK) REPEATER

Jabba repeater sits at 7800ft/2377m just SW of the rounded, semi-glaciated summit of Jabba Peak, NNE of Brucejack camp.

TERRAIN AND ATES RATINGS: 2 options work through CHALLENGING glaciated terrain – one to the SE, the other to the west. COMPLEX terrain prevails in all other directions

KNIPPLE REPEATER

Knipple repeater is on a small sub-peak off the Mt. Jankowski massif at approx. 5900ft/1800m.

TERRAIN AND ATES RATINGS: High ground to the NW and a lower angled bowl to the W is the safest egress option through SIMPLE (upper third) and CHALLENGING terrain. A high pickup at treeline would keep the exposure minimal through mostly SIMPLE terrain. The east side of the peak is COMPLEX avalanche terrain, with numerous start zones to the NE and a large bowl-shaped start zone for a path that runs to the valley floor. To the west is also complex avalanche terrain with numerous overlapping paths that converge in the main drainage

WILDFIRE REPEATER

Wildfire repeater is on a ridgeline that runs from generally N to S at 5100ft/1550m.

TERRAIN AND ATES RATINGS: The North and East sides of the sub-peak are CHALLENGING to COMPLEX terrain with steep corniced start zones. The main ridge to the SE becomes a narrow exposed corniced ridge and is not an option. To the west is CHALLENGING avalanche terrain with no options to avoid exposure. A route exists through largely simple terrain with a few short steeper sections.

SHORTY REPEATER

Shorty repeater sits at 6500ft/1980m on a prominent NE-SW running glaciated ridge between deep valleys.

TERRAIN AND ATES RATINGS: COMPLEX terrain in all directions, with a dropping traverse route through CHALLENGING glaciated terrain immediately to the NW.

Job steps

- Use Repeater Access Go/No Go Flowchart to determine when access is appropriate
- Once on site be efficient with tasks to limit chance of bivouac
- Continuously monitor weather while on site for any deterioration
- Leave immediately if un-flyable weather approaches
- Descend on skis/foot for pickup only if safe, prepared and pickup is assured, otherwise shelter in place and wait for conditions to improve

JABBA (BRUCEJACK) REPEATER EGRESS ROUTES

OPTION 1: Travel due west from the repeater to a steep glaciated roll just to the North (right) of the ridge proper, several hundred metres down from the repeater. A short, committing diagonal NW descent through the skier's left of this feature finds lower angled terrain on the glacier. If unskiable, use the exposed rocks on the left to travel/handrail through the steep section (caution bergschrund on pitch.) Follow to the WNW into a broad gully feature that ends with a short descent to the SW. From here continue west across a bench in the terrain to access the final slopes that descend to the SW to flat ground several km N of camp. Numerous options exist for this final pitch, including following the ridgeline further to the NW before wrapping around on lower angled terrain to reach the flats to the S.

OPTION 2: Requires some visibility and a relatively low avalanche hazard. From the repeater traverse a short ways to the E to find the fall-line route that avoids the more exposed, glaciated terrain further to the E (left). Work through various gullies with numerous options, following a SSW fall-line descent. When the angle eases take a slightly more E (left) line to avoid a bench feature, then follow fall-line to the flats NE of Brucejack Lake.

ATES Overview

Option 1

Option 2

KNIPPLE REPEATER EGRESS ROUTES

OPTION 1: If helicopter is able to fly to treeline, this is the safest and least exposed option. Start by descending north on open slopes to approx. 5200ft/1600m, taking care to keep distance from the cornice to the east (right). Continue in the same general direction across a bench and climb slightly to gain a broad undulating ridge that descends NW initially then turns back to the north. Follow the high ground (will require some uphill travel if unsure of traversing across slopes) to a small saddle below a sparsely treed knob. A helicopter LZ has been cut here on a small high point which allows visibility from the forest to the valley floor.

OPTION 2: As per above, then to continue to valley bottom. It will be necessary to work numerous small slopes and side-hills on the right-hand side that may require some ski cuts and micro terrain management.

This will take you to approx. 3700ft/1100m where you will look for a gully system going west. The gully system is steep and sometimes tight and difficult in early season with open creek holes and unsupported pillows to consider. Descend 1300ft to another gully formed by an old faint lateral moraine that parallels the main creek. Follow this to the valley floor or climb over and descend short steep slopes into the main creek.

It is important to note that the lower half of this egress is continuously steep and has significant early season hazards and thick alder. This area would be difficult/impossible to enact a rescue other than from a HETS system.

OPTION 3: The bowl to the West. This would require good visibility and a low avalanche hazard level as it travels through Complex terrain. The route is straightforward: a descent to the WNW for 1.5 km brings you to a steep sidewall at approx. 3500ft./1050m . This short slope brings you to the main creek bottom which you follow to the NNW and the Bowser River with lots of potential pickup spots enroute. While the overall ski route is not that steep, the exposure from both sides is largely continuous as you descend, with minimal views of the overhead.

Start
Start
Finish
Google Earth
N
4000 ft

WILDFIRE REPEATER EGRESS ROUTE

Descend the ridge proper to the SE for 250m (brief uphill section - vertical drop of only 30-40m) then follow a spur ridge to the SW.

Caution initially required with a cornice to the East (left) and start zones to the West (right.)

Once on the Spur ridge at 5000 Ft./1500m, the high ground of the ridge should be maintained while descending to minimize hazard from avalanche slopes on either side until into the sparse trees at approx. 4300ft./1300m. From this point you can descend the SW side of the Spur ridge through mostly protected Simple terrain with increasing vegetation and small glades to pickup locations that will start to be available around 3400ft./1000m. Be cautious to avoid moving too far to the West (right), which would expose you to the SW bowl and steep-sided gully immediately below the repeater.

If no high pick up is available with a helicopter then continuing in a Southerly direction through low angled terrain (logging roads exist) for 3-3.5 kilometres will bring you to the Stewart - Cassiar Highway.

SHORTY REPEATER EGRESS ROUTE:

Low avalanche hazard and glacier safety precautions required for this egress. Travel on the ridge a short distance to the NNW and continue on this line to descend the skier's left flank of a large bowl. Minimize exposure to steep headwalls to the E (right) and work through rolling terrain towards a bench at 4800ft/1460m. High pickup site here (bring heli stakes if planning on pick up here). From here continue the line of traverse below a large steep slope, or to turn to the West (left) and find a more fall-line route through steep rolling semi-forested (still Challenging) terrain. Numerous pickup areas exist in the valley, and if needed the Premier Mine complex is within reach several km's down the valley, due W of the repeater site at approx. 200m elevation. Late in the season and with Low avalanche hazard follow the first drainage below the egress route to the SW until the service road is reached. In elevated hazard and/or earlier season conditions, continue on the NW-trending route toward the Western shore of Long Lake, then follow the road down (SSW) to the Premier mine camp.

Repeater Access Go/No-Go flowchart and definitions

Note: read all definitions on attached document.

Note: Priority definitions are subjective when combined with timing of incoming storms or length of current storm.

Stable Wx (Weather)

- Clear skies or high overcast combined with calm to light winds. Forecast will reflect stable conditions with no expectations for any significant change. This will allow the helicopter to stay on site at the repeater to ensure easy egress.

Variable Wx

- Scattered to Broken skies with light to moderate winds. Forecast will reflect reasonable expectation of conditions not worsening. The helicopter may not be able to stay at the repeater but should have suitable secondary landing to stay close by with clear line of sight on the repeater and overall weather pattern.

Low Priority

- De-riming, De-Icing, Refuel levels >50%, Restocking Supplies

High Priority

- Fuel levels <35%, Imminent system failure predicted, Power system offline/failed and operating on batteries, System offline/failed.

Trained

- Familiar with all maintenance requirements/procedures for the mission, access/egress for the repeater in question (has physically skied the route), physically capable for all possibilities.

Not Trained

- Unfamiliar with any aspect of the maintenance requirements/procedures for the mission, access/egress for the repeater in question (has not physically skied the route), injured, sick, unfit.

Hazard

- As per CAA OGRS

Mitigation YES

- Able to reduce hazard to Low-Moderate with explosives to the satisfaction of the mission team in conference with Avalanche Supervisor or Lead Hand.

Mitigation NO

- Hazard mitigation is unachievable/unreasonable

Appendix C.13

BJ-AVL-SOP-015 – Terrain Assessment Management Plan

PRETIVM		BJ-AVL-SOP-013 Tower Climbing	
Owner: Ken Black/ Jim Franken	Approver: Jim Barbondy/ Don Sather	Revision Number: 1.0	Creation Date: 03/05/2018 Revision Date:

Objective

To provide a safe work procedure for climbing the tower structures, working at heights including work positioning systems, and efficient and safe companion rescue should a worker require rescue from height.

Scope

This SWP applies to anyone working on maintenance or repair of the Brucejack MET and repeater stations at a height above 3m. The main tasks/duties associated are clearing ice/rime off of the instruments and solar panels, battery checks and swaps, Geonor fluid changes (due to volume capacity or seasonal changes), and any repairs required.

All rescues are situational dependent; that is why we train to be prepared for worst-case scenarios. Our philosophy to working safely is by taking a proactive preventative approach. With proper job planning, hazard assessment and risk management procedures, we are able to manage and mitigate the hazards.

Health, Safety & Reclamation Code of BC

- Air Quality Permit 107025 - July 12, 2016
- HSRC Part 1.11.1 Training, 2.2 Hazards, 3.3.1 Hazardous Work, 6.1.1 Qualified Persons
- WSBC 3.12 Refusal of Unsafe Work, G34 Rope Access

Definitions

- MET - Meteorological
- Geonor – all weather precipitation rain gauge
- High Angle Rope Rescue – rescue in which the load (technician) is predominantly supported by the rope rescue system
- Rime – the accumulation of granular frost on the windward sides of exposed objects that is built out directly against the wind.
- Petzl I.D. – self-braking descender used for technical rescue
- Petzl ASAP – mobile fall arrester for workers at height
- Petzl Sorber or Absorbica – a shock absorber used in conjunction with the ASAP to dissipate fall force on the rope in the event of a fall
- Scaffold Hooks – Oversized connectors that hook over scaffold and oversize anchor points to form the basis of mobile fall arrest systems
- ANSI – American National Standards Institute
- CSA – Canadian Standards Association

Preparation

Hazards

- Falling from heights.
- Snow and ice falling from above (accumulated on tower equipment and/or structure).
- Working at heights errors such as improper use of climbing equipment or improper rigging of anchors.
- Sharp/abrasive surfaces.
- Communication difficulty due to wind or passing vehicles or loss/malfunction of handheld radio.

- Dropped tools or materials while working at height.
- Prolonged exposure to the elements, severe winds, cold/freezing temperatures.
- Electrical shock when working with batteries, solar panels, instrumentation.

Tools

- 2 x ANSI/ CSA Approved full body harness (with basic rope tech gear/work positioning equipment i.e. grillon's)
- 2 x Fall Arrest lanyards and Scaffold hooks with appropriate shock pack.
- 30m 11mm Kernmantle rope (rope double the length of the Tower)
- Steel Anchor slings
- Pulleys
- ASAP
- Rope Grabs (Ascender/Kroll)
- Cable clamp
- Connectors/Carabiners
- Petzl Jag System (4:1 pulley system)
- Petzl I.D. (Descender)

Requirements

- Tower Access and Companion Rescue training provided by Mountain Safety
- Fall Arrest training package provided by Pretivm
- Standard First Aid Training
- First Aid Kit

Job Step

TRAINING:

Mountain Safety Technicians performing tower climbing duties will hold a valid rope access ticket and be restricted to scope of practice. Environmental technicians that have rope access training from an approved source or have fall protection training may climb towers.

TOWER ACCESS and WORK POSITIONING:

1. Tower will be accessed by Tower Climbing Techniques. The use of these techniques is situationally dependent and also depends on the level of training of the individual performing the work. For practical purposes, Tower Climbing Techniques will be employed by the majority of personnel performing maintenance work on the MET stations.
2. Tower Climbing involves the use of CSA approved Scaffold Hooks or an appropriate cable clamp (Photo 2: Cable grab) to attach the worker to the metal tower structure or climbing cable. The Scaffold hooks are attached to the worker's ventral D-ring on their harness and have a built in lanyard shock pack that ensures your impact force will not exceed 6kN or 600kgs; see Photo 1: Scaffold Hooks.
3. Work positioning involves employing a positioning lanyard attached to a descent controller which is used to position a worker at height. In this case, the work positioning system employs a Petzl Grillon attached to the lateral D-rings on each side of the worker's harness. A properly rigged work positioning system essentially allows the worker to perform tasks with both hands while being safely supported by the tower structure. See Photo 3: Work positioning for the proper set-up.

Photo 1: Scaffold Hooks

Photo 2 Cable Rope Grab

Photo 3: Work Positioning

HAULING LOADS:

4. Workers needing to transport equipment, materials, tools, etc., up the towers will utilize a high point anchor to rig a rope and pulley system and employ a rope grab such as a basic ascender or progress capture pulley. Utilizing a rope grab will limit the effort required to haul the load as well as preventing the load from being dropped accidentally.

EGRESS/COMPANION RESCUE:

5. Rescuer will utilize a high point anchor to rig a two rope lower system with Petzl I.D, ASAP and one 11mm rope. If the casualty is unconscious and/or suspended, the rescuer will then 'pick' casualty from suspension with a pre-rigged 4:1 haul (Petzl Jag) and lower to ground. If casualty is not suspended then a 'pick' is not necessary and casualty can be lowered directly to ground. See Photo 3: Properly set-up Rope Rescue System for the equipment and set-up required for a companion rescue.

Photo 3: Properly Set-up Rope Rescue System

Responsibilities

Mine Manager or designate is responsible for:

- Ensuring this SOP is implemented and maintained.
- Ensuring on-site personnel have up-to-date information regarding this SOP.

Departmental Manager / supervisor is responsible for:

- Ensuring that this SOP is read and understood by the employees who will be conducting the work.
- Ensuring persons conducting the work have the proper training.

Pretium Mountain Safety is responsible for:

- Assisting in developing and delivering a training package for MET station tower climbing and companion rescue.

Health and Safety Manager/Coordinator is responsible for:

- Monitoring the implementation of this procedure.

Personnel performing this task are responsible for:

- Being fit and ready to work safely and within the scope of their training.

Employees are responsible for:

- Following this SOP as outlined and directed by the Environmental Supervisor and Certified Rope Access Technicians.

BJ-AVL-SOP-018 – Avalanche Related Road Closure Sustainability Plan

PRETIVM		BJ-AVL-SOP-018 Avalanche Related Road Closure Sustainability Plan	
Owner: Mountain Safety	Approver: Ken Black	Revision Number: 1.2	Creation Date: 01/08/2019 Revision Date: 02/26/2019

Objective

To establish structure in the advent of an extended road closure due to elevated avalanche hazard to roads and/or work areas with no means to mitigate it in a timely fashion. This procedure ensures worker safety site wide while minimizing business interruptions and allowing for business continuity and resiliency.

Scope

This SOP applies to all personnel at the Brucejack Project. As weather conditions deteriorate and avalanche hazard increases, it is the responsibility of everyone working outdoors to monitor and report these conditions to their supervisor. This SOP describes escalating levels of avalanche road closures and classifies them based on duration of closure and impact to site safety and site operations sustainability. It outlines the appropriate actions to minimize exposure and its impact on workers and the operation. The Mine Manager or designate shall be kept informed by the Mountain Safety Superintendent or designate, and at the discretion of the Mine Manager, activates IMT.

Health, Safety & Reclamation Code of BC

- 1.9.1 – Workplace Conditions
- 3.13.1 – Evacuation, Procedures and instructions.
- WSBC G4.1.1 Avalanche Assessment, G4.1.2 (c) Avalanche Planning
- 3.7.1 – Mine Emergency Response Plan
- Part 3 Rights and Responsibilities WSBC 3.3
- HSRC Part 1 Section 1.6 Health and Safety Program

Definitions

- IMT – Incident Management Team
- Avalanche Terrain – Any terrain feature capable of producing an avalanche given the correct snowpack conditions
- Avalanche Terrain Map – a map produced by the Mountain Safety Department, the Engineering Department, and outside Engineering Contractors
- Restricted visibility- Visibility in certain areas limits safe operation of equipment, to see pedestrians and to fly helicopters.

Preparation

Hazards

- Extreme weather reduces likelihood of a helicopter landing at Brucejack, as well, it can lead to closures of both Lakeshore and VOK ground egress from Brucejack. If a serious injury was to occur during extreme weather it would be very difficult to safely escort the injured person from site.
- Loss of process with Operations

Tools

- Two way radio.
- Proper winter clothing and PPE.
- Avalanche packs (beacon, shovel, probe) whenever traveling in avalanche zones.

Requirements

- Knowledge of Code 1 procedure
- Knowledge of Avalanche hazards
- IMT
- Interdepartmental SOP's

Job Step

The following Action Levels will take place in the event of avalanche road closures.

Action Level 1

Condition – CONSIDERABLE OR HIGH avalanche hazard. Estimate 3 hour closure

- Timing of control may be affected by prolonged or extended conditions of reduced visibility
- Control work may be affected if snow roads are not maintained or weather is not suitable for heli control work.
- MINOR impact to essential freight or road travel, road closures < 3hrs, MINOR impact to mill operations
- Intermittent closures expected, km 2, km 44, km 58 to km 59.5, Lakeshore Drive, VOK glacier road and VOK glacier bypass road.

Action Required

- Mountain Safety Superintendent or designate notifies the Surface Operations Supervisor or Road Access Superintendent, Dispatch and the Mine Manager.
    - Work restrictions possible.
- Surface Operations or Road Access Superintendent allocates support as required; equipment and trained operators and will communicate unforeseen delays or limitations.
- Surface operations or Road Access Superintendent to monitor and relay any significant changes in the conditions and road clearing to Mountain Safety Superintendent or designate and Dispatch.
- Haul road contingency plan. I.e. Timing of essential freight.
- Scheduled avalanche control work as planned.
- Convoy spacing (minimum 300m) in high risk areas is required. Traffic control possible to spot and coordinate traffic.
- If required VOK bypass glacier road to be maintained in case of emergency.
- May escalate to Action Level 2

Action Level 2

Condition – estimate 3 to 6 hour closures

- Timing of control work will be affected if access roads to upper targets are not safe to travel due to visibility or drifting snow and have not been maintained or equipment is not available to support.
- Extended closures due to a variety of factors such as restricted weather, avalanche control and debris clearing.
- MODERATE impact to essential freight or road travel, 3-6hr road closures likely, higher planning priority to limit potential impact to mill operations and critical freight and emergencies.
- Km 2, km 44, km 58 to km 59.5, Lakeshore Drive and VOK glacier bypass road may be closed.

Action Required

- Mountain Safety Superintendent or designate notifies the Surface Operations Supervisor or Road Access Superintendent, Dispatch and the Mine Manager.
- Surface Operations or Road Access Superintendent allocates support as required; equipment and trained operators and will communicate unforeseen delays or limitations.
- Haul road contingency plan.
- Prioritize avalanche control work, closures along the road or worksites may be in effect in order to safely reduce the risk in one area before moving to another.
- Convoy spacing (minimum 300m) in high risk areas is required. Traffic control possible to spot and coordinate traffic.
- If required, VOK bypass glacier road to be maintained in case of emergency.
- Mine Manager or designate will activate the IMT
    - High-risk tasks shall be restricted.
    - Haul road contingency plan. I.e. Timing of essential freight.
    - Consider extending closure boundaries to stop traffic going under the mill or roof lines.
    - As directed by Mine Manager, Logistics shall issue a travel advisory which could include no travel allowed from Wildfire to Knipple access road, the Knipple Glacier and Lakeshore Drive.
    - As directed by Mine Manager, Supervisors shall communicate appropriately with their crews and contractors/visitors under their area of responsibility.
- Emergency Response Team on standby if required.
- May escalate to Action level 3

Action Level 3

Condition – extended though undetermined road closure duration

- Control work is suspended until safe access can be assured.
- Closures in place. Km 2, km, 44, km 58 to km 59.5, Lakeshore Drive and VOK glacier bypass road may be closed.

Action Required

- Mountain Safety Superintendent or designate notifies the Surface Operations Supervisor or Road Access Superintendent, Dispatch and the Mine Manager.
- Surface Operations or Road Access Superintendent allocates support as required; equipment and trained operators and will communicate unforeseen delays or limitations.
- Mine Manager or designate will activate the IMT
    - High-risk tasks shall be restricted.
    - Mountain Safety Superintendent to advise IMT of prolonged storm and elevated hazards.
    - High priority planning as delays for essential freight, production, and emergencies are certain, due to road closures.
    - Prohibited outside travel except in emergency conditions, or if authorized by Mine Manager or designate.
- IF BOTH ROADS are impassable and no aircraft can land, the Mine Manager or designate has the authority to suspend ALL work on site until one of the access roads is open or an aircraft can land.
- IF ALL WORK on site is suspended, ALL supervisors shall ensure that ALL employees/workers are all accounted for.
- ALL PERSONNEL shall muster in the kitchen or a designated safe zone and wait for further instructions.

- Emergency Response Team required to be on standby.

Restrictions during a Level 3

- Only critical areas determined by the Mine Manager shall be in operation.
- If operations are suspended all personnel shall retreat to a designated safe location.
- Escorted travel will be established between the safe location and bunk houses as directed by Mine Manager or designate.
- NO person shall return to work without the approval from the Mine Manager or designate.

BJ-AVL-SOP-024 – Wyssen Helicopter Operations

PRETIVM		BJ-AVL-SOP-015 Terrain Assessment Management Plan	
Owner: Mountain Safety	Approver: Jim Barbondy	Revision Number:	Creation Date: Sep 14, 2017 Revision Date: Jun 25, 2018

Objective/Rationale

The purpose of this evaluation is to provide Pretivm supervisors and contractors with a detailed hazard assessment of terrain prior to starting work. The Best Practice herein sets out in general principal the actions necessary when conducting operations in any type of terrain. This step by step process will categorize the terrain, identify hazards and set in motion planning and mitigation strategies to reduce risk to personnel working on the site. Due to the need for Mtn Safety to assess terrain for both planning and rescue needs, these guidelines will be used in the operation as part of a jobsite hazard assessment.

Regulations

- OHS G4.20.1, G4.20.2, G4.21 HSRC 3.3.1, 3.4.2, CAGC – Terrain Assessment Guidelines

Definitions

Helicopter External Transportation System (HETS): A system used to provide prompt evacuation of sick or injured workers from rugged areas

See work book for definitions for Terrain Classification, Terrain Steepness, Rockfall hazard

Affected Departments

Mountain Safety, Safety, Geology, Surface Operations, Planning Department and Trades, Environment

Preparation

Hazards

- Rockfall, landslips, serac fall, ice fall, crevasses, avalanches, access egress routes, slips trips falls, weather, rain, snow, wildlife, lack of communication, remote location, Fall from heights, complex terrain increasing planning for rescue and evacuation, weather, lightening, wildlife, helicopter hazards, heat cramps, heat exhaustion, heat stroke, snow blindness, human hazards, heuristics, untrained worker, inadequate gear, overnighting, dehydration, bush whacking

Tools

- Foot wear appropriate to walking conditions
- Head protection with chin straps
- Overnight survival kit
- Radio and extra battery
- Bear spray, Bear bangers
- Bush saw
- Headlamp
- GPS
- First Aid kit
- Proper PPE for the task
- Satellite phone
- Inreach beacons
- Avalanche PPE
- Glacier PPE
- CDFL HETS kit

- Hilti and anchor building kit
- Belay kit and harnesses

Requirements

- Helicopter Orientation, hover exit if appropriate
- Established Check In
- Bear awareness course
- SOP Working Alone or in High Risk Remote Locations
- JHA or SOP for the task
- First Aid Trained
- CDFL HETS certification

Primary Assessment

- Terrain Classification Assessment, as set forth in this document, must be performed by a competent person. The terrain classification information must be documented and available to all persons who have access to the project; any safety concerns that result from terrain assessments must be communicated during all safety orientations.
- Due to a multitude of factors such as weather, snow, ice and seasonal changes, Rock fall, fall potential, danger trees, wildlife and environmental hazards, terrain classifications are subject to change. Be prepared to reclassify terrain on an ongoing basis. Any safety concerns that result from changing terrain conditions must be communicated during all safety orientations.
- Persons working in all terrain classifications must be qualified, certified and at a minimum trained in the following.
- Minimum provincial standard of First Aid
- Wildlife and mountain awareness training
- Be physically capable of carry out the assigned duties
- The higher the class of terrain, the more training and certification is needed in order to work
- safely in these areas.
- Terrain Classification Assessment Guidelines
- Design – In order to minimize or avoid the hazard, consider terrain implications when designing the project. If class 3, 4, 5 and 6 terrain is identified during the project design, consider the impact if managing steep terrain with the project. Consider methods of rescue and evacuation
- Planning – Use maps and other sources to classify terrain steepness (C1-6), terrain surface condition (S1-4) and Rockfall hazard (R1-4). Understand terrain hazards. Determine project needs to manage the terrain hazards appropriately.
- Terrain Management Plan – Walk or fly over the project to classify terrain steepness, terrain surface condition and rockfall hazard. A terrain management plan must be developed in order to mitigate risk of any classes greater than class 3. The plan should include but not be limited to the following:
- Methods of keeping untrained workers out of the area.
- Methods of how the workers will be moving around the steep terrain.
- Methods of entering and exiting steep terrain.
- Methods of managing terrain hazards.
- Qualification and training of workers required for that area.
- Methods of rescue and evacuation.
- A map that identifies class 3,4,5 and 6 terrain
- Mapping and Zoning – Terrain classification, maps can be made to help identify areas where both travel and rescue will be difficult. Zones may be created to make it easy to identify levels of

difficulty. A map reflecting zones will dictate 'go' or 'no go' decisions relative to working when the helicopter is unable to fly.

- Green zone = Class 1 and 2 terrain – open to all field personal who meet training requirements.
- Yellow zone = Class 3 and 4 terrain – Greater slip trip and fall hazards, greater risk of rockfall hazards. Accessible to only personal who meet minimum fitness requirements, have been trained, and have demonstrated competency in more rugged terrain. Yellow zones may only be accessed when rescue and evacuation systems are available.
- Red zone = class 5 and 6 terrain – Significant slip, trip and fall hazards, greater risk of falls from heights and greater rockfall hazards. Accessible only to personal who have been trained in the use of fall protection and rope access systems. Red zones may only be accessed when rescue and evacuation systems are available.
- Traverse Planning – As the traverse progresses, reevaluate the terrain to confirm steepness classification, terrain surface conditions and rockfall hazard. Use terrain management techniques to reduce hazards where possible. Communication at this stage is extremely important and can be achieved at meetings, updating maps and terrain assessments.
- Continuous Evaluation – Throughout the project continuously reevaluate the terrain and re-rank classification when necessary in response to changes in ground surface conditions; such as slippery due to snow, ice water, overhead rockfall or avalanche hazard, etc. Communication at this stage is extremely important and can be achieved at meetings, updating maps and terrain assessments.

Job Step

- When contemplating a new project or development in mountainous terrain the associated department will first consult with Mountain Safety and determine if the project is exposed to potential risk due to the terrain (see attached). The associated department and Mountain Safety will carry out an initial assessment and go through a pre planning JHA exercise prior to the work being carried out.
- Or if a worker or supervisor recognizes that they are to be exposed to potential terrain hazards they are to request Mountain Safety to perform an assessment.
- Mountain Safety will then:
- Gather geographic information about the sites location, elevation and transportation.
- Provide definitions and classifications of terrain for the purpose of evaluating terrain steepness in order to:
- Prevent falls from heights
- Plan for rescue and evacuation
- Comply with Occupational health and Safety (OHS) and HSRC regulations related to;
- Hazard assessment
- Fall protection and working at heights
- Plan for rescue and evacuation.
- Determine the terrains classification by using the terrain classification scale in the workbook. Include the egress and access to the site.
- Provide definitions and classifications of terrain for the purpose of evaluating terrain surface condition (reference the workbook) in order to:
- Prevent slips trips and falls
- Plan for rescue and evacuation
- Create a safe work place
- Comply with all Provincial OHS and HSRC Regulations related to:
- Hazard assessment
- Rescue evacuation

- Use the terrain classification scale in the workbook to rate the exposure to rockfall.
- Determine Rescue and Evacuation Concerns use the chart in workbook.
- Input all this information into the terrain assessment form. See example below.

Pretivm Terrain Assessment

Site Location:	4007	Revision Date:	6/11/2016
Site UTM:	9V 435298.00 m E 6233382.00 m N	Name:	Steve Parsons
Site Elevation:	746m	Terrain Class:	Class 4
Activity at site:	TL Construction	Terrain Surface:	S4
Contractor:	BJTL Contractors	Rockfall Hazard:	R3
		Rescue/Evacuation:	Class 4

Site Description

Site location number 4007 is a high priority planning area, access and egress to the site from the helicopter pad travels through a large talus rock slope. The trail is steep and overgrown. The worksite is situated above a cliff greater than 10m in height.

General Access / Egress

Helicopter pad access only. Access is challenging and requires slashing to provide safe access for crews.

Rescue Access / Egress

Depending on injury, standard helicopter pad or HETS if patient is unable to move or immobilized.

Hazard Rating/ Planning Priority

Use the Planning Rating Table to score the hazard rating for the site. Use the definitions provided to help you find the appropriate score for each item listed on the terrain assessment form.

PLANNING RATING

Probability of Exposure	Impact to Life	Impact the hazard has on the ability to do a rescue	Total Score	Explanation
5= Frequent 4= Often 3= Occasional 2= Possible 1= Improbable 0 = Impossible	5= Permanent disability or death 4= Critical injury or possible death. 3= Severe injury of possible disability 2= Moderate injury 1= Minor injury 0 = Impossible	5= Severe impact, will make rescue in the golden hour unlikely, rescue will place rescuers at risk. 4= High Impact, rescue in the golden hour difficult and might place rescuers at risk. 3= Moderate impact, rescue in the golden hour possible. 2= Low impact, rescue in the golden hour possible, 1= No impact on rescue 0 = won't happen	**13 to 15 =**	**Very high** planning priority for training and hazard mitigation. Either avoid area or use special teams trained to manage this type of hazard. Special evacuation and rescue measures may need to be taken.
			10 to 12 =	**High** planning priority for training and hazard mitigation. Either avoid area, use special teams trained to manage this type of hazard or provide training to workers. Special evacuation and rescue measures may need to be taken.
			7 to 9 =	**Moderate** planning priority for training and hazard mitigation. Provide training to workers in basic wilderness safety. Reinforce training often.
			3 to 6 =	**Low** planning priority for training and hazard mitigation. Basic mountain/wilderness safety training should be sufficient.
			1 to 2 =	**Very low** planning priority for training and hazard mitigation.
			0 =	Don't need any planning, the hazard does not exist

- List the concerns in the boxes provided across from the score given.
- The overall goals are to
- Identify and understand terrain hazards
- Determine project needs to manage the terrain hazards appropriately.

Step 2: Hazard Rating/Planning Priority		
Item	Score	Explanation
Probability of exposure to hazard	3	Exposure to occasional slip and falls traveling to site and possible fall beyond marked working edge off cliff.
Impact to life or limb	5	Slips, trips and environmental exposure. Access to site from heli pad. Cliff/ fall potential. Excavator roll-over.
Hazard and/or terrain's impact on ability to rescue worker	4	Helicopter rescue only. HETS required for all injuries where patient is immobilized.
Total Score	12	
Planning/training priority for hazard management		STOP - HIGH PRIORITY PLANNING

- Add up the total and determine the planning priority for the site.
- See table below:

RISK ACCEPTABILITY

Score	Definition
1-3	Acceptable Risk- Hazards can be eliminated or avoided.
4-7	Controllable Risk-Required action Rules, PPE, Skills training or other hazard mitigation techniques
8-11	Moderate- Controllable with conditions-Required action= qualified personnel only, special procedures, work practices, skills and training required along with rescue system. Conditions will be constantly re-evaluated throughout the job and at any time the conditions may be downgraded to unacceptable.
12-15	Unacceptable Risk-STOP=It is unsafe to perform tasks, hazards cannot be managed.

Hazard Management Controls and Conditions

- Provide controls and safety solutions that once implemented will effectively minimize or completely eliminate the workers exposure to risk of identified hazards at a work site. Follow The Terrain management plan which should include but not be limited to:
- Method of keeping untrained workers out of the area
- Methods of how the workers will be moving around the terrain
- Methods of entering and exiting steep terrain
- Methods of marking and managing terrain hazards
- Qualification and training of workers required for that area
- Determine rescue requirements, Implement an emergency action plan that will make rescue from the site more efficient therefore decreasing the time required for transporting an injured worker to higher care. Predetermined access routes and systems for extrication.
- A map that identifies class 3,4,5 and 6 terrain
- Continuous evaluation of the terrain and change of the classification when necessary to reflect the changes in ground surface conditions (slippery due to snow, ice water, machine altered ground)
- This should be constructed prior to work beginning at a site.
- Communication at this stage is extremely important and can be achieved at meetings, updating maps and terrain assessments.
- See example below:

Step 3: Hazard Management/Controls/Conditions
Daily JHA to promote situational awareness.
Capable personnel. Fit and strong enough to deal with rough terrain.
Standard PPE,high quality footwear, chin straps on helmets, appropriate mountain clothing.
Train for hazard identification and avoidance, safe work practices, safe travel procedures.
Define work site perimeter, establish safe working edge and well marked and cleared access/egress.
Slash and clear work site and access to tower site. Mark obvious trip hazards at work site.
Consider fall protection where required as per Part 11 Fall Protection Regulation.
Consider rope access techniques and properly certified personnel where required .Part 34 Rope Access Regulation.
Design a site specific rescue plan, additional heli pads. Identify staging points for ground and HETS rescue.

Determine Risk after Controls

- Determine if the hazard is acceptable after applying hazard management controls. Score the individual items again and determine if the risk is now manageable once the controls are in place and maintained.
- Re-access work site once work has commenced and the site has been altered. Mitigate new hazards and adjust the emergency action plan if required.
- Communication at this stage is extremely important and can be achieved at meetings, updating maps and terrain assessments.
- See example below:
-

Step 4: Determine if hazard is Acceptable-After applying hazard management controls		
Item		Explanation
Probability of exposure to hazard	2	Identify and mark hazards, clear access/egress routes. Mark and respect safe working edge. Possible
Impact to life or limb	4	as above
Hazard and/or terrain's impact on ability to rescue worker	4	Reduce rescue time for certain injuries with access improvements. Look at closer Heli pad for rescue.
Total score after mitigation techniques applied	10	
Risk tolerability after controls are in place		MODERATE RISK - CONTROLLABLE WITH CONDITIONS

If hazards are completely unmanageable for a site and a high planning priority cannot be managed due to hazards, discuss moving the site to a more suitable location with the Department head or Supervisor.

Appendix C.16

BJ-AVL-SOP-026A – Wyssen Charge Construction

Objective

To provide the user with a process for constructing Wyssen charges in a methodical safe manner.

Scope

Wyssen Deployment boxes (void of explosive charges) will be stored in sea-cans at km 48 magazine laydown, approximately 100m off the Brucejack Access road. The storage sea-cans are located approximately 12m away from a Type 9 magazine used for storage of explosives for the use of avalanche control.

During fall commissioning, the deployment boxes will be removed from the storage sea-cans and lined up systematically between the storage sea-cans and the Type 9 magazine. Assembly and priming of the Wyssen charges will take place in an "arming shack" (sea-can).

An accidental ignition pit (in the event of a misfire) is located behind the arming seacan. It is about 3 feet deep, lined with old ¾" rubber belt matts with 12" of fines over top. Surrounding the pit are 8 concrete barriers.

Health, Safety & Reclamation Code of BC

- Not applicable

WorkSafe BC Regulations

- 21.3 Dangerous incident reports
  - (1) If a blasting accident occurs which causes personal injury, or if there is any other dangerous incident involving explosives, whether or not there is personal injury, the employer must
  - (a) report the incident immediately to the Board, and
  - (b) forward a written report of the incident to the Board without undue delay.
  - (2) The written report of the incident must contain
  - (a) the date, time and location of the incident,
  - (b) the names and certificate numbers of all blasters involved,
  - (c) the names and occupations of any persons injured,
- 21.5 Authority to blast
  - (1) Only the holder of a valid blaster's certificate issued by the Board or acceptable to the Board is permitted to conduct or direct a blasting operation, and then only if the work involved is within the scope of that certificate.
  - (2) All work within the blasting area must be done under the authorization of the designated blaster of record responsible for that area.
  - (3) A blaster may be assisted by persons who do not hold blaster's certificates, but the blaster must have authority over the assistants and must exercise visual supervision over them and be responsible for their work during explosive loading, priming, fixing or firing.
- 21.7 Training
  - A worker engaged in loading, unloading, or conveying explosives must be trained in the proper means for handling the explosives, the hazards of fire and mishandling and the procedures to follow in the event of a fire or explosion.
- 21.16 Detonators
  - (1) Detonator products must not be kept in a store or receptacle in which explosives or safety fuses, fuse lighters, igniter cords or connectors are stored.
  - (2) At the loading site, detonator products must be stored separately from other explosives, and in a crush resistant box which is clearly identified.

- 21.17 Worksite storage
  - Explosives at the worksite must be guarded or contained in secured day boxes until used or returned to storage magazines.
- 21.18 Communication
  - (1) The employer must ensure that the location of a magazine in which explosives are stored, and any restrictions on access or activity around the magazine area, are clearly communicated to all workers.
  - (2) A day box and receptacle used for day storage of explosives on a work site must, when they contain explosives, display signs indicating the presence of explosives in a conspicuous manner, and the signs must be removed when they are empty.
- 21.19 Magazine condition
  - (3) Any article or substance likely to cause a fire or explosion must be kept out of and at a safe distance from an explosives magazine.
- 21.37 Defective explosives
  - Explosive materials or accessories which have deteriorated, or are believed to be defective, must not be used and must be handled and disposed of in a safe manner following the manufacturer's recommendations.
- 21.38 Cold temperatures
  - If the sensitivity of an explosive is affected by cold temperatures the explosive may be brought to a working temperature in a manner recommended by the manufacturer, but must not be warmed near an open fire or a steam boiler nor by direct contact with steam or hot water.
- 21.40 Ignition sources prohibited
  - (1) Smoking is prohibited within 15 m (50 ft) of where explosives are stored, being handled, or are in loaded holes.
  - (2) Open flame ignition sources must not be permitted within 15 m (50 ft) of where explosives are stored, being handled, or are in loaded holes, unless the blaster of record gives consent.
- 21.41 Containers
  - (1) Containers, known or suspected to contain explosives or explosive residue, must be handled with care to prevent undue impact or exposure to excessive heat or flame.
  - (2) All empty explosives containers must be disposed of by burning or as recommended by the manufacturer.
- 21.45 Priming
  - A primer must not be made up until immediately before placing the explosives.
- 21.49 Electrical storms
  - If there is any sign of thunder or lightning storm activity, all blasting activity must be suspended and the danger area must be cleared and guarded if explosives are present at the blast site.
- 21.56 Safety fuse assemblies
  - (1) Only safety fuse assemblies with antistatic protection may be used for safety fuse blasting.
  - (2) Safety fuse assemblies less than 1 m (3.3 ft) in length must not be used.
  - (3) Safety fuse assemblies must be handled with care to avoid pinching or kinking and damaged fuse assemblies must not be used.
- Safety fuse assembly length
- The Regulation states that "safety fuse assemblies less than 1 m (3.3 ft) in length must not be used." A safety fuse from a manufacturer is 1 metre or 3 feet 3 inches long. As provided by section 21.57(2) of the Regulation, this fuse length may be trimmed to expose fresh powder or to remove the igniter cord connector. The minimum trimmed length cannot be less than 90 cm or 3 feet.
- 21.57 Lighting safety fuse

- (1) When lighting a single safety fuse assembly a match may be used.
- (2) When multiple safety fuses are to be lit, a suitable safety fuse lighting device must be used to ensure that a minimum 90 cm (3 ft) fuse length safety factor is maintained.

- 21.73 Misfires
  - (1) If there is evidence or suspicion of a misfire after a blast is initiated, the blaster of record must not permit anyone to enter the danger area until the later of the following:
    - (d) if a safety fuse was used to initiate the blast, 30 minutes after the estimated time of detonation;
    - (e) the waiting period stated in the manufacturer's instructions.
- (2) If there is evidence or suspicion of a misfire after a blast is initiated and a charge is known or suspected to be burning, the blaster of record must not permit anyone to enter the danger area until the later of the following:
    - (a) one hour after the smoke clears;
    - (b) the waiting period stated in the manufacturer's instructions.
- 21.79 Relighting a safety fuse is prohibited.
- 21.85 Avalanche control
- (1) Explosive charges must not be placed manually on site by workers or projected by any means for the purpose of avalanche control, until the proposed work procedures have been submitted to and accepted by the Board.
- (2) Explosives must not be primed until the last most practicable moment which means that point in time when the explosives are as close to the control route as possible, in a safe, sheltered location excluded from public access.
- (3) The pull-wire lighter must not be placed on the safety fuse assembly until immediately before placing the charge.
- (4) The employer must ensure that procedures are reviewed annually and that proposed changes to the procedures are submitted to the Board for approval before implementation.

Definitions

- *"blaster of record"* means the blaster who is designated to be in charge of a blasting operation.
- *"blasting area"* means an area extending at least 50 m (165 ft) in every direction from a place where explosive materials are being prepared or fixed, or where an unexploded charge is known or believed to exist;
- *"blasting operation"* includes preparing, placing, and firing a charge, handling a misfire, and destroying or disposing of explosive materials;
- *"charge"* means explosive materials which may or may not contain a primer, and which are placed for the purpose of detonation.
- *"danger area"* means an area in which there may be danger to persons or property from flying material or other hazardous condition resulting from a blast;
- *"dangerous incident"* means an accident or near miss occurrence caused by or as a result of the use of explosives, and also includes an unexpected result or problem with explosive products.
- *"detonator" or "detonator products"* includes those explosives commonly called blasting caps, or electric caps, or other similar devices used to detonate commercial explosives;
- *"initiating device"* means a blasting machine, non-electric starter, fuse lighter and any other device used to initiate a deflagration or detonation but does not include a detonator or electric igniter;
- *"explosive"* means a substance that is made, manufactured or used to produce an explosion or detonation, including but not limited to blasting explosives, pyrotechnic devices and accessories containing explosives;
- *"primer"* means an explosive to which a detonator is attached or into which a detonator is inserted;
- *"safety fuse assembly"* means a manufactured blasting accessory consisting of a precut length of safety fuse, an igniter cord connector, and a detonator.

- **Qualified Personnel** – Personnel operating the Wyssen Avalanche Towers or Wyssen Helicopter Latch must be officially approved by the company management. They must possess personal certification of training on the installations carried out by the manufacturer as well as a nationally valid license for the artificial release of avalanches with explosives for operating the avalanche towers. Instruction by colleagues within the company are not valid as a replacement for the installation training by the supplier. Persons who have not been trained by the supplier and who do not have the above-mentioned certification may not operate this installation

Preparation

Hazards

- Explosion
- Personal injury
- Property damage
- Fly rock
- Proximity to charge
- Wildlife in area
- Proximity to Explosive magazine
- Unauthorized personnel in the work area
- Slips, trips and falls
- Lightning
- Wildfire
- Static / electrical / Generator fire

Requirements

- Approved Variance VR201900088 for Section 21.56(2) of the OHSR and follow special terms
- Wyssen Manual
- Pretium Blasting Procedures
- BJ-AVL-SOP-026A Wyssen Charge Construction
- BJ-AVL-SOP-026B Wyssen Charge Priming
- BJ-AVL-SOP-026C Wyssen Box loading
- Brucejack Mine Fire Safety Plan 48 km Magazine Site 2020
- Brucejack Mine Security Plan 48 km Magazine Site 2020
- Brucejack Mine Key Management Plan 48 km Magazine Site 2020
- Annex B - Cleared Employee List
- Blaster of Record must hold a valid avalanche control blasting certification
- Storage and handling of explosives
- TDG, TDG IATA and WHMIS
- SDS
- Personal training certification by the supplier of the Wyssen Tower
- Never leave explosives unattended
- Ensure explosives, safety fuse and percussion igniters SZ83 are compatible and approved by regulatory bodies and sufficient to a temperature of -30°C.

Responsibilities

Mine Manager or Designate

- Ensure this SOP is implemented and maintained.
- Ensure personnel have up-to-date information regarding this SOP.

Department Manager/Supervisor

- Ensure that all workers perform tasks in a safe manner
- Review procedure with any persons performing tasks pertaining to this SOP

Health and Safety Manager or Designate

- Monitoring the implementation of this SOP

Workers

- Ensure that they are authorized to perform tasks as required
- Report to their supervisor any issues pertaining to the above procedure
- Stop work if unsure and report to supervisor

Job Step

- **Ensure Blasting Codes are in a secure Lockbox**
- **Site Preparation**
  - Gate is closed and locked and primary closure established at the haul road junction.
  - No unauthorized personnel in the worksite.
  - The deployment box must be placed on a flat surface, ensure that there is not more than 30cm under the deployment box
  - Ensure deployment boxes are located close to the worksite where the charges are prepared (maximum distance 50m)
  - Ensure route from worksite to deployment boxes is free of obstacles
  - Ensure assembly table is stable, free of any sparking material and unnecessary objects or tools.
  - Turn off heater in the arming seacan.
  - Open doors of the arming seacan and ensure clear pathway to the Accidental ignition pit
- In the event of accidental ignition during charge construction, priming and loading of explosives follow BJ-AVL-SOP-027 Wyssen Accidental Ignition

- **Gather all equipment and supplies at the 48km magazine area**
  - Km 48 gate key
  - Deployment box key
  - Magazine keys
  - Measuring tape
  - 12" Brass punch tool
  - Crimpers
  - Electrical tape
  - Wyssen Charge Assembly and charge control check list
  - Generator, gas and duck pond
  - Electrical cords
  - Wyssen battery chargers
  - Nitrile gloves

- **Charge construction components**
  - 2 charge container half shells
  - 1 short retaining cord
  - 1 hangar cord with pull wire clips and ring
  - 1 1kg Unimax stick
  - 3 1kg Dyno TX stick
  - Foam Stopper
  - Recco sticker

Preparation of the charge container

- **Inspect charge container half shells for defects**
  - Ensure all tabs are in place and there are no obvious cracks

- **Place two of the Dyno TX sticks inside one of the half shells**
  - Ensure slight angle to leave access to the 2 fuse holding tabs
  - Leave slight gap between charges and bottom of casing to ensure bottom tabs connect with another casing half

- **Load Remaining Dyno TX and Unimax sticks**
  - Ensure Unimax is placed on the right immediately below the igniter
  - Leave slight gap between charges and bottom of half shell to ensure bottom tabs connect with other half shell

- **Assemble casing**
  - Start from bottom and work tabs together slowly and firmly to bring together the two half shells
  - If one side tab is broken in the process tape can be applied to continue using the half shell
  - If one of the bottom or top tabs are damaged then unassemble the charge container and discard the damaged side
  - Push the charges to the bottom of the charge container

- **Thread and tie off the Retaining Cord (Short Piece)**
  - Thread the short string through both halves of the charge container in a Z pattern
  - Tie a figure eight on one end
  - Follow through the figure eight to complete the knot

- **Prepare the tied off Retaining Cord**
  - Move the knot off to one side
  - Gather both strands and equalize above the center of the casing

- **Prepare the Hanger rope (long piece) and connect Long Hanger cord to Retaining Cord**
  - Pull off the taped on top section of cord
  - Look for two spring clips
  - Inspect loop and knot at end
  - Connect long to short with a girth hitch and center hitch on Retaining Cord

- **Connect Spring Clips into the eyelets of the percussion igniter SZ83**
  - Ensure both side of each clip is through pull wire hole
  - Ensure cords are aligned/not twisted

- **Place remaining cord bag on top**
  - Ensure cord bag has ring on top
  - Ensure no snag potential with charge container holes
  - Remove tape holding ring on top of bag

- **Charge Assembly Quality Control Checklist**
- Follow Wyssen Charge Assembly and charge control check list -Carried out by designated person
  - 2 Bottom tabs - secure fit / no cracks
  - 3 Side tabs - secure fit / no cracks
  - Cartridge orientation - Unimax positioned correctly (for detonator placement)
  - Retaining cord -Tied through all 4 tabs, figure 8 follow through knot used and secure)
  - 2 Top tabs - secure fit / no cracks
  - Girth hitch - Tied, weight test
  - Spring hooks - Both arms clipped through igniter
  - Cord sack - Placed neatly, ring facing up
  - Recco chip – Place Recco chip inside charge container

- **Place foam on top to protect from premature pulling of igniters and to indicate QC complete**
- **Place charges back in boxes in preparation for priming phase**

Appendix C.17

BJ-AVL-SOP-026B – Wyssen Charge Priming

Objective

To provide the user with a safe and methodical process for priming the Wyssen charge containers with safety fuse assemblies.

Scope

Wyssen Deployment boxes (void of explosive charges) will be stored in sea-cans at km 48 magazine laydown, approximately 100m off the Brucejack Access road. The storage sea-cans are located approximately 12m away from a Type 9 magazine used for storage of explosives for the use of avalanche control.

During fall commissioning, the deployment boxes will be removed from the storage sea-cans and lined up systematically between the storage sea-cans and the Type 9 magazine. Assembly and priming of the Wyssen charges will take place in an "arming shack" (sea-can).

An accidental ignition pit (in the event of a misfire) is located behind the arming seacan. It is about 3 feet deep, lined with old ¾" rubber belt matts with 12" of fines over top. Surrounding the pit are 8 concrete barriers.

Health, Safety & Reclamation Code of BC

- Not Applicable

WorkSafe BC Regulations

- 21.3 Dangerous incident reports
  - (1) If a blasting accident occurs which causes personal injury, or if there is any other dangerous incident involving explosives, whether or not there is personal injury, the employer must
  - (a) report the incident immediately to the Board, and
  - (b) forward a written report of the incident to the Board without undue delay.
  - (2) The written report of the incident must contain
  - (a) the date, time and location of the incident,
  - (b) the names and certificate numbers of all blasters involved,
  - (c) the names and occupations of any persons injured,
- 21.5 Authority to blast
  - (1) Only the holder of a valid blaster's certificate issued by the Board or acceptable to the Board is permitted to conduct or direct a blasting operation, and then only if the work involved is within the scope of that certificate.
  - (2) All work within the blasting area must be done under the authorization of the designated blaster of record responsible for that area.
  - (3) A blaster may be assisted by persons who do not hold blaster's certificates, but the blaster must have authority over the assistants and must exercise visual supervision over them and be responsible for their work during explosive loading, priming, fixing or firing.
- 21.7 Training
  - A worker engaged in loading, unloading, or conveying explosives must be trained in the proper means for handling the explosives, the hazards of fire and mishandling and the procedures to follow in the event of a fire or explosion.
- 21.16 Detonators

    - (1) Detonator products must not be kept in a store or receptacle in which explosives or safety fuses, fuse lighters, igniter cords or connectors are stored.
    - (2) At the loading site, detonator products must be stored separately from other explosives, and in a crush resistant box which is clearly identified.
- 21.17 Worksite storage
    - Explosives at the worksite must be guarded or contained in secured day boxes until used or returned to storage magazines.
- 21.18 Communication
    - (1) The employer must ensure that the location of a magazine in which explosives are stored, and any restrictions on access or activity around the magazine area, are clearly communicated to all workers.
    - (2) A day box and receptacle used for day storage of explosives on a work site must, when they contain explosives, display signs indicating the presence of explosives in a conspicuous manner, and the signs must be removed when they are empty.
- 21.19 Magazine condition
    - (3) Any article or substance likely to cause a fire or explosion must be kept out of and at a safe distance from an explosives magazine.
- 21.37 Defective explosives
    - Explosive materials or accessories which have deteriorated, or are believed to be defective, must not be used and must be handled and disposed of in a safe manner following the manufacturer's recommendations.
- 21.38 Cold temperatures
    - If the sensitivity of an explosive is affected by cold temperatures the explosive may be brought to a working temperature in a manner recommended by the manufacturer, but must not be warmed near an open fire or a steam boiler nor by direct contact with steam or hot water.
- 21.40 Ignition sources prohibited
    - (1) Smoking is prohibited within 15 m (50 ft) of where explosives are stored, being handled, or are in loaded holes.
    - (2) Open flame ignition sources must not be permitted within 15 m (50 ft) of where explosives are stored, being handled, or are in loaded holes, unless the blaster of record gives consent.
- 21.41 Containers
    - (1) Containers, known or suspected to contain explosives or explosive residue, must be handled with care to prevent undue impact or exposure to excessive heat or flame.
    - (2) All empty explosives containers must be disposed of by burning or as recommended by the manufacturer.
- 21.45 Priming
    - A primer must not be made up until immediately before placing the explosives.
- 21.49 Electrical storms
    - If there is any sign of thunder or lightning storm activity, all blasting activity must be suspended and the danger area must be cleared and guarded if explosives are present at the blast site.
- 21.56 Safety fuse assemblies
    - (1) Only safety fuse assemblies with antistatic protection may be used for safety fuse blasting.
    - (2) Safety fuse assemblies less than 1 m (3.3 ft) in length must not be used.
    - (3) Safety fuse assemblies must be handled with care to avoid pinching or kinking and damaged fuse assemblies must not be used.
- Safety fuse assembly length

- The Regulation states that "safety fuse assemblies less than 1 m (3.3 ft) in length must not be used." A safety fuse from a manufacturer is 1 metre or 3 feet 3 inches long. As provided by section 21.57(2) of the Regulation, this fuse length may be trimmed to expose fresh powder or to remove the igniter cord connector. The minimum trimmed length cannot be less than 90 cm or 3 feet.
- 21.57 Lighting safety fuse
    - (1) When lighting a single safety fuse assembly a match may be used.
    - (2) When multiple safety fuses are to be lit, a suitable safety fuse lighting device must be used to ensure that a minimum 90 cm (3 ft) fuse length safety factor is maintained.
- 21.73 Misfires
    - (1) If there is evidence or suspicion of a misfire after a blast is initiated, the blaster of record must not permit anyone to enter the danger area until the later of the following:
        - (d) if a safety fuse was used to initiate the blast, 30 minutes after the estimated time of detonation;
        - (e) the waiting period stated in the manufacturer's instructions.
- (2) If there is evidence or suspicion of a misfire after a blast is initiated and a charge is known or suspected to be burning, the blaster of record must not permit anyone to enter the danger area until the later of the following:
        - (a) one hour after the smoke clears;
        - (b) the waiting period stated in the manufacturer's instructions.
- 21.79 Relighting a safety fuse is prohibited.
- 21.85 Avalanche control
- (1) Explosive charges must not be placed manually on site by workers or projected by any means for the purpose of avalanche control, until the proposed work procedures have been submitted to and accepted by the Board.
- (2) Explosives must not be primed until the last most practicable moment which means that point in time when the explosives are as close to the control route as possible, in a safe, sheltered location excluded from public access.
- (3) The pull-wire lighter must not be placed on the safety fuse assembly until immediately before placing the charge.
- (4) The employer must ensure that procedures are reviewed annually and that proposed changes to the procedures are submitted to the Board for approval before implementation.

Definitions

- *"blaster of record"* means the blaster who is designated to be in charge of a blasting operation;
- *"blasting area"* means an area extending at least 50 m (165 ft) in every direction from a place where explosive materials are being prepared or fixed, or where an unexploded charge is known or believed to exist;
- *"blasting operation"* includes preparing, placing, and firing a charge, handling a misfire, and destroying or disposing of explosive materials;
- *"charge"* means explosive materials which may or may not contain a primer, and which are placed for the purpose of detonation;
- *"danger area"* means an area in which there may be danger to persons or property from flying material or other hazardous condition resulting from a blast;
- *"dangerous incident"* means an accident or near miss occurrence caused by or as a result of the use of explosives, and also includes an unexpected result or problem with explosive products;
- *"detonator" or "detonator products"* includes those explosives commonly called blasting caps, or electric caps, or other similar devices used to detonate commercial explosives;
- *"initiating device"* means a blasting machine, non-electric starter, fuse lighter and any other device used to initiate a deflagration or detonation but does not include a detonator or electric igniter;

- *"explosive"* means a substance that is made, manufactured or used to produce an explosion or detonation, including but not limited to blasting explosives, pyrotechnic devices and accessories containing explosives;
- *"primer"* means an explosive to which a detonator is attached or into which a detonator is inserted;
- *"safety fuse assembly"* means a manufactured blasting accessory consisting of a precut length of safety fuse, an igniter cord connector, and a detonator;
- **Qualified Personnel** – Personnel operating the Wyssen Avalanche Towers or Wyssen Helicopter Latch must be officially approved by the company management. They must possess personal certification of training on the installations carried out by the manufacturer as well as a nationally valid license for the artificial release of avalanches with explosives for operating the avalanche towers. Instruction by colleagues within the company are not valid as a replacement for the installation training by the supplier. Persons who have not been trained by the supplier and who do not have the above-mentioned certification may not operate this installation

Preparation

Hazards

- Explosion
- Personal injury
- Property damage
- Fly rock
- Proximity to charge
- Wildlife in area
- Proximity to Explosive magazine
- Unauthorized personnel in the work area
- Slips, trips, and falls
- Lightning
- Wildfire
- Static / electrical / generator fire

Requirements

- Approved Variance VR201900088 for Section 21.56(2) of the OHSR and follow special terms
- Wyssen Manual
- Pretium Blasting Procedures
- BJ-AVL-SOP-026A Wyssen Charge Construction
- BJ-AVL-SOP-026B Wyssen Charge Priming
- BJ-AVL-SOP-026C Wyssen Box loading
- Brucejack Mine Fire Safety Plan 48 km Magazine Site 2020
- Brucejack Mine Security Plan 48 km Magazine Site 2020
- Brucejack Mine Key Management Plan 48 km Magazine Site 2020
- Annex B - Cleared Employee List
- Blaster of Record must hold a valid avalanche control blasting certification
- Storage and handling of explosives
- TDG, TDG IATA and WHMIS
- SDS
- Personal training certification by the supplier of the Wyssen Tower
- Never leave explosives unattended

- Ensure explosives, safety fuse and percussion igniters SZ83 are compatible and approved by regulatory bodies and sufficient to a temperature of -30°C.
- Energy Resources Department

Responsibilities

Mine Manager or Designate

- Ensure this SOP is implemented and maintained.
- Ensure personnel have up-to-date information regarding this SOP.

Department Manager/Supervisor

- Ensure that all workers perform tasks in a safe manner
- Review procedure with any persons performing tasks pertaining to this SOP

Health and Safety Manager or Designate

- Monitoring the implementation of this SOP

Workers

- Ensure that they are authorized to perform tasks as required
- Report to their supervisor any issues pertaining to the above procedure
- Stop work if unsure and report to supervisor

Job Step

- **Ensure Blasting Codes are in a secure Lockbox**
- **Site Preparation**
  - Gate is closed and locked and primary closure established at the haul road junction.
  - No unauthorized personnel in the worksite.
  - The deployment box must be placed on a flat surface, ensure that there is not more than 30cm under the deployment box
  - Ensure deployment boxes are located close to the worksite where the charges are prepared (maximum distance 50m)
  - Ensure route from worksite to deployment boxes is free of obstacles
  - Ensure assembly table is stable, free of any sparking material and unnecessary objects or tools.
  - Turn off heater in the arming seacan.
  - Open doors of the arming seacan and ensure clear pathway to the Accidental ignition pit
- In the event of accidental ignition during charge construction, priming and loading of explosives follow BJ-AVL-SOP-027 Wyssen Accidental Ignition

- **Gather required elements**
  - 2 - 1m Cobra Safety fuse assemblies
  - 12" Brass punch tool
  - Fuse Crimpers
  - Nitrile gloves
  - Wyssen Charge Assembly and charge control check list

- **Place prepared charge on the table and remove protective plug from bottom of igniter**
  - Loosen the screw sleeve at the bottom of the percussion igniter
  - One full turn on each Igniter
  - Hold the percussion igniter SZ83 at the top to prevent twisting
  - If the percussion igniter becomes completely unscrewed, do not screw it together again. Discard the half shell.

- **Puncture both Dyno TX and Unimax stick in preparation for cap insertion**
  - Use caution to ensure punch does not go through

- **Cut Fuse to length**
  - Measure and cut SFA down to 30cm. Only one fuse can be cut at a time.
  - Fuses once cut cannot be stored in the magazine, any cut fuses will need to be destroyed.
  - Discarded ends can be burned in incinerator in small bundles.

- **Insert and secure the SFA on the Unimax Side**
  - Insert the free end of the SFA into the percussion igniter SZ83
  - Firmly tighten the crew sleeve by the lug prevent twisting

- **Cap placement Fuse routing and securement**
  - Place the blasting cap into the punctured stick and ensure it is fully embedded
  - Do not pull the SFA out of the percussion igniter SZ83
  - At this point the charge is primed
  - With gentle pressure route safety fuse into the two sets of plastic clips in an **S** pattern
  - Ensure smooth bends and avoid kinking the safety fuse
  - Create a bend from upper plastic clip to igniter for creating upward pressure on the safety fuse
  - Ensure safety fuse is not protruding from the opening in the side of the casing
  - Insert and secure the safety fuse to the plastic clips on the Dyno TX side and repeat for Unimax

- **Quality Control of completed Primed Charge** -Carried out by designated person
- Follow Wyssen Charge Assembly and charge control check list
  - Detonator Placement - well placed in cartridge (one Unimax, One Dyno TX**)**
  - Fuse Routing - Clean routing no fuse protruding beyond shell, fused clipped in two plastic clips
  - Ignitor tightness - Igniters screwed tightly
  - **Important note – Never leave the primed charge unattended.**
  - Immediately after inspection the primed charge should be placed into the deployment box

BJ-AVL-SOP-026C – Wyssen Box Loading Procedure

Objective

To provide the user with a process for loading the Wyssen tower boxes in a methodical safe manner

Scope

Wyssen Deployment boxes (void of explosive charges) will be stored in sea-cans at km 48 magazine laydown, approximately 100m off the Brucejack Access road. The storage sea-cans are located approximately 12m away from a Type 9 magazine used for storage of explosives for the use of avalanche control.

During fall commissioning, the deployment boxes will be removed from the storage sea-cans and lined up systematically between the storage sea-cans and the Type 9 magazine. Assembly and priming of the Wyssen charges will take place in an "arming shack" (sea-can).

An accidental ignition pit (in the event of a misfire) is located behind the arming seacan. It is about 3 feet deep, lined with old ¾" rubber belt matts with 12" of fines over top. Surrounding the pit are 8 concrete barriers.

Health, Safety & Reclamation Code of BC

- Not Applicable

WorkSafe BC Regulations

- 21.3 Dangerous incident reports
  - (1) If a blasting accident occurs which causes personal injury, or if there is any other dangerous incident involving explosives, whether or not there is personal injury, the employer must
  - (a) report the incident immediately to the Board, and
  - (b) forward a written report of the incident to the Board without undue delay.
  - (2) The written report of the incident must contain
  - (a) the date, time and location of the incident,
  - (b) the names and certificate numbers of all blasters involved,
  - (c) the names and occupations of any persons injured,
- 21.5 Authority to blast
  - (1) Only the holder of a valid blaster's certificate issued by the Board or acceptable to the Board is permitted to conduct or direct a blasting operation, and then only if the work involved is within the scope of that certificate.
  - (2) All work within the blasting area must be done under the authorization of the designated blaster of record responsible for that area.
  - (3) A blaster may be assisted by persons who do not hold blaster's certificates, but the blaster must have authority over the assistants and must exercise visual supervision over them and be responsible for their work during explosive loading, priming, fixing or firing.
- 21.7 Training
  - A worker engaged in loading, unloading, or conveying explosives must be trained in the proper means for handling the explosives, the hazards of fire and mishandling and the procedures to follow in the event of a fire or explosion.
- 21.16 Detonators

    - (1) Detonator products must not be kept in a store or receptacle in which explosives or safety fuses, fuse lighters, igniter cords or connectors are stored.
    - (2) At the loading site, detonator products must be stored separately from other explosives, and in a crush resistant box which is clearly identified.
- 21.17 Worksite storage
    - Explosives at the worksite must be guarded or contained in secured day boxes until used or returned to storage magazines.
- 21.18 Communication
    - (1) The employer must ensure that the location of a magazine in which explosives are stored, and any restrictions on access or activity around the magazine area, are clearly communicated to all workers.
    - (2) A day box and receptacle used for day storage of explosives on a work site must, when they contain explosives, display signs indicating the presence of explosives in a conspicuous manner, and the signs must be removed when they are empty.
- 21.19 Magazine condition
    - (3) Any article or substance likely to cause a fire or explosion must be kept out of and at a safe distance from an explosives magazine.
- 21.37 Defective explosives
    - Explosive materials or accessories which have deteriorated, or are believed to be defective, must not be used and must be handled and disposed of in a safe manner following the manufacturer's recommendations.
- 21.38 Cold temperatures
    - If the sensitivity of an explosive is affected by cold temperatures the explosive may be brought to a working temperature in a manner recommended by the manufacturer, but must not be warmed near an open fire or a steam boiler nor by direct contact with steam or hot water.
- 21.40 Ignition sources prohibited
    - (1) Smoking is prohibited within 15 m (50 ft) of where explosives are stored, being handled, or are in loaded holes.
    - (2) Open flame ignition sources must not be permitted within 15 m (50 ft) of where explosives are stored, being handled, or are in loaded holes, unless the blaster of record gives consent.
- 21.41 Containers
    - (1) Containers, known or suspected to contain explosives or explosive residue, must be handled with care to prevent undue impact or exposure to excessive heat or flame.
    - (2) All empty explosives containers must be disposed of by burning or as recommended by the manufacturer.
- 21.45 Priming
    - A primer must not be made up until immediately before placing the explosives.
- 21.49 Electrical storms
    - If there is any sign of thunder or lightning storm activity, all blasting activity must be suspended and the danger area must be cleared and guarded if explosives are present at the blast site.
- 21.56 Safety fuse assemblies
    - (1) Only safety fuse assemblies with antistatic protection may be used for safety fuse blasting.
    - (2) Safety fuse assemblies less than 1 m (3.3 ft) in length must not be used.
    - (3) Safety fuse assemblies must be handled with care to avoid pinching or kinking and damaged fuse assemblies must not be used.
- Safety fuse assembly length

- The Regulation states that "safety fuse assemblies less than 1 m (3.3 ft) in length must not be used." A safety fuse from a manufacturer is 1 metre or 3 feet 3 inches long. As provided by section 21.57(2) of the Regulation, this fuse length may be trimmed to expose fresh powder or to remove the igniter cord connector. The minimum trimmed length cannot be less than 90 cm or 3 feet.
- 21.57 Lighting safety fuse
    - (1) When lighting a single safety fuse assembly a match may be used.
    - (2) When multiple safety fuses are to be lit, a suitable safety fuse lighting device must be used to ensure that a minimum 90 cm (3 ft) fuse length safety factor is maintained.
- 21.73 Misfires
    - (1) If there is evidence or suspicion of a misfire after a blast is initiated, the blaster of record must not permit anyone to enter the danger area until the later of the following:
        - (d) if a safety fuse was used to initiate the blast, 30 minutes after the estimated time of detonation;
        - (e) the waiting period stated in the manufacturer's instructions.
- (2) If there is evidence or suspicion of a misfire after a blast is initiated and a charge is known or suspected to be burning, the blaster of record must not permit anyone to enter the danger area until the later of the following:
        - (a) one hour after the smoke clears;
        - (b) the waiting period stated in the manufacturer's instructions.
- 21.79 Relighting a safety fuse is prohibited.
- 21.85 Avalanche control
- (1) Explosive charges must not be placed manually on site by workers or projected by any means for the purpose of avalanche control, until the proposed work procedures have been submitted to and accepted by the Board.
- (2) Explosives must not be primed until the last most practicable moment which means that point in time when the explosives are as close to the control route as possible, in a safe, sheltered location excluded from public access.
- (3) The pull-wire lighter must not be placed on the safety fuse assembly until immediately before placing the charge.
- (4) The employer must ensure that procedures are reviewed annually and that proposed changes to the procedures are submitted to the Board for approval before implementation.

Definitions

- *"blaster of record"* means the blaster who is designated to be in charge of a blasting operation;

Responsibilities

Mine Manager or Designate

- Ensure this SOP is implemented and maintained.
- Ensure personnel have up-to-date information regarding this SOP.

Department Manager/Supervisor

- Ensure that all workers perform tasks in a safe manner
- Review procedure with any persons performing tasks pertaining to this SOP

Health and Safety Manager or Designate

- Monitoring the implementation of this SOP

Workers

- Ensure that they are authorized to perform tasks as required
- Report to their supervisor any issues pertaining to the above procedure
- Stop work if unsure and report to supervisor

Job Step

- **Ensure Blasting Codes are in a secure Lockbox**
- **Site Preparation**
  - Gate is closed and locked and primary closure established at the haul road junction.
  - No unauthorized personnel in the worksite.
  - The deployment box must be placed on a flat surface, ensure that there is not more than 30cm under the deployment box
  - Ensure deployment boxes are located close to the worksite where the charges are prepared (maximum distance 50m)
  - Ensure route from worksite to deployment boxes is free of obstacles
  - Ensure assembly table is stable, free of any sparking material and unnecessary objects or tools.
  - Turn off heater in the arming seacan.
  - Open doors of the arming seacan and ensure clear pathway to the Accidental ignition pit
  - In the event of accidental ignition during charge construction, priming and loading of explosives follow BJ-AVL-SOP-027 Wyssen Accidental Ignition
- **Prepare Wyssen Box**
  - Open the padlocks with the key and turn locking levers
  - Lift cover until safety catch engages
  - Press all sliders of the cord dropper into the rear position
  - Remove the plexi glass cover
  - Keep surface towards the antenna free so that prepared charges can be set down

- **Carry charge to Wyssen Box and place on rim of box**
  - Cradle primed charge with two hands
  - Set charge near antenna
  - Charges are loaded in order starting at tube 12

- **Remove cord dropper**
  - Place cord dropper next to charge on rim of box

- **Remove foam from top of charge**
  - Careful to ensure the cord or ignitor connectors inside do not pull out with foam

- **Take hold of charge container on the inside through the holes at the upper edge**
  - Take care to not pinch/disturb deployment cords
  - Carefully insert into tube holder
  - Ensure to load in decreasing order from 12 backwards to 1 for the control system to correctly register the number of charges in a test run
  - Align charge in tube for placement of cord dropper

- **Prepare cord dropper and insert retaining ring to the cord dropper**
  - Ensure cord dropper is in the open position
  - The retaining ring is attached to the cord dropper and the slider is brought to the front extended position. The ring is held by the cord dropper

- **Place cord dropper back into the notches of the tube holder**
  - Ensure ball bearings point to center of deployment box
  - Ensure mechanism is flush with top of tube
  - Ensure wheel is facing the inside of box
  - After cord dropper has been placed, check that the retaining ring is correctly mounted
  - **Sign off QA / QC sheet**

- **Final QA / QC check –** Carried out by designated person
- Follow Wyssen Charge Assembly and charge control check list
  - Ring placement - Ring secure in cord dropper (not pinched, moves freely)
  - Place tube cover to protect charge
  - Complete Test Run (Follow instruction on top of control box)
  - Visual check of deployment hole – Complete closure and seal
  - Close and lock deployment box lid

Appendix C.19

BJ-AVL-SOP-027 – Wyssen Accidental Ignition

Objective

To provide the user with complete information and all necessary details in order to safely and properly dispose of accidentally ignited explosive charges.

Scope

Wyssen Deployment boxes (void of explosive charges) will be stored in sea-cans at km 48 magazine laydown, approximately 100m off the Brucejack Access road. The storage sea-cans are located approximately 12m away from a Type 9 magazine used for storage of explosives for the use of avalanche control.

During fall commissioning, the deployment boxes will be removed from the storage sea-cans and lined up systematically between the storage sea-cans and the Type 9 magazine. Assembly and priming of the Wyssen charges will take place in an "arming shack" (sea-can).

An accidental ignition pit (in the event of a misfire) is located behind the arming seacan. It is about 3 feet deep, lined with old ¾" rubber belt matts with 12" of fines over top. Surrounding the pit are 8 concrete barriers.

Km 48 magazine layout

Accidental Ignition Pit

Health, Safety & Reclamation Code of BC

- Not Applicable

WorkSafe BC Regulations

- 21.3 Dangerous incident reports
  - (1) If a blasting accident occurs which causes personal injury, or if there is any other dangerous incident involving explosives, whether or not there is personal injury, the employer must
  - (a) report the incident immediately to the Board, and
  - (b) forward a written report of the incident to the Board without undue delay.
  - (2) The written report of the incident must contain
  - (a) the date, time and location of the incident,
  - (b) the names and certificate numbers of all blasters involved,
  - (c) the names and occupations of any persons injured,
- 21.5 Authority to blast
  - (1) Only the holder of a valid blaster's certificate issued by the Board or acceptable to the Board is permitted to conduct or direct a blasting operation, and then only if the work involved is within the scope of that certificate.
  - (2) All work within the blasting area must be done under the authorization of the designated blaster of record responsible for that area.
  - (3) A blaster may be assisted by persons who do not hold blaster's certificates, but the blaster must have authority over the assistants and must exercise visual supervision over them and be responsible for their work during explosive loading, priming, fixing or firing.
- 21.7 Training
  - A worker engaged in loading, unloading, or conveying explosives must be trained in the proper means for handling the explosives, the hazards of fire and mishandling and the procedures to follow in the event of a fire or explosion.
- 21.16 Detonators
  - (1) Detonator products must not be kept in a store or receptacle in which explosives or safety fuses, fuse lighters, igniter cords or connectors are stored.
  - (2) At the loading site, detonator products must be stored separately from other explosives, and in a crush resistant box which is clearly identified.
- 21.17 Worksite storage
  - Explosives at the worksite must be guarded or contained in secured day boxes until used or returned to storage magazines.
- 21.18 Communication
  - (1) The employer must ensure that the location of a magazine in which explosives are stored, and any restrictions on access or activity around the magazine area, are clearly communicated to all workers.
  - (2) A day box and receptacle used for day storage of explosives on a work site must, when they contain explosives, display signs indicating the presence of explosives in a conspicuous manner, and the signs must be removed when they are empty.
- 21.19 Magazine condition
  - (3) Any article or substance likely to cause a fire or explosion must be kept out of and at a safe distance from an explosives magazine.
- 21.37 Defective explosives
  - Explosive materials or accessories which have deteriorated, or are believed to be defective, must not be used and must be handled and disposed of in a safe manner following the manufacturer's recommendations.
- 21.38 Cold temperatures

    - If the sensitivity of an explosive is affected by cold temperatures the explosive may be brought to a working temperature in a manner recommended by the manufacturer, but must not be warmed near an open fire or a steam boiler nor by direct contact with steam or hot water.
- 21.40 Ignition sources prohibited
    - (1) Smoking is prohibited within 15 m (50 ft) of where explosives are stored, being handled, or are in loaded holes.
    - (2) Open flame ignition sources must not be permitted within 15 m (50 ft) of where explosives are stored, being handled, or are in loaded holes, unless the blaster of record gives consent.
- 21.41 Containers
    - (1) Containers, known or suspected to contain explosives or explosive residue, must be handled with care to prevent undue impact or exposure to excessive heat or flame.
    - (2) All empty explosives containers must be disposed of by burning or as recommended by the manufacturer.
- 21.45 Priming
    - A primer must not be made up until immediately before placing the explosives.
- 21.49 Electrical storms
    - If there is any sign of thunder or lightning storm activity, all blasting activity must be suspended and the danger area must be cleared and guarded if explosives are present at the blast site.
- 21.56 Safety fuse assemblies
    - (1) Only safety fuse assemblies with antistatic protection may be used for safety fuse blasting.
    - (2) Safety fuse assemblies less than 1 m (3.3 ft) in length must not be used.
    - (3) Safety fuse assemblies must be handled with care to avoid pinching or kinking and damaged fuse assemblies must not be used.
- Safety fuse assembly length
- The Regulation states that "safety fuse assemblies less than 1 m (3.3 ft) in length must not be used." A safety fuse from a manufacturer is 1 metre or 3 feet 3 inches long. As provided by section 21.57(2) of the Regulation, this fuse length may be trimmed to expose fresh powder or to remove the igniter cord connector. The minimum trimmed length cannot be less than 90 cm or 3 feet.
- 21.57 Lighting safety fuse
    - (1) When lighting a single safety fuse assembly a match may be used.
    - (2) When multiple safety fuses are to be lit, a suitable safety fuse lighting device must be used to ensure that a minimum 90 cm (3 ft) fuse length safety factor is maintained.
- 21.73 Misfires
    - (1) If there is evidence or suspicion of a misfire after a blast is initiated, the blaster of record must not permit anyone to enter the danger area until the later of the following:
        - (d) if a safety fuse was used to initiate the blast, 30 minutes after the estimated time of detonation;
        - (e) the waiting period stated in the manufacturer's instructions.
- (2) If there is evidence or suspicion of a misfire after a blast is initiated and a charge is known or suspected to be burning, the blaster of record must not permit anyone to enter the danger area until the later of the following:
        - (a) one hour after the smoke clears;
        - (b) the waiting period stated in the manufacturer's instructions.
- 21.79 Relighting a safety fuse is prohibited.
- 21.85 Avalanche control

- (1) Explosive charges must not be placed manually on site by workers or projected by any means for the purpose of avalanche control, until the proposed work procedures have been submitted to and accepted by the Board.
- (2) Explosives must not be primed until the last most practicable moment which means that point in time when the explosives are as close to the control route as possible, in a safe, sheltered location excluded from public access.
- (3) The pull-wire lighter must not be placed on the safety fuse assembly until immediately before placing the charge.
- (4) The employer must ensure that procedures are reviewed annually and that proposed changes to the procedures are submitted to the Board for approval before implementation.

Definitions

- *"blaster of record"* means the blaster who is designated to be in charge of a blasting operation;
- *"blasting area"* means an area extending at least 50 m (165 ft) in every direction from a place where explosive materials are being prepared or fixed, or where an unexploded charge is known or believed to exist;
- *"blasting operation"* includes preparing, placing, and firing a charge, handling a misfire, and destroying or disposing of explosive materials;
- *"charge"* means explosive materials which may or may not contain a primer, and which are placed for the purpose of detonation;
- *"danger area"* means an area in which there may be danger to persons or property from flying material or other hazardous condition resulting from a blast;
- *"dangerous incident"* means an accident or near miss occurrence caused by or as a result of the use of explosives, and also includes an unexpected result or problem with explosive products;
- *"detonator" or "detonator products"* includes those explosives commonly called blasting caps, or electric caps, or other similar devices used to detonate commercial explosives;
- *"initiating device"* means a blasting machine, non-electric starter, fuse lighter and any other device used to initiate a deflagration or detonation but does not include a detonator or electric igniter;
- *"explosive"* means a substance that is made, manufactured or used to produce an explosion or detonation, including but not limited to blasting explosives, pyrotechnic devices and accessories containing explosives;
- *"primer"* means an explosive to which a detonator is attached or into which a detonator is inserted;
- *"safety fuse assembly"* means a manufactured blasting accessory consisting of a precut length of safety fuse, an igniter cord connector, and a detonator;

Preparation

Hazards

- Explosion
- Personal injury
- Property damage
- Fly rock
- Proximity to charge
- Wildlife in area
- Proximity to Explosive magazine
- Unauthorized personnel in the work area
- Slips, trips and falls
- Lightening
- Wildfire

Requirements

- Approved Variance VR201900088 for Section 21.56(2) of the OHSR and follow special terms
- Pretium Blasting Procedures
- Wyssen Manual
- BJ-AVL-SOP-026A Wyssen Charge Construction
- BJ-AVL-SOP-026B Wyssen Charge Priming
- BJ-AVL-SOP-026C Wyssen Box loading
- Brucejack Mine Fire Safety Plan 48 km Magazine Site 2020
- Brucejack Mine Security Plan 48 km Magazine Site 2020
- Brucejack Mine Key Management Plan 48 km Magazine Site 2020
- Annex B - Cleared Employee List
- Pretium Health and Safety Manual Dangerous incidents and Reporting
- Blaster of Record must hold a valid avalanche control blasting certification
- Storage and handling of explosives
- TDG, TDG IATA and WHMIS
- SDS
- Personal training certification by the supplier of the Wyssen Tower
- Never leave explosives unattended
- Ensure explosives, safety fuse and percussion igniters SZ83 are compatible and approved by regulatory bodies and sufficient to a temperature of -30°C.

Responsibilities

Mine Manager or Designate

- Ensure this SOP is implemented and maintained.
- Ensure personnel have up-to-date information regarding this SOP.

Department Manager/Supervisor

- Ensure that all workers perform tasks in a safe manner
- Review procedure with any persons performing tasks pertaining to this SOP

Health and Safety Manager or Designate

- Monitoring the implementation of this SOP

Workers

- Ensure that they are authorized to perform tasks as required
- Report to their supervisor any issues pertaining to the above procedure
- Stop work if unsure and report to supervisor

Job Step

- **Ensure Blasting Codes are in a secure Lockbox**
- **Site Preparation**
  - Gate is closed and locked and primary closure established at the haul road junction.
  - No unauthorized personnel in the worksite.
  - The deployment box must be placed on a flat surface, ensure that there is not more than 30cm under the deployment box
  - Ensure deployment boxes are located close to the worksite where the charges are prepared (maximum distance 50m)
  - Ensure route from worksite to deployment boxes is free of obstacles
  - Ensure assembly table is stable, free of any sparking material and unnecessary objects or tools.
  - Turn off heater in the arming seacan.
  - Open doors of the arming seacan and ensure clear pathway to the Accidental ignition pit

In the event of accidental ignition during charge construction, priming and loading of explosives, the following steps will be followed. **Approx. 40 second fuse**

- Call "IGNITION, IGNITION, IGNITION"
- Person assembling explosive (builder) hands primed charge to Explosive QC (at arming seacan door)
- Explosive QC takes primed charge and discards in accidental ignition pit
  - Builder(s) and Explosive QC move into the arming seacan and confirm audible detonation.
- Follow manufacturers recommendation and Pretium Blasting Procedures in the event of a misfire. Minimum 30-minute wait time before returning to site. Do not leave seacan until after confirmation of audible detonation or minimum 30 minute wait time in the event of a misfire.
- Cease assembly of operations.
- Report incident to the Road and Mine Manager.
- Fill out an Incident Report as per Pretium Health and Safety Manual.
- Report the incident immediately to the Workers Compensation Board Inspector and forward a written report of the incident to the Board without undue delay.
- Fill out F07-01_E(1) incident report form for explosives and Restricted C...
- Review incident

BJ-AVL-SOP-028 – Helicopter Flight Ops During ILI Hazards

PRETIVM		BJC-AVL-SOP-028 Helicopter Flight Ops during ILI Hazards	
Owner: Mountain Safety	**Approver**: Ken Black, Jim Franken	**Revision Number**: 1	**Creation Date**: 2020-06-13 **Revision Date**:

Objective

Outline procedures and protocols for managing worker safety during heli copter explosives avalanche control work when there is increased hazard from transmittable diseases.

Scope

This SOP applies to explosives avalanche control work performed from a helicopter by the Mountain Safety Department.

Health, Safety & Reclamation Code of BC

- 1.8.1 Personal Protective Equipment
- 1.9.1 Workplace Conditions
- 8.4.2 Transportation of explosives
- WCB Blasting Regulations
- WSCB Covid-19 Safety Plan
- WSBC COVID-19 information and resources
- TDG IATA
- TDG

Definitions

- ILI – Influenza Like Illness
- Xh - Explosives avalanche control from helicopter

Preparation

Hazards

- Influenza type virus transmission
- Reduced vision of team members due to mask use
- Overheating from mask use

Tools

- PPE (Gloves, Masks, Goggles), Sanitizers.
- Xh heli kit (harness etc.)

Requirements

- All team members up to date with latest protocols and PPE use.
- Follow current YHL protocols (Covid-19 Pandemic Flight Operations, 2020-05-14)
- Follow current Pretium protocols for social distancing and sanitization
- Pre-control checklist including wellness checks
- Always consider selecting protocols for your workplace; Elimination, Engineering controls, Administrative Controls, PPE

Job Step

1. Identify period of increased concern. Examples: Pandemics, epidemics, local area outbreaks, onsite outbreaks, recent illness within Mtn. Safety team.
2. Identify team members (essential team only-limit number) and perform ILI screening
3. Ensure enough stock of PPE and sanitizer for mission
4. Follow current protocols for travel to magazine/staging areas. ie. Sanitize vehicles, limit team size and number of people in each vehicle. If it is not possible to ensure 2 meters of distance between workers in a vehicle the use of a mask should be considered.
5. Explosives prep: All team members don gloves and maintain social distancing during preparation of charges. Discuss roles to limit cross contamination during process.
6. Confirm high touch surfaces and headsets/microphones have been sanitized prior by YHL staff (microphones should have latex covers to allow easy sanitization).
7. Prepare and load helicopter as per Xh SOP
8. Remove gloves and sanitize hands immediately after charge and helicopter preparation.
9. Follow all Transport Canada and TDG IATA regulations.
10. Spotter and Bombardier to wear gloves, mask and glasses or goggles. Consider issues of eyewear/mask interactions creating fogging (experiment prior to avoid mission interruptions)
11. Sanitize high touch surfaces and headsets post mission.

Appendix C.21

BJ-AVL-SOP-029 – Wildfire Weather Observations

Objective

- To ensure all personnel doing weather observation at Wildfire camp use a standardized method. Not following this procedure could result in wrong assessment of avalanche hazard.

Scope

- This procedure will outline the standard practice to note and report weather observations. This procedure is to ensure avalanche hazard is properly assessed.

Health, Safety & Reclamation Code of BC

- 4.13 Risk assessment
  - (1) The employer must conduct a risk assessment in any workplace in which a need to rescue or evacuate workers may arise.
  - (2) If the risk assessment required by subsection (1) shows a need for evacuation or rescue, appropriate written procedures must be developed and implemented, and a worker assigned to coordinate their implementation.

WorkSafe BC Regulations

- Not Applicable

Definitions

- HS – Height of snow
- H2D board – Snow board on which snow measurements are taken twice a day at 12hrs interval
- Ruler- Rigid measuring instrument graduated in centimeters

Preparation

Hazards

- Slips Trips and Fall
- Adverse weather
- Slippery surfaces

Tools

- PPE
- HS stick
- H2D board
- Thermometer
- Ruler
- Notebook

Requirements

- Signed off on BJ-AVL-SOP-018

Responsibilities

Mine Manager or Designate

- Ensure this SOP is implemented and maintained.
- Ensure personnel have up-to-date information regarding this SOP.

Department Manager/Supervisor

- Ensure that all workers perform tasks in a safe manner
- Review procedure with any persons performing tasks pertaining to this SOP

Health and Safety Manager or Designate

- Monitoring the implementation of this SOP

Workers

- Ensure that they are authorized to perform tasks as required
- Report to their supervisor any issues pertaining to the above procedure
- Stop work if unsure and report to supervisor

Job Step

- At 0600 and 1800hrs measure/observe and note the following weather observations
  - **H2D**
    - With the ruler, vertically measure the height of snow on the H2D board (See image 1).
    - Round up or down to the nearest cm.
    - Once noted, clear the H2D board of all its snow.
    - H2D board should be kept level with the snow. Use scraped snow to fill in depression and level out the snow surface before replacing board.
  - **HS**
    - While standing at about 1m from the HS stick (so to not disturb the snow around it), note the height of snow around the HS stick.
    - Make sure to get rid of the snow cone that often forms around the HS stick with a bamboo so the snow is leveled with the surrounding. (See image 2).
  - **Temperature**
    - Note the temperature on the thermometer in Celsius without touching the thermometer.
    - Thermometer should be kept in shadowed area so that solar radiation does not skew its reading.
  - **Precipitation**
    - Note the type of precipitation and its estimated intensity; light, moderate, heavy.
    - It is also important to note if there is no precipitation. E.g. light snow, heavy rain, no precipitation.
- Email weather observation to mountainsafety@pretivm.com
  - Title the email yymmdd AM/PM Wildfire Weather Observation. E.g. 190130 PM Wildfire Weather Observation.

- Email should include:
  - Time of observation
  - H2D
  - HS
  - Temperature
  - Precipitation
  - Any relevant change in weather.

Image 1 - H2D reading

Image 2 - HS reading

Appendix C.22

BJ-AVL-SOP-031 – Crevasse Rescue

PRETIVM		BJ-AVL-SOP-031 Crevasse Rescue	
Owner: Mountain Safety	**Approver**: Ken Black Jim Franken	**Revision Number**: V1.1	**Creation Date**: 2018-10-22 **Revision Date**: 2020-06-19

Objective

To ensure the safety of rescuers and reduce the potential further risk to a person or persons who have fallen into a crevasse, millwell, bergschrund or similar (all referred to as "Crevasse" for ease of use in this SOP).

Scope

This procedure will outline the steps needed to perform a crevasse rescue using the tools available to Mountain Safety and ERT.

Health, Safety & Reclamation Code of BC

- WSBC Part 32 – Evacuation and Rescue

Definitions

- Crevasse - a deep crack, or fracture, found in an ice sheet or glacier
- Mill well – Open hole in the glacier formed by running water
- Bergschrund – A crevasse that forms where the glacier separates from firn snow or rock face above
- Snow bridge - An arch across a crevasse. It is typically formed by snow drift, which first creates a cornice, and may gradually grow to reach the other side of the opening while remaining open underneath.
- Litter/SKED – spinal immobilization/extraction device to raise victim in vertical rescue situations
- "Mauthner Mound" – a step at the lip, with a mound of snow roughly 1 meter from edge. Backpack or similar item placed on top to prevent ropes from digging in.
- RAD kit – Purpose built compact rescue and descent rope kit
- Screamer Suit – A triangular diaper style harness that can be put on quickly
- Fresh Eyes – A component or system check by a team member not involved in the original task
- Danger Zone – Delineated area where rescuers are always required to be on rope.

Preparation

Hazards

- Crevasse or other falls for rescuers
- Mechanical failure
- Rope failure
- Human error
- Weather (visual limitations)
- Environmental exposure
- Overhead Hazard for persons in crevasse
- Avalanches
- Sharp points (ice tools, crampons, etc)

Tools (will vary with location and season)

- Dual rope rescue kits
- Glacier RAD rescue kit
- Vehicles – sled, snow cat, truck, other heavy equipment.

- Rescue Tripod. Terradaptor in BJ firehall. Carbon tripod at KNP firehall (Mountain Safety Seacan).
- Aztec
- Glacier Travel PPE
- Avalanche Safety gear
- Helmet
- Crampons
- Ice Axe
- Skis
- Rope handling gloves
- First aid kit
-

Requirements

- PPE for rescuers
- Knowledge of rope rescue equipment being used
- Proper anchor building techniques for use with "live (human) loads"

Job Step

Crevasse preamble

Personal injury is possible but not always certain with a fall. Swift and safely executed rescue is paramount due to the cold environment that exists in the glacier.

Initial report of incident

In the event of a crevasse fall a CODE ONE call will be made by the person involved or by a reporting party who has either witnessed the fall or who discovers the event initially. This CODE ONE call may be downgraded depending on the level of risk to the subject in the crevasse.

Rescue site preparation

- Establish safe area for rescue operation.
  - Incident Command System (ICS) structure to organize site. Notify IC and dispatch of who will be acting Operations Chief
  - Ops Chief to identify safe area for rescuers to be un-roped/off belay
  - Probe area, complete visual sweep for depressions in snow (snow bridges, etc.) Use belayed approach if necessary
  - Use delineators (marking paint, bamboo, flagging tape etc.), guards, flares or lights to safeguard work zone
- Ops Chief to determine type of rope rescue system required
  - Where possible, a Dual Capability Twin Tension Rope System should be used
  - Crews must be trained prior to use in rescue situation
- Build reliable anchor and back up anchor
  - Adequate training for personnel required
  - All anchor systems must be reliable, with backup anchors to guard against failure. (Redundancy in system)
  - All rescuers must always be connected to anchors when in danger zone (beyond the safe work area)
  - All connections and harnesses must be double checked

  - The rescuers must proceed as quickly as possible using efficient, thorough execution of every step
  - Use proper equipment in its designated manner in accordance with manufacturer. Use of adequate breaking strength, including a safety factor for size of load
  - If man power allows a check with "Fresh Eyes" will be completed.
- Rescuer approaches the lip of the crevasse while on belay.
  - Partner belays rescuer to edge or rescuer self-belays with prussik or similar device
- Rescuer probes the lip of the crevasse
  - Rescuer probes to find the edge of crevasse with avalanche probe or another appropriate tool. (ie: hiking pole, bamboo stake)
  - Rescuer assesses the strength and condition of the crevasse lip
  - If inadequate, unstable, or directly above the victim (risk of falling ice or equipment on the victim) slightly offset the crevasse entrance location or completely reestablish anchors in safer location (ie on the other side)
- Rescuer visually and verbally assesses victim
  - Visually and verbally assess the victim for life threatening injury
  - Rescuer relays information to Ops Chief to prepare for handoff and assess urgency of the situation
  - Rescuer should assess the depth of the victim and other potential hazards
- Rescuer cleans the lip if necessary and builds "Mauthner mound", in summer a backpack alone may suffice.

Rescue Ops with Glacier Rescue Kit and Capable Victim

- Prep edge
- Lower drop loop or single strand of rope, and locking carabiner to victim
- Haul or build additional mechanical advantage into system
- Assess edge transition often
- Administer first aid if required

Rescue Ops with Glacier Rescue Kit and Non-Capable Victim

- Prep edge
- Rappel into crevasse
- Secure victim to safety line
- Administer critical first aid if required
- Ascend out of crevasse
- Haul or build additional mechanical advantage into system
- Assess edge transition often
- Administer first aid if required

Rescue Ops with Dual Rope Rescue Kit and Capable Victim

- Crews must be trained prior to use in rescue situation
- Resultant angles must be considered relative to anchor strength

- Rescuer visually assesses the victim's condition, depth, accessibility and other objective hazards in the crevasse itself. If the victim is capable and in a precarious position, the rescuer can lower equipment to victim (fixed rope or screws and slings to secure from falling deeper)
- Prepare the lip of the crevasse
- Lower rescuer and any additional gear required (i.e. "screamer suit" or chest harness, first aid materials) to victim
- Rescuer connects victim, double-checks all connections and hanging distances
- Set up mechanical advantage Edge transition (vector)
- Raise rescuer and victim using appropriate mechanical advantage (add or subtract as required)
- Administer further first aid, if required

Rescue Ops with Dual Rope Rescue Kit and Non-capable victim

- Crews must be trained prior to use in rescue situation
- Resultant angles must be considered relative to anchor strength
- Prepare the rescue litter/SKED
- Lower rescuer with litter/SKED to victim (bringing any extra gear required, ie first aid materials)
- Rescuer connects victim
- Second rescuer may need to be lowered to assist with loading and edge transfer
- Rescuer(s) load victim into litter/SKED
- Raise rescuer and victim using appropriate mechanical advantage (add or subtract as required)
- Set up mechanical advantage Edge transition (vector)
- Perform further first aid as required

Site Demobilization

- Evacuate patient
- Remove all gear from "danger zone"
- Pack up all gear; check and dry before re-packing
- Incident debrief with all parties involved as soon as possible

BJ-AVL-SOP-035 – Transceiver Maintenance

PRETIVM		BJC-AVL-SOP-035 Transceiver Maintenance	
Owner: Mountain Safety	**Approver**: Ken Black Jim Franken	**Revision Number**: V1	**Creation Date**: 2020-06-20 **Revision Date**: 2020-11-09

Objective

Ensure transceiver fleet is maintained in good working order with record keeping twice a year both spring and fall

Scope

This applies to all Pretivm owned Transceivers managed by the Mountain Safety department

Health, Safety & Reclamation Code of BC

- HSRCBC 1.8.1(2) Ensure workers are instructed in the use and maintenance of the equipment, the reasons for it, and also it location and limitations. And to ensure the equipment is adequate for its purpose

WorkSafe BC Regulations

- 12.10 Identifying unsafe equipment
  - An unsafe tool, machine or piece of equipment must be removed from service and identified in a manner which will ensure it is not inadvertently returned to service until it has been made safe for use.
  - **Note**: The procedure for determining whether the tool, machine or piece of equipment is unsafe for use is provided by the requirements on the correction of unsafe conditions and refusal of unsafe work in Part 3 (Rights and Responsibilities).

Definitions

- Dongle. Manufacturer supplied device that attaches via USB to desktop computer to provide a link to service software.
- Transceiver - An avalanche transceiver is a type of emergency locator beacon, a radio transceiver (a transmitter and receiver in one unit) operating at 457 kHz for the purpose of finding people buried under snow.

Preparation

Hazards

- Lack of understanding of Software program, not identifying transceivers that require outside agency maintenance.
- Missing unit
- Industrial use of recreational device

Tools

- Dongle
- Barryvox Tester 2.0
- W-Link Stick 2.0
- Computer

Requirements

- Training
- Transceiver specific software
- Transceiver knowledge

Responsibilities

Mine Manager or Designate

- Ensure this SOP is implemented and maintained.
- Ensure personnel have up-to-date information regarding this SOP.

Department Manager/Supervisor

- Ensure that all workers perform tasks in a safe manner
- Review procedure with any persons performing tasks pertaining to this SOP

Health and Safety Manager or Designate

- Monitoring the implementation of this SOP

Workers

- Ensure that they are authorized to perform tasks as required
- Report to their supervisor any issues pertaining to the above procedure
- Stop work if unsure and report to supervisor

Job Step

Spring Round Up

1. Gather all transceivers and ensure all still have batteries with more than 40% charge
2. Remove from Harness
3. Place in numerical order close to computer. Dongle in groups of 20.
4. Plug in dongle to computer
5. There are two programs, one for each model of Transceiver. Open appropriate program on desktop. If you do not have them or need them updating you will need to have the IT department provide the permission for this download.
6. Click "Add devices" (Green "+" sign)
7. Turn on each unit **ONE at a time in sequential order**. Wait until startup of each transceiver has completed by listening for the 3 tone beeps before turning on next numbered transceiver in sequence.
8. Program will show each unit as you turn it on. Look at list and ensure all units are showing.
9. Click "Stop Searching"
10. Note any units that did not pass the self-test or are scheduled for maintenance or in the next six months. Note ones that are close to maintenance (*3 year maintenance schedule)
11. Note which units have below 75% battery
12. Save file under Jdrive, Mtn. Safety, Operations, Transceivers and Avi PPE, YYYY-MM-DD Transceiver and Avi PPE, Post season Transceiver tests YYYY-MM-DD

13. File name example "Elements 1-20 YYYY-MM-DD" or "New units 1-20 YYYY-MM-DD"
14. If some units are missing note that in the file name. ie. "New units 1-20 missing 21,23,24 YYYY-MM-DD"
15. Highlight all units on computer screen and click "Remove devices" (Red "x"). You are now ready to dongle the next 20 units.
16. Separate out units that need to go back for maintenance.
17. Remove batteries from all units, recycle if less than 75%, store batteries in file cabinet for next year if more than 75%.
18. Store units that do not need maintenance in storage room with harnesses.
19. Package and send back units to manufacturer's representative that require maintenance.
20. **Note** there is a quirk to using the dongle. Occasionally units will show as "unreachable". If this occurs, you can turn off the unit manually and restart it or click device on the program and choose restart from the drop-down menu. Sometimes this error does self-correct.

Fall Prep and Issue

1. Replace batteries in all transceivers (battery strength 75% or more)
2. Place in numerical order close to computer. Dongle in groups of 20.
3. Plug in dongle to computer
4. **Note** The dongle we have is good for only firmware updates on Pulse and Element transceivers. Not the Barryvox S or Barryvox. The newer models need to be updated by a distributer, Barryvox Tester 2.0, or W-Link Stick 2.0.
5. Use appropriate service software as described above (Spring Round Up Step 5).
6. Click "Add devices" (Green "+" sign)
7. Turn on each unit **ONE at a time in sequential order**. Wait until startup of each beacon has completed by listening for the 3 tone beeps before turning on next numbered beacon in sequence.
8. Program will show each unit as you turn it on. Look at list and ensure all units are showing.
9. Click "Stop Searching"
10. Note any units that show below 75% battery strength and replace before issue.
11. Save file under Jdrive, Mtn. Safety, Operations, Transceivers and Avi PPE, YYYY-MM-DD Transceiver and Avi PPE, Post season Transceiver tests YYYY-MM-DD
12. File name example "Elements 1-20 YYYY-MM-DD" or "New units 1-20 YYYY-MM-DD"
13. If some units are missing note that in the file name. ie. "New units 1-20 missing 21,23,24 YYYY-MM-DD"
14. Highlight all units on computer screen and click "Remove devices" (Red "x"). You are now ready to dongle the next 20 units.
15. After units are Dongled place transceivers into corresponding numbered pack
16. Create a spreadsheet showing each department and the unit numbers they are receiving.

Appendix C.24

BJ-AVL-SOP-037 – Longline Operations

Objective

To provide detailed methodology and establish a safe and efficient system for sending and receiving suspended loads from a helicopter which would include cargo nets, oxygen cradles and Wyssen deployment boxes

Scope

This SOP applies to any Pretium personnel that may be participating in these tasks as a designated grounds receiver. Furthermore, this SOP is written to ensure that all aforementioned personnel are aware of the hazards associated with these tasks.

Health, Safety & Reclamation Code of BC

- HSRC – Section 2.2.1 (Hazard Free Workspace)
- HSRC – Section 4.9 (Mobile Equipment)
- HSRC – Section 4.20 (Rigging)
- HSRC – Section 4.21 (Slings)

WorkSafe BC Regulations

- OHS Part 29.3 Pre-job planning and training
- OHS 29.5 Communications
- OHS 29.9 Airlifted loads
- OHS 29.12 Unstable materials

Definitions

- Pretivm Grounds Personnel: Pretium employee responsible for sending and receiving suspended loads from a helicopter
- Spotter: A person who looks or observes a particular activity, one that keeps watch, one who assists another during exercise(s). Essential for Gazex and Wyssen longlining.
- Pinch Point/Crush Point: A place or point of where two objects more toward each other or when a moving object approaches a stationary object.

Preparation

Hazards

- No pre-flight briefing
- Helicopter hazards, rotor downwash, noise, static discharge, cross loaded electric or dead hook to long line attachment point
- Untrained or inexperienced ground crew, fatigue, rushing or taking chances
- Loose items (helmet no strap, loose clothing, harness clipping into hook)
- Flying over roads or infrastructure with suspended loads.

- Visual distraction for haul traffic vehicles
- TDG, Compressed gases and explosives
- Pinch Points; keep hands out of line of fire and use gloves.
- Caught between load and fixed object. (I.e. Oxygen cradles)
- Sharp metal or wood splinters
- Fall hazard (Particularly Gazex shelter and removal of guard rails for flight operations)
- Trip hazard (Particularly railing support on Gazex deck)
- Suspended, spinning, swinging, unsecured or dropped load
- Small landing footprint
- Damage to infrastructure
- Crush point
- Miscommunication (radio channel and hand signals)
- Environmental, Poor visibility
- Lack of vision between the helicopter pilot and grounds personnel
- Human (Blasting at the km 59 quarry) and helicopter interactions
- Slipping hazards due to wet and/or snow-covered ground

Equipment

PPE must be appropriate for the weather, very high wind and noise conditions

- Hard hat with secure chin strap, Hi-Vis, ear protection, protective work gloves, safety glasses / googles, and appropriate boots.

Tools

- Slings, Wyssen heli latch, electric or manual hook

Requirements

- Review Construction Health and Safety Manual – Helicopter lifting
- Grounds Personnel must have read and signed off on the Helicopter Slinging SOP.
- Familiar with Wyssen and Gazex SOPS
- TDG ticket (Wyssen and Gazex)
- WCB Blasting ticket (Wyssen)

Responsibilities

Mine Manager

- Review, comment and sign off on the procedures

Supervisors

- Ensuring this SOP is implemented and maintained.
- Ensuring field personnel have all necessary training and information to safely complete the job.

Workers

- Following this SOP as outlined and directed by the supervisor.
- Proper helicopter orientation training has been completed.
- Ensuring safe practices are maintained at all times.

Job Step

The key element in a helicopter lift is planning. This requires the participation and cooperation of all workplace parties. Planning includes, but is not limited to, the following points.

- Planning meetings will be arrange with all flight operations members prior to the operations.
- Some training and review of current SOPS or JHAS are essential to ensure safe operations.
- Communication- Pre plan, assign individual assignments and responsibilities designated radio channels, hand signals
- Load weights- Consider helicopter limited lifting capacity
- Load shape, orientation and packaging- affect in flight handling
- Rigging plans – rigging devices and assemblies, briefing on load rigging
- Flight plan- designate staging area, flight path (consider roads and infrastructure)
- Lifting plan- include load line, hook up device and configuration, cable lengths, static discharge,
- Risk assessment- Identify, assess, and eliminate or provide protection against risks
- Rigging inspection- Inspect, record and have certificates of testing for rigging components and assemblies
- Site Safety- Follow up on all points covered in the risk assessment. Site cleanup. Remove loose materials. Minimize dust.
- Security and notification- Notify workplace parties of where and when helicopter lifts will be conducted. Prohibit access to nonessential personnel.

Site Preparation:

- Grounds personnel must ensure that the slinging area is clear of all non-essential personnel and that nearby personnel are aware of helicopter activities.
- Any loose articles or debris must be removed or secured before arrival of the helicopter.
- All personnel must be wearing the required PPE.

Receiving external loads:

- Stay in a safe location with spotter until it is determined to approach the load. Spotter will observe flight operations and signal the pilot of any safety concerns.
- Approach the load when it is at eye level and face the load at all times.
- Consider controlling the load with the use of tag lines. If the load is spinning, the pilot can touch down to stop the spin.
- Use hand signals to guide the load into position. Never get under the load as precise control of loads is not possible with a hovering aircraft.
- Always keep eye contact with the load. Watch for pinch points, crush points, and tripping hazards while receiving the load.
- Ensure load is released from the helicopters' long-line before notifying the pilot (hand signals or radio communications) that he is clear to depart.

Hooking Up external loads:

The procedures used for hooking up must be confirmed during the pre-flight briefing.

- There must be no loose wrapping, packing or objects on the load.
- The hook-up person stands with back to the wind while the aircraft approached into the wind.
- Spotter will remain in a safe location, observe flight operations and signal the pilot of any safety concerns.
- The hook-up person stays with the load.
- The aircraft will approach and hover over the hook-up person.
- Place the pear ring or other attachment point onto the hook and contact the pilot to start lifting

- If using tag lines; consider synthetic fiber rope and keep them shorter that the load line.

Before the load clears the ground:

- Stay with the load and ensure the hook does not become cross loaded.
- Don't turn your back on the load.
- Double-check that the loads center of gravity is below the rigging attachment points.

Lift-off

- When satisfied with load rigging, the hook-up person will walk out from beneath the helicopter to a safe area.
- Once the hook-up person is in a safe position, a signal can be given to the helicopter to continue lifting until the load is clear.
- The helicopter is now free to deliver the load.

Appendix C.25

BJ-AVL-SOP-039 – Gazex Lockout Tagout

PRETIVM		BJ-AVL-SOP-039 Gazex Lockout/Tagout	
Owner: Mountain Safety	Approver: Ken Black Jim Franken	Revision Number: V1	Creation Date:2020-10-23 Revision Date:

Objective

To provide guidelines for achieving energy isolation on equipment and processes for the purpose of performing maintenance on or near all potential forms of hazardous energy. Ensure all personnel are using the proper lockout and de-energization procedures to guarantee their safety and that of others from accidental ignition while performing maintenance on the Gazex system. Failing to do so could result in serious injury.

Scope

This procedure pertains to all personnel performing work on the Gazex system at both the shelter and exploder locations. This document is a necessary compliment to the Gazex maintenance manual

Health, Safety & Reclamation Code of BC

- Health, Safety and Reclamation Code for B.C Section 4.11 – Lock Out Procedures

WorkSafe BC Regulations

- WSBC OH&S Regulation Part 10: De-energization and Lockout
- 10.3 When lockout required
  - (1) If machinery or equipment is shut down for maintenance, no work may be done until
    - (a) all parts and attachments have been secured against inadvertent movement,
    - (b) where the work will expose workers to energy sources, the hazard has been effectively controlled, and
    - (c) the energy isolating devices have been locked out as required by this Part.
  - (2) If machinery or equipment is in use for normal production work, subsection (1) applies if a work activity creates a risk of injury to workers from the movement of the machinery or equipment, or exposure to an energy source, and the machinery or equipment is not effectively safeguarded to protect the workers from the risk.
- 10.4 Lockout procedures
  - (1) When lockout of energy isolating devices is required, the devices must be secured in the safe position using locks in accordance with procedures that are made available to all workers who are required to work on the machinery or equipment.
  - (2) The employer must ensure that each worker required to lock out has ready access to sufficient personal locks to implement the required lockout procedure.
  - (3) Combination locks must not be used for lockout.
  - (4) Each personal lock must be marked or tagged to identify the person applying it.
  - (5) Procedures must be implemented for shift or personnel changes, including the orderly transfer of control of locked out energy isolating devices between outgoing and incoming workers.
  - (6) If the use of a personal lock is not practicable for lockout, another effective means, if approved by the Board, may be used in place of a personal lock to secure an energy isolating device in the safe position.
- 10.5 Access to energy isolating devices
  - When an energy isolating device is locked out, the lock must not prevent access to other energy isolating devices supplying machinery or equipment that could cause injury to workers.

- 10.6 Checking locked out equipment
  - (1) Effective means of verifying lockout must be provided and used.
  - (2) Before commencing work, a worker must verify that all energy sources have been effectively locked out.
- 10.7 Worker responsibilities
  - Each worker who works on machinery or equipment requiring lockout is responsible for
    - (a) locking out the energy isolating devices before starting work, except as provided by section 10.9,
    - (b) removing personal locks on the completion of his or her work, and
    - (c) maintaining immediate control of the key(s) to personal locks throughout the duration of the work.
- 10.8 Removal of locks
  - (1) A personal lock must only be removed by the worker who installed it, or if this is not possible, the matter must be referred to the supervisor or manager in charge, who will be responsible for its removal.
  - (2) The supervisor or manager in charge must
    - (a) make every reasonable effort to contact the worker who installed the lock, and
    - (b) ensure that the machinery or equipment can be operated safely before removing the lock.
  - (3) A worker must be notified at the start of his or her next shift if the worker's personal lock(s) have been removed since the worker's previous shift.
- 10.9 Group lockout procedure
  - (1) If a large number of workers are working on machinery or equipment or a large number of energy isolating devices must be locked out, a group lockout procedure that meets the requirements of subsections (2) to (7) may be used.
  - (2) In a group lockout procedure 2 qualified workers must be responsible for
    - (a) independently locking out the energy isolating devices,
    - (b) securing the keys for the locks used under paragraph (a) with personal locks or other positive sealing devices acceptable to the Board, and
    - (c) completing, signing and posting a checklist that identifies the machinery or equipment components covered by the lockout.
  - (3) Before commencing work each worker working on the locked out components must apply a personal lock to the key securing system used in subsection (2)(b).
  - (4) Workers may lock out a secondary key securing system if 2 qualified workers lock out the primary key securing system and place their keys in the secondary system.
  - (5) On completion of his or her work, each worker referred to in subsections (3) and (4) must remove his or her personal lock from the key securing system.
  - (6) When the requirements of subsection (5) have been met and it has been determined that it is safe to end the group lockout, 2 qualified workers must be responsible for removing their personal locks or the positive sealing device(s) from the key securing system or systems containing the keys for the locks used under subsection (2)(a), and once those keys are released, the system is no longer considered to be locked out.
  - (7) The written group lockout procedure must be conspicuously posted at the place where the system is in use.
- 10.10 Alternative procedures
  - (1) If lockout of energy isolating devices as required by section 10.3 is not practicable,
    - (a) in the case of a power system as defined in Part 19 (Electrical Safety), the requirements of that Part must be followed,

        - (c) in the case of machinery or equipment designed and equipped with effective control system isolating devices, the devices must be locked out as required by sections 10.4 to 10.9, and 10.10(2), and
        - (d) in an emergency, the energy isolating devices or control system devices must be effectively controlled to prevent inadvertent start up or hazardous energy release.
    - (2) Control system isolating devices and the procedures for using them must be approved in writing by the Board and must be used by workers qualified and authorized to carry out the work.
- 10.11 Locks not required
    - The application of a lock is not required under section 10.3 or 10.10 if
        - (a) the energy isolating device is under the exclusive and immediate control of the worker at all times while working on the machinery or equipment, or
        - (b) a tool, machine or piece of equipment which receives power through a readily disconnected supply, such as an electrical cord or quick release air or hydraulic line, is disconnected from its power supply and its connection point is kept under the immediate control of the worker at all times while work is being done.

Definitions

- **De-energization** – means removing the energy from machinery or equipment.
- **Lockout** – refers to using lock(s) to isolate energy source or to ensure machinery or equipment is inoperable.
- **Control system isolating device** - means a device that physically prevents activation of a system used for controlling the operation of machinery or equipment
- **Energy isolating device** - means a device that physically prevents the transmission or release of an energy source to machinery or equipment
- **Energy source** - means any electrical, mechanical, hydraulic, pneumatic, chemical, thermal, or other source of energy of potential harm to workers
- **Key securing system** - means a system which physically prevents access to keys when locks or positive sealing devices are applied in a group lockout procedure
- **Lockout** - means the use of a lock or locks to render machinery or equipment inoperable or to isolate an energy source in accordance with a written procedure
- **Maintenance** - means work performed to keep machinery or equipment in a safe operating condition, including installing, repairing, cleaning, lubricating and the clearing of obstructions to the normal flow of material
- **Normal production** - means work that is routine, repetitive, and integral to the normal use of machinery or equipment for production
- Applying a Danger Tag or "Tag out" - the process of attaching a sign or label to an isolating device in order to warn others not to restore energy to the system or equipment bearing the label. The practice of using tags is done in conjunction with locks to increase the visibility and awareness that equipment is not to be energized or activated until such devices are removed. The Tag must be dated with the name of the person who applied the lock out. The Tag must have a date and the name of the person's supervisor. All information on the tag must be legible. The danger tag is also applied in conjunction with a Departmental lock when mechanical or electrical devices are not to be operated for purposes of protecting the equipment from damage.
- **Personal Locks - RED** - A uniquely keyed lock or lock set issued to an employee after completing training in Pretivm Isolation and Lookout Procedure. The personal lock(s) identifier # is kept on a master list along with the name of the employee. Personal locks are used as a primary lock for jobs involving up to three (3) isolating devices. Personal locks are also used in conjunction with group locks to secure a lock box when more than three (3) isolation points are involved.

- **Group Lockout** - In instances where more than five (5) workers are working on machinery that must be locked out, or when more than three (3) energy-isolating devices require isolation, a group lookout will be required. Follow Group lookout procedure.
- **Lock Box** - A device used as a primary key securing system during a group lookout. The lock box must be approved by a Supervisor prior to using.
- Group Lookout Checklist - List of energy-isolating devices that are subject to lookout according to the JHA for the work to be performed. Qualified persons de-energizing equipment and performing lockout/tagout will initial the checklist as each item is isolated. The two qualified persons will also do a bump test on each piece of equipment and initial on the checklist that it is complete.
- Completed Group Lookout Checklist will be attached to Lookout Board and accompany the Group Lock Box.

Preparation

Hazards

- Pressurized vessels, propane and oxygen, gas explosions, misfires, grease/oxygen interaction, cold burns from propane, miscommunication, stored energy, personnel in line of fire, unfamiliarity with task
- Gazex system stored energies
    - 100Ah Gel Battery Nominal Voltage 12VDC
    - Propane Source (high pressure) 100LBS bottles x4 @ 24.8bar @ 70 degrees C
    - Oxygen Source (high pressure) 3 cradles 18 bottles @150bar @ 20 degrees C
    - Propane Dosing Tank (low pressure) One tank per exploder, 454 Litres vaporized gas @ 1.4bar @ 20 degrees C
    - Oxygen Dosing Tank (low pressure) One tank per shelter, 454 Litres vaporized gas @ 6.5bar @ 20 degrees C
    - Ignition batteries are 8x 2.5Ah, 1.5VDC AA batteries in series making 12VDC @2.5Ah
    - Capacitor/Igniters -I have no data for the capacitors or igniters in the ignition box. The series packs of AA cells in the ignition box charge the capacitors only when pressure is sent to the ignition hose and pressostate switch.

Tools

- Locks for all workers
- Lock out tags

Requirements

- Pretivm Lock out / tag out training for all workers
- BJ-OHS-SOP-014 – Energy Isolation Lockout must be referenced
- Personal Locks
- Familiarity and high level of training with the Gazex system
- Ongoing communication (prior to any steps being carried out) between personnel at the exploder and at the shelter is imperative for safe operation of maintenance duties.

Responsibilities

- **Mine Manager or Designate**
    - Ensure this SOP is implemented and maintained.
    - Ensure personnel have up-to-date information regarding this SOP.

- **Department Manager/Supervisor**
  - Ensure that all workers perform tasks in a safe manner
  - Review procedure with any persons performing tasks pertaining to this SOP
- **Health and Safety Manager or Designate**
  - Monitoring the implementation of this SOP
- **Workers**
  - Ensure that they authorized to perform tasks as required
  - Report to their supervisor any issues pertaining to the above procedure
  - Stop work if unsure and report to supervisor

Job Step

Two options are possible for lockout depending on the maintenance to be carried out.

Option A (Electrical lockout with Guard)
Requires an electrical lockout and a trained guard to stay at shelter and manage dosage tanks for Pipeline pressure testing. Follow applicable guidelines in BJ-OHS-SOP-014 – Energy Isolation Lockout

All workers gather at shelter

- Open the electrical compartment on the door of the shelter.
- Locate the main fuse on the terminal strip
- Open the fuse normally and entirely to disconnect. De-energization is made automatically after disconnecting.

- Ensure system is deenergized by noting no lights on the communication system for a period of 2 minutes. The blue light must never be lit, confirming that there is no power source. This removes all power and controls from the electromagnetic control valves within the shelter.

- Close door for Electrical components and lock with Scissor Hasp secured with a lock from all personnel working on the system.

- Consider the electrical Lockout-Tagout as effective at this point

Opening the shelter door

- Wait one minute for ventilation of the space before entering the shelter.
- Trained personnel to remain at the shelter for security and to assist with pressure testing of pipes.

Personnel descend to Gazex exploders

- Upon approaching an exploder immediately remove the ignition hose, this in return removes any possibility of spark

- Personnel at the exploder location then confirm via the radio with the guard at shelter that the ignition line has been disconnected from chosen exploder (I.e. number #1)
- Begin maintenance on the exploder as per BJ-AVL-SOP-15 Gazex Annual Maintenance

Live Testing

Is done to pressure test the pipelines and repair any possible leaks. **Note*** When pressure testing of pipes is to be performed, personnel must gather at only one exploder location prior to test. During this procedure only one technician is within 30m of the shelter being tested.

- The Gazex electrical components remains locked out and tagged out.
- The exploder being tested has its ignition hoses removed, this removes any possibility of spark.
- The main supply lines are then removed and capped with hydraulic plugs and gauges.

- Once communication has been established with the guard at the shelter and confirmation of chosen exploder is confirmed. The guard then overrides the pneumatic valve associated with the chosen exploder. This charges the lines with gas pressure to perform measurements.
- Oxygen is always tested first and vented to the atmosphere before testing propane.

Option B (Full electrical and pneumatic lockout)

Requires no guard and involves a full electrical and pneumatic lockout. Follow applicable guidelines in BJ-OHS-SOP-014 – Energy Isolation Lockout.

All workers gather at shelter

- Open the electrical compartment on the door of the shelter.
- Locate the main fuse on the terminal strip
- Open the fuse normally and entirely to disconnect. De-energization is made automatically after disconnecting.

- Ensure system is deenergized by noting no lights on the communication system for a period of 2 minutes. The blue light must never be lit, confirming that there is no power source. This removes all power and controls from the electromagnetic control valves within the shelter.

Opening the shelter door

- Wait one minute for ventilation of the space before entering the shelter.
- Close the O2 valve supplying the electromagnetic valves. This mechanically isolates the electromagnetic valves from shifting the dosing tanks pneumatic valves and removes any risk of accidentally sending gas to the exploder.

- Close doors and lock both electrical and shelter doors with Scissor Hasp secured with a lock from all personnel working on the system.

Personnel descend to Gazex exploders

- Upon approaching an exploder immediately remove the ignition hose, this in return removes any possibility of spark

- Personnel at the exploder location then confirm via the radio with the guard at shelter that the ignition line has been disconnected from said exploder (I.e. number #1)
- Begin maintenance on the exploder as per BJ-AVL-SOP-15 Gazex Annual Maintenance

BJ-AVL-SOP-041 – Gazex Firing Procedures

Objective

The purpose of this procedure is to ensure that all safety precautions are taken to protect all employees and contractors and provide safe and consistent Gazex firing for all personnel associated with the Pretivm Avalanche Control program.

Scope

Mountain Safety team members participating in avalanche control using the Gazex RAC system.

Health, Safety & Reclamation Code of BC

- HSRC 8.0 Explosives
  - **Guarding 8.6.2** Before blasting, the blaster, or person designated responsible for blasting, shall (1) clear the blast danger zone of all persons, (2) ensure that all entrances to the blast danger zone are guarded to prevent access, and not rely only on signs for the purpose, and (3) when blasting on the surface of a mine, ensure that an effective audible warning is given.

WorkSafe BC Regulations

- WSBC G4.1.1 Avalanche Assessment
- 21.5 Authority to blast
  - (1) Only the holder of a valid blaster's certificate issued by the Board or acceptable to the Board is permitted to conduct or direct a blasting operation, and then only if the work involved is within the scope of that certificate.
  - (2) All work within the blasting area must be done under the authorization of the designated blaster of record responsible for that area.
  - (3) A blaster may be assisted by persons who do not hold blaster's certificates, but the blaster must have authority over the assistants and must exercise visual supervision over them and be responsible for their work during explosive loading, priming, fixing or firing.
- 21.7 Training
  - A worker engaged in loading, unloading, or conveying explosives must be trained in the proper means for handling the explosives, the hazards of fire and mishandling and the procedures to follow in the event of a fire or explosion.

Definitions

- *"hazard"* means a thing or condition that may expose a person to a risk of injury or occupational disease;
- *"hazard area"* means an area in a workplace where a hazard exists, or is created, due to a condition in the area or the activities conducted in it;
- *"incident"* includes an accident or other occurrence which resulted in or had the potential for causing an injury or occupational disease;
- *"qualified"* means being knowledgeable of the work, the hazards involved and the means to control the hazards, by reason of education, training, experience or a combination thereof;

- *"risk"* means a chance of injury or occupational disease;
- *"supervisor"* means a person who instructs, directs and controls workers in the performance of their duties;

Preparation

Hazards

- Un-exploded ordnance; post control avalanches; underestimating the remaining avalanche hazard, natural avalanches during debris clearing, weather factors; lack of radio communications; loss of control zone; vehicle collisions; damaged equipment; injured workers; backed up traffic in avalanche areas; logistical delays; cognitive overload, making mistakes that have been previously identified; extended exposure to overhead hazards; getting stuck; too narrow single lane; improper vehicle spacing; logistical delays; miscommunication between snow removal equipment and traffic, lack of equipment available to carry out the task, vehicle breakdowns, loss of process from extended closure, inadequate equipment, inexperienced operator, river, rockfall, icefall, equipment proximity to area of concern, hazards left over from clearing, terrain traps, snow (uphill side of the road) falling from debris cones onto roads / vehicles, loose rock slabs near gun #5

Tools

- PPE
- Companion Rescue Equipment
- Radio
- Suitable heavy equipment (Loader, Excavator, Snowcat)
- Truck
- Closure Gates
- Lighting (Light Plants)
- Gazex Tablet / Gazex Firing Codes
- Allen Key and Gazex tablet maintenance tools
- Antenna and DC Adapter

Requirements

- Avalanche Safety Plan (ASP)
- Avalanche Safety Equipment
- Equipment training
- Prior Training/Familiarity
- BJ-AVL-SOP-005 Guarding and Sweeping
- BJ-AVL-SOP-007 Avalanche Debris Clearing
- BJ-AVL-SOP-009 Pre-Blast Considerations / Avalanche Control Checklist
- BJ-AVL-SOP-018 Avalanche Related Road Closure Sustainability Plan

Responsibilities

Mine Manager or Designate

- Ensure this SOP is implemented and maintained.
- Ensure personnel have up-to-date information regarding this SOP.

Department Manager/Supervisor

- Ensure that all workers perform tasks in a safe manner
- Review procedure with any persons performing tasks pertaining to this SOP

Health and Safety Manager or Designate

- Monitoring the implementation of this SOP

Workers

- Ensure that they are authorized and trained to perform tasks as required
- Report to their supervisor any issues pertaining to the above procedure
- Stop work if unsure and report to supervisor

Job Step

1. Inform shareholders of avalanche control via:
    - Face-to-Face with surface ops manager if possible, to coordinate guarding/sweeping, clearing and spotting personnel.
    - Brucejack Control flash.
    - Two-hour, one hour, 30 min blast warning over Road channel and Repeater 2.
2. Complete pre-blast check list.
    - Discuss mission details (Timing, what guns will be fired and in what succession, etc..).
3. Ensure the tablet is charged, with required DC adaptor and antenna.
4. Drive to Km 44.4, ensure guards are in place and area is swept and secure.
5. Notify dispatch that the area is secure, AC is ready to commence and provide 5 min blast warning.
    - Repeat 5 min blast warning over the Road channel.
6. Attach DC adaptor and antenna to the truck and Gazex case. (Ensure red switch is on DC)
    - Turn the tablet on (top left button)
    - Select the Gazex icon.
    - Click the Trigger Icon.
    - Choose the user (BOR)
    - Type in your password and hit enter.
    - Choose the Slasher shelter (your only option) by hitting enter.
    - Wait for a connection with the shelter.
    - Select an exploder. (1,2,7(2.5),3,4, or 5) (ensure not simu-blast)
        - When firing both guns 2 and 7(2.5) in the same mission, fire one first and the other last as they are on the same line and require 15 minutes because of longer gas fill times.
    - Enter the firing code.
    - The gases will then enter the guns and initiate the explosion.
7. Once fired, seismic information will be displayed, and the screen will return to select an exploder.
    - Wait a “timed 5 minutes” before firing the next shot, this ensures proper dosage tank fill level and avoids backburn.
8. Monitor results per shot and determine whether further control work is required.
9. Once the mission is complete, evaluate the paths to determine whether hazard remains on the slope and if it is safe to proceed into debris clearing operations.
    - It is required to wait approximately 20 mins post control when missions are being conducted with a spring-like snowpack, and post control releases.
    - Refer to Avalanche Debris Clearing SOP (BJ-AVL-SOP-007).

Appendix C.27

BJ-AVL-SOP-042 – Magazine Checks

Objective

To fulfill our regulatory requirements Mountain Safety will conduct weekly and monthly inspections of our explosives magazines. This SOP aims to establish clear, consistent and safe practices.

Scope

Applies to mountain safety team members who are required to do weekly and monthly explosive magazine checks at both km 73.3 and km 48.

Health, Safety & Reclamation Code of BC

- HSRCBC 8.1.6 (1) Magazine rules
- Canada Explosives Act, Part 6, 157

WorkSafe BC Regulations

- OHS Regulation Part 21: Blasting Operations
- TDG

Definitions

- **SFA** – Safety Fuse Assembly, pre-built fuse and detonator
- **ANFO** – Prilled ammonium nitrate bulk explosive
- **Booster** – detonator sensitive, high density, high energy explosive cast into a shell

Preparation

Hazards

- Explosive hazards
- Powder headache (Nitroglycerin exposure)
- Heavy magazine doors
- Uneven and/or slippery ground
- Vehicle blind spots and collisions
- Driving hazards
- Wildlife
- Deep snow (hidden hazards)
- Heavy lifting
- Lost, stolen or misplaced keys
- Frozen door (pulling/kicking/etc)

Tools

- Magazine keys
- Gate keys

- InReach GPS communication device (charged)
- Lighting (headlamp)
- Gloves (nitrile) and standard worksite PPE
- Shovel, ice chipper, dead blow
- Sand or salt as required
- L6 Graphite Spray

Requirements

- Annual review of Fire Safety Plan
- Annual review of Key Control Plan
- Annual review of Site Security Plan
- Criminal background check and Clearance letter updated on the Cleared Employee document
- Minimum 2 workers at site (one worker must have a valid blasting certificate and be signed off on Key control plan)
- Fire extinguisher (up to date check both monthly and six year)
- ERAP in vehicle for transport
- TDG for transport
- Placards for transport
- Shipping documents

Responsibilities

Mine Manager or Designate

- Ensure this SOP is implemented and maintained.
- Ensure personnel have up-to-date information regarding this SOP.

Department Manager/Supervisor

- Ensure that all workers perform tasks in a safe manner
- Review procedure with any persons performing tasks pertaining to this SOP

Health and Safety Manager or Designate

- Monitoring the implementation of this SOP

Workers

- Ensure that they are authorized to perform tasks as required
- Report to their supervisor any issues pertaining to the above procedure
- Stop work if unsure and report to supervisor

Job Step

Preplan

- Check charge on InReach before departure
- DO NOT enter Magazine area if there is any chance of an electrical storm (e.g. thunderstorm)
- Collect required items before leaving office
    - Magazine keys (including sign in and out)
    - Gate keys if required (including sign in and out)
    - InReach

    - Pencil and notebook
    - Headlamp
    - Tools listed above as required

At magazine

- Inspect area surrounding magazine
    - No flammable materials within 10m
    - Fire extinguisher
        - Charged and in good condition
        - Monthly inspection, tag clipped
        - Expiry date checked
    - Signage in place
    - Integrity of magazine
        - Grounding cable intact
        - Groundcover is stable and level
        - No signs of damage or attempted break-in (walk around entire magazine)
    - Send InReach message from site for magazine inspection
    - Clear snow from entrances to magazines

In Magazine

- Ensure magazine license is current, up to date and posted
- Ensure Magazine rules are posted
- No excess flammable materials inside the magazine (empty boxes, etc)
- No broken or spilled explosives
- Contents organized
- Ensure all boxes are labeled with correct license number
- Count product and update in/out record in magazine with partner assisting
    - Trace back any errors
        - Implement any corrective actions
- Record inventories in field book (2 initials required)
- Clean and sweep magazine

Receiving Product

- Check shipping documents for quantity to be received.
- Load product into appropriate Magazine ensuring no broken or spilled explosives
- Contents organized with old stock rotated to front
- Label all boxes with correct magazine license number
- Count product and update in/out record in magazine with partner assisting
    - Trace back any errors
        - Implement any corrective actions
- Record inventories in field book (2 initials required)
- File Shipping document in office

Transferring Product

- Fill out TDG shipping documents for all transfers between Magazines at Km 48 and Km 73.3
- Update IN/OUT record in Magazine

- Load product into truck ensuring to not exceed 80% of GVW
- Ensure separation of Detonators and Anfo/Boosters
- Ensure correct placards are in place on all four sides of truck
- When driving on glacier notify dispatch of explosives shipment
- At destination Magazine update IN/OUT record in Magazine
- Load product into magazine with contents organized and old stock rotated to front
- Cross out old magazine license number and relabel products with new magazine license number

Before Departing Magazine

- Thoroughly clean door seals and sweep out all snow
- Partner checks that all doors are locked
- Ensure InReach and Magazine keys are accounted for
- Wait and listen to radio for any nearby traffic on road before exiting magazine area
- Close and lock gates as required

Upon Return to Office

- Dispose of empty boxes if required
- Input inventories in J drive: Daily Workflow: Pretivm Explosives Summary: Explosive Inventory
- Return all keys (sign back in)
- Return and charge InReach
- Move email message from InReach to appropriate folder

COMMUNICATIONS AND CONTACT LISTS

Communications at Brucejack is available by VHF radio, satellite phones, and satellite Internet. Tables 1 to 3 provide internal and external contacts as well as other useful communications related references. Planning Managers will direct the maintenance team to maintain and monitor the communications system.

Table 1. Medical Emergency Contacts

Service	Party	Contact Number
Ambulance	BC Road and Air Ambulance	1-800-461-9911
	Back-up BC Ambulance	1-800-561-8011
	Terrace	1-250-638-1102
	Stewart Lora Lee Murray	1-250-636-2676
Hospitals	Stewart – Stewart General Hospital and Nurse On-duty	1-250-636-2221
	Terrace – Terrace Mills Memorial Hospital	1-250-635-2211

Table 2. Mine Camp Coordinates

	UTM NAD 83 Zone 9		WGS 84	
Locations	Easting	Northing	Latitude	Longitude
Brucejack Camp	427,080	6,258,695	N 56°28’01”	W 130°11’01”
Wildfire Camp	469,101	6,264,071	N 56°31’12”	W 129°30’8”
Bowser Aerodrome	44,367	6,250,234	N 56°23’35”	W 129°56’59”
Knipple Camp	43,795	6,251,226	N 56°24’44”	W 130°19’

Brucejack Camp is approximately 65 km by air north-northwest of the town of Stewart. It is 73 km via the Brucejack Access Road west from km 215 on Highway 37.

It is approximately 240 km by air from Terrace to Brucejack Camp, and about 370 km by road from Terrace to Brucejack Camp.

BRUCEJACK SITE EMERGENCY PHONE CONTACTS

The main Brucejack Phone Number is **778-724-4186**.

The primary means of communications on site is VHF Radio. There are three repeater channels allowing for long distance VHF communications and a number of shorter ranges "Talk Around" channels that require line of site with the receiving party (Table 4).

Table 4. Brucejack Radio Frequencies

Channel	Name	RX Frequency	TX Frequency	Tone
Ch 1	New Road **(NEW)**	166.080	166.080	
Ch 2	Repeater 1 **(Brucejack)**	162.735	167.715	71.9
Ch 3	Talk Around 1	162.735	162.735	
Ch 4	Repeater 2 **(Bowser)**	162.810	167.790	123.0
Ch 5	Talk Around 2	162.810	162.810

1 MINE EMERGENCY RESPONSE PLAN (MERP)

1.1 MERP OBJECTIVES

The goal of this Mine Emergency Response Plan (MERP) is to provide Pretium Resources Inc. (Pretium) employees, contractors and their employees with guidance to prepare and respond to an emergency situation in an organized and effective manner (formal structure). An organized response will contain and control the situation, and will mitigate consequences to people, property and the environment. The MERP outlines the response procedures and preventive measures that will achieve effective and timely management of an emergency.

This MERP is proposed to cover all the Brucejack Mine facilities and work areas, which include the access road, satellite camps (i.e., Knipple, Bowser and Wildfire camps), construction activities and in mine site production operations for the surface and underground areas.

The MERP, dependent on the nature of the emergency, can be activated when a project-related emergency and/or incident occurs anywhere on the mine.

This plan also outlines the responsibilities and duties of an Emergency Response Team (ERT) as required by Pretium in the event of an emergency at the mine.

The MERP is intended to meet the following objectives:

- Provide a pre-determined course of action during a mine site emergency situation;
- Provide a listing of the duties and responsibilities of personnel;
- Assist personnel in determining appropriate responses to emergency situations;
- Provide guidance to prevent and minimize personal injury during a mine-site emergency situation;
- Provide guidelines for initial first aid treatment of injured personnel;
- Provide guidance for initial emergency response to minimize damage to property, equipment and the environment;
- Enable communication and co-operation between corporate personnel, site personnel, mutual aid organizations, agency officials, and the community at large;
- Provide guidelines for ensuring the safety of site personnel, visitors, and community members;
- Provide guidance to reduce the magnitude of environmental impacts;
- Assist response personnel to determine and perform remedial actions quickly;
- Comply with legal requirements in response related matters in case of emergencies;
- Reduce recovery time and cost;
- Inspire confidence in response personnel;

- Ensure procedures comply with OHS and environmental requirements; and
- Safely restore operations to normal.

Anyone discovering a potential emergency should know the immediate steps to take and will follow the "decision flow chart" included in this plan (See Section 2.1). The MERP will provide guidance when the initial attempts to control a situation are not successful.

1.2 MERP POLICY DIRECTIVE

A Mine Emergency Response Plan is required by Part 3.7.1 of the *Health, Safety and Reclamation Code for Mines in BC*, 2017 (MEMPR 2017), and must be in general accordance with the *Mine Emergency Response Plan Guidelines for the Mining Industry*, 2017, version 1.4.

Pretium management is dedicated to providing a safe workplace for its employees and contractors. The goals of this MERP are, in order of priority, to protect the health and safety of workers and the public, protect the environment, avoid adverse social and economic effects, preserve heritage, as well as protect and minimize damage to company properties.

This MERP was developed to assist in protecting personnel and company facilities in the event of an emergency. An emergency is the unforeseen combination of circumstances, unusual occurrences or resulting state which may result in endangerment to lives or areas of the mine. This emergency may call for the immediate action from management and/or trained mine rescue, fire and first aid personnel.

Possible situations with the potential to create an emergency under some circumstances might include:

- avalanches;
- wildlife and human interaction;
- fire (electrical/mechanical);
- spills of fuel or hazardous substances;
- contact water pond and tailings line discharge;
- underground mine emergencies: ground failures, main fan ventilation failure, etc.;
- unexpected/unplanned explosions;
- aircraft/ground vehicle accidents;
- non-life- and life-threatening injury or fatality;
- flooding/snowstorm/blizzards/ice storms; and
- natural disaster.

In order to protect site personnel, Pretium will use specific evacuation procedures to remove all personnel from the source of danger and to account for all personnel on shift.

During the operation and closure phases of the Brucejack Mine, senior management will assign various responsibilities to specific personnel, and will provide overall supervision and monitoring.

Pretium will ensure that the MERP is current and maintained at all times. The Mine Manager will ensure that there is a budget is in place to address the requirements of the MERP, including related training. As per the annual budgets, funding is provided for emergency response team training, high level scenarios, incident management team tabletop and mock scenarios. Additional funds are also provided for emergency and auxiliary equipment used during the scenarios. The Mine Rescue Team will be compensated if a call out occurs after their working hours. Copies of the MERP will be posted in common locations for workers to review. Each worker will be required to become familiar with the details of the MERP, and the location of all emergency services at the time of the initial mine site familiarization training.

Pretium is strongly committed to having in place an efficient MERP resulting in an organized and effective response at containing and controlling the situation, as well as mitigating consequences to people, property and the environment. In meeting this commitment Pretium will:

- Provide training to all employees, contractors and their employees for their roles in all emergency plans;
- Ensure that ALL site personnel are familiar with and are able to call a CODE 1 for any type of emergency, BJ-OHS-SOP-002 - Code One Call Out & Response;
- Ensure all supervisors are responsible that their employees are aware of, and trained in, the proper emergency response procedures and that procedures and contact information are posted in all work areas. Supervisors are also responsible for ensuring that all employees follow safe work procedures and follow regulations to prevent emergencies from occurring, and that they are provided with the proper tools to do so, including PPE;
- Ensure all personnel (including Pretium employees, contractors and their employees) will participate in emergency response drills on a regular basis;
- Appoint a qualified person as a trainer for mine rescue members as per Part 3.7.9 or the HSRC;
- Procure the necessary mine rescue and emergency response equipment, and ensure adequate training in the use of this equipment is provided by the qualified person(s);
- Develop the required Emergency Response Teams as per Part 3.7.2 of the HSRC;
- Appoint a Mine Emergency Response Plan Coordinator and Planning Committee;
- Set up and continually improve the long-term goals of the plan;
- Establish a budget for the emergency response program, including hiring and training qualified personnel, to ensure the successful implementation of the MERP; and
- Support all other activities necessary to develop and implement an effective Emergency Response Plan.

All Pretium employees, contractors and their employees will need to be aware of the normal hazards associated with their work area. A sudden change from the norm may result in an unusual and dangerous situation. Being prepared for an emergency will mean quicker action and ensure proper manner of action in cases of individual injury, help for individuals or of a mine problem area.

All Pretium employees, contractors and their employees will be shown at the time of initial mine site familiarization:

- the emergency response and first-aid procedures and where are they posted;
- the procedure to summon the emergency response team in the event of any emergency by using the CODE 1 emergency procedures;
- the procedure to summon first aid;
- the procedure to follow in the event of a fire;
- the ability to access information for emergency facilities such as air ambulance, police, and hospital; and
- the location of their assembly area in case of an emergency; they will be given names of emergency personnel, their qualifications, and their contact information. This information will be posted at each individual working area and updated as necessary.

All Pretium employees, contractors and their employees will also receive the Brucejack Project Occupational Health and Safety Plan (OHSP) at the initial mine site orientation. After a general presentation of the company's Health and Safety Program, each worker will be required to complete a written sign-off and acknowledgement of understanding this material.

Emergency response drills will be undertaken for the following reasons:

- to validate the adequacy of the organizational infrastructure to effectively deal with emergencies;
- to test the initial communications sequences;
- to verify contact numbers are correct;
- to familiarize personnel with their duties and responsibilities;
- to evaluate the preparedness of each party involved in the Emergency Response Program;
- to identify and correct deficiencies in the Emergency Response Program;
- to verify the availability of support services;
- to exercise tactical site-specific responses; and
- to examine the interaction between the individuals, support groups, organizations, and agencies named in the Emergency Response Program, and to address identifiable shortfalls in the established lines of authority.

1.3 MERP LINKAGES TO OTHER ENVIRONMENTAL MANAGEMENT PLANS

Pretium is committed to providing safe and healthy working conditions, and protecting the health, safety and the environment as vital elements of the mine. This commitment is essential to achieving a successful long-term operation. Throughout the various mine phases, Pretium plans to conduct activities to minimize impacts on the environment.

The commitment to this objective will be achieved with the preparation and integration of Environmental Management Plans (EMPs) into mine operations. Each plan will provide methods, procedures, and actions to be utilized by Pretium personnel and/or its contractors to ensure that their activities comply with appropriate environmental legislation, mine commitments, and applicable environmental standards. This MERP is one of several plans that form part of the Brucejack Mine Environmental Management System (EMS).

Other Mine EMPs related to this MERP include:

- Occupational Health and Safety Manual (OHSM);
- Chemicals and Materials Storage and Handling Management Plan (CMSHMP);
- Fuel Management Plan (FMP);
- Spill Response Plan (SRP)
- Hydrocarbon Contaminated Soil Management Plan (HCSMP);
- Construction Environmental Management Plan (CEMP); and
- Waste Management Plan (IDWMP).

1.4 MERP Coordinator and Planning Committee

On the Brucejack Mine, the Mine Manager will appoint the Health and Safety Manager, or a designate, to act as the Mine Emergency Response Plan Coordinator (ERCC) for the site. The ERCC will have the full support of Pretium to successfully implement the MERP. Currently the ERCC is the Emergency Response Team Coordinator.

The Mine Manager will select members for a Mine Emergency Response Planning Committee (ERPC), and will integrate the ERPC, ERCC and the Joint Occupational Health and Safety Committee (JOHSC).

The ERPC will perform the following duties:

- Examine possible eventualities for each area of the mine, together with the possible measures of prevention and protection and resulting actions. The outcome of this pre-planning exercise will be reviewed periodically as conditions change over time. Initially, all areas and processes of the mine will be inspected to determine the risks associated with the work environment, including confined spaces, mine fires, explosions, rock-bursts, falls of ground, runs of muck, inrushes of water and avalanches.
- Review mitigation measures designed to prevent emergency events from occurring and reduce the adverse effects of such events. The review will assess the effectiveness of the mitigation and consider alternatives where necessary.
- Confirm the appropriateness of training and procedures, safe working practices, housekeeping programs, and first aid training to prevent a minor emergency escalating to a crisis or a disaster.
- Review the MERP annually to verify its effectiveness. As the Brucejack Mine develops, a re-assessment of emergencies and incidents will be undertaken. Findings from this periodic assessment will be used to update and revise procedures associated with the MERP.

Updates will be made based on corrective actions noted during tabletop and mock high-level exercises. Pretium Resources/Brucejack Mine has set the standard to run a minimum of three tabletop scenarios and one mock scenario per calendar year. The scenarios need involve the Brucejack Site Emergency Response Team and Incident Management Team, as well as the corporate office in Vancouver.

1.5 ERPC DUTIES AND RESPONSIBILITIES IN REGARD TO THE MERP

Regarding the MERP, specific members of the ERPC have various duties and responsibilities, as detailed below.

1.5.1 Mine Manager

The Mine Manager shall:

- ensure that personnel, equipment and resources are adequate to effectively deploy the MERP;
- ensure that a MERP has been developed and communicated to site staff and contractors;
- participate in the emergency response evaluation meeting after each emergency response; and
- interface and communicate with corporate senior management.

1.5.2 Health and Safety Manager

The Health and Safety Manger is a member of the ERPC, which develops, maintains and implements the MERP that is comprehensive and is regularly updated to meet the changing needs of mine activities.

The Health and Safety Manager shall:

- ensure that mine orientation and safety meetings include training for ERP roles and responsibilities;
- participate in post-incident evaluation meeting to review emergency response, MERP effectiveness and opportunities for improvement;
- work with the Mine Manager to identify and implement improvements to the MERP;
- coordinate annual fire drill and “man-down” drills to test and evaluate emergency preparedness; and
- update and post the MERP, telephone lists and plot plans (i.e., muster areas; location of emergency/medical equipment).

1.5.3 Operations Supervisors

The Operations Supervisors shall effectively communicate MERP roles and responsibilities to new employees.

1.5.4 Joint Occupational Health and Safety Committee (JOHSC)

The JOHSC committee is made up of worker and employer representatives consulting in a cooperative atmosphere to identify and resolve health and safety issues/concerns in support of the MERP.

The JOHSC shall:

- participate in the identification of dangers to safety and health in places of employment, and recommend means of controlling the hazards;
- obtain information from the employer and from additional sources regarding the identification of existing or potential dangers to safety and health;
- receive, consider, and where necessary, investigate complaints respecting safety and health of workers at this workplace, and where necessary, make recommendations to the employer;
- participate in workplace inspections; and
- participate in incident investigations.

1.6 PROJECT HAZARD IDENTIFICATION, PREVENTION AND PROTECTION

The Brucejack Mine has developed a Risk Assessment document that will continue to be used through mine operation and closure. The purpose of this document is to provide direction to personnel related to hazard identification and risk assessment. This is a multi-page Excel spreadsheet used to identify the steps, associated hazards, controls in place, and additional controls needed after the assessment has been completed. The additional controls are assigned to a specific worker and have a completion date. These processes will continue to be used to identify and evaluate both existing and potential hazards throughout the mine site. They will also assist in defining methods to control and/or eliminate the hazards identified.

As part of the Hazards Identification program, all Pretium employees, contractors and their employees shall assess their worksite and complete a Job Hazard Analysis form (available in supervisor's office). This assessment process must be completed prior to the start of all jobs, particularly new jobs to identify existing or potential hazards to workers and then to eliminate and/or control these hazards through the use of appropriate engineering or administrative controls, proper training or the use of personal protective equipment.

All company staff and contractors are required to take a proactive approach to managing and reporting hazards. When they observe a hazard, they shall take steps to manage that hazard directly (provided they are knowledgeable / trained to safely do so) – eliminate the hazard or get assistance from appropriate persons to do so whenever reasonably possible. Where hazards cannot be eliminated immediately, take necessary steps to warn others of the hazard. Report hazardous or potentially hazardous conditions and acts to a supervisor or your site contact if a contractor.

1.7 EMERGENCY RESPONSE PROGRAM (ERP) OUTLINE

As part of the MERP, the Brucejack Mine has proposed the Emergency Response Program (ERP) for the mine site, described in Section 2. The ERP details emergency response levels, emergency management team, planning and training, emergency response team structure, etc.

1.8 RELEVANT ENVIRONMENTAL ASSESSMENT CERTIFICATE CONDITIONS

On March 26, 2015, Pretium was granted an Environmental Assessment Certificate (#M15-01) which included a series of conditions. This MERP fulfills Condition #2, in relation to a Component Plan for mine emergency response planning, presented within Schedule B of the Certificate and copied below.

Condition 2

> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*
> - *Effects mitigation measures;*
> - *Monitoring programs;*
> - *Monitoring schedules; and*
> - *Reporting requirements.*
>
> *The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5. The Aboriginal Consultation Plan outlines the notification process if there is an emergency at the Brucejack Mine.*
>
> *The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."*

1.9 FIRST RESPONDER CONSULTATION

The MERP will be provided to all mutual aid parties, British Columbia Ambulance Service, Stewart RCMP and Stuart Hospital. A map with helicopter landing zones will also be provided to Yellowhead Helicopters, BCA, Canadian Helicopters and Lakelse Helicopters.

2 EMERGENCY RESPONSE PROGRAM (ERP)

The Brucejack Mine has developed an Emergency Response Program (ERP) for the mine site. Details regarding certain aspects covered in the following sub-sections include:

- Emergency Response Levels: contains the emergency criteria, emergency level characteristics, reporting sequence and implementation summary;
- Emergency Response Management Team (ERMT): identifies who is on the Emergency Response Management Team(s) and identifies responsibilities and duties; and
- Planning and Training: documents pre-planning activities such as the development of the organization's emergency plans, education and training.

2.1 EMERGENCY CRISIS PROCESS

The Emergency Crisis Process assesses the consequence and severity level of an emergency (Figure 2.1-1). The Severity Table is provided in Appendix B.

Figure 2.1-1. Emergency Crisis Process

2.2 EMERGENCY RESPONSE LEVELS

2.2.1 Introduction

The following emergency response level concept was originally conceived by Galore Creek Mining Corporation as part of their Emergency Response Plan v. 2.1 (GCMC ERP v. 2.1). This concept will be adopted in this MERP because it provides sound directions, procedures, and courses of action to follow in the event of a mine site emergency.

An emergency can be defined as any incident, or event that causes or creates the potential for a serious injury, loss of life, significant loss or damage to property, or environmental damage. Although emergencies by definition are unexpected events, the relative risk of some occurrences can be identified and preparations (policy and procedures) put in place for timely and effective response. Remember, this identification is the first step in ensuring adequate response.

Pretium incident reporting policy requires all levels of emergencies to be reported to the Health and Safety Manager (or designate). The urgency shall depend on the severity of the situation.

Emergency response criteria, definitions of Level 1, 2 and 3 emergencies and emergency level decision flow chart are discussed in the following sections of this MERP. It is anticipated that Pretium employees, contractors and their employees will be able to utilize this system, to aid in making appropriate decisions regarding the emergency response.

2.2.2 Emergency Response Criteria

The Risk Ranking Matrix presented in Figure 2.2-1 will be used by the Emergency Response Coordinator (ERC; or designate) to determine the level of emergency and deployment of emergency response personnel as follows:

- Activities with Low risk or acceptable risk level are denoted in **Green** in the Matrix
- If the Ranking Matrix indicates a low potential (**Blue**), the ERC (or designate) will initiate a Level 1 Alert.
- If the Ranking Matrix indicates medium potential (Yellow), the ERC (or designate) will initiate a Level 2 Alert and review the situation.
- If the Ranking Matrix indicates high potential (**Red**), the ERC (or designate) will initiate a full Level 3 Alert.

2.2.3 Emergency Level Characteristics

The Emergency Decision Flow Chart provides a summary of emergency level characteristics and processes for the Brucejack Mine (Figure 2.2-2). The flow chart will be utilized to assist management and employees in ensuring that a proper approach is taken in case of an emergency incident.

STEP 1 DETERMINE LIKELIHOOD

Likelihood (L)			
A	Almost Certain	Happens often	More than one event per month
B	Likely	Could easily happen	More than one event per year
C	Possible	Could happen and has occurred here or elsewhere	One (1) event per 1 to 10 years
D	Unlikely	Hasn't happened yet, but could	One (1) event per 10 to 100 years (within a single mine life)
E	Rare	Conceivable but only in extreme circumstances	Less than one (1) event per 100 years (life of Pretivm Resources Inc.)

STEP 2 DETERMINE CONSEQUENCES

Consequence/Severity (C)						
Rank	Consequence	People	Damage/Loss	Environment	Business	Reputation
1	Catastrophic	Fatality	Extreme Financial Loss (>US$1,000,000)	Irreparable Damage, very serious long term impairment of the eco-system	>48 Hours Production Delay	Major Damage to Reputation receiving national or international negative media OR production to cease as a result of statutory concerns
2	Major	Permanent and total disability	Major Financial Loss (US$500K – 1,000K)	Major Impact, serious medium term environmental impact effecting the whole eco-system	24 to 48 Hours Production Delay	Major Damage to reputation receiving province-wide negative media OR non-compliance with statutory requirements resulting in a major fine
3	Moderate	Loss Time Injury	Moderate Financial Loss (US$100K – 500K)	Minor Impact, moderate short term effects affecting part, but not affecting whole eco-system	12 to 24 Hours Production Delay	Moderate Damage to reputation localized to regional media OR non-compliance with statutory requirements resulting in minor fine
4	Minor	Disabling Injury	Minor Financial Loss (US$ 10K – 100K)	Minor Impact on biological or physical environment	6 to 12 Hours Production Delay	Minor Impact to reputation localized to communities OR technical divergence that may attract attention from statutory authorities
5	Low	First Aid/Medical Aid with no time lost or change of duties	Low Financial Loss (US$ <10K)	Limited Damage to minimal area of low significance or previously disturbed areas	<6 Hours Production Delay	No Impact on stakeholder or reputation

STEP 3 CALCULATE RISK

		Consequence / Severity (C)				
Likelihood (L)		1 Catastrophic	2 Major	3 Moderate	4 Minor	5 Low
A	Almost Certain	1 (Ex)	2 (Ex)	4 (Ex)	7 (H)	11 (H)
B	Likely	3 (Ex)	5 (Ex)	8 (H)	12 (H)	16 (M)
C	Possible	6 (H)	9 (H)	13 (H)	17 (M)	20 (M)
D	Unlikely	10 (H)	14 (M)	18 (M)	21 (L)	23 (L)
E	Rare	15 (M)	19 (M)	22 (L)	24 (L)	25 (L)

Consequence Severity Table												
SEVERITY LEVEL	Severity Rating	Financial		Operations						Compliance	Strategic	
		Liquid Cash	Project Budget Variance	Mine Shutdowns	Project Delays	Security	Health	Safety	Environment	Legal/Regulatory	Community Perception/Stakeholder Relations	Strategy
5	Catastrophic	>$40M	>20%	>15% impact on production volume	> 6 months	Security breach resulting in material theft and loss of significant assets	Multiple fatalities or serious disabling illness to multiple people.	Multiple Fatalities; or Permanent impairment to multiple people.	Extensive impact (>20 years) to land, biodiversity, ecosystem services, water resources or air	Fines and prosecutions relating to criminal breaches including jail terms and being the subject of a royal commission	Prolonged (>2months) international multi-NGO and media condemnation Extensive long-term social impacts and serious infringements of cultural heritage	Loss of significant business capability
4	Major	$30 -$ 40M	15 - 20%	7.5 – 15% impact on production volume	3 - 6 months		Single fatality or irreversible health effects or disabling illness.	Single fatality or Permanent impairment to > 30% of the body	Major impact (5-20 years) to land, biodiversity, ecosystem services, water resources or air	Major civil litigation including class actions	Major adverse international multi-NGO and media condemnation Major long-term social impacts and infringement of cultural heritage	Significant reduction in business capability
3	Serious	$20M - $30M	10 - 15%	2.5 – 7.5% impact on production volume	1 - 3 months	Security breach resulting in serious theft and/or loss of significant assets	Severe, reversible health effects of concern that would typically result in a lost time illness.	Permanent impairment, < 30% of the body to 1 or more Days lost due to injury/illness	Serious impact (1-5 years) to land, biodiversity, ecosystem services, water resources or air	Breach of regulations and lack of exploration title	Serious public or national media outcry, damaging NGO campaign Moderate medium-term social impacts	Temporary loss of service or business capability
2	Moderate	$10M - $20M	5 - 10%	0.5 – 2.5% impact on production volume	2 - 4 weeks	Security breach resulting in moderate theft and/or loss of low value assets	Reversible health effects of concern that would typically result in medical treatment.	Objective but reversible impairment Medical treatment for injury/illness	Moderate impact (<1 year) to land, biodiversity, ecosystem services, water resources or air	Minor legal issues, non-compliances and breaches of regulation	Non-material reputation damage Attention from regional media and local public attention and complaints Minor social impacts	Temporary delay in reaching objectives
1	Low / Minor	<$10M	<5%	< 0.5% impact on production volume	< 2 weeks	Security breach resulting in small theft	Reversible health effects of little concern, requiring first aid treatment at most.	Low-level short-term subjective symptoms or inconvenience. No medical treatment required	Minor disturbances and/or Low-level impact to land, biodiversity, ecosystem services, water resources or air	Low-level legal issues	Public concern restricted to local complaints Low-level interest from local media and/or regulator Low-level social impacts	No material impact on the achievement of business objectives

RISK MATRIX

LIKELIHOOD	Score	1	2	3	4	5
	Rating	Rare	Not Likely	Possible	Highly Likely	Expected
Chance of the potential consequence occurring considering the controls in place	Frequency	Greater than 100 year event	Every 10 to 100 years	Every 1 to 10 Years	Every 2 to 3 years	Almost Yearly

Risk Level	Actions Required
Critical	STOP - Manager approval required. Controls to reduce risk must be identified and implemented before performing work.
High	STOP - Superintendent approval required. Controls to reduce risk must be identified and implemented before performing work.
Moderate	STOP - Review and follow Work Instruction or complete Group JHA with team members and Team Leader.
Low	Worker conducts personal JHA prior to performing task and continually assesses risks.

Figure 2.2-1. Risk Ranking Matrix

Emergency levels are classified into three categories, based on different criteria described below. Generally, Level 1 emergencies can be controlled entirely by personnel within the immediate vicinity of the incident/accident. Notification will be made immediately with documentation to the safety department within 24 hours of the incident. As for Level 2 and 3 emergencies, they may force temporary suspension or shut down of operations indefinitely. These incidents must be reported immediately to the Mine Manager.

Level 1 – Potential Emergency (Containment Level)

- Can be controlled entirely by mine site personnel and operations;
- Located within the immediate vicinity of the incident/accident site;
- No danger outside of the mine site;
- Immediate control of the hazard/sources is possible;
- No threat to the public;
- Minimal environmental impact; and
- Little or no media interest.

Level 2 – Emergency (Notification Level)

- A section of the operation is temporarily shut down;
- Can be controlled by the personnel and equipment that are readily available at the mine;
- Potential exists for the emergency to extend beyond the mine site;
- Outside agencies (MEMPR, police, fire, etc.) must be alerted and kept informed of the situation;
- Imminent control of the emergency is probable;
- Some threats to the public exist;
- Moderate environmental impact; and
- Local/regional media interest is probable.

Level 3 – Major Emergency (Mobilization Level)

- Forces the indefinite shut down of operations;
- External emergency support services are required;
- Safe operating control has been lost;
- Actual or potential severe injuries or fatalities;
- Public safety jeopardized;
- Significant and ongoing environmental impact;
- Significant media interest;
- Immediate multi-agency involvement; and

- Assistance from outside parties required.

2.2.4 Emergency Level Decision Flow Chart

This flowchart, provided in Figure 2.2-2 is a simplified decision guide to assist management and particularly employees in taking appropriate actions in case of an emergency.

2.2.5 Emergency Response Plan Implementation Summary

Table 2.2-1 provides additional information for Pretium employees, contractors and their employees to ensure decisions are commensurate with the level of emergency.

Figure 2.2-2. Emergency Decision Flow Chart (after GCMC Emergency Response Plan v. 2.1)

Table 2.2-1. Emergency Response Summary

Level	Criteria	Examples	Pretium Actions	Government Agency Actions
Level 1: ERT members to the initial response	• No danger outside of company property. • Immediate control of hazard/ source. • No immediate danger to public exists. • Minimal environmental impact. • Little or no media interest. • Situation handled entirely by company personnel.	• Potential for a small spill or small release of product confined to company property • Company/Contractor. Personnel minor injury or property damage. • Complaint telephone call received. • Trespassers on company property. • Spot fire/minor explosion	• Operational response made. • Reported as required internally. • Comply with appropriate government reporting after the fact. • Additional company personnel may be placed on standby status • Pretium initial response is undertaken as per the site specific ERP.	• No actions required. • Monitors response if advised.
Level 2 Mobilize IMT	• No immediate danger outside of company property, potential exists for emergency to extend beyond company property. • Outside services and Provincial Government agencies must be alerted • Imminent control of hazard is probable. • Some threat to workers or the public. • Moderate environmental impacts. • Local/regional media interest.	• Confirmed release with imminent control of the hazard probable. • Injuries/accidents involving workers. • Mischievous acts by trespassers threatening worker or public safety. • Fire/explosion that has a direct impact on worker/public safety.	• Pretium fully activates its ERP - internal resources mobilized - External resources mobilized. • Pretium mobilized and the emergency operations centre (EOC) may be on standby. • Lead agency notified (Smithers). • Public safety actions begin which could involve sheltering or evacuation. • External communications to media prepared and executed.	• Pretium has the capability to manage and control the incident using its own resources and expertise with limited assistance from local agencies and government authorities (MEMPR and WorkSafe BC, if necessary). • Lead agency notifies other agencies that may be affected. • Lead agency puts government EOC on standby. • Agencies with direct involvement may establish direct contact with Pretium. • Government agencies activate their
Level 3 Mutual aid mobilized to assist.	• Worker and/or public safety jeopardized. • Uncontrolled hazard. • Significant and ongoing environmental impacts. • Immediate multi-agency municipal and provincial government involvement. • Assistance from outside parties is required.	• Major accident impacting on workers or the public • Explosion with extensive damage to facilities • Mischievous acts which result in major damage • Major fire in a populated area and/or major wild fire	• Pretium emergency response is at maximum. • Pretium notifies lead agency • Pretium dispatches representative to Government EOC. • Pretium mobilizes corporate emergency response capabilities including Public Affairs, Legal, Executive, etc.	• Hospitals in Terrace and Stewart notified of potential trauma patients. • Government agencies with direct involvement dispatch staff to Pretium Operations. • Full activation of the Government Emergency Response Support Program to support Pretium.

2.3 EMERGENCY RESPONSE MANAGEMENT TEAM (ERMT)

Overall command to activate the Emergency Response Program shall be the responsibility of Pretium senior management at the incident site and/or the ERMT. Pretium personnel and contractor employees have the responsibility to implement the Brucejack Mine ERP.

Depending on the emergency level and the type of emergency, the Brucejack Mine - ERMT described below shall be formed to respond to an emergency.

In the event of an emergency at the mine, the chain of command structure provided in the Incident Command Emergency Management Organizational Chart will be enacted (Figure 2.3-1). The lead person for the chain of command will be the Emergency Response Coordinator (ERC), or alternatively the Mine Manager. This organization chart will expand or contract depending on the type and severity of the incident/emergency.

2.3.1 Emergency Operations Center (EOC)

The EOC will be established at the On-site Conference and Training Room following notification of an emergency. The site ERC (or designate) and facilitators of the site Mine Rescue Emergency Response Team (ERT) shall converge at this office. Requirements may include activities such as the allocation of on-site resources (personnel and equipment), setting up a communications center and external reporting of the incident/accident to government agencies, etc.

Should conditions dictate evacuation due to imminent danger; the EOC will be located at another defined location that is farthest from the imminent danger zone.

Figure 2.3-1. ICS Emergency Management Organizational Chart

Once established, EOC personnel will manage the emergency and undertake the following functions:

- Ensure that the Brucejack Mine ERP has been properly implemented;
- Monitor the health and safety of workers at the site;
- Monitor Security; and
- Provide appropriate technical information related to the incident.

2.3.2 Emergency Response Responsibilities and Duties

The following personnel involvement or requirements will depend solely on the Level emergency response (i.e. Level 1, 2, or 3).

All major emergencies require senior management personnel to form an ERMT. This team will direct emergency operations and assign tasks to individuals or groups. Responsibilities for each group are described in the following subsections. Note the list is not exhaustive and additional responsibilities may be identified commensurate with the type of incident.

2.3.2.1 Mine Rescue Emergency Response Team

The on-site surface and/or underground ERTs will consist of personnel trained as required of Part 3.7.7 of the *Health, Safety and Reclamation Code for Mines in BC*, 2017. They will be notified and requested as necessary.

2.3.2.2 First Responders – Level 1, 2, or 3 Emergency

- Take action to ensure their own safety;
- Alert other personnel in the immediate vicinity of the incident/accident;
- Determine the magnitude of hazards present, contact the Health and Safety Department and provide particulars of the emergency and request appropriate help;
- Perform duties as directed by the on-site supervisor (or designate). These initial duties may be as follows:
  - Providing assistance to injured personnel;
  - Assisting with procedures to control or minimize the effects of the emergency;
  - Determine if Personal Protective Equipment (PPE), safety equipment and supplies are adequate; and
  - Initiate an Event Log for the emergency.

No worker will approach a hazardous condition alone or without the proper PPE. First Responders will wait for the arrival of additional personnel and equipment.

2.3.2.3 Medic/Advanced First Aider – Level 1, 2, or 3 Emergency

When an injury requiring medical attention is reported, the Health and Safety Department will call the Medic/Advanced First Aider who will assess the degree of response required. All events shall be recorded in the Treatment Logbook. The Medic/Advanced First Aider shall:

- Take action to ensure your own safety;
- Alert other personnel in the immediate vicinity of the incident;
- Upon notification, the on-site supervisor (or designate) will meet with the Medic/Advanced First Aiders at the incident/accident scene (unless in radio contact). On-site supervisor (or designate) ensures that the Medic/Advanced First Aiders have the required supplies and that the area is secured and does not present any further danger to personnel; and
- The Medic/Advanced First Aiders will stabilize casualties and prepare for transportation. If transported, an Advanced First Aider will be required to attend.

2.3.2.4 Emergency Response Coordinator (ERC)

Upon hearing of and/or arrival at the scene of an emergency, the on-site Emergency Response Coordinator (or designate) will assume full command for the emergency response actions. Sometimes the ERC will work in conjunction with the on-site Mine Manager who will act as the representative of the company. In the event of an emergency the ERC will be responsible for:

- Determining the Level response of the emergency;
- Coordinating all emergency procedures through various levels of company personnel and delegate authority where appropriate;
- Making available the resources necessary to set up the ECO to deal effectively with the emergency including rehabilitation;
- Informing the Health and Safety Office of the emergency and have them remain on standby at the phones;
- Designating a person for traffic control who shall not allow any person to leave or enter the property via the glacier road or aircraft. The exception will be the following personnel who will be directed to the appropriate site locations:
    - Mine Rescue Emergency Response Personnel;
    - Emergency Response Team (ERT);
    - Mines Inspectors – BC Ministry of Energy, Mine, and Petroleum Resources; and
    - Other approved essential personnel.
- Conducting, in conjunction with the Health and Safety Office, all aspects of the investigations both at and away from the emergency scene, and report to the on-site Mine Manager; and
- Maintaining a log of occurrences.

Note the person designated for traffic control shall record the names and affiliations of any persons entering or leaving the property (after permission is given) and direct incoming workers to the mine dry to await instructions from the EMT.

2.3.2.5 Mine Manager

If the Emergency Response Coordinator is not immediately available, then upon hearing of and/or arrival at the scene of an emergency, the Mine Manager will assume full command for the emergency response actions until the ERC arrives at the EOC.

Otherwise in the event of an emergency the Mine Manager will be responsible for:

- Requesting assistance from agencies and others as required;
- Contacting local Mine's inspector as per the Mines Act requirements;
- Contacting R.C.M.P., Coroner, and senior management, as required;
- Activating the Mutual Aid Agreement; and
- Reviewing and making recommendations on emergency reports submitted by the ERC.

All public and press inquiries shall be directed to the Vancouver office.

2.3.2.6 Operations Superintendent

The Operations Superintendent (or designate) will ensure that Pretium employees, contractors and their employees are aware of their responsibilities under the plan. When notified of an occurrence, the Operations Superintendent will delegate authority to those on the scene, and relay pertinent information to those as required.

The Operations Superintendent will coordinate the efforts of response groups focusing on the following:

- **Evacuating the Mine:**
  - accounting for all employees and their locations;
  - evaluate the situation and estimate the number of personnel to handle the situation;
  - have mine rescue teams prepare and go on standby; and
  - in conjunction with the Mine Manager, arrange to have appropriate tasks assigned to all outside agencies and personnel on site as required.

- **If men are underground the Operations Superintendent will:**
  - devise a plan for rescue operations;
  - if fire, will devise a plan for control and extinguishment;
  - instruct / brief response group; and
  - send rescue teams underground.

- **As information from underground comes in, decide if additional rescue teams are required, change in rescue/procedures are required.**

- **If all men are accounted for and evacuated:**
  - locate the fire;
  - control and extinguishment of the fire;
  - ventilate the mine;
  - check the rest of the mine and assess damage;
  - determine causes and make reports; and
  - rehabilitation of damaged area.

- **In conjunction with the Mine Manager and ERC, will arrange to have appropriate tasks assigned to all outside agencies and on-site personnel as required.**

2.3.2.7 Mine Foreman or Shift Boss

The Mine Foreman or Shift Boss at the scene will assume command of the emergency until control is passed onto the Operations Superintendent. The Mine Foreman or Shift Boss will then work under the direction of the Operations Superintendent to implement rescue and rehab procedures. The Mine Foreman will take on the same responsibilities as the ones listed for the Operations Superintendent until the Superintendent arrives on the scene.

2.3.2.8 Security/Safety Manager

The Security/Safety Manager (or designate) will report directly to the Operations Superintendent and will be responsible for:

- Supervising all first aid, security and mine rescue operations;
- Ensuring all first aid, firefighting and mine rescue equipment is available to the accident scene;
- Coordinating call out of outside emergency agencies (Air Medivac, Ambulance) or other as required; and
- Coordinating investigation team, findings and reporting of emergency.

2.3.2.9 Maintenance Superintendent

Upon being notified of an emergency, the Maintenance Superintendent (or designate) will report to the EOC.

The Maintenance Superintendent will assist in mechanical/electrical matters relating to:

- mechanical/electrical problems and personnel;
- supply of compressed air;
- supply of tools and equipment that may be needed for the rescue operation;
- technical matters relating to power distribution and communication systems; and
- will ensure adequate water supply to the mine and servicing of pumping equipment underground.

2.3.2.10 Engineering Department

The Engineering Department will report to the Operations Superintendent and will provide up to date 1:250 and/or 1:3,000 scale plans showing:

- refuge stations;
- exit routes;
- fire-fighting equipment locations;
- an up to date ventilation plan showing directions and volumes of air flowing, fans and vent tubing extensions; and
- all vent doors being closed or open.

Upon the location of a fire, the Engineering Department designate along with the Operations Superintendent will assist in identifying locations of workers and equipment underground.

2.4 PLANNING AND TRAINING

2.4.1 Pre-incident Planning

2.4.1.1 Safety Precautions and Personnel Training

In preparation for implementation of this ERP, the Mine Manager shall verify the following measures are taken:

- Conduct safety meetings and orientation sessions with ERT Members to review the contents of the ERP;
- Ensure personnel on the mine site are familiar with their roles, duties, and safety responsibilities;
- Conduct ERP exercises four times per year to familiarize personnel with the correct emergency reporting and response procedures. On completion of each exercise, evaluate how efficiently the exercise was conducted, and address any areas of concern;
- ERT members respond in all mock scenarios as a training exercise. This is in addition to weekly planned training which is organized by the ERCC to cover all aspects of emergency response. Which includes specific focus on actual incidents in the mining industry;
- The Incident Management Team (IMT) planning manager and the rest of the IMT participate in all tabletop and mock scenarios where the focus is on incident management and business continuity planning;
- Ensure personnel are familiar with equipment they may be required to use; and
- Verify adequate safety equipment is available to meet the requirements in an emergency.

2.4.1.2 Mine Rescue Emergency Response Program Exercises

An emergency response exercise is a mechanism used to review the level of emergency preparedness within an organizational infrastructure and to evaluate the ability of the infrastructure to respond to potential emergencies that could arise (Table 2.4-1).

Table 2.4-1. Incident Management Team Training

Team	Induction (role specific)	Desktop Exercise	Mock Exercise (frequency/participants)
IMT	Within 2 months of joining (at a maximum)	Quarterly (four times a year)	Every 1-2 years

Prior to becoming an Incident Management Team Member, an individual must complete practical training with the ERT Coordinator. This will be achieved in one of two ways:

- One-on-One training: The new member and the ERT Coordinator will go through the IMT Room, IMT status boards, breakout room, communication systems, and general workflow of an IMT incident.
- Desktop Scenario: The new member will participate in an IMT desktop scenario, either as a primary, alternate, or observer. Every 1 to 2 years this will include all external offices to participate.

Once the member is trained, they become an Incident Management Team Member.

Objectives

Emergency Response Exercises are to be conducted for the following reasons:

- to validate the adequacy of the organizational infrastructure to effectively deal with emergencies;
- to test the initial communications sequences;
- to verify contact numbers are correct when required;
- to familiarize personnel with their duties and responsibilities;
- to evaluate the preparedness of each party involved in the ERP;
- to identify and correct deficiencies in the ERP;
- to verify the availability of support services;
- to exercise tactical site-specific responses; and
- to examine the interaction between the individuals, support groups, organizations, and agencies named in the ERP, and to address identifiable shortfalls in the established lines of authority.

Once scenarios are completed a debrief will be conducted to determine where changes need to be made. A record will be kept and followed up on until all items have been completed.

Scope

Emergency response exercises are held to review and evaluate existing ERPs. Normally a programmed scenario is developed to present a set of hypothetical emergency conditions, relevant to activities that fall under the scope of an existing ERP.

Emergency response exercise scenarios can be targeted to evaluate the initial response to potential emergency situations that may develop at both the site-specific level or at the senior management level.

Hypothetical criteria can be targeted to measure immediate tactical response or the extent of initial administrative support, depending upon how the scenario is devised.

Emergency response exercises may involve active communications from personnel within the organization, from government agencies, contract support services, and other parties involved in the ERP. Only those communication responses as described in the scenario will be activated.

A performance review meeting should be held immediately following the exercise. At the conclusion of the exercise a report will be generated to describe the outcomes for further analysis and to initiate remedial action and follow up.

2.4.2 Post-incident Review

2.4.2.1 Critical Incident Stress Debrief (CISD)

A critical incident stress debrief is a short (30 to 45 minute) non-judgmental session with all personnel involved in responding to a workplace incident. An incident is any workplace event like an accident, injury, or fatality that causes emotional or psychological trauma.

The critical incident Stress Debrief should occur no longer than 6 hours after the incident and should be carried out by professionals. The group will consist of personnel involved in the incident. Topics will vary but should include: what happened, what was learned, what was done well, as well as actions needing further improvement. The CISD should be a constructive experience for all those involved.

2.5 POSSIBLE FUTURE INCLUSIONS TO THE MERP

Further to the Emergency Response Process there are additional components, which are only outlined and/or not included in this initial MERP document. These additional MERP components should be developed by the Brucejack Mine operations management. They may include:

- **Detailed Emergency Response Team Structure:** Outlining the infrastructure of personnel that will be established to respond to an emergency and to provide further details on their assigned responsibilities.
- **Detailed Alerts and Warnings:** Documentation on how the organization will be alerted to an event or incident, and how the emergency communications sequence will be implemented for the Emergency Response Program.
- **Assessment and Notification:** Documentation of communications protocols within the organization and with outside agencies, including relationships with the media, before and after the event. Provisions for assessing and documenting the nature and severity of the

incident will also need to be developed. The MERP includes a family liaison, external affairs and human resource manager which is responsible for contacting and updating next of kin, managing press and social media.

- **Comprehensive Emergency Response Details:** Description of procedures needed to test the efficiency of the Emergency Response Program. This would document how members of the emergency management group would respond to emergencies within the context of the organization's EOC. Full comprehensive procedures combined with charts with tactical maps will need to be developed for both the alert and activation phases of the EOC.

3 EMERGENCY EVACUATIONS

3.1 OVERVIEW OF EVACUATION PROCEDURES

Structural fires may present the highest potential hazard at the Brucejack Mine. This is because of the flammable nature of the materials used in the construction of most buildings (camp, offices and administration complex).

The following functions listed below are essential in maintaining the integrity of the fire suppression systems and also providing adequate and effective response in the case of a fire.

Evacuation procedures will need to be further developed for the administration, processing and maintenance facilities. However, if there is an alarm or initiation of an evacuation order (administration facility, processing plant, etc.) or stench warning (underground), ensure you follow these procedures immediately:

- Evacuate the facilities, area of work or underground;
- Warn others of the emergency if you encounter them during your evacuation;
- Notify appropriate emergency services and your supervisor;
- All personnel will assemble in the designated (muster) areas and will remain there until ordered to move by the supervisor or the emergency services;
- If you did not evacuate to the designated area immediately you could be classified as missing, therefore immediately report to the supervisor in charge to get checked off the list;
- Some personnel may elect to use emergency equipment to control and/or extinguish flames, spills, etc. but at no time is any worker to remain in the facilities or underground if further exposure shall increase the risk hazard to the worker;
- No worker shall re-enter the workplace and/or return into the buildings after an evacuation until authorized by the Mine Manager and the emergency services; and
- Appoint a person to direct emergency vehicle(s) or personnel to the emergency site.

In the event of an emergency response, the responsibility for directing the response will be the ERC. The Supervisor(s) and Mine Rescue Emergency Response Team will assemble with the ERC at the EOC, who will then direct rescue and firefighting operations.

The response group will assess any reporting on anyone missing and/or details concerning the fire. The response group will then locate and rescue anyone not accounted for, and deal with the emergency response.

3.2 MEDICAL EMERGENCIES

In the event of an incident requiring first aid and/or evacuation, the Medic/Advance First Aider will attend immediately to the scene of the accident to provide first aid and to assess the requirement

for evacuation of the injured. The Medic/Advance First Aider, upon deciding to evacuate these person(s), will inform the ERC and Mine Manager who will then decide upon an appropriate course of evacuation for the injured.

Monthly fire suppression systems inspections will be essential to ensure their integrity. Scheduled maintenance and repairs will be undertaken in order to maintain the integrity of fire suppression systems.

Particular attention to housekeeping and observing the BC Fire Code will ensure that fire protection remains effective at all times. Combustibles shall not be stored inside buildings unless they are part of a work process. Flammable materials such as paints and aerosols shall be stored in approved and appropriate storage cabinets.

Fire drills and evacuation drills will be conducted periodically by management, and all persons shall co-operate during these drills.

3.3 General Mine Emergency Response Procedures – Surface Operations

Surface Operations include all surface activities such as the mill and maintenance operations, administration, camp, vehicle use, access roads, glacier travel routes, quarries, snow dump, etc.

In the event of a surface operations emergency, announce a Code One as per the Code One SOP.

3.3.1.1 Emergency Notification Plan, BJ-OHS-SOP-002 - Code One Call Out & Response

The person(s) discovering the emergency shall do the following.

If you have a radio, announce the "**Code 1**" three times on radio **Channel 2, Repeater 1** and stay on this channel until you receive confirmation that your notification was received by Dispatch. Make sure you pass on all details of the emergency, including:

- your name;
- nature of the emergency;
- location of the emergency;
- requirements for handling the emergency (i.e., first aid, rescue team, ambulance, firefighting);
- number of injured personnel; and
- description of the injuries.

When notification is received by Dispatch, they will instruct **"Radio silence – Code 1"** three times on **Channel 2, Repeater 1** as this channel is monitored at all times. All nonessential radio traffic and work activity will cease until further notice.

The onsite clinic personnel will be monitoring the repeater channels at all times.

If only a surface emergency, the Medic/Advanced First Aider assumes command and coordinates with Medical Aid and Air Operations. If it is a Code 1 then the ERCC assumes command and follows the ERP protocols.

3.3.2 Administration Facilities Emergency Evacuation

The procedure for evacuation from the facilities is clear. If some personnel elect to use emergency equipment to control and/or extinguish flames, spills, etc. they may do so until further exposure increases the risk hazard to that worker. If a risk hazard increase than all personnel will need to evacuate from the facilities immediately.

3.3.3 Camp Muster Areas

All emergencies will be coordinated through the senior on-site supervisor or designated person. All radio traffic will be cleared in the event of an emergency. All Camp mustering stations are clearly marked on-site.

3.3.4 Employee Responsibilities during All Emergencies

In an emergency, employees shall:

- ensure their own personal safety;
- assist others, alert others;
- check work area for others;
- close doors and windows;
- report to the muster station during an emergency or drill;
- bring appropriate PPE and clothing for the weather;
- report to their supervisor at the muster station; and
- remain in the muster area until directed by their supervisor.

3.3.5 Supervisor Responsibilities during All Emergency

All supervisors shall:

- Report to the muster station during an emergency or drill;
- Account for all employees under their direction;
- Provide a report to the ERC, if applicable regarding status of head count;
- Report all unaccounted employees including the last known whereabouts of the employee(s); and
- Instruct employees to remain at the muster station until the emergency is over.

3.4 MOBILE EQUIPMENT/VEHICLE ACCIDENTS

There is a potential for vehicle accidents involving multiple casualties on the Mine Access road.

In the event of these accidents it is highly likely to encounter multiple casualties because of the high volume of traffic on the road and the type of vehicles used (buses and multi-passenger vehicles).

In the event of an accident of this type the following procedures must be followed:

- Assess the accident scene for hazards, such as:
  - fire;
  - spills – hazardous cargo (chemicals or fuels);
  - equipment stability; and
  - electrical hazards from downed wires, etc.
- If you have a radio, announce the "**Code 1**" three times on radio **Channel 2, Repeater 1** and stay on this channel until you receive confirmation that your notification was received by Dispatch. Make sure you pass on all details of the Emergency:
  - your name;
  - nature of the emergency;
  - location of the emergency;
  - requirements for handling the emergency (i.e., first aid, rescue team, ambulance, firefighting);
  - number of injured personnel; and
  - description of the injuries.
- If it is not safe to approach the accident scene, stay clear, until appropriately trained mine rescue emergency response team arrives.

Figure 3.4-1 summarizes these procedures in flow chart format.

Figure 3.4-1. Mobile Equipment Accident Response Flow Chart

3.5 GENERAL MINE EMERGENCY RESPONSE PROCEDURES – UNDERGROUND OPERATIONS

The following ERP outlines the basic procedures to follow should any emergency occur in the underground operations at the Brucejack Mine. This section deals specifically with the underground; however, several of the other components of this plan are as relevant for the entire operation including fire and emergency procedures.

Some of the information in this section was sourced from the SOP "Underground Emergency Response Plan – Brucejack". Review the SOP for additional details.

Underground emergencies are those events that could cause an immediate threat to life. Types of underground emergencies could include the following but not limited to:

- injury to, or people requiring rescue;
- loss of life;
- unexpected/unplanned explosion;
- fire/heat/smoke;
- falls of ground;
- equipment electrical - failure/damage;
- loss of main ventilation; and
- any other situation that may jeopardize the safety of workers and/or the mine.

It is very important that all personnel be prepared. In order to accomplish this the following should be undertaken:

- Every employee should be trained and familiar with the MERP;
- Each employee must be familiar with the stench gas warning system, how it works and must understand what to do upon smelling it;
- All management personnel must be familiar with their roles in an emergency;
- Mine rescue personnel should be properly trained. Locations in where they can be reached shall be posted and their personnel in/out tags should be marked so they can be located easily;
- Refuge stations must be located where needed, maintained in good condition, well equipped, and with instructions for procedures to be followed posted in each station;
- Fire extinguishing equipment must be located where needed, must be ready for use and inspected regularly;
- The communication system underground must be kept in good condition;
- Ventilation doors if installed must be well located, kept in good repair and clearly marked "OPEN" or "CLOSED";

- Mine plans showing exit routes, refuge station locations must be posted; and
- All underground employees will receive basic training in the use of fire extinguishers and water hoses as well as survival mine rescue and first aid.

3.5.1 General Underground Emergency Response Procedure

3.5.1.1 Emergency Notification Plan, BJ-OHS-SOP-002 - Code One Call Out & Response

The person or persons discovering the emergency shall do the following:

- If you have a radio, or are at an underground phone (Femco), announce "**Code 1**" three times on your radio – UG All Dispatch **Channel 1** and stay on this channel until you receive confirmation that your notification was received by Dispatch. Note*: Underground Emergency – Code 1 will deploy UGIC if stench has been released.* Make sure you pass on all details of the Emergency:
  - your name;
  - nature of the emergency;
  - location of the emergency;
  - requirements for handling the emergency (i.e., first aid, rescue team, ambulance, firefighting);
  - number of injured personnel; and
  - description of the injuries.
- Remain on the radio or phone and wait for further directions.
- If you do not have a radio, go to the nearest Femco phone and announce the Code 1. Ensure supervisor has heard and will pass on to Dispatch.
- Warn all personnel in the area by releasing the stench gas in the ventilation system. Releasing the stench gas in compressed airlines requires approval from the Mine Manager.
- According to your skills and training, do what you can do to correct the situation with whatever you may have at hand to do so. Remember; do not jeopardize your own personal safety.
- When calling out ensure you give as complete information as possible to ensure correct and appropriate response.
- If there is any sign of fire or smoke put on your W65 self-rescuer, retreat to a refuge station or fresh air escape way and advise others in the area.
- If surface visibility is compromised due to whiteout snow conditions, the mine manager or designate shall organize for a guideline to be strung between the portal and truck shop.

3.5.2 Underground Fire Emergency Procedures

3.5.2.1 Discovery of Smoke Underground

If you encounter smoke anywhere in the underground mine workings:

- Assess the type of smoke you have encountered. Is this blasting smoke, diesel smoke or possible smoke from a fire? You will have to use your sense of smell and judgment to distinguish between the different types of smoke.
- If you suspect the smoke is from a fire, go to the nearest phone and call site dispatcher/ supervisor or the surface shops/offices and pass on all details of the emergency and have them call a **"Code 1"** three times on the UG Emergency **Channel 4**.
- Make sure you pass on all details of the emergency and ask for the stench gas to be injected:
  - provide your name and location of the emergency;
  - the precise location, nature of the fire and what is burning;
  - the size of the fire; and
  - your planned destination after the call.
- Put on your self-rescuer and proceed to the portal. If egress through the portal is not possible, proceed to the nearest refuge station or place of safety and await further instructions.
- Advise other workers that you encounter of the emergency.
- If your passage to the nearest refuge station or place of safety is blocked proceed to the nearest dead-end drift that has air and water available and seal yourself in using any available materials. Use your jacket, oiler jacket or shirt to make a tent over your head and the air header and crack open the airline and wait for help.
- **Do not panic and enter smoke** – trained rescue personnel will get you out.
- Occasionally beat on a pipe in a series of three (3) taps to indicate your location.
- If you reach the portal, proceed immediately to the tag board and tag yourself out. Then report immediately to your supervisor and notify him that you are out of the mine.
- Do not leave the truck shop area until authorized to do so by your supervisor.

3.5.2.2 Discovering Fire or Emergency

Persons discovering the fire or emergency shall:

- Immediately try to extinguish the fire with whatever means are available. Fire extinguishers are located at all refuge stations, shops, electrical sub-stations, storage areas, fuse and powder magazines and on all pieces of mobile equipment.
- If you cannot put the fire out quickly, try to warn everyone that you can and or get to a phone or radio and call your supervisor or the surface shops/offices and pass on all details of the emergency and have them call a **"Code 1"** three times on UG Emergency Channel 4. Make sure you pass on all details of the emergency and ask for the stench gas to be injected:

- your name and location of the emergency;
- the precise location, nature of the fire and what is burning;
- the size of the fire; and
- your planned destination after the call.

When the alarm is turned on, a stench gas warning will be introduced into the airline and ventilation system in the mine and all persons underground should proceed as follows:

- Put on your self-rescuer and proceed to the portal. If egress through the portal is not possible, proceed to the nearest refuge station or place of safety and await further instructions.
- Advise other workers that you encounter of the emergency.
- Upon reaching the portal, proceed immediately to the tab board and tag yourself out. Then report immediately to your supervisor and notify him that you are out of the mine. Remain at the pre-arranged safe designated place.
- Do not leave the truck shop area until authorized to do so by your supervisor.

3.5.2.3 Fire on Piece of Underground Equipment

If there is a fire on a piece of equipment in the underground mine workings:

- Stop the piece of equipment and shut down the engine.
- Turn off the master switch.
- Extinguish the fire using the handheld fire extinguisher from the piece of equipment first. If you are unsuccessful activate the fire suppression system from one of the two activation points located on most pieces of underground equipment.
- Do not expose yourself to smoke or gases.
- Even if you succeed in extinguishing the fire do not delay in announcing an emergency. Go to the nearest phone and call your supervisor or the surface shops/offices and pass on all details of the emergency and have them call "**Code 1**" three times on the **UG Emergency Channel 4.** Make sure you pass on all details of the emergency and ask for the stench gas to be injected:
  - your name and location of the emergency;
  - the precise location, nature of the fire and what is burning;
  - the size of the fire; and
  - your planned destination after the call.

When the alarm is turned on, a stench gas warning will be introduced into the airline and ventilation system in the mine and all persons underground should proceed as follows:

- Put on your self-rescuer and proceed to the portal. If egress through the portal is not possible, proceed to the nearest refuge station or place of safety and await further instructions.
- Advise other workers that you encounter of the emergency.

- Upon reaching the portal, proceed immediately to the tab board and tag yourself out. Then report immediately to your supervisor and notify him that you are out of the mine. Remain at the pre-arranged safe designated place.
- Do not leave the truck shop area until authorized to do so by your supervisor.

3.5.3 Emergency Activation System (Stench Gas)

3.5.3.1 Stench Gas Activation

Stench gas is normally injected for emergencies requiring mine evacuation or refuge such as fires. In the event of a stench gas deployment, all persons shall:

- Evacuate to a safe area where communication can be maintained unless immediately requested to assist.
- Evacuate to a designated assembly area for a head count or further instruction.
- Not leave the assembly areas or go back into the area until authorized.
- Not make any off-site phone calls with details of the emergency.
- If underground proceed to the portal. If egress is not possible, proceed to the refuge station and contact surface via the mine phones.

In order to release the stench gas underground follow BJ-OHS-SOP-004 Stench Gas Release.

3.5.3.2 Person Encountering Stench Gas

If you smell stench gas (ethyl mercaptan/rotten egg smell) anywhere in the mine:

- Stop working immediately and make sure others in the area are aware of the emergency.
- Shut down and secure any equipment you have been using. Make sure it is not parked blocking the roadway or access to emergency or electrical equipment.
- If egress to the portal is not possible (do not go past a refuge station), proceed to the refuge station.
- Travel quickly but calmly and do not run. Take any available tools with you. If there is any indication of the smell of smoke put on your W65 self-rescuer or Ocenco 6.5 EBA.
- Always stay on the fresh air side; never travel in air containing smoke.
- Do not change the ventilation system.
- Warn anyone you meet along the way of the emergency.
- Upon reaching the portal, proceed immediately to the tag board and tag yourself out. Then report immediately to your supervisor and notify him that you are out of the mine.
- Do not leave the tag board area until authorized to do so by your supervisor.

3.5.4 Loss of Ventilation

If ventilation is lost in the mine:

- In the event of an auxiliary fan failure:
  - leave the area;
  - shutdown all diesel-powered equipment;
  - notify your shift boss of the problem;
  - the shift boss will call an electrician to evaluate the problem;
  - once evaluated and fixed the ventilation will be turned on to flush out the affected area for 20 minutes prior to resuming work in the area; and
  - work will not resume in the heading until adequate ventilation can be established.
- In the event of a main fan failure:
  - shut down all diesel-powered equipment and notify shift boss;
  - small diesel-powered tractors or utility vehicles may be used to egress;
  - all personnel should proceed to the refuge station;
  - roll call will be completed from the tag board to ensure all personnel are accounted for;
  - work will not resume in the mine until adequate ventilation has been established; and
  - a gas tests as well as flow and velocity checks in all work areas will be completed prior to work resuming.
- If smoke or fire is encountered at any point refer to Section 3.5.2 of this MERP.

3.5.5 Refuge Station

3.5.5.1 Action Steps for Refuge Station Procedures

Step I – General Actions

1. A responsible person will take charge immediately (Does not have to be a supervisor).
2. Determine if there is compressed air coming in or not (airline).
3. Follow Step II or Step III, depending on compressed air.
4. Call in (phone/radio) and report all persons in refuge station. Double-check all names and those present. Make certain all present have been reported in.

Step II – When Compressed Air Is Available

1. Go in through the first door and close it behind you.
2. Purge contaminated air in the air lock with provided compressed air cylinders.
3. Open second door to enter chamber and close behind you.
4. Ensure compressed air is on.
5. Keep a check on pressure inside refuge station (must be positive). This can be determined by holding a string or piece of paper, etc. in exhaust pipe opening.
6. Conserve oxygen by keeping quiet and still.
7. Mix the air by having one-person walk around every fifteen (15) minutes or so.

8. Keep off the floor. The exhaled air containing CO_2 is heavier than normal air and settles to the floor.
9. Conserve cap lamps. One on per group is adequate.
10. Remain in station until you receive official instructions.
11. “NO SMOKING “at any time during Emergency Stench Warning.
12. Remain calm, follow Emergency refuge conduct procedures.
13. Ensure continuous gas monitoring to ensure air quality is sufficient.

Step III – If Compressed Air Is Not Available

***Note**: When compressed air (airline) is not available extra care must be exercised.*

1. Go in through the first door and close it behind you.
2. Purge contaminated air in the air lock with provided compressed air cylinders.
3. Open second door to enter chamber and close behind you.
4. Ensure the compressed air valve is closed.
5. Turn on oxygen and refuge chamber continuous gas monitor. This will continually measure the air quality in the chamber.
6. Ensure names of those in refuge station are phoned/radioed in and update information as necessary.
7. Frequently check sealed openings for possible leaks and maintain positive air pressure.
8. Conserve oxygen by keeping quiet and still.
9. Mix the air by having one-person walk around every fifteen (15) minutes or so.
10. Keep off the floor. The exhaled air containing CO_2 is heavier than normal air and settles to the floor.
11. Conserve cap lamp batteries – use only one cap lamp at a time.
12. Remain in the refuge station until you receive official instructions that it is safe to leave.
13. **NO SMOKING** at any time in the refuge station during the emergency.
14. Remain calm, you will eventually be rescued.

3.5.5.2 Duties of Person in Charge of Station

Duties of person in charge of station (a responsible person or as designated by Supervisor):

- Phone/radio mine office. If phone/radio is out of order, stay at your location until rescued.
- Report number and names of personnel in refuge station, injuries if any, location of fire if known, smoke conditions, ventilation, locations of other persons if known.
- Maintain discipline in the refuge station.
- Keep use of phone/radio to a minimum.

- Remain in refuge station until instructed otherwise.

3.5.5.3 Persons Entering Refuge Station

Duties of person entering a refuse station (a responsible person or as designated by Supervisor):

- Report your name and working place to person in charge.
- Follow any instructions by the person in charge.
- Sit down and remain calm and quiet.
- Do not smoke in the refuge station.
- Turn off your cap lamp to conserve the life of your battery. One lamp on per group is sufficient to illuminate the station.
- Save any food or liquid in case your rescue may be delayed.
- If you are alone in the refuge station, follow instructions given above or as posted in the refuge station.

REMEMBER: You are in no danger if you remain where you are. You will be advised via telephone/ radio by someone in authority or by the Mine Rescue Emergency Response Team when it is safe for you to leave and by what route you should travel to reach surface.

3.5.5.4 Refuge Station Locations

All refuge station locations must be constructed and equipped in accordance with Part 6.13.3 of the HSRC, 2017.

3.5.5.5 Refuge Station Required Emergency Supplies

The following items are to be stocked in each refuge station. No person may use or consume any of these supplies unless it is an emergency.

- first aid supplies and blankets;
- oxygen therapy unit;
- radio communications;
- phone (Femco or other);
- CO_2 scrubber;
- oxygen bottles;
- food rations;
- drinking water;
- portable toilet;
- sealant; and

- compressed air.

If inventory is taken from the refuge station, the safety department must be notified immediately so it may be restocked.

3.5.6 Employee Tally Procedures

In the event of an emergency a systematic check must be conducted to account for all persons underground at the time of the emergency. To achieve this, the following procedures must be followed.

1. Once an emergency has been established, the Shift Boss or designate will begin a roll call of all employees known to have gone underground. This firstly can be assessed by checking the tag board located in the main dry/shifters area. All employees going underground are required to place their personal ID tag on the board. All others such as visitors or contractors would be tagged accordingly. A back up check would be to do a mine lamp count and compare to tag count.
2. Should anyone be unaccounted for, the Shift Boss or designate would then determine their job description (miner, electrician, mechanic, etc.) and the last location where the person was working.
3. Once the Incident Command Group has been assembled a search and rescue plan shall be initiated.

4 GENERAL PROCEDURES TO FOLLOW FOR ACCIDENTS AND FIRST AID TREATMENTS

4.1 FIRST AID AND MEDICAL SERVICES

As per requirement of Part 3.6.1 of the *Health, Safety and Reclamation Code for Mines in BC*, 2017, Pretium Resources/ Brucejack Mine is providing and maintaining first aid supplies and services as required by WorkSafeBC. As part of the emergency response plan, Pretium Resources/ Brucejack Mine has mutual aid partnerships with Silvertip Mine and New Gold and will mutually provide resources and compensation as required.

The fully equipped first aid facility is located in a designated facility on the property. The facility and equipment are clearly identified and reserved for the treatment of injured personnel. The Medic/OFA 3 can be reached by radio at all times, On Channel 2, Repeater 1 in case of emergency, or if underground call on Channel 1.

All personnel working on site, including laborers and equipment operators are required to:

- have general knowledge of how to summon first aid help, and general knowledge of securing the scene and helping (as per the level they are trained at); and
- be authorized to call for transportation for injured workers and must be trained in the procedures.

The mine site should have a percentage of employees who have Level 1 and Transport first aid tickets while working on the mine site.

Any work site that requires specialized equipment for the rescue or transport of injured personnel is clearly identified. The equipment is properly stored to prevent damage or deterioration. Clear access to this equipment will be always maintained, and a regular inspection program has been established to check for deficiencies.

To complement the first aid services, Pretium has enacted the general procedures described in Section 4.2. All employees, contractors and their employees should follow these procedures in case of first aid treatments, accidents, and dangerous occurrences.

An Emergency Response Coordinator (or designate) will be in command during Code 1 emergencies.

To ensure that appropriate information is gathered during a site emergency or during a first aid response, checklists will need to be developed. An example form is provided in Section 9.

4.2 FIRST AID, MEDICAL AID AND TREATMENT PROCEDURES

4.2.1 First Aid Treatment Procedure

Any worker who sustains an injury or illness that is, or may be, work related shall report for treatment as soon as possible. The following three (3) situations below highlight, depending on the type of injury, what type of actions are required:

- If you suffer a minor injury that requires First Aid, the first three (3) action items are required.
- If you suffer a significant injury and are unable to continue work, and/or will not return to work the next day or for a period of time, all five (5) action items are required.
- If you suffer a significant injury and will not return to work the next day or for a period of time, all five (5) action items are required.

Action items to follow depending on the type of injury situation:

1. Report injury to First Aid Attendant.
2. Ensure you receive proper treatment.
3. Document in treatment record book.
4. Notify supervisor, who will initiate an investigation.
5. Complete required paperwork and forms.

If you encounter these typical first aid scenarios, be prepared and know how to treat them:

- bleeding from cuts and abrasions;
- slips and falls – injuries such strains, sprains and broken bones (fractures) or concussions;
- burns; and
- allergic reactions.

4.2.2 Procedures for Handling Medical Emergencies

The following assessment will be necessary during any medical emergency. Whether it is minor or life threatening, use the following simplified **Priority Action Approach:**

1. **Scene Assessment:** Mechanism of Injury? Hazards? Environment?

   First: Keep yourself safe

   Second: Observe for bleeding/deformities/eyes

   Third: Observe the skin/level of consciousness – moving/verbal

   Fourth: Spinal Precautions

   Fifth: **Airways** – With C-spine: Open/Clear – manually stabilize head

   Breathing – Rate and Quality

   Circulation – Radial/Carotid, skin – color, temperature and condition

   Sixth: Rapid Body Search (RBS) – Rapid/Through Life Threatening

Seventh: Warmth – Blankets/Reassurance/Support Injuries

2. **Transport Decision:** Load and Go (Hospital and/or Call for an ambulance)/Stay and Play (Administer First Aid).
3. **Communicate to Emergency Services:** Stewart or Terrace Hospital or call for help from other persons on-site.
4. **Secondary Assessment:** Vital, History, Head to Toe Evaluation.
5. **Definitive Treatment:** Ice, Dressings, Splitting, Wound Cleaning, etc.

Once relieved by the Medic/Advanced First Aider, continue to assist if required and pass on any information gathered during assessment of patient.

If the injury requires offsite medical aid, it will be the sole responsibility of the Medic/Advance First Aider on duty to do all Medical Aid Referrals, by making the decision to transport, the choice of methods and the decision to accompany the patient, if necessary. The direct supervisor is then solely responsible to arrange for the required transportation for the injured worker. If the transport is by helicopter than the Medic/Advanced First Aider will call the Site Dispatcher who will contact VIH Helicopters on radio Channel 2 or at the VIH Hanger in Stewart at 1-250-636-2498. Advise them if a litter stretcher is required. **THE LITTER STRETCHER IS REQUIRED FOR ALL SPINEBOARD SCENARIOS**.

If ambulance transportation is required from the Stewart Airport to the Stewart Health Centre or there is more than one injured person, contact BC Ambulance Services at 1-800-461-9911.

It is the responsibility of the Medic/Advance First Aider to complete the proper forms and submit them to WCB; as well to distribute a copy to the Mine Manager and if necessary, provide a copy for Pretium Resources Inc. head office. A record of every injury or illness that requires first aid treatment is kept in the Accident Record Book. Each record must be signed and dated by the person providing treatment. The First Aid statistics shall be reviewed monthly at a safety meeting to determine trends and recommend corrective action.

4.2.3 Procedures to Follow in Case of a Serious Accident or Fatality

The following basic procedures should be followed in the event of a serious (life-threatening) accident requiring first aid treatment or a fatality. It is imperative that you ensure there is no further danger to yourself and to the patient before starting treatment.

If you have a radio, call “Code 1” three times on UG Emergency Channel 4 and stay on this channel until you receive confirmation that your notification was received by Supervisor/Site Dispatcher/ Security/Safety Manager. If you are near a phone call extension 100 to dispatch and call a Code 1. ***Note:*** *Code 1 Emergency will deploy ERMT. Make sure you pass on all details of the Emergency*.

- Then follow the appropriate Emergency Evacuation Procedures that have been established for your area of operations;
- Ask Supervisor/Site Dispatcher/Security/Safety Manager to notify the Medic/Advanced First Aider (by radio) and indicate there is a medical emergency – **STAY CALM**;

- All work at the area of the accident, must cease, all equipment is to be shut off and made secure, except for those required to assist in the emergency; and
- ENSURE THAT THE ACCIDENT SCENE IS SAFE TO APPROACH – If not, report what you see.

If the scene is safe and you are able to approach the injured person, report and complete the Procedures for Handling Medical Emergencies as noted in Section 4.2.2.

REMEMBER: Call for help, stop or control bleeding, restore breathing, and avoid panic. Do no more than is necessary until help arrives.

Even if not in danger, **DO NOT MOVE** the injured patient but provide the best available first aid treatment that does not exceed your level of training. Provide comfort and warmth to the patient.

Ensure that, except for the purpose of saving a life or relieving human suffering, the scene of the accident or occurrence is not disturbed without appropriate approvals as required by Part 1.7.1 (2) of the HSRC, 2017.

If the injury is an obvious **fatality**, immediately contact the Mine Manager, who in turn will contact the appropriate authorities (RCMP and Chief Inspector of Mines). Every serious accident must be reported immediately to the Mine Manager, by the first aid attendant on duty after requesting an ambulance or helicopter. The Mine Manager will then contact MEMLCI, who will advise whether the Ministry will investigate the accident.

4.2.4 Procedures to Follow when Calling for a Provincial Ambulance

When instructed by the Medic/Advance First Aider or the Direct Supervisor, follow these steps:

1. Call AMBULANCE: Phone 1-800-561-8011 or 911;
2. When asked “For what place?” answer “Pretium – Brucejack Mine”;
3. As the mine does not have a municipal address, the dispatcher may not be familiar with the locations. If that is the case, pass along the following information that fits the 911 dispatch system:
   - First Name: Brucejack Camp
   - Last Name: Pretium Exploration Inc.
   - Street Number: Northern BC
   - Street Name: Near KM 215, Highway 37, Down 73 km Haul Road
   - City: Between Meziadin Junction and Bell 2
   - Other Information: LAT 56°27’57.64’N LON 130°11’11.32”W
     Elevation 1,440 m asl, 73 KM Haul Road Access off Hwy 37
4. State that “We have life threatening injuries and request vehicle or helicopter evacuation”;
5. There will be several questions the dispatcher will ask including:
   - “Your exact location?”
   - The Brucejack Camp co-ordinates are?”

     Latitude: 56 degrees 28 minutes 01 seconds

Longitude: 130 degrees 11 minutes 01 seconds

Map Coordinates: NAD 83 UTM: 9V East: 427080 North: 6258695

- What is the phone number you are calling from?
- What happened exactly?
- What are the injuries?
- Are you with the injured person now?
- How many people are hurt?
- How old is the patient?
- Is the patient conscious or unconscious?
- Is the patient on a spine board?
- Is the patient breathing?
- What is the weather at site?
- Is there an accessible area to safely land a helicopter?
- Is the patient accessible?
- How many daylight hours are left?

Triage is done based on the information you are able to provide. A road or air ambulance will be dispatched to the required location. If the ambulance crew from Stewart is required, they will come in a helicopter from Stewart. Flying conditions will be reviewed and Medevac will proceed at the discretion of the pilot in command.

The **one-way** flight lengths to Stewart:

- Direct: 60 km (approximately 20 minutes)
- Via the Granduc Valley and Knipple Glacier: 76 km (approximately 30 minutes).

Flight lengths to the Terrace airport:

- Direct: 245 km (approximately 80 minutes).

If you are calling for an air ambulance, then you must prepare a helicopter landing pad/area. This area must be clearly marked and cleared of debris that could become airborne when the helicopter approaches and damage the rotors in the machine. A guard must be posted in this area and all traffic in the vicinity stopped. The helicopter will be looking for this area and can be guided into the landing area.

4.2.5 Reporting of Illness or Injury

Every Pretium employee, contractor and contractor employee at the Brucejack Mine must report any work-related injury or illness to their immediate supervisor, immediately. It is the responsibility of the supervisor and/or Medic/Advanced First Aider to ensure that the ill or injured worker receives appropriate first aid or medical treatment immediately.

Failure to report any work-related injury or illness is grounds for discipline, up to and including dismissal.

Any non-work-related injury or illness that will result in a worker being absent from work, for any reason, must be reported to their immediate supervisor as soon as possible after the worker learns of his or her inability to work. All personnel (management, direct employees and contractor employees) with non-work-related injury or illness shall provide the immediate supervisor with any information they have as to the expected duration of the injury recovery or illness to allow for efficient manpower planning.

Prior to returning to work (from a work caused illness or injury or nonwork-related illness or injury) the person shall contact the immediate supervisor to confirm their return-to-work date.

5 SURFACE FIRE EMERGENCIES

Fires could be one of the most common incidents on the job. Therefore, it is important to have some general fire protection rules that must be adhered to by all Pretium employees and contractors.

5.1 GENERAL FIRE PROTECTION RULES

General protection rules include, but are not limited to the following:

- There will be no smoking on the job, other than those areas designated as “smoking areas.”
- Evacuation routes are to be posted at various locations throughout the mine site. Every person shall be familiar with the emergency escape routes and the evacuation procedures from their workplaces to the assigned assembly area.
- No person shall tamper with fire protection equipment or issue a false alarm.
- Discharged fire extinguishers and non-serviceable fire protection equipment shall be reported immediately to the supervisor on duty. Discharged and expired fire extinguishers shall be returned immediately to the Warehouse for a replacement, and the replacement shall be installed in its proper location.
- Any fire, and use of fire protection equipment regardless of severity, shall immediately be reported to management.
- Except for during an emergency, no work shall be performed on any fire protection system, including fire alarms and fire water supply, without the prior approval of the Mine Manager. In the case of emergency work being performed on fire protection system, the Mine Manager shall be immediately notified.
- Fire hazard areas shall be identified by warning signs, and no person shall smoke or use open flames in designated fire hazard areas.
- All persons shall be familiar with the location, and the use of the fire extinguishers, and know how to summon assistance.
- Fire extinguishers and fire suppression systems shall be inspected annually by an authorized person, and a written record of the inspection will be reported to management.
- Open flames, welding, and cutting and similar activities in certain locations shall not be permitted without following protocol as noted in the maintenance (welding) section.
- Flammable liquids shall be labeled, stored in a separate area, and transported and disposed of in an approved manner.
- When using gasoline-powered engines, do not refuel hot or running engines. After refueling, clean up all spills before starting.
- Never use gasoline or other flammable materials as a cleaner.
- When using propane for heating or other purposes in an enclosed area ensure that the gas supply is turned off at the cylinder, or the torch is removed from the area when the flame is extinguished.

5.2 PROCEDURES TO FOLLOW IN CASE OF A FIRE

If you encounter smoke and/or a fire, follow the rules listed below. A fire/explosion emergency response flowchart is provided in Figure 5.1-1.

- Attempt to extinguish the fire only if you can do so safely.
- If you encounter smoke, shout “FIRE” and sound an alarm or have someone do it and/or call on the mobile radio the situation.
- Evacuate the area and **call a Code 1 on Channel 2**, **repeater 1**.
- Immediately notify the supervisor on duty and/or Mine Manager.

If you are in a building and hear an alarm, the following procedures shall be followed:

- Leave the building immediately by the nearest fire exit, alerting people on the way.
- Close the doors behind you when exiting the building – REMAIN CALM.
- When exiting the building shout “FIRE” and knock on doors as you go out, but do not wait for an answer as the person may be off shift or working elsewhere.
- When you have reached the outside, move away from the building.
- Go to the designated assembly area.
- Wait for further instructions from either the supervisor on duty or the Mine Manager. If you are part of the emergency response team, at your discretion, attempt to control the fire with available fire equipment.
- DO NOT GO BACK INTO THE BUILDING FOR ANY REASON.

Record information about the fire; someone must keep notes on the situation, such as:

- Where was the fire?
- When was it discovered and by whom?
- Whom did you contact and when?
- What actions were taken to contain the fire?
- What is the extent of damage?
- Your name and telephone (contact) information.

5.3 PROCEDURES FOR USE OF FIRE EXTINGUISHERS

Attempt to extinguish a fire with an extinguisher only if the following conditions exist:

- There is a clear exit and the fire is small;
- The person using the fire extinguisher is familiar with its use; and
- The extinguisher is in working order.

When using a portable fire extinguisher:

- never place the fire between yourself and the exit;
- never turn your back on the fire;
- always keep your back to the exit; and
- remember PASS: Pull – Aim – Squeeze – Sweep.

A person shall not attempt to extinguish a fire if:

- the fire is quickly spreading beyond its point of origin; and
- the fire could block the exit, or the person is unsure how to use a fire extinguisher.

Figure 5.1-1. Fire/Explosion Emergency Response Flow Chart

6 AVALANCHE EMERGENCIES

6.1 INTRODUCTION

The Brucejack Mine operates in a high snowfall area with steep terrain subject to snow avalanches. At this time, some infrastructure facilities are located outside of known avalanche-prone areas, however personnel do work in avalanche-prone areas. During periods of (high) snow, advice on current (avalanche) risks must be obtained from an avalanche technician. As well all personnel must be equipped with appropriate safety gear and trained to use avalanche beacons.

At the mine, the Mine Rescue Emergency Response Team(s) will be trained in avalanche rescue techniques in case an avalanche affects facilities and personnel. Avalanche rescue will not be attempted unless the site is considered to be safe from further danger by Pretium's Mountain Safety personnel.

Pretium currently has an avalanche safety plan (ASP, Brucejack Mine Avalanche Safety Plan, updated March 2021) developed by Pretium's Mountain Safety Department. Some of the information in this section was obtained from the ASP, which will remain current for avalanche safety during mine operation and closure.

The ASP contains pertinent information on the following:

- Organization Structure and Personnel – Roles and Responsibility of Pretium and the Avalanche Contractor;
- Avalanche Training;
- Equipment and Infrastructure;
- Operational Procedures; and
- Search and Rescue, etc.

Pretium management, as part of the on-site training, will ensure that all employees, contractors and their employees have reviewed the ASP. Further, the ASP will be accessible on-site and available for future review.

6.2 GENERAL AVALANCHE SAFE OPERATIONAL PROCEDURES

All Pretium employees, contractors and their employees will be required to adhere to the General Avalanche Safe Operational Procedures. These procedures ensure work is conducted safely within avalanche areas and are effective at all hazard levels. General procedures include:

- attending scheduled avalanche safety training sessions;
- familiarizing themselves with avalanche hazard zones;
- familiarizing themselves with the location and use of rescue equipment;
- knowing how to properly use avalanche PPE, including the rescue transceiver;

- reading the Avalanche Hazard form every day, and adjusting work and PPE accordingly;
- following check-in, check-out procedures as per the Underground Incident Command Procedure;
- ensure that personal avalanche PPE is maintained and ready for use;
- reporting avalanche accidents or near misses immediately to Mountain Safety technicians, the Mine Manager, Health and Safety Manager and Operator Supervisor; and
- contacting Mountain Safety Technicians (MSTs) to update them of unusual weather or snow conditions.

6.3 AVALANCHE ACCIDENT/INCIDENT REPORTING AND REVIEW

All avalanche accidents, incidents or near misses will be immediately reported to MSTs, the Health and Safety Manager and the Mine Manager and Operator Supervisor. MSTs will complete the avalanche incident investigation reports and depending on the severity of the incident will be reported to the appropriate authorities as necessary (MEMPR, JHSC, WorkSafeBC, the CAA (Infoex) and Insurance agents if applicable). Standard WorkSafeBC protocols will be followed for accident investigation.

6.4 SEARCH AND RESCUE

In the event of an avalanche involvement, rescue must be initiated immediately. TIME IS OF THE ESSENCE. If people are buried in a vehicle, they may have several hours of available oxygen if they are not injured. If buried on foot, then they may only have 10 to 15 minutes, or less.

Rescuer safety is of paramount importance in an avalanche rescue. Under no circumstance should a rescue party enter an avalanche area unless it is certain that the area is safe. If in doubt, consult with MSTs.

There are three (3) separate documents that make up the overall Avalanche Emergency Response Plan for an avalanche accident/incident:

1. **Avalanche Rescue Card** – for those involved in or witnessing an avalanche.
2. **Site Rescue Leader (Commander)** (cheat sheet) – for the site rescue leader.
3. **Emergency/Incident Response Plan** – for base/office personnel.

6.4.1 Avalanche Rescue Card

Immediate Action for Vehicle or Worksite

IF YOU ARE BURIED IN A VEHICLE, DO THE FOLLOWING:

1. Shut off the engine and lights.
2. DO NOT smoke.
3. CALL a “Code 1” three times on the radio.
4. Make sure your avalanche beacon is on.

5. Turn on your four-way flashers.
6. Honk briefly 2 to 3 times/minute.
7. If you are completely buried, try pushing a probe out of the snow.
8. Stay calm and wait to be rescued.
9. DO NOT GET OUT OF VEHICLE, ANOTHER AVALANCHE COULD COME DOWN.
10. WAIT FOR INSTRUCTIONS FROM THE MOUNTAIN SAFETY TECHNICIANS.

If you witness an avalanche accident, follow these steps:

1. Note the last seen point and number of people caught in avalanche.
2. Ensure personal and/or group safety.
3. CALL “Code 1” three times on the radio and initiate the Incident Response Plan.
4. Reference the Site Rescue Leader (Commander) (Cheat Sheet).
5. WAIT FOR INSTRUCTIONS FROM MOUNTAIN SAFETY.

6.4.2 Site Rescue Leader (Commander) (Cheat Sheet)

Guidelines contained in the Site Rescue Leader Cheat Sheet are shown in Figure 6.4-1.

6.4.3 Avalanche Emergency Response Plan

The Avalanche Emergency Response Plan has been developed for a Level 1, 2 or 3 incidents at the Brucejack Mine. The plan is based on the Incident Command System (ICS) structure. It is envisioned that on-site resources will complete the rescue in the first Operational Period (1 to 2 hours) dependent on size and location of incident.

In the event of a Code 1 avalanche being called, Emergency Response Teams (including Mountain Safety) will mobilize to the scene, the Fire Hall or be put on standby.

The Incident Management Team (IMT) will convene in the Incident Management Room (IMR) which is the boardroom in the Main Camp.

The IMT will define the Objectives, the Response Level and Strategies to be adopted as well as assigning resources to the rescue.

In the event of a large avalanche or an incident involving occupied buildings being damaged or destroyed, a Second Operational period would likely be required and the initial ICS structure expanded.

Figure 6.4-1. Site Rescue Leader Cheat Sheet

7 ON-SITE MINE RESCUE

7.1 MINE RESCUE EMERGENCY RESPONSE TRAINING

Pretium's underground contractor (Procon) has a fully developed underground MERP, that includes a fully trained mine rescue team equipped with all required emergency equipment, according to Part 3.7.1 of the HSRC, 2017. Pretium will continue to utilize the underground MERP and will develop and implement as well a surface MERP for the Brucejack Mine.

As per requirements of Parts 3.7.1 to 3.7.13 of the HSRC, 2017, the Brucejack Mine will have in place the appropriate mine rescue response capabilities. To this end several Pretium employees and contractors will be certified mine rescue personnel. They will meet the requirements of the Code and will have appropriate training.

The Mine Rescue Emergency Response Team will have qualified trainers, who will conduct classroom and field training/practice for not less than eight (8) hours in each three-month period of mine operations.

A training record/logbook is maintained on site. The surface/underground training programs will include both theory and practical training, in such things as:

- Mine Rescue Operations;
- Mine Gases – Recognition, Effects and Treatment;
- Oxygen Therapy;
- Gas-Detection Instruments;
- Fire Emergencies and Safe Firefighting Practices;
- Respiratory Protection Equipment Training;
- Mine Ventilation and Fire Suppression Underground;
- Emergency in Underground Mining Operations;
- Electrical Safety;
- Rescue Rigging;
- Rescue Operations, and
- Special Hazards of Winter Conditions.

7.2 UNDERGROUND MINE RESCUE EQUIPMENT INVENTORY

The Brucejack Mine will maintain the underground mine rescue equipment inventory shown in Table 7.2-1.

Table 7.2-1. Underground Mine Rescue Inventory

Description	Quantity	Part #
Dräger BG4's breathing apparatus	23	PSS BG4 PLUS
Ambulance – Miller Toyota	1	
BG4 oxygen bottles - spare (full)	34	B30230
BG4 filter mats (50)	3	4058167
BG4 ice molds	5	4056449
BG4 Tramix kit	1	R33777
BG4 dryer	1	R28305
Masterline Oxygen Booster Pump	1	
18 kg keg of Drägersorb	20	6737985
Filling stand for reusable canister	2	R33752
Dräger Tester RZ 7000	1	AG02690
Drager Quaestor 5000	1	
Airkem A-33 disinfectant	2	DIN 02035707
Klar-pilot anti fog	33	D40699
BC Level 3 first aid kit, soft case	1	EMFBC309
Basket stretcher	2	EMF34000
Spine board	2	EMF34100
Clam shell	1	
Set of spider straps	2	FOW770C
Adjustable hard collar	2	ABU000-281-000
Multipurpose splint	6	GEEM100
Gray utility blanket	14	SAFC125
50 ft canvas fire hose	4	ANG014909-1IF
200 ft Bag of 12 mm rescue rope	1	MSASRP504866SL200
100 ft Bag of 11 mm rescue rope	1	MSASRO544000100
30 m roll of 25 mm webbing	1	7901-RD
50 mm minding pulleys	4	610014
13 mm pulleys	4	610013
Scarab descender	2	NFPA128701
Full body harness	5	MLRRDT-TB/UBK
6 ft shock absorbing lanyard	5	DBI1240211C
Carabiners	25	NGSN263G
Mine rescue whistle	1	73-0646-0
8.5 x 11 clip board	2	97123
Scales	4	987-18-4

7.3 SURFACE MINE RESCUE EQUIPMENT INVENTORY

The Brucejack Mine maintains two sets of surface/crevasse rope rescue equipment. The first set is located in the Brucejack Mine Rescue Room (Table 7.3-1). The other set is located in the km 59 staging area shipping container (Table 7.3-2).

Table 7.3-1. Brucejack Surface/Crevasse Rescue Equipment Inventory-Brucejack Mine Rescue Room

Description	Quantity
70 L dry bag	1
60 m x 11 mm rope	1
Climbing harness (BD, large)	1
PSS 7000 SCBA	14
Petzl Bermuda Triangle evacuation sling	1
Camp helmet	1
Crampons	1
Petzl tikka headlamps	2
Picket	1
G3 steel probe (350 cm)	1
Edge protector	1
Ice screws	4
BD ascenders	2
ATC	1
MPD industrial device	1
Industrial pulley (1 single sheave, 1 double sheave)	1
Small pulley	1
Carabiners (non-locking)	4
Munter carabiners (locking)	2
Steel master link carabiner	1
SMC rigging plate	1
Locking carabiners	13
Yates sewn sling (yellow)	1
Bulk 1# tape sling material	2
7 mm prussic slings	4
8 mm prussic slings (long)	5
8 mm prussic slings (short/knotted or sewn)	4

Small pulley	1
Carabiners (non-locking)	4
Munter carabiners (locking)	2
Steel master link carabiner	1
SMC rigging plate	1
Locking carabiners	12
Yates sewn sling (yellow)	1
Bulk 1# tape sling material	2
7 mm prussic slings	3
8 mm prussic slings (long)	5
8 mm prussic slings (short/knotted or sewn)	4

7.4 ACTIVATING THE MINE RESCUE MUTUAL AID PARTNERS

Pretium Brucejack Mine has a written agreement with mutual aid partners for on-site assistance, as needed. These partners are: New Gold based in Kamloops, BC, and Silvertip Mine located in northeast BC.

The decision to activate the mine rescue mutual aid partners shall be made in conjunction with the General Manager, the Mine Manager (or designate) and the Emergency Response Coordinator (ERC).

7.4.1 Standby Status

Once an emergency which has the potential need for mutual aid response is identified, Pretium's Mine Manager (or designate) or ERC will notify the mutual aid partner(s) to be prepared to respond.

Pretium's staff will begin evaluating transportation options and notifying Granmac Services and VIH Helicopters to standby and be ready to mobilize personnel, vehicles, and equipment.

Contact information for all mutual aid partners is included in the Emergency Contact List. The Mine Manager will notify the MEMLCI of this decision.

7.4.2 Activation Status

Once it is clear that additional assistance is required, the Mutual Aid Partners will be activated. At this time, Pretium staff will begin making transportation requirements. All mutual aid partners requested to help will start transporting personnel and equipment to site as directed by Pretium's staff.

The Mine Manager will notify the MEMLCI of this decision.

8 EARTHQUAKE RESPONSE

8.1 INTRODUCTION

The Brucejack Mine is located on the Pacific Rim and earthquakes of varying magnitudes are a possibility. An earthquake at site could affect:

- personnel safety;
- building structural integrity;
- fixed equipment integrity;
- waste dump stability;
- underground geotechnical conditions;
- avalanche slopes; and
- rock slope stability.

The following response protocols will be initiated in the event of a significant earthquake. For the purposes of this document a significant earthquake is an event during which buildings can be felt to sway or that will cause some noticeable damage.

8.2 INCIDENT MANAGEMENT

Depending on the severity of damage, the Mine Manager will decide if implementation of the Incident Command System is required.

8.3 PRIORITIES FOR RESPONSE

During or following an earthquake, the following actions will take priority:

- **Save Lives**: The preservation of life will be the top priority of managers and first responders and take precedence over any and all other considerations.
- **Diminish Suffering**: All possible efforts will be made to diminish suffering by providing basic human needs, including medical care, heated shelter, food, and water.
- **Protect Property:** All possible efforts will be made to protect Pretium and contractor property from further damage.
- **Protect the environment:** All possible efforts will be made to protect the environment from further damage. Protection of waterways will take priority.
- **Restore Basic Services: P**ower, heat, sanitation, and medical services will be restored as quickly as possible to enable the camp to function.

- **Restore Production:** Once the above items have been accomplished efforts to restore production will begin. Some production restoration items may be completed in parallel with the prior activities.

8.4 ROLES AND RESPONSIBILITIES

8.4.1 Brucejack Mine Site

In the event of an earthquake, the Mine Manager will be responsible for coordinating emergency medical response, environmental response, and facilities inspections. The various department heads will report to the Mine Manager.

8.4.2 Mine Manager

The Mine Manager will assign roles to the Incident Command system if necessary.

Once site conditions are assessed and response efforts are underway, the Mine Manager shall notify the senior management in the Vancouver and Smithers offices of the incident and any support required.

If damage or injuries fall under any immediately reportable category as defined by HSRC Section 1.7.1 and 1.7.3, the Mine Manager shall immediately report the incident to a BC MEMPR Inspector of Mines.

As soon as particle after the incident, the Mine Manager shall assign a qualified person to complete an incident report.

8.4.3 Access Road Manager

The Access Road Manager is responsible for coordinate response and doing inspections along the access road from km 0 to the base of the glacier. He is also responsible for coordinating response and inspections at Wildfire, Bowser, and Knipple Transfer Station camps.

8.4.3.1 Camp Inspections

Each Camp Manager shall be responsible for inspecting their camp's facilities in the event of a significant earthquake. All camp personnel shall report to their camp's muster location for roll call. Any personnel unaccounted for at the muster stations should be contracted on the radio. Searches will be completed for any personnel not accounted for during roll call.

The Camp Managers shall inspect or appoint a competent person to inspect the following items:

- **Propane tanks**: Propane supply valves should be shut off if it is safe to do so. They should not be turned on again until an inspection of the propane distribution system is completed.
- **Propane pipes**: The propane distribution pipes should be inspected for damage. If any rotten-egg smell from ethyl mercaptan in the propane is noted, the area should be evacuated and the propane supply isolated. Repairs to the propane piping shall be repaired and pressure tested by a qualified person prior to use.

- **Structural damage**: All buildings shall be inspected for damage to the structure or foundations. Damage should be documented so that repair planning can be implemented. The Mine Manager shall decide if damage is severe enough to require restrictions on building use.
- **Fuel stations**: All fuel storage areas shall be checked for damage. The inspection shall include the tanks, piping, and containment systems. If damage is noted to one or more tanks, efforts shall be made to immediately stop any leaks by plugging or transferring of fuel to another tank if possible. All spills shall be reported to the Environmental Manager. All spills over regulatory thresholds will be immediately reported to the Emergency Management BC.
- **Drinking Water Systems**: The drinking water system shall be inspected. Short term silting of the potable water system may be expected. If silting is sustained, bottled water should be used until confirmatory water analysis can be completed.

8.4.3.2 Road Conditions

The Access Road Manager shall inspect or appoint a qualified individual to do an inspection of the entire road. Areas of concern are:

- loose rock falling on the road;
- avalanches triggered by the earthquake;
- cracks in the road surface, particularly near the Bowser River and an elevated road surfaces; and
- cracks in any fill slopes above and below the road surface.

Any damage shall be reported to the Access Road Manager so that repairs can be planned. The Access Road Manager will determine if any road closures or restrictions are required.

8.4.3.3 Bridge Inspections

There are fifteen bridge along the access road between Hwy 37 and the Knipple Glacier. In the event of an earthquake, each of the bridges listed in Table 8.4-1 shall be inspected. The Access Road Manager shall inspect or appoint a competent person to perform a visual inspection of the bridge deck and footings prior to authorizing traffic over the bridges. If inspections show damage to the bridges, a qualified bridge engineer will be contacted to complete a formal inspection and make recommendations for repairs and any necessary load restrictions.

8.4.3.4 Airstrip Inspections

The Access Road Manager shall inspect or assign a competent person to inspect the airstrip. The runway and apron surfaces shall be inspected for any damage that would make it unsafe to land airplanes. The airstrip navigation lights and instrumentation shall also be checked for functionality.

If any airplanes are inbound at the time of an earthquake, the airstrip staff will attempt to divert the plane until an inspection of the runway surface can be completed.

Table 8.4-1. Access Road Bridges

Bridge	Road Kilometre	Notes
1	0.5	Bell Irving River
2	2.2	Wildfire Creek
3	4.3	
4	8.9	
5	12.6	
6	23.8	
7	30.6	
8	38	Scott Creek
9	40.3	
10	40.9	
11	46.9	
12	48.7	
13	49.7	
14	53.7	Knipple Causeway
15	53.9	Knipple Causeway

8.4.4 Emergency Response Staff

All paramedics, nurses, and OFA 3's shall call inform dispatch of their location and ability to respond to medical emergencies. All emergency response staff shall remain on standby until notified by dispatch that they may return to normal duties.

8.4.5 Dispatch

8.4.5.1 Roll Call

In the event of an emergency, the dispatcher shall report to the muster area with a copy of the current camp roster. The dispatcher shall confirm the presence of each individual by performing a roll call. Personnel unaccounted for at the muster station shall be contacted by radio. The mine tag board shall be checked to confirm which employees are underground. In the event that individuals are still not accounted for, the Mine Manager will be notified so that he may assign a person to perform a search.

8.4.5.2 Confirm Communications Systems Operational

The following communications procedures will take place following an earthquake:

- **Radio:** The Brucejack Mine Site dispatcher will verify radio functionality over all frequencies. If service is disrupted on a repeated channel, the Mine Manager will authorize helicopter mobilization so that the repeater(s) in question can be inspected.

- **Phone**: The IT department will verify phone system functionality. If service is disrupted, the satellite dish should be inspected for damage and alignment.
- **Internet**: The IT department will verify internet functionality. If service is disrupted, the satellite dish should be inspected for damage and alignment.

8.4.5.3 Notify Pretium Senior Management

At the Mine Manager's instruction or in the event the Mine Manager is unable, the Dispatcher shall attempt to contact Pretium's Senior Management Team in Smithers and Vancouver. Those contacts are listed in Appendix A-3.

8.4.6 Surface Foremen

In the event of a significant earthquake, the first duties for surface supervisors are as follows:

1. Recall all personnel and equipment from the Brucejack Lake waste rock dump site.
2. Conduct a roll call to confirm the location and wellbeing of their direct reports.
3. Check in with the dispatcher and Mine Manger.
4. Perform inspections of the following facilities:

- propane storage and distribution facilities;
- fuel storage and containment facilities;
- generators;
- waste rock dump;
- maintenance shops; and
- other active work areas.

8.4.7 Mine Superintendent

The Mine Superintendent is responsible for confirming the safety of all underground employees and the status of all underground workings and infrastructure. The Mine Superintendent will also coordinate any rescue or repair work required. The Mine Superintendent will report his findings and any updates to the Mine Manager. The Mine Superintendent will advise if Mine Rescue Teams should be placed on standby or if they can be assigned to assist with surface rescue needs.

8.4.8 Underground Shift Boss

In the event of an earthquake, the first priority for the Shift Boss is to account for the safety and whereabouts of his crews. Following that, he should report that status to the Mine Superintendent and standby for further instructions.

If a mine evacuation is warranted due to fire or other underground emergency, the Shift Boss will assign a person to guard the mine entrance against further entry. The Shift Boss will report to the mine tag in board to make sure all underground personnel are accounted for. Attempts shall be

made to contact any missing personnel by radio or by calling the mine refuge stations. If persons are still missing, the mine rescue team shall be assembled and prepared for an underground search. Once the mine has been evacuated no personnel shall enter the mine until authorized by the Mine Manager.

Once mine entry is authorized by the Mine Manager, all underground work areas shall be inspected for physical damage and adequacy of ventilation. The Shift Boss shall check and document gas readings in all headings prior to the Mine Manager authorizing re-entry.

In addition to active headings, the following infrastructure areas will be inspected for damage:

- Main fan;
- Mine heater and propane lines;
- Portal structures;
- Infrastructure areas;
- Refuge stations;
- Maintenance facilities;
- Crusher chamber;
- Fan Installations;
- Fuel storage bays;
- Substations;
- Conveyor declines;
- Explosives storage bays; and
- Active stope areas.

8.4.9 Mine Rescue Team

In the event of a significant earthquake, all members of the mine rescue team shall check in with the Mine Superintendent and standby for instructions.

8.4.10 Mill Manager

The Mill Manager shall inspect or appoint a competent person to inspect the mill facilities for damage to the process plant, paste backfill plant, mine water treatment plant, and tailings infrastructure.

8.4.11 Avalanche Technicians

In the event of a significant earthquake, the Mountain Safety Technicians (MSTs) should immediately call in to dispatch and report their availability to assist as needed.

The MSTs shall report current avalanche conditions to the Mine Manager and await his instructions in case inspections along the road are required. Depending on snow conditions, the MSTs may issue short-term closures or restrictions for certain sections of the mine, specially for Lake Shore Drive.

9 EMERGENCY CHECKLISTS AND REPORTING FORMS

As part of the revisions to this MERP, it is expected that Brucejack Mine management will develop and document critical information such as EOC location, EOC staffing and layout, building descriptions, personnel assets, transportation assets, communications assets, emergency equipment and supply assets, and medical staff and supplies. The revisions will also include current contact numbers, forms, site plans, and a controlled product inventory.

To ensure that appropriate information is gathered during a site emergency or during a first aid response, checklists will be developed for the Brucejack Mine. An example of an Incident reporting form is provided in Figure 9.1-1, the Brucejack evacuation map is provided in Figure 9.1-2, Figures 9.1-3 and 9.1-4 show the locations of primary and secondary muster stations for the main and upper camps, Figure 9.1-5 shows the layout of underground workings, and Figure 9.1-6 shows the underground evacuation.

In addition, Duty Cards are provided in the following sections:

- Section 10: Duty Cards for the Incident Management Team
- Section 11: Duty Cards for the Underground Incident Command Team Figure 9.1-1. Example Incident Reporting Form

Figure 9.1-1. Example Incident Reporting Form

This form needs to be completed before the end of the shift and sent directly to safety@Pretium.com					
Date:		Time:		Equipment Involved (if any):	
Supervisor:		Location (be specific):		Department/Contractor:	
Incident Category					NM - Near Miss High Potential
Injury/Illness		Property Damage		Other	
	FA – First Aid		PD – Property Damage		Loss of process
			FR – Fire		**DO** – Dangerous Occurrence

Occupation:		Task experience:	
Shift:	Day ☐ Night ☐	Regular schedule ☐	Overtime ☐

Description of the event: (What happened? How? What was the current task?)
IMMEDIATE CORRECTIVE ACTIONS TAKEN:
(Actions taken immediately to prevent re-occurrence, to make the scene safe for others)

Nature of material damage (if applicable):			
A. Was the workplace and/or equipment in good order?		Yes ☐	No ☐
B. Was the working method adequate (procedure respected)?		Yes ☐	No ☐
C. Was the employee trained to perform the task?		Yes ☐	No ☐
D. Did the employee wear the correct PPE to perform the task?		Yes ☐	No ☐
If you answered 'no' to any of the points A – D, explain the reason:			
For severity levels, refer to below chart of the incident report form			
Real severity:	1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐	Potential severity:	1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐
Is an A required?	Yes ☐ No ☐	(the supervisor is responsible for initiating the Analysis process)	

In order to determine the level of intervention, the following gravity codes have been established:

Classification of accidents/incidents:

Impact Category	Actual & Potential Impact Rating				
	1 – Low	**2 – Minor**	**3 – Moderate**	**4 – Major**	**5 Catastrophic**
Health and Safety	First Aid assessment only	First Aid Treatment	Lost Time Injury Restricted Work Medical Treatment	Serious injury, significant lost time > than two rotations	Permanent disability or fatality
Cost	> $50,000 > 1 hr. production delay	$50,000 - $250,000 1 - 4 hr. production delay	$250,000 - $1 Million 4 - 18 hr. production delay	$1 Million -$5 Million 18 hr. - 4 d production delay	> $5 Million > 4 d production delay

Incidents OR Potential of category 3, 4 or 5 must be incident analysis. Repeat incidents of category 2 or 1 that could have a higher severity level must also be investigated. The following table shows the times of investigation, analysis and report production.

Deadlines for the investigation, analysis, preparation and transmission of the investigation report:

Actual & Potential Impact Rating			
	4 or 5	**3**	**1&2**
Investigation	Immediately	Immediately	
Analysis and report production	Immediate verbal summary report max. 12h or less	Max. 72h	Potential is >3 completed 72h
Temporary corrective measure	Immediately	Immediately	Immediately
Permanent corrective action/preventative measure must be realized in:	3 days	5 days	5 Days

10 DUTY CARDS FOR THE INCIDENT MANAGEMENT TEAM

10.1 IMT LEADER

DUTY CARD 1 — IMT LEADER Reports to: Brucejack Mine President & CEO
Objective: The IMT Leader has overall responsibility for the management of the Incident Management Team (IMT). The IMT Leader leads and supervises the activities of IMT staff, develops objectives, approves plans and ensures that the response is carried out in a safe and legally sound manner. The IMT Leader interacts with appropriate government officials, the media, the community, and company management. The IMT Leader can delegate authority to IMT members to act on their behalf but retains the final responsibility for IMT response actions and decisions.
RESPONSIBILITIES
PRE-INCIDENT
☐ Ensure the operational readiness of the IMT; ☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT.
IMMEDIATE ACTIONS
☐ Obtain a verbal briefing outlining the incident from the relevant manager and on-scene coordinator (if deployed); ☐ Start an individual log; ☐ Proceed to the IMR; ☐ Assess the level of the incident/issue using the Brucejack Mine Severity Table; ☐ Decide the level of IMT activation required to respond to the incident and activate the IMT if required via Dispatch ext 108; ☐ Authorize any additional resources or specialist advisors required; ☐ Obtain a current situation update on the incident; ☐ Confirm the IMT appointments required for the crisis; ☐ Conduct an initial team brief and detailed initial response priority to the IMT Managers; and, ☐ Ensure that relevant regulatory authorities are notified.
DURING INCIDENT
☐ Lead the IMT; ☐ Ensure the ERT are supported in their emergency response activities; ☐ Establish communications, exchange information and coordinate activities with other relevant response organisations (ERT, Emergency Services) and appropriate management personnel; ☐ Ensure that all necessary and required internal and external notifications have been made, ☐ Especially to government agencies and key stakeholders; ○ Doug Flynn Senior Inspector of mines (acting) - 1-250-847-7386 or 250-877-9747(cell) ○ Jacque Perron, President & CEO – 778-357-0809, 1-604-209-5456 cell ○ Patrick Godin, VP Operations & COO – 604-566-8784 ○ Sean Masse, General Manager – 250-202-2038 (140), 1 (604)754-9671 cell ☐ Manage the activities of the IMT and maintain overall control at the operational level. ☐ Ensure all IMT Group Managers are briefed and understand their individual and team responsibilities;

☐ Request additional specialist support if required; ☐ Regularly review the response by convening IMT update briefings at regular intervals; ☐ Oversee planning and set recovery and business resumption goals; ☐ Approve and authorise implementation of incident specific response and recovery plans; ☐ Monitor and control access to the IMR; ☐ Keep the President informed of the situation via regular situation reports; ☐ Remain aware of the communication strategy and be prepared to act as a media spokesperson; ☐ Authorise dissemination of press releases and statements to the public and media; ☐ Ensure active and on-going engagement with all relevant local stakeholders; ☐ Ensure all actions, decisions and events are accurately recorded and documented; ☐ Document all personal actions and decisions on an individual log; ☐ Decide when the crisis is over, inform IMT members; and, ☐ Communicate end of crisis response internally and externally.
POST-INCIDENT
☐ Oversee the conduct of an investigation; ☐ Review and approve the incident report; ☐ Allocate and supervise the implementation of the recovery plan; ☐ Chair the incident post-crisis review and ensure all lessons learned are recorded and implemented; ☐ Ensure all ERT and IMT members are debriefed and receive feedback; and, ☐ Debrief the IMT Deputy and IMT Group Managers and provide feedback;

10.2 DEPUTY IMT LEADER

DUTY CARD 2 — DEPUTY IMT LEADER Reports to: IMT Leader
Objective: The Deputy IMT Leader reports to the IMT Leader and is responsible for assisting the IMT Leader in managing the team's response to an incident. The Deputy IMT Leader assists in developing incident objectives, supervises the activities of the IMT Managers and manages set-up of the IMR. The Deputy IMT Leader conducts assessment meetings, oversees implementation of approved plans and ensures that safety of all responders is the highest priority. The Deputy IMT Leader assumes the responsibilities of the IMT Leader in their absence.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the IMR; ☐ Start an individual log; ☐ Confirm the arrival of all IMT members; ☐ Facilitate the initial team brief for the IMT Leader; ☐ Advise on the mobilisation of additional resources or specialist advisors required; ☐ Advise on the notification of the relevant Health Safety Environment Community (HSEC) related stakeholders; and, ☐ Draft relevant HSEC related reports for approval by the IMT Leader prior to releasing to external stakeholders.
DURING INCIDENT
☐ Understudy the IMT Leader; ☐ Ensure all IMT Control Group members are briefed and understand their individual responsibilities; ☐ Coordinate the activities of the IMT and manage work effort between groups as required; ☐ Facilitate regular IMT update briefings; ☐ Ensure regular situation reports are distributed to key stakeholders; ○ Doug Flynn Senior Inspector of mines (acting) - 1-250-847-7386 or 250-877-9747(cell) ○ Jacque Perron, President & CEO – 778-357-0809, 1-604-209-5456 cell ○ Patrick Godin, VP Operations & COO – 604-566-8784 ○ Sean Masse, General Manager – 250-202-2038 (140), 1 (604)754-9671 cell ☐ Assume the IMT Leader's role when he/she is unavailable; ☐ Supervise the activities of the IMT Group Managers, ensuring they act in a manner;

☐ Consistent with corporate policy and applicable government regulations and directives; ☐ Take the lead in the coordination, development and review of the response plan including: ☐ Coordinating of the plan and any sub-plans; ☐ Documenting response decisions; ☐ Consulting with specialist advisers and use of additional resources; ☐ Oversee the operation of the IMR, including status board updates and the flow of information; ☐ Keep the IMT Leader updated on the nature and status of the response operations; ☐ Check all correspondence drafted for release prior to approval by the IMT Leader; ☐ Remain aware of the communications strategy set by Brucejack Mine; ☐ Ensure regular liaison and reporting with Brucejack Mine employees; ☐ Ensure team rotations occur and back-up shifts are arranged for the ERT and IMT; ☐ Document all personal actions and decisions on an individual log; and, ☐ Ensure all ERT and IMT actions, decisions and events are recorded.
POST-INCIDENT
☐ Oversee post-crisis actions on behalf of the IMT Leader when required; ☐ Coordinate the incident post-crisis review; ☐ Debrief all Control Group members and provide them with feedback; and, ☐ Coordinate the development of the incident report.

10.3 IMT COORDINATOR

DUTY CARD 3 — IMT COORDINATOR Reports to: Deputy IMT Leader
Objective: The IMT Coordinator reports to the Deputy IMT Leader. This role is responsible for coordinating IMT preparation activities, overseeing the management of IMT information, and providing for the administrative requirements of the IMT.
RESPONSIBILITIES
PRE-INCIDENT
☐ Coordinate and attend all training activities organised for the IMT;
IMMEDIATE ACTIONS
☐ Proceed to the IMR; ☐ Start an individual log; ☐ Obtain a current situation update; ☐ Provide the IMT Leader with regular updates; ☐ Ensure the IMR is set-up as required; ☐ Ensure that the Log Keeper has commenced the IMT log; and, ☐ Attend the IMT initial briefing.
DURING INCIDENT
☐ Establish communications, exchange information and coordinate activities; ☐ Ensure the status boards are regularly updated by the Recorder; ☐ Assist the Log Keeper in maintaining a chronological log of events and make tape recordings as appropriate (pay special attention to times of significant activities and events); ☐ Ensure IMT members are present for briefs as required by the IMT Leader and Deputy; ☐ Ensure that any IMT member not able to attend a briefing session is updated with the relevant information; ☐ Manage the flow of hard copy information and retain copies for the permanent log; ☐ Provide administrative support to the IMT as required; ☐ Regularly collate the notes (logs) from other IMT groups into the IMT log; ☐ Collate all documentation for follow-up investigation, compensation, insurance and litigation purposes; ☐ Provide administrative, IT and catering support to the IMT; ☐ Monitor health, fatigue, morale and stress levels of the group and advise the Deputy as required; and, ☐ Document all personal actions and decisions on an individual log sheet.
POST-INCIDENT
☐ Participate in the post-crisis review; ☐ Contribute to the development of the incident report; ☐ Evaluate the effectiveness of the IMR during the response and implement any necessary changes to the room or associated procedures.

10.4 OPERATIONS MANAGER

DUTY CARD 4 — OPERATIONS MANAGER Reports to: IMT Leader
Objective: The Operations Manager reports to the IMT Leader and manages operations directly related to the IMT's field response. He/she activates, organises, assigns and directs all resources and activities in the field. He/she implements all operational plans to achieve the response objectives and protect people, the environment and property. He/she communicates frequently with the IMT Leader and Deputy IMT Leader to keep them updated on the progress of response operations.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT and the Operations Group.
IMMEDIATE ACTIONS
☐ Proceed to the IMR; ☐ Obtain all available information on the situation from the ERT, Dispatch, Underground Command Centre and/or Medical Clinic; ☐ Start an Individual log; ☐ Recommend to the IMT Leader the incident categorisation and the level of response required; ☐ Mobilise any additional resources or specialist advisors immediately required to assist with the crisis; ☐ Activate initial personnel required in the Operations Group; and, ☐ Attend the IMT initial briefing.
DURING INCIDENT
☐ Manage the activities of the Operations Group (including shift rosters); ☐ Ensure communications are maintained with the ERT; ☐ Ensure all Operations Group members are briefed and understand their individual and team responsibilities, and assess the need for additional specialist support; ☐ Attend IMT briefs and keep the IMT informed of progress on resolving the issue; ☐ Oversee and monitor the ERT response; ☐ Support the ERT; ☐ Ensure the Incident Dispatch and/or Medical Team are kept informed of the IMT response; ☐ Manage the development of the Response Plan; ☐ Manage the implementation of the Response Plan; ☐ Contribute to IMT situation reports; ☐ Allocate tasks to Operations Group members; ☐ Ensure that the Operations Group and the ERT are aware of and are following applicable Brucejack Mine policies and government agency directives; ☐ Document all personal actions, decisions and instructions on an individual log sheet; and ☐ Ensure all group actions, decisions, instructions and events are accurately recorded and documented in the IMT Log.
POST-INCIDENT

- Inform the ERT and Operations Group members when the crisis is over;
- Identify any group follow-on actions required and allocate responsibilities, resources and deadlines;
- Conduct Operations Group incident review and consolidate group feedback points;
- Attend the ERT debrief;
- Attend the post-crisis review;
- Debrief all Operations Group members and provide feedback; and,
- Contribute to the incident report.

10.5 RECORDER

DUTY CARD 5 — Recorder Reports to: Deputy IMT Leader
Objective: The Recorder reports to the Deputy IMT Leader and is responsible for updating the status boards, managing and equipping the Incident Management Room and providing for administrative requirements of the IMT.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; ☐ Ensure status boards, charts, maps and other tools/aids are readily available; ☐ Remain familiar with your responsibilities within the IMT; ☐ Confirm that there are sufficient quantities of consumables available for the IMT; and, ☐ Understand where the Incident Management Room equipment is stored and its use.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the Incident Management Room; ☐ Assist the IMT Coordinator in the set-up of the Incident Management Room; ☐ Start an Individual Log; and, ☐ Attend the IMT initial briefing.
DURING INCIDENT
☐ Record key incident information on the status boards; ☐ Manage the flow of hard copy information and retain copies for the permanent log; ☐ Assist the Log Keeper with the IMT Log as required; ☐ Alert other IMT members to major changes, issues and outstanding actions; ☐ Take digital photos of status boards before they are updated; ☐ Proactively monitor all communications and record pertinent points as they arise; and, ☐ Document all personal actions and decisions in an Individual Log.
POST-INCIDENT
☐ Assist with the collection and filing of all documentation from all groups; ☐ Ensure allocated post-crisis follow-up actions are completed; ☐ Participate in the IMT post-crisis review; ☐ Assist with refurbishing the IMR back to a ‘ready’ state; and, ☐ Assist the incident investigation as required.

10.6 LOG KEEPER

DUTY CARD 6 — Log Keeper Reports to: Deputy IMT Leader
Objective: The Log Keeper reports to the Deputy IMT Leader and is responsible for maintaining an accurate, up-to-date record of the decisions and actions of the IMT.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; ☐ Remain familiar with your responsibilities within the IMT; ☐ Understand where the Incident Management Room equipment is stored and its use; and, ☐ Assist the Recorder in maintaining the readiness of the Incident Management Room.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the Incident Management Room; ☐ Assist the IMT Coordinator in the set-up of the Incident Management Room; ☐ Start an individual log; ☐ Start the IMT log; and, ☐ Attend the IMT initial briefing.
DURING INCIDENT
☐ Assist the Recorder with updating the status boards; ☐ Request additional Log Keeper support as required; ☐ Maintain a chronological log of events and make tape recordings as appropriate (pay special attention to times of significant activities and events); ☐ Manage the flow of hard copy information and retain copies for the permanent log; ☐ Collect and retain a copy of all relevant IMT documents and incorporate into the incident log; ☐ Regularly collate the notes (logs) from other IMT groups into the IMT log; ☐ Remind the Deputy IMT Leader of outstanding issues or actions from the log; and, ☐ Proactively monitor all communications and record pertinent points as they arise.
POST-INCIDENT
☐ Assist with the collection and filing of all documentation from all groups; ☐ Ensure allocated post-crisis follow-up actions are completed; ☐ Participate in the IMT post-crisis review; ☐ Contribute to the development of the incident report; ☐ Assist with refurbishing the Incident Management Room back to a ‘ready’ state; and, ☐ Assist the incident investigation as required.

10.7 PLANNING MANAGER

DUTY CARD 7 — PLANNING MANAGER Reports to: IMT Leader
Objective: The Planning Manager reports to the Deputy IMT Leader and manages IMT related planning for the detailed recovery and resumption of normal operations. He/she oversees preparation of the Recovery Plan and assists in the development of other specialist plans, if required.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT and the Planning Group.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the IMR; ☐ Start an individual log; ☐ Attend the IMT initial briefing; ☐ Confirm the level of activation of the Planning Group in consultation with the IMT Leader; and, ☐ Mobilise any additional resources or specialist advisors required for the Planning Group.
DURING INCIDENT
☐ Manage the activities of the Planning Group; ☐ Ensure all Planning Group members are briefed and understand their individual and team Responsibilities; ☐ Ensure that the response plan and the recovery plan flow logically and are coordinated; ☐ Attend IMT briefs and keep the IMT informed of progress on the recovery plan; ☐ Manage the business continuity response including the implementation of workarounds; ☐ Lead the development of the business recovery plan and manage its implementation; ☐ Consult with specialist advisers (if required) for their input into the recovery plan (Maintenance, engineering, etc.); ☐ Contribute to the IMT Update Meetings; ☐ Document all personal actions and decisions on an individual log sheet; and, ☐ Ensure all group actions, decisions and events are accurately recorded and documented, and recorded in the IMT Log.
POST-INCIDENT
☐ Inform Planning Group members when the crisis is over; ☐ Identify any group follow-up actions required and allocate responsibilities and deadlines; ☐ Conduct Planning Group post-crisis review and record outcomes; ☐ Attend the incident post-crisis review; ☐ Debrief all Planning Group members and provide feedback; and, ☐ Contribute to the incident report.

10.8 SURFACE OPERATIONS SUPERVISOR

DUTY CARD 8 — SURFACE OPERATIONS SUPERVISOR Reports to: IMT Leader
Objective: The Surface operations supervisor reports to the IMT Leader and manages IMT related-support and service activities for the response. He/she is responsible for obtaining personnel, equipment, facilities and material needed to carry out response operations. He/she provides food, shelter, transportation, facilities, security, communications and other necessities for response personnel who are located both in the field and at the IMR. The Surface operations supervisor is to ensure that internal and external service needs are met.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT and the Logistics Group.
IMMEDIATE ACTIONS
☐ Respond to IMT activation ☐ Proceed to the IMR; ☐ Activate initial personnel required for Dispatch upon activation of the IMT ☐ Start an individual log ☐ Attend the IMT initial briefing ☐ Mobilize any additional resources or specialist advisors required for Dispatch; and, ☐ Conduct an initial group briefing.
DURING INCIDENT
☐ Manage the activities of Dispatch; ☐ Ensure Dispatch has been briefed and understand their individual and team responsibilities, and assess the need for additional specialist support; ☐ Identify the location and status of off-site equipment and personnel suitable to deal with the issue and coordinate their deployment as required; ☐ Liaise with the Operations Manager to provide transport and care/accommodation for employees and relatives if necessary. ☐ Ensure an overall inventory is maintained of all equipment, materials and supplies purchased, rented, borrowed or otherwise obtained; ☐ Inform the IMT Leader of logistical movements (include names and locations); ☐ Develop a resource plan in support of the response plan to: ○ Prioritize needs; ○ Identify alternative resources and supplies; ○ Coordinate delivery/deployment; ☐ Attend IMT briefings and keep the IMT informed on the actions of Dispatch; ☐ Contribute to the development of the response plan; ☐ Contribute to the development of the recovery plan;

☐ Contribute to the IMT situation reports; ☐ Document all personal actions and decisions on an individual log sheet; and, ☐ Ensure group actions, decisions and events are accurately documented, are recorded in the IMT Log.
POST-INCIDENT
☐ Inform Dispatch when the crisis is over; ☐ Identify any group follow-up actions required and allocate responsibilities and deadlines; ☐ Conduct Dispatch post-crisis review and record outcomes; ☐ Attend the incident post-crisis review; ☐ Debrief Dispatch and provide feedback; and, ☐ Contribute to the incident report.

10.9 HUMAN RESOURCES OFFICER

DUTY CARD 9 — HUMAN RESOURCES OFFICER Reports to: External IMT Coordinator
Objectives: The Human Resources Officer identifies and tracks all personnel involved in the incident. He/she coordinates and provides feedback to employees, ensures that consistent messages are conveyed to all concerned, and provides counselling services as required.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the IMR; ☐ Start an individual log; ☐ Participate in the initial group briefing.
DURING INCIDENT
☐ Work with Operations Group to establish the facts relating to casualties/numbers/severity of injuries/location etc.; ☐ Track casualties progress and inform the Family Liaison Officer; ☐ Ensure that Casualty Board is kept up to date; ☐ Verify any discrepancies relating to casualties; ☐ Provide advice to the IMT on ○ Employee relations; ○ Industrial relations; ○ Company HR Policy; ☐ Ensure that appropriate resources are available. Consider alerting all employers of personnel working at the site and/or within the asset/operation; ☐ Consider arrangements for handling / assisting employees, contractors, next-of-kin and public affected by the emergency; ☐ Ensure that appropriate systems are in place for managing Human Resource issues; ☐ Arrange grief counselling where needed for employees and families; ☐ Verify and maintain a record of location and status of persons involved in the incident; ☐ Verify details of fatalities, casualties, missing people and survivors; ☐ Arrange survivor reception and support for evacuees; ☐ Liaise with the Family Liaison Officer and External Affairs Officer to provide verified facts on the situation; ☐ Establish the Next-of-Kin room with the Family Liaison Officer; ☐ Work with External Affairs to draft internal messages and site notices; and, ☐ Document all personal actions and decisions on an individual log sheet.
POST-INCIDENT
☐ Complete any follow-up actions as directed; ☐ Contribute to the dispatch post-crisis review; and, ☐ Contribute to the incident report.

10.10 External Affairs Officer

DUTY CARD 10 — EXTERNAL AFFAIRS OFFICER Reports to: External IMT Coordinator
Objectives: The IMT External Affairs Officer reports to the External IMT Coordinator and manages IMT-related media and community issues for the response. He/she compiles and releases information on the incident and response efforts to the media and organises IMT press conferences and briefings. He/she works closely with the Family Liaison Officer to develop a community and stakeholder response strategy and arranges community outreach programs.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and,
IMMEDIATE ACTIONS
☐ Proceed to the IMR and set-up for operations; ☐ Start an individual log; ☐ Attend the IMT initial briefing; and, ☐ Advise the IMT Leader on potential community and media-related issues.
DURING INCIDENT
☐ In conjunction with the Investor Relations Spokesperson, determine the media strategy to be adopted for the incident and who will handle various aspects of the company's external affairs effort; ☐ Serve as the principal advisor to the IMT Leader regarding interactions with the media and advise him of any pressing media issues, concerns, or problems; ☐ Manage the Media Response Team (MRT); ☐ Establish a media briefing room onsite; ☐ Prepare and disseminate media holding statements, press releases and "fact sheets" for approval by the IMT Leader, as appropriate; ☐ Ensure proper and complete distribution of all approved press releases and fact sheets; ☐ Assist the IMT Leader in preparing for press conferences and interviews; ☐ Pass on all press releases as soon as possible to the IMT Leader; ☐ As appropriate, arrange and manage tours for the media, provided that they do not jeopardise personal safety or inhibit operations; ☐ Be available to respond to inquiries from the media; ☐ Monitor and maintain a record of media and internet coverage of the incident; and, ☐ Prior to demobilisation, ensure that all media, government relations and community issues and concerns have been resolved; Work with the Team Leader, Community Development to ☐ Identify community concerns and key issues; ☐ Identify community stakeholders and determine the best way to communicate with the community ☐ Develop a community management plan, if appropriate;

- Determine the optimum timing for and arrange and manage, community and "Town Hall" meetings;
- Determine whether additional community coordination personnel are needed, and if so, coordinate their activation and supervise their activities;
- Work closely and coordinate activities with the Family Liaison Officer;
- Assess the impact of the incident on the community, including:
- Duration;
- Health and safety issues;
- Impacts on housing and accommodations and the need for shelters;
- Disruptions to utilities and services such as electricity, water, heat, gas, transportation, sewage, etc.;
- Impacts on schools, hospitals, businesses and other institutions; and
- Other issues or causes for concern.
- Serve as the principal advisor to the IMT Leader regarding interactions with the community and advise him/her of concerning pressing issues or problems;
- Assist the IMT Leader or other IMT personnel in preparing for community meetings;
- Be the principal point of contact for the community;
- Attend IMT briefs and keep the IMT informed of community issues;
- Ensure the response plan and the recovery plan adequately considers community issues;
- Establish and maintain contact with relevant community groups;
- Assist the Services Coordinator with drafting internal messaging and site notices;
- Document all personal actions and decisions on an individual log sheet; and,
- Other duties as directed by the External IMT Coordinator.

POST-INCIDENT

- Complete any follow-up actions as directed;
- Contribute to the Dispatch post-crisis review;
- Attend the incident post-crisis review and ensure community issues are captured;
- Work with the Team Leader, Community Development to:
  - Ensure that all community-related concerns have been addressed and the best possible relations with the community are maintained;
  - Continue to monitor community attitudes concerning the incident and keep management advised of any which may have a substantial impact on the company or its operations;
  - Evaluate effectiveness of the community outreach program during the response and make appropriate modifications to IMT strategies and plans; and,
- Contribute to the incident report as required.

10.11 Family Liaison Officer

DUTY CARD 11 — FAMILY LIAISON OFFICER Reports to: External IMT Coordinator
Objectives: To provide support to the employee's family and friends during the incident. The Family Liaison Officer is to be the main point of contact for next-of-kin and friends and works closely with the Human Resources Officer and External Affairs Officer in gaining the latest information on the incident to be passed to the families.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the IMR; ☐ Start an individual log; ☐ Prepare for the initial briefing.
DURING INCIDENT
☐ If applicable, manage the Next-of-kin support Team ☐ Work with the IMT in communicating factual personnel information on the incident: ○ Pass on casualty/fatality list (including next-of-kin details); ○ Identify other stakeholders and ensure close liaison; ○ Provide liaison with Police and any incident investigation teams; ○ Determine the nature, tone and format of communication with employees and families; ○ Conduct post-incident debriefing as soon as possible; ○ Arrange transportation for families; ○ Plan accommodations; ○ Consider need for cash / clothing / communications with families etc.; and ☐ Establish call schedules as appropriate. ☐ Facilitate visits to hospitals by relatives, as requested by IMT; ☐ Provide support for families. Consider: ○ Transportation to hospital / point of arrival; ○ Childcare; ○ Accommodation; ○ Passport / Visa issues; ○ Financial Support; ○ Counselling support; ○ Reassurance, as appropriate. ☐ Document all personal actions and decisions on an individual log sheet; and, ☐ Other duties as directed by the External IMT Coordinator.
POST-INCIDENT
☐ Complete any follow-up actions as directed; ☐ Contribute to Dispatch post-crisis review; and ☐ Contribute to the incident report as required.

10.12 Dispatch and Aviation

DUTY CARD 12 — Dispatch/Aviation Reports to: IMT Leader
Objective: The Dispatch/Aviation reports to the IMT Leader and manages IMT related support and service activities for the response. He/she provides and coordinates radio communications and other necessities for ground/air transportation in the field and at the IMR. Dispatch/Aviation is to ensure that internal and external service needs are met.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT ☐ Remain familiar with your responsibilities within the IMT.
IMMEDIATE ACTIONS
☐ Respond to IMT activation ☐ Activate initial personnel required for dispatch upon activation of the IMT ☐ Contact and assist in mobilizing additional resources or specialist advisors ☐ Start an individual log ☐ Attend the IMT initial briefing
DURING INCIDENT
☐ Identify the location and status of off-site equipment and personnel suitable to deal with the issue and coordinate their deployment as required; ☐ Liaise with the Operations Manager to provide transport and care/accommodation for employees and relatives if necessary. **Medivac will be arranged by Iridia Personnel with the assistance of Dispatch.** ☐ Inform the IMT Leader of logistical movements (include names and locations); ☐ Develop a resource plan in support of the response plan to: ○ Prioritise needs; ○ Identify alternative resources and supplies; ○ Coordinate delivery/deployment; ☐ Attend IMT briefings and keep the IMT informed on the actions of Dispatch/Aviation; ☐ Contribute to the development of the response plan; ☐ Contribute to the development of the recovery plan; ☐ Contribute to the IMT situation reports; ☐ Document all personal actions and decisions on an individual log sheet; and, ☐ Ensure group actions, decisions and events are accurately documented, and recorded in the IMT Log.
POST-INCIDENT
☐ Identify any group follow-on actions required and allocate responsibilities and deadlines; ☐ Attend the incident post-crisis review; ☐ Contribute to the incident report.

11 DUTY CARDS FOR THE UNDERGROUND INCIDENT COMMAND TEAM

11.1 INCIDENT COMMAND DUTY CARD

INCIDENT COMMANDER - **Checklist**		
☐	1)	In the event that there is an Underground CODE 1 **fire** emergency, it is critical that the Underground Emergency warning system is activated without delay, and that the accounting for personnel begins. These Three Actions must be taken FIRST before the Underground Incident Command Team musters: • Ensure the Main fan (WZ and VOK) Stench Gas has been released: • Only if required, have the electricians manually release the stench in the compressed airlines • Ensure Code One was called on all channels (Dispatch is responsible for this action); • Secure the UG tag-in board by placing a guard at the board. Non-fire emergencies require Code One call, and radio message to clear the ramp to the scene.
☐	2)	Ensure the Underground Incident Command Team positions are fulfilled: Operations Coordinator; Engineering Coordinator; Maintenance Coordinator; and Recorders. <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444

☐	3)	Obtain a verbal briefing outlining the incident from the relevant Underground Team Captain and/or ERT Advisor (ext 444 Fire Hall).
☐	4)	Conduct an initial team brief and detail initial response priorities to the Underground Incident Command Team.
☐	5)	Start an individual log, document all personal actions and decisions. Ensure the Recorder has posted the status boards and is recording relevant information.
☐	6)	If the fire is in a heading with charged explosives (Operations Coordinator will confirm) and communicate this with the ERT Coordinator. The ERT Coordinator will instruct the ERT not to fight the fire.
☐	7)	In consultation with ERT Coordinator decide on a response plan for the Mine Rescue Team and whether or not to activate the Incident Management Team. Ventilation cannot be changed until the mine manager has approved changes and all personnel are accounted for. As well, everyone must be made aware of the ventilation change.
☐	8)	Determine staging areas for the extra people and traffic that are in the area effected by the code one.
☐	9)	Follow up and monitor assigned responsibilities.
☐	10)	Consult with ERT Coordinator and Mechanical Supervisor to determine if a mechanical inspection of any mobile equipment involved is required prior to calling the Code One over.
☐	11)	In consultation with the ERT Coordinator, decide when the incident is over. The ERT Coordinator will make arrangements for the “Code One Over” message to be relayed and broadcast. Dispatch will receive confirmation from the Incident Commander prior to broadcasting “Code one over”
☐	12)	Ensure all relevant information is entered in Incident Commander Log sheet.
☐	13)	At the conclusion of the incident, sign the Incident Commander log sheets.
Post Incident - **Checklist**		
☐	1)	Ensure the ERT Coordinator replenishes the Duty Card Packets.
☐	2)	Debrief the Underground Incident Command Team and provide feedback.
☐	3)	Confirm recommended changes to the Underground Incident Command Manual and other relevant documents have been completed (ERT Coordinator is responsible).

11.2 ERT COORDINATOR DUTY CARD

ERT Coordinator - Checklist		
☐	1)	Coordinate with Incident Commander and Underground Incident Command Team to plan the Mine Rescue Teams actions while underground. <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	Brief Mine Rescue Team 1 on incident and plan of action. When Team 2 is travelling to Underground, Team 1 will get under air. Once Team 2 enters the Underground surface building, Team 1 can commence with their rescue operation.
☐	3)	Record all actions and orders given to Mine Rescue Team in your action log. Record the time Team 1 enters the underground in the ERT Coordinator Logbook (Approximately 1 bar for every 1-minute Underground with the BG4). Check in every 15mins and record all air supply levels of the team.
☐	4)	Maintain contact with Mine Rescue Team while underground and provide direction as required. Always follow the Mine Rescue Principals in order: Safety of the team; Safety of the trapped/injured; Protection of mine property; Rehabilitation of mine property.
☐	5)	Consult with Incident Commander and Mechanical Supervisor to determine if a mechanical inspection is required prior to calling the Code One over.
☐	6)	Check with Incident Command on areas underground where pre-loading of emulsion explosives are located. **NOTE: Under no circumstances will the Mine Rescue Team fight fires in a heading with charged explosives**
☐	7)	Contact Incident Command to relay 'The Code One is over' once the final Team is finished.
☐	8)	Replenish incident command cards
Post Incident- Checklist		
☐	1)	Debrief with ERT members at the Fire Hall.
☐	2)	Follow-up with Incident Commander and Engineering Coordinator on the Underground Incident Command Team debrief. Gather notes and action items.

11.3 ERT ADVISOR DUTY CARD

ERT Advisor - Checklist		
☐	1)	Gather cap lamps, tag-in cards, and W65's for incoming teams.
☐	2)	Report to Dispatch (108) or ADMIN CH 1 (ERT CHANNEL) when ERT arrives at the Fire Hall (both Team 1 and 2).
☐	3)	Brief Mine Rescue Team 1 on incident and plan of action. When Team 2 is travelling to Underground, Team 1 will get under air. Once Team 2 enters the Underground surface building, Team 1 can commence with their rescue operation.
☐	4)	Contact ERT Coordinator via Channel 1 (ERT Channel) <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
Post Incident- Checklist		
☐	1)	Debrief with ERT members at the Fire Hall.
☐	2)	Follow-up with Incident Commander and Engineering Coordinator on the Underground Incident Command Team debrief. Gather notes and action items.
☐	3)	Collect all information from rescue and make any necessary changes to procedure.

11.4 OPERATIONS COORDINATOR DUTY CARD

Operations Coordinator - Checklist		
☐	1)	Record all relevant information in the Operations Coordinator log sheet.

☐	2)	Oversee all immediate needs of the Incident Commander.
☐	3)	Assign the following responsibilities: Check-in Coordinator – Name: Mine Entrance Guards – Names: West Zone portal guard: VOK portal guard: Office Entrance Guard(security) – Name: Door guard: Transportation Coordinator (not required unless operation is extensive) Transportation Coordinator name:
☐	4)	Confirm with ERT Coordinator to ensure the Underground Mine Rescue Team has been notified and all necessary radio calls have been made.
☐	5)	If applicable, barricade or post guards at the incident area to prevent any unauthorized access and remove all non-essential personnel.
☐	6)	Brief and keep the Incident Commander informed. This communication must include any area that has the potential for explosives.
☐	7)	Monitor assigned responsibilities.
☐	8)	Sign the Operations Coordinator log sheet and return to Recorder when emergency is over.

Post Incident - Checklist		
☐	1)	Participate in the post crisis review
☐	2)	Evaluate the effectiveness of the Underground Incident Management Team during the response and implement any necessary changes to the room or associated procedures

11.5 Engineering Coordinator Duty Card

Engineering Coordinator - Checklist		
☐	1)	Set up personal workstation.

		Required Phone Numbers: Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	Enter all relevant information on the Engineering Coordinator log Sheet.
☐	3)	Assign a Ventilation Engineer and provide instructions and support throughout the incident.
☐	4)	Provide copy of current ventilation plans. Review plans showing mining areas, ventilation flows and controls, refuge stations, escape ways, explosives magazines, etc.
☐	5)	Provide technical assistance to the Incident Commander.
☐	6)	Ensure main surface fans are operating as required.
☐	7)	Follow up and monitor all assigned responsibilities.
☐	8)	Sign the Engineering Coordinator log sheet and return to the Recorder when emergency is over.
Post Incident - Checklist		
☐	1)	Assist with the collection and filing of all documentation from all groups. Pass the information onto the ERT Advisor.
☐	2)	Participate in the post-crisis debrief.
☐	3)	Ensure allocated post-crisis follow-up actions are completed.

11.6 MAINTENANCE COORDINATOR DUTY CARD

Maintenance Coordinator - Checklist		
☐	1)	Assign Mechanical Supervisor and Electrical Supervisor, if required: Name of Mechanical Supervisor:

		Name of Electrical Supervisor:
☐	2)	Confirm that Stench at the main fans has been released (by radio). Only if required, check to make sure the stench gas has been released in the compressed lines.
☐	3)	Report to Incident Commander that stench has been released.
☐	4)	Under the direction of the Incident Commander, identify and work to remedy any maintenance related issues.
☐	5)	Discuss with the ERT Coordinator the need to have a mechanic inspect equipment involved in the incident prior to calling the Code One over.
☐	6)	Record relevant information in the Maintenance Coordinator log sheet.
☐	7)	Sign the Maintenance Coordinator log sheet and return to Recorder when emergency is over.
Post Incident - Checklist		
☐	1)	Participate in the post crisis review
☐	2)	Evaluate the effectiveness of the Underground Incident Management Team during the response and implement any necessary changes to the room or associated procedures
☐	3)	Provide a list of what equipment is locked out and/or need repair.

11.7 RECORDER DUTY CARD #1

Recorder - Checklist		
☐	1)	Set up personal workstation and start recorder.
☐	2)	Record key incident information on the event log and/or the status boards (rolled up poster sheets located in the auxiliary room). This must include times.
☐	3)	Update the status boards and manage administrative functions.
☐	4)	Manage the flow of hard copy information and retain copies for the permanent log.
☐	5)	Assist the Incident Commander in record keeping.
☐	6)	Alert team members of major changes, issues and outstanding actions.
☐	7)	Take digital photos of status boards before they are updated.
☐	8)	Proactively monitor all communications and record pertinent points as they arise.
Post Incident - Checklist		
☐	1)	Assist with the collection and filing of all documentation from all groups.
☐	2)	Participate in the IMT post-crisis interview.
☐	3)	Assist with refurbishing the Incident Management Room back to a ready state.

11.8 RECORDER DUTY CARD #2

Recorder - Checklist		
☐	1)	Set up personal workstation.
☐	2)	Record key incident information on the event log. This must include times.
☐	3)	Assist Dispatch in all aspects.
☐	4)	Manage the flow of hard copy information and retain copies for the permanent log.
☐	5)	Record all pertinent information from radio and telephone communication
☐	6)	Alert team members of major changes, issues and outstanding actions.
☐	7)	Take digital photos of information received
☐	8)	Proactively monitor all communications and record pertinent points as they arise.
Post Incident - Checklist		
☐	1)	Assist with the collection and filing of all documentation from all groups.
☐	2)	Participate in the IMT post-crisis interview.
☐	3)	Assist with refurbishing the Incident Management Room back to a ready state.

11.9 DISPATCH DUTY CARD

Dispatch - Checklist		
☐	1)	If an underground emergency is called on any UG channel, immediately relay the message without delay to Senior Management as per site extensions. Ch2 days Event: _____ Location of Event: _____ Person Reporting Event: _____ Injuries: _____ <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	If it is a medical emergency, inform all personnel on all underground channels to clear all ramps to the incident scene.
☐	3)	Monitor channel “all dispatch” and record any information in the Dispatch logbook.
☐	4)	If calls are received from a refuge station to report people present tell the caller that someone will contact them shortly. If the caller has information regarding the emergency record on log sheet. Relay information to Operations Coordinator.
☐	5)	Relay relevant information received from the UG channels to the Operations Coordinator.
☐	6)	When requested, provide any information on the location of personnel or equipment to the Operations Coordinator.
☐	7)	Record relevant information on Dispatch log sheet.
Post Incident - Checklist		
☐	1)	Participate in the IMT post-crisis interview

11.10 Check-In Coordinator Duty Card

Check-In Coordinator - Checklist		
☐	1)	Start your Check in Coordinator log sheet. <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	Designate the West Zone shop area and VOK Portal entrance as the muster area.
☐	3)	Assign one of the people mustering to direct, supervise & monitor personnel in the muster area. Instruct them to ensure all personnel remain in the muster area. Name: _____ Assign one Tag Board Check-In Assistant to oversee/guard the tag board. Instruct them not to let anyone remove a tag from the board until all workers are accounted for and the Check-In Coordinator has given approval. Tag board check in assistant: _____
☐	4)	Install the TAG BOARD “NO ENTRY” BARRICADES around the tag board to prevent persons from entering the TAG BOARD area.
☐	5)	Assign two Refuge Station Check-In Assistants. Designate each person specific refuge stations. Distribute refuge station records accordingly.
☐	6)	Delegate two Check-In Assistants to sit in the Shifter’s office to start call ins. Refuge Station Check-In Assistants #1: Refuge Station Check-In Assistants #2: Ensure the Check-In Assistants have their appropriate Refuge Station Check-In sheets (#1 and #2). The refuge stations are split up between Assistants to increase efficiency.
☐	7)	Monitor and direct the activities of the Check-In Assistants and UG Office muster area.
☐	8)	Provide a list of personnel accounted and unaccounted for and any Refuge Stations that were not contacted to the Operations Coordinator
☐	9)	Inform Operations Coordinator when all personnel are accounted for.
☐	10)	Release persons in the UG Offices muster area once the Code One is over.

☐	11)	Ensure all relevant information is entered in Check-In Coordinator log sheet, sign, then give to the recorder.
Post Incident - Checklist		
☐	1)	Participate in the IMT post-crisis interview

11.11 Check-In Assistant Duty Card

Check in Assistant - Checklist		
☐	1)	Use the REFUGE STATION RECORD sheets to phone all assigned refuge stations and record the name, employer/company name, refuge location, and condition of all personnel. Repeat the names to the refuge station attendant for verification. Ensure to include the refuge station attendant name. If a refuge station cannot be contacted by phone inform the Check-In Coordinator who will provide a radio. Attempt to contact the refuge station on radio channel 1, 2, and 3. Use a separate sheet for each refuge station and circle the refuge station location at the top of the sheet. <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	After all refuge stations have been contacted once, take the REFUGE STATION RECORD to the tag board and read the names one at a time to the Tag Board Check in Assistants. The Tag Board Check in Assistant will flip the tags as you read them. The Refuge Station Check in Assistant will mark an X in the column on the REFUGE STATION RECORD beside the person's name to indicate their tag has been flipped. Once all names have been read from the Refuge Station Check in Assistants list, compile a list of people not accounted for and notify the Check-In Coordinator.
☐	3)	Return to designated office and contact all the refuge stations again for any new arrivals. Repeat process at tag board of confirming names and flipping tags.
☐	4)	Provide a list of personnel unaccounted-for to the Check-In Coordinator.
☐	5)	Follow all directions from the Check in Coordinator.

☐	6)	Record all relevant information in the Refuge Station Check in Assistants Log sheet
☐	7)	Sign the Refuge Station Check in Assistant's Log sheet and return all paperwork to Recorder when emergency is over.
Post Incident - Checklist		
☐	1)	Attend the incident post-crisis review

11.12 Entrance Guard Duty Card

Entrance Guards - Checklist		
☐	1)	There are two locations that need to be guarded: West Zone Portal; VOK Portal; The Operations Coordinator will brief the two individuals with all pertinent information.
☐	2)	Obtain communications radio (Channel 2 RPT 1) and proceed to your designated location.
☐	3)	Record all relevant information in the Entrance Guard log sheet.
☐	4)	Position yourself, or vehicle: West Zone Portal - In a location that allows visual surveillance of the portal without being exposed to mine exhaust flow. VOK Portal - In a location that allows visual surveillance of the portal without being exposed to mine exhaust flow.
☐	5)	Stop anyone: West Zone Portal – Who attempts to enter the mine via the West Zone Portal. Contact Operations Coordinator to advise. VOK Portal – Who attempts to enter the mine via the VOK Portal. Contact Operations Coordinator to advise.
☐	6)	Identify anyone who exits the mine via the West Zone or VOK Portal. Contact the Operations Coordinator (Channel 2) to request transportation or first aid treatment of personnel exiting the mine.
☐	7)	Follow all directions from the Operations Coordinator.
☐	8)	Duties are not relieved until the Operations Coordinator instructs you to leave your post.
☐	9)	Sign the entrance guard log sheet and return to Underground Incident Command Team when emergency is over.

Appendix C.29

BJ-OHS-SOP-002 – Code One Call Out & Response

Objective

To provide clear details for the Code One response process and the associated responsibilities for all departments involved.

Scope

The requirements of this procedure apply to all Brucejack operations and activities.

Health, Safety & Reclamation Code of BC

- 3.7.1 – Mine Emergency Response Plan.
- 3.13.1 – Procedures for Safe Evacuation.

Occupational Health & Safety (OHS) Regulation (WorkSafe BC)

- 3.17 First Aid Procedures
- 4.14 Emergency Procedures
- 4.16 Training

Workers Compensation Act

- Part 2 Division 4 - General Duties of Employers, Workers and Others

Definitions

- Code One - Notification that an emergency is in progress.
- Code One Termination - Radio announcement once the emergency is over is transmitted on the radio channels. Normal work may resume in all areas.
- Emergency Response Team (ERT) - Designated team members trained for responding to site emergencies.
- Incident Coordinator - ERT member in the field providing direction to the Captain of the ERT at the scene and communicating with Dispatch.
- MERP – Mine Emergency Response Plan
- Brucejack Dispatch - Brucejack dispatch staff monitoring telephones and radio channels.
- RCO – Roll Call Officer.
- Resume Operation - Radio announcement once ERT has arrived at the scene and performed initial assessment. Message will be transmitted on all radio channels except for area affected by the Code One

Preparation

Hazards

- Miscommunication
- High stress scenarios

Tools

- Radio
- Emergency response equipment

Roles and Responsibilities

Brucejack Dispatch Is responsible for:

- Transmitting all Code One emergencies in an easily understandable manner.
- Transmitting "Resume Operation" and "Code One is Over" termination messages.
- Provide assistance to the Incident coordinators regarding logistics.
- Maintain a log of the progress of the emergency situation.

Incident Commander (Mine Manager or Designate) is responsible for:

- Overall Authorization and oversight of the Emergency situation.
- Ensure the emergency situation is managed in line with the Brucejack MERP.
- Shall ensure that normal operations can resume
- Will determined when to call the Incident Management Team.

Incident Coordinator is responsible for:

- Application and authorization of appropriate equipment and personnel for the response.
- Keep the Incident Commander up to date on the emergency situation as it progresses.
- Determines if the incident is completed (i.e. return to normal operations) or if the incident is escalating.
- Demobilize the ERT once the incident has concluded.
- Conduct a debrief with the ERT members, the Incident Commander and Dispatch.

Supervisor of the Affected Area is responsible for:

- Provide assistance as needed.
- Monitor radio Channel 2 Repeater 1 in case assistance is required by ERT.
- Standby in the area but not close to the emergency.

All Workers are responsible for:

- Assist in response when requested.
- Understanding and adhere to this Procedure.

Job Steps

When to Declare a Code ONE

Pretivm is dedicated to providing a safe workplace for its employees and contractors. The goals of this SOP and our MERP are, in order of priority, to protect the health and safety of workers and the public, protect the environment, avoid adverse social and economic effects, and preserve heritage, as well as protect and minimize damage to company properties.

An emergency is the unforeseen combination of circumstances, unusual occurrences or resulting state which may result in endangerment to lives or areas of the mine. This emergency may call for the immediate action from management and/or trained mine rescue, fire and first aid personnel.

Possible situations with the potential to create an emergency under some circumstances might include:

- Fire (electrical/mechanical) on surface or underground;
- Spills of fuel or hazardous substances;
- Unexpected/unplanned Explosions;
- Vehicle Accidents;
- Non-life and Life-Threatening Injury or Fatality; and,

- Avalanches.

A Code ONE must be declared in the following situations without delay:

- If the underground emergency is a fire*;
- A fire alarm is activated;
- A fire extinguisher is discharged to put out a fire*;
- The fire suppression system goes off on a vehicle for no reason; and
- A chemical spill with toxic vapor emissions.

***Note:** Even if the fire has been extinguished, a Code ONE must be called.

Examples of underground emergencies where a Code ONE will be called (and whether or not the stench will be released) include, but are not limited to, the following situations:

- Serious Injuries to, or people requiring rescue; (Code ONE, no stench release);
- Loss of life; (Code ONE, no stench release);
- Unexpected/unplanned explosion; (Code ONE, Stench is released);
- Flame or where fire extinguisher has been used or fire suppression has been released. (Code ONE, Stench is released). If the fire suppression is obviously triggered accidently, no Code ONE is required;
- A Fall of ground with trapped or injured workers; (Code ONE, no stench released);
- Equipment electrical - failure/damage and there are flames. (Code ONE, Stench is released);
- Loss of power and ventilation underground – NO Code ONE, stench is not released. Workers report and go to surface if extended beyond 30 minutes; and,
- Any other situation that may jeopardize the safety of workers and / or the mine.

In the event of a Code ONE, workers shall only proceed to the refuge station if the stench gas is released. Otherwise workers will remain in their respective headings and wait for further instructions.

Declaring an Code ONE

CODE ONE, CODE ONE, CODE ONE on radio Channel 2, Repeater 1 (for Brucejack), Channel 4 Repeater 2 (for Knipple) or Channel 6 Repeater 3 (for Wildfire) or Underground radio Channel 1 ALL: DISPATCH or a phone call to ext. 108 will initiate an emergency.

The radio call will be answered by Brucejack dispatch and will activate the Emergency Response Call-Out System.

If known, all the following information should be relayed when reporting an emergency:

- Name of the person calling
- Description of exactly what happened;
- Specific location and time;
- Extent of injuries and/or damages;
- What risks still exist; and,
- What action has been taken so far and who is involved.

Once a CODE ONE has been initiated, the CODE ONE shall not be interrupted or overridden by any individual. The CODE ONE must continue until investigated and deemed "over" by the Emergency Response Team Coordinator or designate.

Brucejack Dispatch Response

Once Dispatch is notified of a Code ONE, the following will occur:

- Brucejack Dispatch announces on all radio channels (Admin Channel 2 – ALL: ERT, Admin Channel 7 BCST: EMERG_CALL, Analog Channel 2 repeater 1, Analog Channel 9 Ladd 2, Analog Channel 10 Ladd 3):

Example: **"CODE ONE, CODE ONE, CODE ONE.**

There is a FIRE / MEDICAL/ SPILL emergency etc. at given LOCATION

Radio silence is now in effect."

Note: Announcement must indicate the type of emergency and precise location of the emergency

In the event of a Bunk fire, Dispatch/Logistics to supply a room list to the muster station to complete a roll call for the affected bunks. Supervisors are responsible for their crew head count. The ERT Coordinator will appoint an ERT member to assist and communicate with the RCO from the muster locations. They are to report any missing personnel with their room numbers.

Resume Operation Notification

The Incident Coordinator will notify Dispatch that operations may resume in all areas other than the affected area once they determine that there are no other associated hazards and that sufficient Emergency Response Team members are standing by and available in the event of another simultaneous emergency. Once the Incident Commander (Mine Manager or Designate) receives notification from Dispatch that operations may resume in all areas other than the affected area, the Incident Commander (Mine Manager or Designate) will instruct Dispatch to transmit the "Resume Operation" on all repeater radio channels.

Example: "Except for the Underground, all operations may resume."

Code One Termination

The Incident Coordinator will notify Dispatch when a Code ONE is over. Upon receiving notification from the Incident Coordinator, the Incident Commander (Mine Manager or Designate) will instruct Dispatch to announce that the "Code One is over" on all radio channels.

Example: "The Code ONE for the Underground area is over."

Emergency Response Team (ERT)/ Maintenance/ Mill Control Room Response

Maintenance and or the Mill Control Room can direct the ERT to the identified location of the alarm based on the alarm panel. Main Camp and Upper Bunk panels cannot be accessed by Maintenance personnel until the area has been inspected and deemed safe and accessible by the ERT.

Personnel Response to a Code One Announcement

If the Code ONE announcement is for an area you are working in, follow the Emergency Response Procedures for that area.

All persons operating light vehicles or mobile equipment on Surface Roads or Underground Ramps must pull over and stop the equipment in a safe manner and wait for the 'Resume Operation' authorization before returning to normal operating conditions.

If the emergency is not in your work area all crews are to continue working safely. If there is a task that presents a risk unusual to normal operating conditions, report to the supervisor for specific directives. Dependent on the emergency response capabilities of the ERT, work in all or some areas may have to remain stopped until the emergency is over.

If while you are driving and there are emergency vehicles approaching with flashing lights, pull over, stop your equipment in a safe manner, and wait until the 'Resume Operation' authorization from Dispatch has been given before returning to normal operations. If you are unsure of the status of the Code One in your area, contact your supervisor.

Once notified of a Code ONE, all personnel are required to maintain radio silence until the 'Resume Operation' for their work area has been announced by dispatch. Radio silence may be broken if relaying important information about the emergency.

Resume Operation Response

Upon hearing the 'Resume Operation' message, non-affected areas can return to normal operating conditions.

Code ONE Termination Response

Upon hearing the "CODE ONE termination" message, affected areas can return to normal operating conditions.

Supervisor Responsibility

If a supervisor or designate has important information relating to the emergency, the supervisor is responsible to notify the Incident Coordinator or Dispatch (on Channel 2 Repeater 1) as soon as possible, and to break radio-silence if necessary.

Supervisors of the affected area are to stand by and monitor Channel 2 Repeater 1 in case their assistance is required.

BJ-OHS-SOP-015 – Extreme Weather Conditions

PRETIVM		BJ-OHS-SOP-015 Extreme Weather Conditions	
Department: Safety	**Manager/Designate**: George Friesen	**Revision Number**: 2	**Creation Date**: Nov. 21, 2015 **Revision Date**: Feb. 26, 2021

Objective

The purpose of this procedure is to ensure the safety of all employees and contractors during extreme weather conditions, either by restricting employee's movements and work activities, or if necessary, suspend all work activities on site until the weather conditions improve.

Scope

This SOP applies to all personnel working at the Brucejack Project and access road. As weather conditions deteriorate, it is the responsibility of everyone working outdoors to monitor and report poor or worsening weather conditions to their supervisor, and if required to STOP work if it becomes unsafe to travel. The Mine Manager or designate shall be kept informed of the conditions by site supervisors, and if necessary, the Mine Manager shall restrict all work.

Health, Safety & Reclamation Code for Mines in British Columbia

- 1.9.1 – Workplace Conditions
- 3.13.1 – Evacuation, Procedures, and instructions
- 3.3.1 – Mine Emergency Response Plan

Occupational Health & Safety (OHS) Regulation (WorkSafe BC)

- G4.1.1 Avalanche assessment and planning

Definitions

- Reduced Visibility – Winds and blowing snow begin to restrict visibility of equipment operators.
- Restricted Visibility – Visibility in some areas of the mine limit safe operation and only essential equipment and traffic are permitted. Outside pedestrian travel should be prohibited.
- Total Whiteout – Weather conditions have deteriorated to a point where all work is deemed hazardous due to lack of egress for emergency.
- Essential Equipment and Traffic – Snow Removal and emergency equipment.

Roles and Responsibilities

The Mine Manager or Designate is responsible for:

- Ensure this SOP is implemented and maintained.
- Ensure personnel have up-to-date information regarding this SOP.

The Health and Safety Manager or Designate is responsible for:

- Monitoring the implementation of this SOP

The Area Manager or Designate is responsible for:

- Ensure that all workers perform tasks in a safe manner
- Review procedure with any persons performing tasks pertaining to this SOP

The Worker is responsible for:

- Ensure that they are authorized to perform tasks as required
- Report to their supervisor any issues pertaining to the above procedure
- Stop work if unsure and report to supervisor

Preparation

Hazards

- Low visibility due to fog, low cloud, blowing snow and whiteout conditions can cause vehicle operators to stray off the road, or to cause pedestrians to become lost and disorientated. When combined with extreme cold, whiteout conditions pose a greater potential for personal harm to persons' working in outdoor conditions.
- Extreme weather and blowing snow reduce egress on the entire access road out of site. If a serious injury was to occur during an extreme weather event it would be difficult to safely transfer an injured person from the site.

Tools

- Two-way radio.
- Proper winter clothing and PPE.
- Avalanche packs (beacon, shovel, probe) whenever traveling in avalanche zones.

Requirements

- Knowledge of the Extreme Weather SOP.
- Knowledge of the Extreme Weather SOP.
- BJ-AVL-SOP -018 Avalanche Related Road Sustainability Plan

Job Step

In the event of any change in weather resulting in limited visibility any person on site can initiate a Weather Advisory Level 1 update based on change in weather conditions in their work area. Higher level weather advisories will be confirmed by Mountain Safety and Supervisors.

After initiation:

- The Mine Manager will be updated on weather conditions and the resources available for authorization.
- Dispatch will issue a Weather Advisory Level Update on all channels; defining the weather condition and road status (if road closures in place; kilometer location and estimated time of opening) and associated action required.
- Dispatch will issue an email outlining the Weather Advisory Level, defining the weather condition and road status (if road closures in place; kilometer location and estimated time of opening) and associated action required.
- Supervisors will restrict any high-risk work, if necessary.

Level 1 Weather Advisory

Condition – Reduced Visibility

- Weather conditions such as high winds, drifting snow or fog causing limited visibility during driving and/or operating conditions.
- Avalanche hazard will be monitored.

Action Required

- Personnel will monitor conditions and report any changes to their Supervisor or Dispatch.
- Persons driving or working outside shall limit their speed and work activity to levels appropriate to conditions.

Level 2 Weather Advisory

Condition – Restricted Work

- Weather conditions in some areas of the project have reduced visibility to such an extent that some work may be restricted, and travel to specific areas may be restricted.
- High-risk tasks outside the scope of normal duties for inside work shall be restricted. Including underground.
- Avalanche hazards will likely be elevated; personnel movement may be limited.
- Site access or egress can be acquired within 3 hours.
- Road closures and avalanche control can be expected.

Action Required

- Supervisors shall determine if restricted work or travel is required.
- Supervisors shall notify the Mine Manager of any area closures or work restrictions.
- Supervisors shall communicate appropriately with their crews and contractors/visitors under their area of responsibility. Work and travel activities may be restricted in certain areas.
- Outside pedestrian travel shall be prohibited.
- Surface Operations equipment and operator's priorities shift to maintaining site egress and emergency access.

- Emergency Response Team on standby if required.

- Restrict work activities in the event of an escalation to a Level 3 Weather Advisory

Action Level 3

Condition - Total Whiteout

- The weather conditions have deteriorated to the point that it is not possible to determine the direction of travel, possible obstructions, or known landmarks.
- Avalanche hazards could be at high and personnel are removed from avalanche zones, unless direct supervision of Mountain Safety at the approval of the Mine Manager.
- The ability to safely respond to site emergencies is not possible.
- Site egress is not possible.

Action Required

- Mine Manager will implement the IMT so that level of work restrictions, emergencies response and priorities will be determined.
- Supervisors shall suspend all work including underground for crews and contractors/visitors within their area of responsibility.
- Emergency Response Team shall by escorted by surface snow clearing equipment for responding to emergencies.
- IF ALL WORK on site is suspended, ALL supervisors shall ensure that ALL employees/workers are all accounted for.
- ALL PERSONNEL shall muster in a designated safe zone and wait for further instructions.

Restrictions during a Level 3

- Prohibited outside travel except in emergency conditions.
- Operations suspended, and all personnel shall retreat to a safe location.
- Only essential workers authorized by the Mine Manager may continue work as directed, such as emergency services and snow removal.
- Outdoor pedestrian traffic is prohibited.
- Only critical areas determined by the Mine Manager shall be in operation.
- NO person shall return to work without the approval from the Mine Manager or designate.

Appendix C.31

BJ-OHS-SOP-007 – Working Alone or in High Risk Remote Locations

PRETIVM		BJ-OHS-SOP-007 Working Alone or High Risk Remote Locations	
Owner: Joe Nicholson	Approver: Wayne Osborne	Revision Number: 2.0	Creation Date: 5/10/2017 Revision Date: 5/10/2018

Objective

To ensure all personnel working alone or in high risk areas are accounted for and working safely.

Scope

This SOP applies to anyone working alone or groups that work in remote locations. It will be administered by the immediate supervisor of any worker that is in the position of working alone or working in high risk areas while on this mine site, and it is the sole responsibility of the immediate supervisor to ensure that employees are continuously in contact to ensure their safety and return back to camp.

Health, Safety & Reclamation Code of BC

- 3.2.3 - When a worker is working alone and may not be able to secure assistance in the event of an injury or other misfortune, the manager shall ensure that a means exists for checking the well-being of the worker and that interval between checks does not exceed 2.5 hours.
- OHS Regulations - 4.21 Procedures for checking well-being of worker

Definitions

- Working Alone - Any person who is working by themselves at any work site or anywhere on the Project

  * A person working alone in high risk areas or performing high risk activities off site require one (1) hour check-ins with dispatch.
- High Risk Areas - Known Avalanche zones, rock fall areas, steep slopes, mountain tops, glaciers and lakes/rivers, or any other area off site that would not have immediate access to emergency response or immediate assistance.

  * A person working alone in high risk areas or performing high risk activities off site require one (1) hour check-ins with dispatch.
- Designated Check-In Person - A person assigned by the workers supervisors' or a company assigned individual that is responsible to be in regular contact with person(s) working alone or in high risk areas.
- Brucejack Logistics & Dispatch - A 24/7 monitored dispatch team that monitors all road traffic, air traffic, people working alone and site emergencies.

Preparation

Hazards

- Mountainous terrain, fog, rain, blowing snow and extreme cold temperatures
- Wildlife encounters
- Failure to follow the working alone procedure will put people at risk and could result in serious injury or death

Tools

- Two way radios
- GPS trackers - SPOT or InReach Explorer
- Satellite Phones
- Bear bangers and bear spray
- FLHA and/or JHA

- Proper PPE and safety equipment for the area that the person(s) are working in

Requirements

All personnel that intend to work alone or companies that intend to have employees to work alone who DO NOT have a supervisor or assigned person to check on people working alone, shall inform Brucejack Dispatch and make prior arrangements for regular radio check-ins through the Brucejack Dispatch.

Responsibilities

Mine Manager or designate is responsible for:

- Ensuring this SOP is implemented and maintained.
- Ensuring on-site personnel have up-to-date information regarding this SOP.

Departmental Manager / supervisor is responsible for:

- Ensure employees are aware of the working alone procedures
- Ensure that dispatch is notified whenever a person is working alone or a group is working in a remote location

Health and Safety Manager/Coordinator is responsible for:

- Monitoring the implementation of this procedure.
- Auditing this procedure

Logistics & Dispatch

- Track those working alone or in groups in hazardous areas and ensure regular check-ins occur, and log all call-ins in spreadsheet

Personnel performing this task are responsible for:

- Performing one (1) hour check-ins with dispatch
- Informing dispatch and their supervisor when their work location has changed
- Responding to dispatch when they call

Job Step

Safe Work Instruction for working alone on surface at the BruceJack Site

Where an employee working at this mine site is not in frequent communication with, or is not within sight or sound of another person, for a period exceeding one (1) hour in high risk areas, the following procedure must be followed.

*Working alone in the Underground shall follow the guidelines of the HSRC section 3.2.3

The employee's supervisor must:

- Ensure the employee who is working alone is trained and qualified for the work they are undertaking.
- Ensure the employee is comfortable with the working alone situation, and familiar with the procedure and check-ins
- Complete an FLHA with the employee to identify hazards and risks, and document risk controls
- Inform Brucejack dispatch that an employee is going to be working alone and the location of the person working alone

- Ensure that the employee knows to contact dispatch if job location changes or the person is no longer working alone.

Personal Contact System: (no voice communication available)

- A supervisor or designate must visit the employee at the work place at intervals not to exceed 2 hours (a risk assessment will determine interval time of contact for higher risk activities).
- If the supervisor or designate cannot complete the contact as arranged, another contact must be assigned with enough lead time to meet the arranged 2 hour contact time.
- If physical contact cannot be made then a failsafe voice communication check-in must be implement and dispatch must be informed if this is the case.

Voice Communication System: (radio, telephone, cell etc.)

- A supervisor or designate must set up a contact system whereby the worker calls the supervisor or designate at minimal of one (1) hour intervals.
- If the supervisor cannot set up a contact system then dispatch must be notified and they shall take over as the primary contact for the person working alone.
- Supervisor and worker will complete a FLHA to determine the hazards/risk of the job and implement controls to mitigate risks.
- All personal/voice contact and check-ins will be recorded by supervision, the designated contact person or dispatch.

Groups working in remote locations or hazardous terrain:

All workgroups that intend to work in remote locations or in hazardous terrain shall contact dispatch and give them the location that they are working, what activity they are planning on performing and the duration of the work.

The work group shall contact dispatch and inform them that they have completed the required work and that they are safely back in camp.

If working in a High Risk area the check-in duration shall be one (1) hour with Dispatch

Failure of check-in or missed check-in:

- In the event the worker does not answer a check-in at the designated time interval, the contact person shall continue trying to call every 10 minutes until contact is made.
- If no contact can be made within 30 minutes, dispatch shall inform the workers supervisor that the worker is not responding to the calls and a plan must be implemented to go and check on the worker at the last known location.
- Dispatch will inform the Mine Manager and the ERT Coordinator of the situation. The ERT Coordinator will organize a response team if required.
- If the worker requires emergency attention follow the site emergency procedure by activating the CODE1 radio call.

Document and Records

- FLHA
- Contact persons logbook of check-in calls (Logistics & Dispatch)
- Communication notes if a Code 1 is instituted

Appendix D

Avalanche Emergency Response Plan

Initial Emergency Actions

At any time, a worker may witness an incident and/or be called upon to assist with an avalanche emergency. Therefore, it is important that all workers at Brucejack Mine know and understand these initial emergency response procedures.

Declaring an Avalanche Emergency

CODE ONE – CODE ONE – CODE ONE

Repeater Channel or call Dispatch at **#108** who will then initiate the Avalanche Emergency Response Plan.

The radio call is received by Dispatch, at which time they will contact Mountain Safety and activate the Emergency Response Team. (ERT) All areas at Pretivm Resources must stand down until told otherwise. Supervisors are responsible for ensuring no one is working in their area. All vehicles will go to the nearest safe pull out and remain there until instructed by Dispatch.

ALL THE EMERGENCY PROCEDURES IN THIS

MANUAL ASSUME THE CALL HAS

BEEN INITIATED

It is critical to respond to any issue in an appropriate and timely manner to ensure it is resolved as soon as possible. When considering the level of activation then it is better to over-react and rapidly de-escalate than the opposite reaction.

Mobilization

In the event of a Code 1 avalanche being called Mountain Safety will mobilize members to the incident scene. The Emergency Response Team will mobilize at the fire hall.

The Incident Management Team (IMT) will convene in the Incident Management Room (IMR) in the boardroom at Main Camp.

In the event of a major avalanche incident involving occupied buildings, multiple workers or multiple vehicles, a second operational period would likely be required, and the initial ICS structure would need to be expanded

First Operational Period (1-3hrs)

The IMT will define the objectives, the response level and strategies to be adopted as well as assigning resources to the rescue.

For the First Operational Period (1 to 3 hours) appointments would include:

Incident Commander/Incident Management Team Leader (IC)
The Incident Commander is responsible for management and decision making in relation to incident assessment and the on-going management of the Avalanche Emergency Response Plan. The Incident Commander is the final decision maker in plan development, analysis, selection and execution.

Operations Chief (OC, Op's)
The Operations Chief role will initially be filled by the first Mountain Safety personnel on scene and they will be responsible for organizing the rescue, recovery and evacuation of patients from the scene. If the rescue expands into a second period, becomes more complex or outside the scope of Mountain Safety (ex. Vehicle in river at KM 44) then the role will be transferred to a more qualified person.

ERT Coordinator
ERT Coordinator will be filled by one of first ERT members arriving at the Fire Hall. They are responsible for managing and organizing ERT members into teams as well as distributing specialist equipment and ensuring individuals are correctly equipped and trained for the avalanche rescue.

Staging Coordinator
Staging Coordinator will be filled by a member of the first ERT on scene at the avalanche. They are responsible for managing the Staging area and liaising with the Operations Manager/Chief as well as organizing personnel prior to being deployed onto the rescue site.

Dispatch
Role to be filled by the regular Dispatcher. Their responsibility is to call the Code 1, alert ERT and IMT, gather essential information from the Reporting Person, activate rescue personnel and alert off site (Level 3) resources.

Possible ICS structure for first Operational Period

Level	Criteria	Examples	Pretivm Actions	Government Agency Actions
Level 1	• No danger outside of company property. • Immediate control of hazard • Minimal environmental impact.	• Avalanche hits a vehicle on the road but vehicle can drive on • Minor injury or property damage. • Worker caught	• Mountain Safety respond to scene • Pretivm initial response is undertaken as per the site specific ERP.	• No actions required. • Monitors response if advised.
Level 2	• No immediate danger outside of company property • Imminent control of hazard is probable. • Moderate environmental impacts. • Local/regional media interest.	• Worker(s) out of vehicle partially or fully buried • Vehicle(s) buried in avalanche • Facilities partially damaged by avalanche	• Pretivm fully activates its ERP • Internal resources mobilized • External resources alerted • Pretivm mobilized and the emergency operations centre (EOC) may be on	• Pretivm has the capability to manage and control the incident using its own resources and expertise • Lead agency notifies other agencies that may be affected. • Agencies with direct
Level 3	• Worker safety jeopardized. • Significant and ongoing environmental impacts. • Assistance from outside parties is required.	• Major avalanche impacting vehicles and/or facilities • Multiple workers caught outside their vehicle in an avalanche	• Pretivm emergency response is at maximum. • Pretivm notifies lead agency • Pretivm dispatches representative to	• Hospitals in Terrace and Stewart notified of potential trauma patients. • Government agencies with direct involvement dispatch staff to Pretivm

Second Operational Period – Level 3 Response

In the event the incident requires extensive outside resources the RCMP will be contacted and they will activate Emergency Management BC (EMBC). Brucejack will maintain command of the situation and the organization chart will be expanded as resources arrive until a higher authority (RCMP, Mine Inspector, EMBC) arrives to take command. Once command has been handed over, Brucejack resources will continue to support the incident response.

AVALANCHE INCIDENT - Checklist		
☐	1)	Announce you are IC on radio – "IC"
☐	2)	Proceed to Incident Management Room (IMR) and join Incident Management Team (IMT)
☐	3)	Receive incident report from Dispatch

☐ **4)** **Scene Size-up, Priorities**

Code 1 Avalanche - Reflex Tasking

Already mobilizing

- Mountain Safety travelling to avalanche site
- Mountain Safety from other camp mobilizing (utilize helicopter)
- ERT mobilizing to Fire Hall
- ERT ambulance and ambulance Trooper warmed up
- Surface Operations equipment for snow removal on standby
- Cat on standby for snow removal or VOK ('crummy' for crew and warmth)
- Paramedics on standby at both camps
- Knipple helicopter mobilizing to avalanche site (weather permitting)
- All traffic stops in safe locations (out of avalanche area, collision hazard)

☐ **5)** **Contingencies, Considerations, Problems**

What could make things worse or more complicated? - Checklist		
☐	1)	Scene stable? - *Other hazards (avalanche, rock, icefall), avalanche control needed, medically stable, stable in terrain (steep ground, scree, cliffs), all traffic stopped in safe area (out of avalanche terrain)*
☐	2)	Weather- *visibility, ground/air travel, outside assistance from Stewart or Terrace weather forecast for those areas*
☐	3)	Darkness - *sunrise/sunset time, light plant required*
☐	4)	On/off road incident – *road access, snowcat, steep ground, water, river*
☐	5)	Communications – *announce radio channel to be used, ERT digital only works for mine site, Repeater 2 (Bowser Valley) or Repeater 3 (Wildfire)*
☐	6)	Location from camp – *road, overland or flying,*
☐	7)	Experience - *of reporting person, rescuers (trained, equipped)*

☐	8)	Code 1 – *Mine shut down, road closures and/or traffic and work restrictions, mine site or entire project*

☐ 6) **Objectives, Organize**

What do we need to do?

- **Determine immediate incident objective**

Keep it S.M.A.R.T. (Specific. Measurable. Attainable. Realistic. Timely)

- **Example – "Recover and evacuate all avalanche victims from avalanche on Lake Shore Drive within next hour"**

Objective		
☐	1)	
☐	2)	

☐ 7) **Strategy(s)**

How will we do it?

- **Liaise with Op's Chief to determine incident level of response 1, 2 or 3**

- **Liaise with Operation's Chief to determine strategy**
  - **Example**
    - **Strategy #1 – ERT's locate and evacuate victims to forward staging**
    - **Strategy #2 – Evacuate casualties to Terrace by helicopter**

Strategy		
☐	1)	
☐	2)	
☐	3)	

☐ 8) **Tactics**

Who, What, Where, When, How?

- **Establish initial ICS structure**
- **Assign Resources to Org Chart**

See Fig 2.

Level 2 On Site Resources – Checklist – add to Org Chart		
☐	1)	Mountain Safety (MS) • On scene and becomes Op's Chief • All Av Techs mobilizing - conditions dependent - day/night shift and from other camp
☐	2)	ERT • ERT Coordinator to advise when first team is ready to deploy from Fire Hall to staging area (by truck, ambulance or snowcat) • Second team prepping • Ambulance Trooper being warmed up
☐	3)	**Surface Op's** • Loader and excavators for snow removal to forward staging with Avi PPE • **Snow Cat with 'crummy" mobilized for transport or shelter**
☐	4)	Paramedics (other camp on standby or mobilizing to site) • Mobilize to forward staging
☐	5)	**Knipple Helicopter** • **On route to forward staging with other camp Av Techs**
☐	6)	**Off-site resources alerted –** Reference Outside Resources (conditions for flying)

Level 3 Off Site Resources Support – Checklist – add to Org Chart		
☐	1)	• Reference Outside Resources • Ex. Last Frontier, Northern Escape, Eskay Creek
☐	2)	**Ministry of Transportation and Infrastructure** • Terrace / Stewart
☐	3)	**Helicopters** • YHL, Stewart or Mustang, Smithers

☐	4)	**Ambulance**
☐	5)	**Hospitals**
☐	6)	**RCMP (can activate EMBC, issue NOTAM to keep aircraft out of area, organise rescue dogs)**

☐ **9)** **Monitor Performance**

Is the plan working? Does it need modifying?

- **IC, Op's and Planning assess progress against the control objectives and adjust as required**
- **Command staff conduct strategy and tactics meetings and plan next operational period if required**

See Fig 4.

Post Incident - Checklist

☐ **10)** Reference: Pretivm MERP 2020 document

Duty Card – Dispatch

AVALANCHE INCIDENT - Checklist		
☐	1)	Role to be filled by regular Dispatcher
☐	2)	Your role is to gather initial information from Reporting Person (RP)
☐	3)	Initial report (below) to be passed onto Incident Management Team ASAP
☐	4)	

Incident Details			
☐	**1)**	Incident name and number	
☐	**2)**	Date and Time	
☐	**3)**	Code 1 called on all 5 Channels and relayed to traffic on Pretivm road channel	Time:
☐	**4)**	All traffic to stop in safe location (out of avalanche area)	Time:
☐	**5)**	Incident Commander	Name:
☐	**6)**		
☐	**7)**		

☐	5)	**Code 1 Avalanche - Reflex Tasking** **Check and record status and location** ☐ Mountain Safety (MS) travelling to avalanche site ☐ Mountain Safety from other camp mobilizing (utilize helicopter) ☐ ERT mobilizing to Fire Hall ☐ Ambulance/ Ambulance Trooper warmed up ☐ Surface Operations equipment for snow removal on standby ☐ Cat on standby for snow removal or VOK (‘crummy’ for crew and warmth) ☐ Paramedics on standby at both camps

- ☐ Knipple helicopter mobilizing to avalanche site (weather permitting)
- ☐ All traffic stops in safe locations (out of avalanche area, collision hazard)

☐ 6)

DISPATCHER – repeat all calls from RP			
☐	**1)**	Reporting Party (RP) name	
☐	**2)**	Nature of incident (repeat back)	
☐	**3)**	Remind RP - they are in charge until relieved by more experienced person	
☐	**4)**	Location of incident and RP (KM, GPS)	
☐	**5)**	Immediate safety of RP – scene stabilized (other avalanches, incoming vehicles, personnel)	
☐	**6)**	Number of people involved or buried – partial or fully buried	
☐	**7)**	Number and type of vehicles involved or buried – partial or fully buried	
☐	**8)**	RP and victims equipped with avalanche PPE	
☐	**9)**	Others at scene - names	
☐	**10)**	First aid being given?	
☐	**11)**	**Nature of injuries, Level Of Consciousness (LOC - AVPU) and vital signs (breaths, pulse, colour, pupils)**	
☐	**12)**	Equipment on scene – first aid, overnight gear, shelter	
☐	**13)**	Terrain – roadside, flat, steep, scree, cliffs, glacial	

☐	**14)**	Heli pick up site nearby		
☐	**15)**	Weather conditions, visibility, precipitation, temperature, wind speed and direction		
☐	**16)**	Egress or descent routes		
☐	**17)**	Contact information (if required) – radio channel, satellite phone number		

☐ 7)

Additionally Mobilize			
Team	Time	Names	Present Location
Mountain Safety at both camps to be woken up			
Alert Level 3 Resources (IC to verify)			

☐	8)	Deliver this report to the IMT in the boardroom
☐	9)	Continue with normal Dispatch duties
Post Incident - Checklist		
☐	10)	Reference: Brucejack MERP 2020 document

Notes:

Duty Card – Operations Chief

AVALANCHE INCIDENT - Checklist		
☐	1)	Role to be filled by primary Mountain Safety on scene
☐	2)	Role is to organize all the rescue operation in the field.
☐	3)	Inform the IC that you are on scene and are Operations Chief “Op’s, OC”

Gear Arriving with First ERT		
☐	**1)**	Avalanche rescue party pack #1
☐	**2)**	Vacuum mattress #1, Vacuum splints and Scoop stretcher
☐	**3)**	Jump kit, oxygen and AED
☐	**4)**	RECCO unit
☐	**5)**	2 extra avalanche packs for Surface Ops personnel (Loader, Cat Driver)
☐	**6)**	6 steel shovel,
☐	**7)**	2 x helicopter stakes
☐	**8)**	Forward Staging Checklist

Gear Arriving with Second ERT		
☐	**1)**	Rescue toboggan #1 (with warming kit) - Brucejack
☐	**2)**	Megaphone
☐	**3)**	Avalanche rescue party pack #2
☐	**4)**	Rescue toboggan #2 (with warming kit) - Brucejack
☐	**5)**	At night – headlamps, light plant (Pinto hitch) For deep snow conditions – snow shoes
☐	**6)**	6 steel shovels

Overview of Avalanche Rescue

HYPOTHERMIC SUBJECTS

AVI BURIAL: ≤60 MINUTES or UNKNOWN

- ✚ Assessment: If no signs of life are present (inc. ≤10-60 sec pulse check) begin CPR without delay
- ✚ Initiate AED Protocol as follows:
  - Complete (6) cycles of CPR & AED:

  (Cycle = 2 min of CPR, AED Analysis with Shock / No-Shock)
- ✚ Patients with ROSC should be transported immediately with continual observation: AED should remain attached to the patient during transport
- ✚ All avalanche burial victims should be treated as trauma patients with full spinal immobilization if resources permit

AVI BURIAL: ≥60 MINUTES CONFIRMED

- ✚ Assessment: If no signs of life are present (including ≤10-60 second pulse check) assess for:

FINDING	ECG	ACTION
- Air Pocket Absent; and/or - Snow/Ice Plug Present	Asystole	- Do not initiate resuscitation
- Air Pocket Present; and - Snow/Ice Plug Absent	VT, VF	- Initiate Hypothermia Cardiac Arrest Protocol with Spinal Immobilization
- Air Pocket Present or Absent; and - Snow/Ice Plug Absent	PEA	- Initiate Hypothermia Cardiac Arrest Protocol with Spinal Immobilization
- Air Pocket Uncertain; and - Snow/Ice Plug Absent	VT, VF PEA	- Initiate Hypothermia Cardiac Arrest Protocol with Spinal Immobilization
- Air Pocket Uncertain; and - Avalung Deployed	VT, VF PEA	- Initiate Hypothermia Cardiac Arrest Protocol with Spinal Immobilization

Avalanche Victim resuscitation Checklist (ICAR)

Post Incident - Checklist		
☐	1)	Reference: Brucejack MERP 2020 document

Duty Card – ERT Coordinator

AVALANCHE INCIDENT - Checklist		
☐	1)	Role to be filled by one of first ERT members arriving at Fire Hall
☐	2)	Role is to manage teams leaving the Fire Hall
☐	3)	Inform the IMT that you are ERT Coordinator *(conference room ext. 640)*
☐	4)	**Staging - Checklist**

☐	**1)**	Organize ERT members into Teams with a designated leader
☐	**2)**	Check team members have avalanche packs, are wearing transceivers (physical check and **sending**), dressed appropriately for being in the field for several hours and have required training
☐	**3)**	Distribute first aid and rescue gear to teams – Ops Chief to advise
☐	**4)**	Record teams' details, PPE checked and gear issued
☐	**5)**	Inform IC once each team is ready to mobilize
☐	**6)**	Update Plans group with team name and details *(Brucejack IMR ext. 640)*
☐	**7)**	Warm up Trooper ambulance/ambulance

☐ 5)

Duty Card – Staging Coordinator

AVALANCHE INCIDENT - Checklist		
☐	1)	Role to be filled by member of the first ERT arriving on scene – Use Checklist
☐	2)	Your role is to liaise with the Operations Chief “Ops” as well as manage the Staging area
☐	3)	Inform IMT that you are Staging Coordinator “Staging”
☐	4)	**Staging - Checklist**

☐	**1)**	Check all rescuers have avalanche packs and the correct gear
☐	**2)**	Organize first aid kits and specialist rescue gear for deployment
☐	**3)**	Inform Op’s when teams and equipment are ready to be deployed
☐	**4)**	Direct teams on how to access the site and where to report to Ops. Mark with wands if necessary
☐	**5)**	Transceiver **check of all personnel entering rescue site (ERT already checked). Op’s Chief to advise if transceivers on send or search mode**
☐	**6)**	Select a secure landing site for rescue helicopter and mark with heli stakes (5m apart) for upwind landing
☐	**7)**	**Update IC/Logistics on the arrival and departure of all personnel (non ERT) in and out of forward staging**

☐	5)	**Priority First Aid and Rescue Gear – with 1st ERT**		
		☐	**1)**	Avalanche rescue party pack #1
		☐	**2)**	Vacuum mattress #1, Vacuum splints and Scoop stretcher
		☐	**3)**	Jump kit, oxygen and AED
		☐	**4)**	RECCO unit
		☐	**5)**	2 extra avalanche packs for Surface Ops personnel
		☐	**6)**	6 steel shovels
		☐	**7)**	2 x helicopter stakes
		☐	**8)**	Forward Staging Checklist
☐	6)	**Secondary First Aid and Rescue Gear – with 2nd ERT**		
		☐	**1)**	Rescue toboggan #1 (with warming kit)
		☐	**2)**	Megaphone
		☐	**3)**	Avalanche rescue party pack #2
		☐	**4)**	Rescue toboggan #2 (with warming kit)
		☐	**5)**	At night – headlamps, light plant (Pinto hitch)
		☐	**6)**	For deep snow conditions – snow shoes
		☐	**7)**	6 steel shovels
		☐	**8)**	

☐	7)

1.0 INTRODUCTION

The Pretium Resources Inc. avalanche control blasting procedures described here detail company procedures and policies that ensure “industry best practices” are followed during all avalanche-blasting activities. These blasting procedures comply with WSBC and ERD. Specific safe work procedures are detailed for each type of blasting that may be used at the operation. Pretium Resources and all Mountain Safety team members will review avalanche control blasting procedures annually. At a minimum, all Mountain Safety team members will complete onsite training annually.

2.0 AVALANCHE CONTROL JUSTIFICATION

When the Mountain Safety department's avalanche hazard analysis concludes that the avalanche risk to workers is at acceptable levels, Mountain Safety staff may initiate avalanches under controlled circumstances with the use of explosives. This decreases road closure times, as well as work-site delays and creates a safer environment for workers.

3.0 PERSONNEL

3.1 CERTIFICATION

All Mountain Safety personnel using explosives for avalanche control shall have a valid WorkSafeBC Blasting Certificate, Mines Blasting Certificate (for control work in the zones surrounding the Brucejack camp) and a valid Transportation of Dangerous Goods (TDG) certificate. The Blaster (Mountain Safety) shall be compliant with explosive manufacturers' recommendations, current industry standards, procedures, and legislation surrounding the use of explosives. All Blasters will be familiar with all Standard Operating Procedures (described in the Avalanche Safety Plan (ASP)), pre-identified hazards (described in the Avalanche Atlas and/or ASP), the local terrain and the current and historical snowpack.

3.2 TEAMS

Blasting missions are performed in teams comprised of a minimum of two workers that are trained, equipped, and able to conduct an effective companion rescue: a team leader (Blaster of Record, Blaster) and Assistant(s). They shall have direct communication at all times, via radio or voice, with guards maintaining the closure area free of all non-essential personnel (i.e. all workers who are not part of the blasting team). The team shall be rested, alert, and in good physical and mental condition. All team members shall be capable of moving through difficult mountainous terrain under variable weather conditions. The Blaster and Assistant(s) shall be clothed and equipped to safely conduct avalanche blasting, in accordance with recommendations of the Canadian Avalanche Association or as required by WorksafeBC Occupational Health and Safety Regulations (OSHR) (Part 8: Personal Protective Clothing and Equipment). Such items shall include, but not be limited to: ski helmets (OHSR Section 8.11(2) – Ski Helmets), two-way radio, avalanche transceiver, snow probe, shovel, and first aid kit.

3.2.1 BLASTER OF RECORD

The Blaster of Record will determine if explosives use is required, and will decide on the type and size. They will be responsible for all aspects of the explosive mission, including charge preparation, placement, detonation, and disposal of misfires. The Blaster will determine the number of charges required and will not assemble these until the last most practicable moment, "…that point in time when the explosives are as close to the control route as possible, in a safe, sheltered location excluded from public access," (OHSR Section 21.85 2), which may depend on weather, terrain, and visibility.

Persons who do not hold valid blasters certificates may assist a Blaster of Record, but the blaster must have authority over the assistants and must exercise direct visual supervision and be responsible for their work during explosive loading, priming, fixing or firing (OHSR sec 21.5(3).

3.2.2 ASSISTANT

The Assistant will aid the Blaster as required and be responsible for recording all aspects of the blasting mission. The Assistant shall at all times work under the direct supervision of the Blaster of Record.

3.3 REPORTING

The employer will immediately report theft of, or problems with explosives to the RCMP and Chief Inspector of Explosives - Natural Resources Canada - Explosives Regulatory Division first, then WorkSafeBC. Any repeat or critical failure of explosives, accidents, injuries, or near misses regarding explosives will be reported immediately to WorkSafeBC (OHSR Section 21.3). A written report must be forwarded within 3 days of the incident.

3.4 VEHICLES

Personnel transporting explosives in a vehicle, including snowmobiles, snowcats and ATVs, must comply with all applicable regulations under the Canadian Explosives Act, HSRC for Mines in BC, WorkSafeBC OHSR (Section 21.18.3), and British Columbia Motor Vehicle Act. They shall be certified for the Transportation of Dangerous Goods. All vehicles used for transport will have specified explosives transport containers and appropriate placards on all sides of the vehicle indicating the presence of explosives. The placards will be removed when explosives are not being transported. All vehicles transporting explosives will be equipped with at least two fire extinguishers capable of quickly extinguishing gasoline, oil or electrical fires, which meet the guidelines listed below:

NRC/ERD Part 9 Section 191(8):

> There are to be two fire extinguishers rated at 4A: 40BC in vehicles transporting explosives

OHSR Section G21.23:

> Reasonable quantities of flammable or combustible materials may be carried by a vehicle transporting explosives, but will be contained in a manner which will not cause or transmit a fire or explosion and will be adequately separated from any explosives containers on the conveyance.

HSRC for Mines in BC Part 8.4.2 and 8.4.3

> A vehicle used to transport explosives shall be provided with orange diamond shaped placards and clearly visible signs marked “Explosives” in letters less than 150mm in height which are posted on the front, rear and sides of the vehicle.

3.5 PUBLIC

No members of the public will be allowed to have direct or indirect contact with explosives, or ride in vehicles that are transporting explosives.

4.0 EXPLOSIVES HANDLING

During all Pretium blasting operations and blasting-related activities, Industry best practices will be adhered to. Explosives materials will be stored, transported, handled, and used in a manner recommended by the manufacturer and complying with Federal and Provincial regulations, acts, and current legislation.

NATURAL RESOURCES CANADA – NRC/ERD (EXPLOSIVES ACT) Transportation and storage of explosives will be at all times in accordance with requirements of the Explosives Act (Canada).

The Explosives Act pertains to the manufacture, testing, sale, storage, transportation, and importation of explosives and the use of fireworks.

Magazines will be locked and secured at all times, located, inspected, marked, and constructed in accordance with the Explosives Act of Canada. Appropriate licenses and logbooks will be current and available at magazines, it shall be in the charge of an authorized person and only certified Blasters will make entries into the magazine logbook.

Magazines shall be organized and have an up to date inventory, oldest stock being used first, be kept clean and dry and arranged in a clean and tidy manner. Magazines shall contain an up-to-date inventory and be organized in a clean and tidy manner. The oldest stock is to be used first.

4.1 TRANSPORT CANADA (TRANSPORTATION OF DANGEROUS GOODS ACT)

Transportation of explosives will at all times be in accordance with requirements of The Transport of Dangerous Goods Act (Canada).

Pretium has been approved by NRCAN to follow DYNO NOBEL's Emergency Response Assistance Plan (ERAP # 2-1037)) that has been approved by Transport Canada.

The object of an ERAP is to ensure the immediate availability of a suitable response to emergency situations involving dangerous goods in transport. Assistance from the plan holder may be in the form of telephone advice (based on information from personnel at the emergency scene), or travel to the scene with specialized personnel and equipment.

Any Pretium Blaster or representative who handles, offers for transport, or transports dangerous goods, will be adequately trained and hold a valid Transportation of Dangerous Goods (TDG) training certificate in accordance with the TDG act (Canada).

4.2 WORKSAFE BC (OHSR)

All blasting activities will adhere to WorkSafeBC regulations (OSHR). Specifically:

Explosive charges must not be placed manually on site by workers or projected by any means for the purpose of avalanche control, until the proposed work procedures have been submitted and accepted by the board (OHSR sec 21.85).

Explosives materials must be stored, transported, handled and used in the manner recommended by the manufacturer (OHSH sec 21.36).

Explosives are not be primed until the last most practicable moment, which is that point in time when explosives are as close to the control route as possible, in a safe, sheltered location excluded from public access (OHSR sec 21.85).

Safety fuse assemblies are transported or carried in a crush-resistant container until such time that is deemed the last most practicable moment (OHSR sec 21.16).

Pull wire fuse lighters are transported separately from any explosive or safety fuse assembly. Igniters are not attached to a safety fuse assembly until the fuse is ready to be ignited. (OHSR sec 21.85)

Relighting a safety fuse is prohibited. (OHSR sec 21.79)

If a misfired charge contains a safety fuse and is re-blasted, workers must not return to the blast site until 30 minutes after the detonation.

The location of magazines in which explosives are stored, and restrictions on access or activity around the magazine area will be clearly communicated to all workers. Any day box and receptacle used for day storage of explosives on the work site must, when they contain explosives, display signs indicating the presence of explosives in a conspicuous manner, and the signs must be removed when they are empty (OHSR sec 21.18).

5.0 EXPLOSIVES USED

Pretium Mountain Safety teams may use hand charging, cornice charging, case charging, Avalauncher control, Wyssen Avalanche Tower (WAT) and helicopter deployment techniques to mitigate avalanche risk. Blasters will be familiar with and have a copy of the Pretium Avalanche Control Blasting Procedures readily available, and all personnel involved in the blasting operations will adhere to manufacturers' recommendations. Product literature regarding the explosives materials being used will be readily available. For the various techniques used in explosive avalanche control, a number of explosive products may be used, the most common being:

5.1 PRIMERS

"Primer" generally refers to a cast booster or cartridge that has been connected to an initiating device. Primers may be used on their own, linked together (as for cornice charging), or used to initiate blasting agents. Avalanche personnel may deliver these on foot or skis, by Avalauncher gun, by helicopter or remotely with the Wyssen Avalanche Towers. All regulations regarding length of safety fuse and transportation will be met. The Wyssen Avalanche Towers require a variance (VR201900088) for 30cm safety fuse length.

5.2 BLASTING AGENTS

"Blasting Agent" generally refers to ANFO (Ammonium Nitrate - Fuel Oil). A primer must initiate the blasting agent. These may be utilized by avalanche personnel on foot, skis, or by helicopter.

6.0 CLOSURES / SWEEPS

Danger Area - the area that has potential to be affected by concussion from the blast and/or the resulting avalanches and debris. The Danger Area must be closed, swept (visually and manually), and cleared of all persons.

The Blaster of Record is responsible for contacting the road foreman or work-site supervisor on duty, clearly outlining the Danger Area, and identifying standard closure locations to be used. The supervisor then coordinates traffic control (sweep vehicle, road maintenance equipment, and personnel) for the closure. The Blaster of Record notifies Dispatch and the worksite Supervisor of the closure location and expected duration.

Trained guards / traffic control personnel, with appropriate warning signs and PPE will physically block the road or work-site access at closure locations specified in the Avalanche Safety Plan (ASP).

The danger area is then swept. The person in charge of sweep contacts the Blaster, to confirm that the Danger Area has been swept and is secure.

Once the closure is in place, the Blaster announces the start of blasting operations on the main operational radio frequency and any other relevant frequencies, which all personnel involved with blasting must monitor.

Once control work is complete and the Blaster has completed post blast inspection(s) the road is turned over to the surface operations supervisor for debris clearing.

6.1 SEASONAL WARNING SIGNS

General information signs related to avalanches and explosive use shall be placed at appropriate road / work site locations. These signs warns all users that avalanche control using explosives can start at any time. These signs provide blasting information and a contact number.

7.0 RECORDING OF BLASTING MISSIONS

For every explosive charge used, standard observation records are made and filed by the Blaster in the Blasting Logs. This information includes: explosive placement, results, time, date, location, type, and size, detonation status, avalanche characteristics, resulting damage, closure start, sweep, and end times. These are standard as per the Canadian Avalanche Association's *Observation Guidelines and Recording Standards for Weather, Snowpack and Avalanches* (2016).

Two Blasting records must be maintained, one for the Blaster of Record, and one for the company. These records (logbooks or digital files) must be complete, current, and available at the work site (OHSR sec 21.4). The blaster must ensure that type and quantity of explosives recorded in their logbooks match the type and quantity of explosives removed from the magazines and input in the magazine inventory logbook. The blaster must maintain a personal log of all blasting work that the blaster performed (sec 21.4(4)). The employer must ensure that blasting logs are kept for at least 5 years after the completion of the blasting operation (sec 21.4(3)).

8.0 DISPOSAL OF EXPLOSIVES

8.1 MISFIRE DISPOSAL

Hangfire – delay in detonation

Mislight – Uncertainty whether the fuse is lit or not.

Misfire - a charge, or part of a charge, which, on initiation, fails to detonate or function,

All misfires shall be recorded in the Blasting Log (OHSR sec 21.4).

If an explosive charge/primer is known or suspected to have misfired, the Blaster shall suspend the blasting mission and ensure that the danger area remains closed and that no one approaches the misfire until the greater of the explosive manufacturer's recommendations or at least 30 minutes has elapsed since the time at which detonation should have occurred. (OHSR sec 21.73(2) and 21.78).

The blaster must make a thorough examination of the blast site after charges have been fired to determine that there are no unexploded charges remaining. (OHSR 21.74)

If there is evidence or suspicion of misfired charges or undetonated explosives, all loose unfired explosives must be collected and destroyed in a safe manner. Metallic equipment must not be used during this procedure. The area shall be adequately illuminated and only the Blaster and essential personal shall remain in the area. (OHSR 21.75)

The misfired charge/primer is not to be disturbed at any time. Placing and detonating a second primed charge beside it shall destroy it. The new charge shall not touch or disturb the misfired charge (OHSR sec 21.77). After the misfire is blown in place (BIP) the site will remain closed and under observation for an additional 30 minutes (OHSR sec. 21.78).

If misfires are suspected in an avalanche debris deposit, and machinery is required to clear the debris, the blaster of record must be onsite. The blaster of record is to keep to a minimum, the number of workers required to clear the debris and must be in direct control and supervise the work. Any misfires located or suspected will be handled as required by the OHSR 21.75(c)).

If the misfired charge/primer is not located, or the area is unsafe to approach, the zone affected shall be cordoned off. Attempts to locate the misfire shall be continued during and after spring snowpack "melt off" until the charge/primer is found and detonated. To facilitate these searches, if practicable all suspected misfires locations are to be recorded using GPS and photographed so that the area to be searched is minimized. Appropriate signage is placed to warn users of the hazard and to instruct what to do if they come upon a misfire. Signs must include contact telephone numbers. Signage will be located at access points to the area. Pretium management will be notified of the location, status, and plan to eliminate or mitigate the hazard of any misfire that occurs during blasting operations. Mountain Safety will subsequently inform the landowner and other involved parties (OHSR sec 21.77).

In the event that a misfire is discovered, only an experienced and qualified Blaster will carry out and ensure its destruction. The immediate area will be treated as highly hazardous and restricted to the absolute minimum personnel required to safely complete the task.

Proper belaying techniques must be used when accessing misfires in hazardous terrain with a potential to fall (OHSR Part 34). Non-sparking shovels will be used when digging for misfires within the snowpack. Confirmation of misfire disposal will be recorded in the Blasting Log (Manufacturers recommended safe working practices).

8.2 EXPLOSIVE DISPOSAL

Any explosive products requiring disposal will be dealt with according to the manufacturers' recommended procedures or as recommended by NRC/ERD.

9.0 REVIEW AND REVISION OF BLASTING PROCEDURES

Pretium Resources avalanche control blasting procedures will be reviewed annually, at a minimum, to ensure that industry standard best practices are being met or exceeded.

Blasting procedures are living documents, which will be continually reviewed. If Mountain Safety personnel recognize any situation where a change in procedure would increase safety and/or more effectively mitigate risk, the procedure will be presented to the Mountain Safety Superintendent for review and evaluation. Improvements to the blasting procedures and avalanche safety program will be submitted to WorkSafeBC for approval. The new procedure will be implemented only after WorkSafeBC has approved the procedure and operational personnel have been informed, educated, and trained.

10.0 SAFE WORK PLAN - AVALANCHE CONTROL BLASTING

Prior to every decision to initiate explosive avalanche control, the Blaster of Record and Mountain Safety team will complete an assessment of the area(s) identified for avalanche control.

The Blaster of Record leads the Mountain Safety team, required maintenance personnel, and pilot (if required) in completing a Safe Work Plan (worksheet found in ASP). This identifies potential hazards and applicable risk treatments to safeguard the entire team during the proposed avalanche control mission. The Safe Work Plan selects and documents:

- Safest and most effective control method
- Specific mis-light procedures
- Site-specific hazards and mitigations
- Danger Area: to choose appropriate locations of safe access and egress, and sweep route
- Communication channels and check-in procedures
- Equipment required for closure, sweep and clearing of debris
- Procedures for potential incidents or equipment failure (i.e. Helicopter malfunction, Vehicle breakdown)
- PPE - clothing, rescue equipment and blasting supplies
- Mental and physical preparedness of the Blasting team (including pilot for helicopter use)

The Mountain Safety team then makes a final “go” or “no go” decision to implement the Safe Work Plan and start the mission. Any member of the team (including the pilot in helicopter operations) has veto power to cancel the mission.

Road maintenance and traffic control personnel, as directed by the Blaster of Record, will follow road/work-site closure procedures to close and sweep the Danger Area (manually and visually). The Danger Area must be guarded and supporting personnel in communication with the Mountain Safety team (on main operational radio frequency).

The Danger area must be guarded by personnel in direct communication with the Mountain Safety team.

Once the Blaster of Record is satisfied that the Danger Area is secure, blasting may begin. The Blaster first leads a “dry” test run of the control method. The blasting team will fly to selected targets (no charges will be deployed) to ensure that flying conditions are adequate, and communication and shot placements are understood by all members of the team. The blasting procedures described in this document and any site-specific measures identified in the Safe Work Plan are followed.

<u>At the end of mission, the Blaster of Record will return to the site, by ground or air, to:</u>

- Observe and record avalanche control results (to CAA industry standard)
- Fully document the mission in the Blasting Log
- Re-assess site safety
- Notify road maintenance personnel (on main operational radio frequency) when the control mission is complete and it is safe to begin debris clearing. Mountain Safety then turns the area over to the Surface Ops Supervisor who directs that operation.
- Update personal Blasting logbook
- Debrief

11.0 OPERATIONAL PROCEDURES

11.1 AVALANCHE CONTROL WITH HELICOPTER DEPLOYMENT

Helicopter deployment of explosives is used as a risk reduction strategy, which allows for precision explosive placements in start zones, visual confirmation of road closures and control of multiple paths within a short time frame. Weather is the main constraint on the use of helicopters for avalanche control work.

Helicopter companies are required to have approval from regulatory bodies, which permits them to transport explosives. CAR 527 sets standards for personal safety and restraint systems.

11.1.1 EQUIPMENT

- Helicopter with radio on road/area closure frequency,
- Intercom headsets - 1 per team member (hot mikes required),
- Approved safety harness, slings and carabiners,
- Stopwatch,
- Field notebook and pencils,
- Explosives container for fused primers,
- Primers,
- ANFO Blasting Agent- up to 75% of the remaining allowable load,
- Zap Straps or electrical tape for closing ANFO bags after placing primers inside,
- Pull-wire lighters,
- Blasting tools and accessories,
- Camera and GPS to record misfire placements.
- Fuse cutters

11.1.2 PERSONNEL RESPONSIBILITIES

- All personnel must be TDG certified.

11.1.2.1 PILOT

- Operation and safety of the aircraft and occupants,
- Knowledgeable and experienced in helicopter avalanche control procedures,
- Familiar with the area

11.1.2.2 BOMBARDIER

- Responsible for the entire blasting mission (ref 3.2.1)
- Safety with the use of explosives,
- Direct pilot to do a test run of the area,
- Test all equipment prior to take off,
- Direct pilot to desired start zones,
- Ensure road closure is in place,
- Preparation of, ignition, and deployment of explosives,
- Observation of all results (and confirmation with Assistant).

11.1.2.3 ASSISTANT (OPTIONAL)

- Assist with visual closure sweep during fly-by check,
- Record closure confirmation,
- Aid the bombardier in directing the pilot to placements,
- Record the time of burning fuses,
- Record and spot the placement of charges,
- Record detonation times,
- Photos
- Record the observations, results, photograph or sketch areas where misfire has been dropped.

11.1.3 EXPLOSIVES PREPARATION

A minimum 1 meter fuse length is used on all explosive charges deployed from a helicopter. Primed charges are prepared prior to boarding the aircraft, at the last practicable moment, and as safely close to the helicopter landing as possible. Primed charges are carried and secured in easily jettisoned containers.

Pull wire igniters are transported separately from charges. Only pull wires are used to light safety fuse assemblies, and only one attempt at ignition is made (per manufacturers' requirements). Relighting a safety fuse is prohibited.

Primed ANFO charges may be carried in the helicopter under the following conditions (based on BC Ministry of Transportation – Avalanche and Weather Programs – Explosives Use Operational Plan):

- A minimum amount of fuse should be exposed outside of the bag (10-25cm),
- ANFO bags must be securely placed upright in the foot well of the helicopter or, if necessary, on the seat beside the bombardier,
- ANFO bags must be placed so as not to interfere with safety or efficiency of the mission (i.e. bags must not be stepped on to avoid crimping fuses or ripping bags),
- Only the amount of ANFO required for the mission and capable of being jettisoned by the Bombardier will be permitted on the flight.

11.1.4 PREFLIGHT SAFETY CHECKLIST AND PROCEDURES

All personnel involved in the blasting mission or working around the helicopter are required to be present for a pre-flight safety briefing, which includes:

- Safety in and around the helicopter,
- Safe refueling, explosive assembly, and helicopter loading areas,
- Individual and team experience levels,
- Weather conditions and related terrain access limitations,
- Fuel, personnel, and explosive load limits,
- Removal of door and/or seat cushion and/or practice opening and closing door,

• Safety instructions for ground support personnel,
• Mission-specific terrain considerations and safe standoff distances from blasts and avalanches in motion (dust clouds, airborne debris),
• Seating arrangements and associated pilot visibility limitations,
• Radio call signs and channels / frequencies for support and closure personnel,
• Intercom check,
• Targeting and guiding pilot to targets,
• Bombing run verbal commands,
• Emergency explosive jettison,
• Timing methods, especially for 90 seconds after first fuse of bombing run is lit,
• Mislight, misfire, and disposal procedures,
• Ensure understanding that any team member can abort the mission if they feel unsafe conditions are arising,
• Ground "dry" run to test: intercom, stopwatch and radio.
• Securing and testing Bombardier safety harness - approved harness with non-instantaneous release system, attached to the helicopter via Transport Canada certified anchor point, also wearing approved helicopter seatbelt. Ensure all required blasting tools are within easy reach of the bombardier. Verbal communication:

• Pilot: "Check your tie in"
• Bombardier: "Tie in checked and locked".
• Harness & tie-ins checked by Assistant

11.1.5 IN FLIGHT PROCEDURES

• Assistant starts recording - take off time, helicopter, pilot, date, avalanche area,
• Fly-by of Danger Area and road closure to ensure that the area is secure and clear of people & machinery.
• Pilot is directed to the first bombing location, target and elevation. Complete a test run over the area to determine wind and weather factors,
• Identify alternate safe misfire/mislight (see Sec 11.1.7 below) deposit site (ridge top or flat area) along the same path of travel, which can be reached in 15 seconds. Jettison time for misfires/mislights will follow the manufacturers' recommendations (0 to 15 sec),
• Bombardier readies primer and lighter on approach to target,
• Bombardier trims fuse and attaches pull wire igniter,

IN FLIGHT PROCEDURES VERBAL COMMUNICATION

- Verbal Communication:
    - Bombardier: “Pull wire on”
    - Assistant: “Pull wire on”,
- Bombardier directs pilot to shot placement,
- Bombardier removes pull wire safety mechanism,
- Verbal Communication:
    - Bombardier: “Safety is off”
    - Assistant: “Safety is off”,
- Bombardier lights fuse (directing lighter toward open door),
- Bombardier confirms ignition,
    - Bombardier: “Fuse ignited”
    - Assistant: “Fuse ignited”,
- Assistant starts stop watch/timer,
- Time is recorded,
- Bombardier sites target and drops charge forward, down and away from the helicopter, only when the helicopter is in slow flight speed or hovering,
    - Bombardier: “Shot is away, Shot stuck”
    - Assistant: “Shot is away, Shot stuck”
- If shot does not stick, helicopter will pull back to ensure to watch where the bag slides to, allowing confirmation of detonation.

- Verbal communication when all lit shots have been placed:
    - Bombardier: “All shots away”
    - Assistant: “All shots away”
    - Pilot: “All shots away”

- When more than one shot is being placed, placement will stop 90 seconds after lighting the first fuse to allow helicopter to move to safe location for observation of detonation and results,
- Assistant records results,
- Another bombing run can be initiated after confirmation of detonation,
- Once the bombing mission is concluded and the area deemed secure by the blaster of record, the area is turned over to the Surface Ops supervisor for debris clearing.

11.1.6 SAFETY PRECAUTIONS

• Helicopter standoff distances, including surrounding terrain and vegetation, are always monitored by all team members,
• Blaster of Record must visually evaluate Danger Area prior to blasting,
• Bombardier seating position has unobstructed views of shot placement.
• A charge (if primer only; not ANFO) is pushed down and away from the helicopter, while helicopter is facing uphill of slope. Bombardier's hand is on top of the charge with thumb facing down toward the ground,
• No more than three charges ignited on one run,
• Helicopter moves to identified safe zones while awaiting detonation,
• Bombardier keeps pull wire igniters separate from the primers, with igniters placed on primers at last possible moment,
• Bombardier must inform the pilot immediately of need to jettison explosives due to emergency situation or malfunctioning explosives,
• Pilot directs Bombardier to jettison explosives in event of aircraft malfunction, Assistant records location of discarded explosives,
• Pilot makes all go/ no-go decisions regarding safe flying conditions,
• Pilot always in direct communication with base and following standard check-in procedures,
• Combined weight of explosives and personnel not to exceed 75% of helicopter carrying capacity,
• No extra personnel or passengers allowed on or near aircraft during mission,
• Primers never assembled or dismantled in the helicopter,
• Explosive storage container constructed of non-conductive, non-sparking material.

11.1.7 MISLIGHT PROCEDURES

In the case of a mislight

- Pull wire igniters may not be removed once in place. If pull wire igniters come off while trying to light the safety fuse the charge must be treated as a mislight.

- <u>Verbal Communication of a mislight</u>
- The Bombardier notifies pilot immediately of a mislight.
    - Verbal Communication:
        - Bombardier: “I have a mislight”
        - Pilot:“Mislight”
        - Bombardier: “Can you safely make it to the alternate location (ridge top or flat area that is in the same direction of travel and immediately adjacent to target)?”
        - Pilot: Answers “Yes” or ”No”

        IF “NO”

        - Proceed calmly with original target and normal verbal communication.
            - Bombardier: “Shot’s away”
            - Pilot: “Shot’s away”

        IF “YES”

        - Proceed to the predetermined safe mislight location and use normal verbal communication (mislight will not be in the helicopter for more than 15 seconds total)
            - Bombardier: “Shot is away”
            - Pilot: “Shot is away”
    - This is not an emergency situation. Act calmly and ensure helicopter is clear of the Danger Area within 90 seconds of the first fuse being lit.
    - From a safe distance, landmark and observe blast to confirm detonation.
    - If charge detonates within normal expected time frame, record as normal, take note of suspected reason for mislight, and continue with mission.
    - If the charge does not detonate within expected time, record as misfire. Secure the Danger Area.
    - Follow Misfire and Disposal instructions (Sec. 8.1).

11.2 CASE CHARGING

Case charging is used as a control method for avalanche paths extending only a short distance above the road/worksite, which can be triggered by a charge placed on the road. Case charge procedures are reviewed and a Safe Work Plan completed prior to each mission to ensure team safety and mission effectiveness.

11.2.1 EQUIPMENT

• Appropriate vehicle,
• ANFO Blasting Agent,
• Boosters,
• Safety fuse assemblies,
• Pull wire igniters,
• Stopwatch,
• Field book and pencils,
• Radios on road closure frequency,
• Blasting tools and accessories,
• Hearing protection.

11.2.2 PERSONNEL RESPONSIBILTIES

The case charging team consists of a minimum of two people; Blaster of Record, Assistant, danger area Guard spotter as necessary. Only the Blaster of Record and Assistant shall be in the blasting area. If the spotter is used as the second person he/she must have a visual on the Blaster of Record, have communication protocol in place and be able to conduct an effective companion rescue in the event of an avalanche (OHSR 21.5(3)).

11.2.2.1 BLASTER OF RECORD

• Responsible for safe use of explosives,
• Tests all equipment prior to blasting,
• Ensures road closure,
• Selects safe location for spotter,
• Selects safe priming location close to the blasting site,
• Prepares, ignites, and deploys explosives on the slopes,
• Observes all results and confirms with the assistant,
• Destroys any misfires.

11.2.2.2 ASSISTANT REPONSIBILITIES

• Drives vehicle,
• Assists with closure confirmation,
• Records closure details,
• Keeps watch for natural avalanche activity that would be a safety concern and warning the Blaster in that event.

11.2.2.3 SPOTTER / ROAD GUARD(S)

• Maintain the danger area closure from a safe location outside of the danger area.

• Ensure that no personnel other than the Blaster and Assistant are in the danger area

• Warn the Blaster and / or Assistant of any natural avalanche activity that may become a safety concern.

11.2.3 EXPLOSIVES PREPARATION

A safe location (i.e. not subject to avalanche hazard), as close as possible to the blast site and specific to the target and avalanche path, is selected to prepare primers. Primer fuses are a minimum of 1 meter long and at the discretion of the Blaster of Record may be double fused to ensure ignition. Primer assembly occurs at the last practicable moment (OHSR sec. 21.85.2). All pull wire igniters are transported in a waterproof container, separate from the blasting agent and primers.

11.2.4 PROCEDURES

• Close and sweep Danger Area to be clear of people,

• Place /guard outside of Danger Area, equipped with signal device and radio,

• Prepare explosives,

• Any assembled primers transported for a short duration (path and target specific) must be kept separate (OHSR sec. 21.24) from other explosive products,

• Drive to target location,

• Park vehicle, with engine running, between the slope & the charge location to protect the blaster.

• Place explosives for maximum effectiveness, at pre-selected location on a bamboo tripod, pillow of snow or above gravel shoulder opposite path being controlled,

• If fuse is confirmed not lit, Blaster alerts the team by announcing “mislight”. Other members of team repeat, “mislight” to acknowledge. Refer to mislight procedures (Sec 11.2.6),

• If fuse is confirmed lit, Blaster and Assistant(s) drive out of Danger Area to pre-determined safe location and await detonation. In event of vehicle malfunction, team walks quickly to exit Danger Area,

• Observations are recorded,

• When the mission is completed, the Blaster contacts the road supervisor who then initiates road clearing procedures.

11.2.5 SAFETY PRECAUTIONS

• If natural avalanche activity is noted on the slopes to be controlled, the blasting mission will be suspended.
• Clear line of sight between case charging location and start zone,
• Case charge short slopes only,
Spotter/guard properly equipped and trained in avalanche companion rescue.
• Multiple charges detonated sequentially and separately,
• All personnel leave the Danger Area after ignition,
• All team members to wear hearing PPE.

11.2.6 MISLIGHT PROCEDURES

• Pull wire igniters will not be removed once in place. If pull wires come off while attempting to light the safety fuse, the charge will be treated as a mislight.
• Blaster calls out “mislight”, and team member(s) acknowledge.
Follow Misfire and Disposal procedures (sec. 8.1).

11.3 HAND CHARGING

Avalanche control by hand charging is carried out by a blasting team on skis who use explosives to trigger start zones from safe terrain. Hand charging enables the blaster to conduct effective avalanche control in weather unsuitable for helicopter flight and where case charging is unfeasible due to avalanche path characteristics.

The Blaster and Assistant(s) shall be clothed and equipped to safely conduct avalanche blasting in severe weather conditions. Both will be competent in companion rescue.

All safety procedures and regulations shall be adhered to when transporting explosives on skis.

11.3.1 EQUIPMENT

1. Explosives
2. Safety fuse assemblies (minimum 1m length),
3. Pull wire igniters,
4. Stopwatch,
5. Field book and pencils,
6. Radios - on appropriate frequency,
7. Blasting tools and accessories,
8. Hearing protection,
9. Ski and rescue equipment, including beacon, probe, and shovel.

11.3.2 PERSONNEL RESPONSIBILTIES

Blaster of Record and one assistant make up the blasting team. Both must be: proficient in backcountry travel on skis, capable of moving through mountainous terrain in adverse weather conditions, prepared for emergency situations (including equipment to spend the night in the backcountry if required), proficient in avalanche search and rescue techniques, and carrying portable radios (OHSR 21.5(3)).

11.3.2.1 BLASTER

• Safety with the use of explosives and the entire blasting mission,
• Test all equipment prior to blasting,
• Ensure road/area closure completion,
• Ensure all members are familiar with the route plan and blasting procedures,
• Select safe priming location close to the blasting site,
• Select hand charging placements
• Prepares, ignites and deploys explosives,
• Observe results and confirms with the assistant,
• Construction of primers,
• Place pull wire igniters on primed charges,
• Throw hand charges,
• Destruction of misfires

11.3.2.2 ASSISTANT

• Assist with closure confirmation,
• Record closure confirmation,
• Keep watch for natural avalanche activity that could be a safety concern,
• Ensure all members are familiar with the route plan and blasting procedures,
• Construct of primers,
• Select hand charging placements,
• Place pull wire igniters on primed charges,
• Throw hand charges.

11.3.3 EXPLOSIVES PREPARATION

Assembly of hand charges takes place at the last practicable moment and in a safe, sheltered location as close as possible to the control route. In ideal circumstances, assembly takes place at the blast site.

Primers are placed in their carrying packs, with no flammable or sparking materials present. Pull wire igniters are transported in waterproof bags in a separate pack from the primed charges.

Disassemble as per manufactures instructions.

11.3.4 PROCEDURES

- Initiate closure procedures and proceed to the first target area,
- Ensure closure and sweep completion, such that all areas affected by the blast are clear of people, via both radio and visual confirmation, as per :
- Prepare primers at the last practicable moment and location. In the case of pre- assembled primers, remove from pack and put pack back on, as per:
- Trim fuses immediately before attaching pull-wire igniters. Once attached, verbally communicate, “pull wire on” and ensure the other team member understands.
- Light the igniters, observing for at least 5 seconds, and no more than 15 seconds, to ensure ignition. Verbally communicate, “fuse lit” and ensure the other team member understands. Verbally communicate “fire in the hole”.
- If the fuse is not burning, blaster will announce “mislight” to the assistant, who will repeat “mislight” to ensure that they understand. Refer to mislight procedures.
- If the fuse is lit, the blaster will toss the charge into the desired location,
- Move quickly and safely to a predetermined safe location and, , await detonation,
- Record blast observations, and repeat the above procedures for each additional hand charging location.
- Visually inspect blast site to verify detonation of all charges
- In the case of misfire, refer to misfire procedures.
- Contact surface ops supervisor or designate upon completion of blasting mission to initiate road clearing procedures.

11.3.5 SAFETY PRECAUTIONS

- Blasting team will be in direct communication at all times;
- Pull wire igniters will not be attached to primers until both team members are prepared to move to the predetermined safe location;
- Both members will leave the danger area after the fuse is lit;
- The length of the safety fuse will be increased as necessary to ensure adequate time for the team to reach the safe location;
- Disassembly of cast explosive primers may only be done if recommended by the manufacturers of both primer and SFA. Any other type of explosive must be detonated. The control team trained for each shipment and type of explosives must review the manufacturer's recommendations.

11.3.6 MISLIGHT PROCEDURES

- Follow Misfire and Disposal instructions (Sec. 8.1).

11.4 NITRO EXPRESS AVALAUNCHER

Prior to active explosives control with these guns, all Avalauncher endorsed Blasters must read and understand the Nitro Xpress user manual and go through on-site training. Copies of the manual will be found in the avalanche office(s), on the shared electronic drive and a copy is to be brought to each shoot location and procedures are to be followed step by step.

11.4.1 ABOUT AVALAUNCHERS

The Avalauncher is a two-chambered pneumatic cannon, designed for projecting an impact-detonated explosive projectile into otherwise inaccessible targets. Limitations occur during strong crosswind conditions, which adversely effects projectile flight trajectory.

The Avalauncher is capable of delivering up to a +/-1.4 kilogram explosive projectile (using a 15' launch tube) to avalanche start zone locations within a range of 1200 meters. The Avalauncher can either be mounted on a mobile vehicle or a fixed platform. Mobile units can be transported to access targets on avalanche paths where fixed units have not been established.

Avalauncher explosive payloads and detonators will be transported separately, with detonators in a crush proof container. Tailfin assemblies will be transported in a secure container. Nitrogen used for pressurizing the cannon will be securely mounted on the mobile unit such that it does not obstruct the gun's range of motion. All persons and explosives must be behind the barrel at a minimum distance of 100 feet and the remote firing device must be used when firing is occurring. Firing will be done from a safe distance (11.4.5).

11.4.1a BASIC OPERATION:

- Test fire the gun as per manufacturer's instruction.
- The gun is aimed by altering the azimuth of the gun on the turntable, and raising and locking the barrel to the desired elevation, as marked on the target sheet.
- The projectile is placed in the breech and the safety pin is removed.
- Nitrogen is let into the cylinder until the required pressure is reached
- When the safety and fire valve are released, the measured amount of Nitrogen is released behind the piston. Tank pressure then forces the piston back to clear the muzzle gland, which frees the gas in the tank(s) to enter the launch tube to accelerate the projectile out of the barrel via the base plate.
- Once the projectile is in the air, the base plate is pulled off by air resistance, the spring loaded flight safety cross pin is ejected, and the charge is armed.
- When the projectile impacts snow or rock, the striker pin is dislodged from the magnet holding it in place, so the pin slides forward, igniting the shot shell primer, which sets off the detonator, and subsequently the payload.

11.4.1b EQUIPMENT

- 4X4 truck, snow cat, trailer or tower with Avalauncher securely mounted,
- Compressed Nitrogen,
- Electric firing switch
- Measumax Digital Protractor
- Nitrogen Regulator and filling hose
- 10” crescent wrench,
- Field book and pencils,
- Shot cards,
- Radios – on road closure frequency,
- Hearing protection,
- Transceiver , probe, shovel
- Avalauncher repair kit,
- Shovel and broom,
- Chainsaw file,

- Projectile, consisting of:
    - Payload with a cap well - 1.1 kg,
    - CIL Avalauncher High strength detonator,
    - Plastazote pillow spacer
    - Plastic tailfin assembly (see below),

- Tailfin, consisting of:
    - ’Base-plate’ - holds a spring-loaded striker pin, which is held in place via the ‘arming wire’,
    - Flight safety cross pin’ and compressed spring, which is a second safety for the striker pin,
    - ‘Magnet’ - holds the striker pin in place until impact,
    - ‘Ferrule’ - small charge located between the striker pin and the detonator placement,
    - ‘Magnet Anvil’ – strikes the ferrule on Impact,
    - ‘Thumbscrew’- prevents the fin from unscrewing.

11.4.2 PERSONNEL RESPONSIBILTIES

The Avalauncher crew consists of a Gunner (Blaster of Record) and Assistant gunner. The Gunner must hold a valid WCB blasting certificate with an Avalauncher endorsement and is responsible for the entire blasting mission.

Any member of the blasting team may call a halt to the avalanche control mission if they believe that worker safety is, compromised.

Both crew members must be proficient in avalanche companion rescue techniques and carry portable radios.

11.4.2.1 GUNNER

- Safety with the use of explosives and the entire blasting mission (OHSR 21.5(3)),
- Assembly of charge
- Transportation of explosives,
- Test all equipment prior to blasting,
- Ensure road closure,
- Set and check required pressures, elevations and azimuths,
- Handle the safety lever and the fire valve,
- Fire the gun,
- Ensure all members are familiar with the control plan and blasting procedures,
- Train the Assistant Gunner.

11.4.2.2 ASSISTANT GUNNER

- Transportation of explosives,
- Check pressure in Nitrogen cylinders,
- Crack valve on Nitrogen cylinder to remove any snow,
- Attach regulator to nitrogen cylinder,
- Handle the barrel,
- Load the projectiles,
- Remove the cotter key rings and pins,
- Visually check that the closure area is clear,
- Record the observations.

11.4.2.3 GUNNER AND ASSISTANT GUNNER

- Clean the deck of snow and ice. Check pressure in Nitrogen cylinders,
- Projectile preparation
- Equipment preparation

11.4.3 MATERIAL TRANSPORTATION AND EXPLOSIVES PREPARATION

Avalauncher charges, detonators and tailfins are transported separately to the gun and are primed at the gun (OHSR 21.21). The detonators are transported in a crush proof container. The nitrogen is secured in two aluminum boxes on the deck of the trailer with the shipping caps protecting the valves. When practicable the cylinders should be transported in an upright position (OHSR5.3.8 (2)). Minimums of two bottles are to be on the deck and replaced as necessary.

At the shooting location:

- The assembly of the Avalauncher round will take place at the last most practicable moment at the site, immediately prior to placing each projectile in the breech. Projectiles are to be assembled one at a time. Follow manufactures assembly procedures in APPENDIX C for the Classic Snowlauncher.

11.4.4 FIRING PROCEDURES

For preparation and firing sequence of the B2000 MK2 follow manufacturer's instructions step by step in APPENDIX A.

11.4.4.1 PROCEDURE FOR SHUTDOWN

Follow manufacturers' instructions step for step in APPENDIX A

• Inform closure control personnel of the termination of the Avalauncher mission

• Return the unused explosives and detonators (if any) to their respective magazines.

• Cover and secure the Avalauncher.

11.4.5 SAFETY PRECAUTIONS

- Fire remotely using the Electric Firing Switch and or behind a blast shield
- No talking, other than shooting sequence commands, shall occur during or immediately preceding firing.
- Cotter keys and pins shall be shown to the gunner to ensure that the projectile firing train is in the armed position.
- Cylinders of compressed nitrogen must be transported and secured from movement with their protective caps in place.

11.4.6 MISLIGHT SAFETY PRECAUTIONS

- Fire remotely using the Electric Firing Switch and or behind a blast shield
- No talking, other than shooting sequence commands, shall occur during or immediately preceding firing.
- Cotter keys and pins shall be shown to the gunner to ensure that the projectile firing train is in the armed position.
- Cylinders of compressed nitrogen must be transported and secured from movement with their protective caps in place.

11.4.7 MISFIRE – FAIL TO CLEAR – DROP SHORT PROCEDURES

- From a safe distance, landmark and observe the blast to attempt to confirm detonation.
- If the charge detonates within the normal expected timeframe, record as per normal, and continue with mission.
- If the charge does not detonate within the expected timeframe record the charge as a Misfire. Treat the Danger Area as highly dangerous, keep the area secure and suspend the control mission for at least 30 min or as recommended by the manufacturer.
- If an undetonated payload is suspected in the avalanche debris, the Blaster of Record works with the snow clearing operator and equipment until the Avalauncher round is located or the debris is cleared.
- Follow Misfire and Disposal instructions (Sec. 8.1)
- Since most Avalauncher target areas are inaccessible in winter and the projectiles bury themselves deep in snow, they may be left in place until spring melt-off if disposal attempts are deemed unsafe. After melt-off, a blasting team conducts a search; any misfire located is detonated on the spot by a live primer placed beside, but not touching, the misfired charge. All payloads contain a Recco tab to allow for use of the Recco wand to assist in locating Misfires.

- Hazard warning signs describing the various misfires that may be found will be posted for easy public notice and left in place throughout the year.
- If the projectile does not clear the barrel upon firing:
- Push the projectile back to the breech end of the barrel as per manufacturer recommendation. Ensure the flight safety cross pin is properly secured to the striker pin prior to removing the avalauncher round from the barrel for inspection.
- If the projectile drops short of correct flight after clearing the barrel:
    - Stop the control mission.
    - Treat as Misfire (see above)
    - Inspect gun thoroughly, contact manufacturer as required (OHSR 21.36).

11.4.8 STORAGE

- Per manufacturer's recommendation, storage in the summer months should be in an enclosed building with the gun barrel at a negative inclination. Prior to storage, perform general maintenance outlined in the manufacturer's instructions.
- Grease the nipples on the turntable.
- Cover the end of the barrel.
- Pressurize the chamber to 5psi.

11.5 CORNICE CONTROL

Cornice control is performed with the use of explosives when cornices build up to unsafe proportions. This is often done with a trunk line of explosives, which combines a series of explosives connected with detonating cord to detonate them simultaneously. The Blaster and Assistant(s) shall be clothed and equipped to safely conduct avalanche blasting, in accordance with recommendations of the Canadian Avalanche Association or as required by Worksafe BC Occupational Health and Safety Regulations (OSHR) (Part 8: Personal Protective Clothing and Equipment). Approved activity specific headgear will be worn as per Section 8.11(2)-2 Safety headgear must be worn by a worker in any work area where there is a danger of head injury from falling, flying or thrown, objects, or other harmful contacts. Blasters will be trained and ensure a fall restraint system is in place and the blaster is on belay if working in any hazardous terrain with the potential for a fall as per (OHSR Part 34 and Part 11).

11.5.1 EQUIPMENT

1. Detonating cord
2. Pentex Boosters and/or ANFO,
3. Safety fuse assemblies,
4. Approved sit harness
5. UIAA approved rope
6. Webbing/locking carabiners,
7. PVC Punch or Ice auger,
8. Pull wire igniters,
9. Blasting Log
10. Time piece,
11. Radios on road closure frequency,
12. Blasting tools and accessories,
13. Hearing protection.

11.5.2 PERSONNEL RESPONSIBILITIES

The team consists of a Blaster of Record (OHSR 21.5(3)) and Assistant. The Blaster is responsible for all aspects of the mission. There shall be a minimum of two persons, in certain instances additional personnel maybe required to provide an effective belay system for the working area (OHSR Part 34, Part 11).

11.5.2.1 BLASTER

- Safety with use of explosives,
- Trained in fall restraint (OHSR Part 11) or qualified rope technician (OHSR Part 34)
- Test all equipment prior to blasting,
- Check and test of rope safety system used,
- Ensure road closure completion,
- Select location of watchman,
- Select safe priming location close to the blast site,
- Prepare, ignite and deploy explosives,
- Observe all results and confirm with the assistant,
- Destruction of misfires.

11.5.2.2 ASSISTANT

- Assist with closure confirmation,
- Record closure and blasting information,
- Trained in fall restraint (OHSR Part 11) or qualified rope technician (OHSR Part 34) Check and test rope safety system,
- Keep watch for natural avalanche activity that could become a safety concern.

11.5.3 EXPLOSIVES PREPARATION

A safe location, not subject to avalanche hazard, as close as possible to the blast site, is selected to prepare primers. Fuses on primers are a minimum of 1 meter in length. Assembly occurs at the last practicable moment (OHS sec 21.85.2)

All pull wire igniters are transported in a waterproof container, separate from the blasting agent and primers.

11.5.4 PROCEDURES

- Ensure Danger Area is closed and swept of people.
- Follow Cornice Control Procedure Access Work Plan and JHA
- Build and test anchor
- Both Blaster and Assistant inspect all aspects of the belay system.
- Blaster finds edge of ground where the snow becomes cornice, by probing while harnessed on belay. Where the snow becomes cornice is known as the Safe Line. Workers must be harnessed and on belay while approaching this line and no one will work beyond it.
- The person preparing the holes is harnessed and belayed from an anchor point behind the Safe Line.
- Prepare holes for the insertion of the explosives near the edge of the ridge where the cornice leaves the rock.
- Holes can be punched into the cornice with a 4” diameter PVC pipe, having a webbing loop to retract the pipe, or with a manual snow auger. Holes should be at least 1 meter deep or into harder mature layers of cornice. The distance between holes varies with size and nature of the cornice and will be determined by the Blaster of Record.
- Arm the explosive with 2 to 3 meters of detonating cord. The detonating cord must be long enough to extend out from the hole to behind the Safe Line where the trunk line can be connected.
- Pentex Boosters have the detonating cord passed through the charge and tied with an overhand knot on the end to prevent it from pulling through. The length of detonating cord leading from the explosive is referred to as the branch line.
- Holes are lightly back filled with snow to contain the explosion behind the cornice.
- The trunk line of detonating cord is laid out at a ninety-degree angle from each branch line placed in a hole. Branch lines are only connected to the trunk line once all branch lines have been extended into the safe working area beyond the working line and the blaster is not on the cornice roof. The branch lines are then connected to the trunk line with a double half hitch or clove hitch. It is very important to ensure the trunk lines and branch lines run in straight paths so the detonating cord does not cross over itself, which

can interrupt the explosion series.

- Blaster double checks that there are no crosses in either the trunk line or the branch lines and that each connection to the trunk line is tight and secure.
- Blaster connects a safety fuse assembly to one end of the trunk line by folding 3” of the trunk line end over and securing the detonating end of the safety fuse assembly with electrical tape, directing the charge in line with the trunk line.
- The trunk line is now armed and ready for ignition.
- Blaster visually sweeps the Danger Area, confirms closure with guards, and notifies Dispatch by radio that avalanche control is commencing.
- Blaster places the igniter on the safety fuse assembly and verbalizes for team members “igniter on”,” safety off”, “3, 2, 1, fire”. Blaster confirms ignition, verbalizes “fire in the hole (cornice name here)” over the radio, and retreats to a pre-designated safe area with the Assistant to await detonation.
- If Blaster is sure the fuse is not burning, they alert Assistant by announcing, “mislight”, Assistant repeats to acknowledge. Refer to mislight procedures (Sec 11.6.6).
- After detonation, Blaster inspects site for complete consumption of explosive materials. If explosive materials remain or a “dud’” is suspected, Blaster informs Dispatch, posts a guard, and follows WorkSafeBC and manufacturers’ recommended disposal procedures.
- Once blasting mission is complete and Danger Area is clear, Blaster contacts closure personnel whom initiate road-clearing procedures.
- Blaster may decide to blast the cornice by lowering a primer or primed bag of ANFO over the cornice lip, using resulting concussive blast to lift and break the cornice.

11.5.5 SAFETY PRECAUTIONS

- Persons performing cornice control with the use of explosives will have the WCB cornice control endorsement.
- Persons performing cornice control will have training and follow Cornice Control Procedure Access Work Plan and JHA
- Training for this procedure will be done prior to the start of the control mission.

11.5.6 MISLIGHT PROCEDURES

- Pull wire igniters must not be removed once in place In the event of a mislight, follow mislight procedures
- The Blaster notifies the blasting team by announcing “Mislight”, Assistant repeats, “Mislight” to acknowledge.
- From a safe distance, Blaster landmarks and observes the blast to attempt confirmation of detonation.
- If the charge detonates within the normal expected timeframe, record as per normal and note possible reason for mislight, continue with mission.
- If the charge does not detonate within the expected timeframe, record charge as misfire. Treat Danger Area as highly dangerous, keep secure, and suspend the control mission for at least 30 min.
- Follow Misfire and Disposal instructions (sec 8.1).

12. WYSSEN AVALANCHE TOWER: EXPLOSIVES USE PROCEDURE

12.1 INTRODUCTION

Wyssen Avalanche Towers (WAT) is used for avalanche control between kilometer 58 and 61.5. A WAT is a remote avalanche control system (RACS) that an avalanche technician with a valid blasting certificate uses to deploy explosives into an avalanche starting zone. The system is operated from a safe location on the access road/base computer by means of a digital interface (e.g. tablet or laptop computer) connected to an encrypted communication system (e.g. radio). Explosives are dropped by remote mechanism from a removable deployment box installed at the top of a tower and are suspended several metres above the snow surface. The deployment box holds up to twelve explosive charges (up to 5 kg) that are detonated individually.

These procedures describe blasting equipment used with the WAT, personnel training, the assembly and loading of explosives in the tower deployment box, flight operations for transport of the tower deployment box by helicopter, deployment of the explosives using the remote system, and misfires.

Procedures are in accordance with the following:

- WorkSafe BC (WSBC) Occupational Health and Safety Regulations (OHSR)
    - Part 21 – Blasting Operations
    - Part 29 - Aerial Operations
- Natural Resources Canada Explosive Regulations
- Transportation of Dangerous Goods Regulations Part 12.12 – Aerial Work
- Wyssen Avalanche Tower LS12-5 G3 Instruction Manual (v 3.8, July 2017).

12.2 EQUIPMENT FOR BLASTING

The WAT system components and the equipment used for the assembly, loading and transport of the explosives and tower deployment box are listed below. Further detail of the system components can be found in the WAT Instruction Manual, Wyssen Avalanche

12.2.1 SYSYEM COMPONENTS

- Wyssen Avalanche Tower LS12-5 G3;
    - The tower deployment box (Figure 1);
    - The complete Wyssen Avalanche Tower (Figure 2);
- Wyssen Helicopter Latch HK-02 (Figure 3);
- Web-enabled device (PC, notebook, tablet, smartphone)
- WAC.3 base for radio communication with avalanche tower

12.2.2 EXPLOSIVE CHARGE COMPONENTS (Materials per Charge)

- Explosives charge (up to 5 kg);
- Safety fuse assemblies, 30 cm (variance (VR201900088), 2 units;
- Wyssen percussion fuse lighters, 2 units;
- Wyssen charge container, 1 unit;
- Cord, 3 mm, approx. 7.5 m in cord sack for charge suspension, 1 unit;
- Wire hooks for connecting pull wire lighters to cord, 2 units;
- Retaining ring to connect suspension line to the cable dropper, 1 unit;

- RECCO reflector, 1 unit.

12.2.3 Accessory Tools

- Fuse cutters;
- Punch tool;
- Eye protection;
- Gloves

12.2.4 Other

- Portable radio(s)
- Keys for WAT deployment boxes and control unit.
- Locks for WAT deployment boxes
- Container for safety fuse assemblies
- Quality control checklist

1	Magazine-box cover	12	Antenna holder (antenna not shown)
2	Padlock 3 items	13	Monitoring sensor for the correct position of the magazine-box on the tower
3	Turn lock		
4	Control system with operating buttons on top	14	Cable dropper
5	Seismometer	15	Tube holder
6	Solar panels	16	Battery 12V
7	Lock cylinder	17	APOS: Goniometer potentiometer, analogue
8	DPOS: Carousel position switch, cam-controlled	18	RPOS: Carousel rest position end switch
9	Lock cylinder position switch	19	Gear motor
10	LPOS2. Charge detection switch	20	LPOS1. Charge drop detection switch
11	Dropping hole	21	Insertion funnel

Figure 1. Components of the tower deployment box.

1	Magazine-box	6	Dropping hole
2	Tower	7	Mounting installation
3	Transport hanger for helicopter	8	Retaining line for the charge
4	Radio aerial	9	Dropped charge
5	Solar panel	10	Foundation plate with rock anchors or micropiles

Figure 2. Components of the complete Wyssen Avalanche Tower system.

Figure 3. Wyssen Helicopter Latch HK-02.

Figure 4. Assembled WAT explosive charge.

12.3 DOCUMENTATION

Inspection, testing, maintenance, loading, and use of the Wyssen Avalanche Towers will be carried out in accordance with the manufacturer's recommendations and following the standard procedures outlined in the WAT Instruction Manual, including recommendations for:

- Charge construction;
- Loading and unloading the deployment box with explosive charges;
- Transport of the deployment box by helicopter;
- Seasonal recommissioning and decommissioning; and
- Maintenance.

The maintenance section of the manual includes inspection and maintenance instructions, maintenance schedule and procedures in case of a malfunction. The supplier provides a 24-hour telephone service in the case of a system malfunction.
Records of inspections, pre-season and post-season maintenance, and testing will be maintained. A copy of the Avalanche Safety Plan, WAT Instruction Manual and Explosive Use Procedures will be kept at the work site and made available to technicians using the system.

12.4 PERSONNEL ROLES AND RESPONSIBILITIES

12.4.1 TRAINING AND CERTIFICATION

Personnel who perform charge assembly, loading, coordinating aerial transport and operating the WAT (either for testing or operational use) will have the following training and certifications:

- Site orientation;
- WHMIS training;
- TDG certification;
- WorkSafe BC blasting certificate for avalanche control;
- Wyssen Avalanche Tower specific training provided by an authorized Wyssen representative, covering the following topics:
    - System components, including maintenance and function tests;
    - Communication system operation and tests;
    - Pre-season maintenance requirements;
    - Charge assembly and loading;
    - Aerial transport operations;
    - Misfire procedures; and
    - Post-season decommissioning.

12.4.2 PERSONNEL

The avalanche control team consists of a Blaster of Record (Team Leader) and Assistant(s).
The **Blaster of Record** will be an experienced person meeting the training and certification requirements listed in Section 12.4.1 of these procedures. The Blaster of Record is responsible for safety of the entire operation, including the direct supervision of all aspects of the assembly of charges, loading, testing, operational use and unloading of explosives during post-season decommissioning.
The **Assistant(s)** is responsible for assisting the Blaster of Record with the same tasks described above, as well as observing for anomalies during assembly and loading of explosives.

12.5 OPERATIONAL PROCEDURES

The operational procedures are presented in three sections for each of the following periods of use: commissioning the system at the start of the season, operational use and decommissioning the system at the end the winter season. Personnel performing the tasks described below will meet the training and certification requirements list in Section 12.4.1 of the procedures. A Blaster of Record will be designated for explosive charge assembly, loading, and helicopter transport of the deployment box, testing and operations.

12.5.1 PRE-SEASON COMMISSIONING

Prior to the start of each winter season, several tasks are required to prepare the system for use. This includes inspecting all system components, assembling the explosive charges, loading the deployment boxes and transporting the deployment boxes to the towers. The charge assembly and loading area will be least 400 m from inhabited areas and if necessary the privately travelled road will be closed. This area will be secured a minimum of 50m in all directions during arming of the system to

prevent unauthorized access.

12.5.1.1 PREPARING THE DEPLOYMENT BOX

1. The docking system spike on the tower is to be cleaned and greased. Smooth out any irregularities, burrs, or edges with a coarse file. Apply a thick layer of waterproof and low temperature grease to the spike (grease brand/properties approved by Wyssen).
2. The battery (ies) on the deployment box are charged with a voltage of 12.8 V.
3. Position the deployment box to ensure that there is not more than 30 cm of free height below the bottom of the deployment box (deployment hole).
4. Prior to loading, each deployment box is located such that it is moved less than 50 m to the helicopter attachment point.
5. Open all padlocks on the cover and turn the locking level through 90°.
6. Lift the cover using handles provided until the safety catch engages.
7. Set all sliders of the cable droppers into the rear (open) position.
8. Remove the tube holder covers.
9. Remove cable droppers from the tube holders.

12.5.1.2 EXPLOSIVE CHARGE CONSTRUCTION

1. <u>Preparation of the charge container:</u>

a. Insert the explosive cartridge(s) into one half of the plastic shell. Ensure the cartridge(s) sits at the bottom end of the plastic shell.
b. Snap the second half of the plastic shell together with the first one, starting with the tabs at the bottom of the shell working upwards.

2. <u>Preparation of the retaining cord:</u>

a. Guide the retaining cord through the four holes on the top end of the plastic shell join the two ends with a Flemish bend (aka Figure-8 follow–through knot).
b. Release the cord attached to the back of the pre-assembled cord sack and then fasten the sack with a girth hitch to the retaining cord.
c. Clip the spring hooks into the eyelets of the percussion fuse ignitor and insert the cord sack with the end (ring) on top.
d. A quality control inspection is conducted for each charge by a second trained person, completely independent of the construction process. This inspection will confirm the charge is assembled correctly following the procedure described above.
e. The inspecting person places a RECCO reflector on the inside of the charge container.
f. The inspecting person then places the foam stopper on the top of the cord sack to secure the inserted retaining cord and percussion fuse ignitor.
g. Charges are temporarily stored in a secure manner, e.g. in the charge container box.

3. <u>Preparation of the safety fuse:</u>

a. Prepare the safety fuse assemblies by cutting the fuse to a length of 30 cm, only cut safety fuse assemblies as needed to assemble a charge. Then move onto the next charge. **Do not precut safety fuse assemblies!**

4. <u>Priming of the charge:</u>

a. Loosen the screw sleeves at the bottom of the percussion fuse ignitors by approximately 1 turn and remove the plug. Do not unscrew completely. Hold the ignitor at the top with one hand to prevent twisting. ***NOTE: If the ignitor should be completely unscrewed, do not reassemble; this ignitor must not be used.***
b. Push the free end of the safety fuse assembly fully up into the ignitor and firmly tighten the screw sleeve (compression fitting). Hold the ignitor by the lug with one hand while tightening the screw sleeve in order to prevent twisting. Repeat for the second safety fuse assembly.
c. Pierce explosive cartridge(s) with the punch tool through the side holes in the plastic shell and insert the detonator on the safety fuse assembly securely into the cartridge. Repeat for the second safety fuse assembly.
d. Clip the safety fuse assemblies into the plastic clips on the inside of the plastic shell.
e. A quality control inspection is conducted for each charge by a second trained person, completely independent of the construction process. This inspection will confirm the charge is primed correctly following the priming procedure described above.

12.5.1.3 LOADING THE DEPLOYMENT BOX WITH EXPLOSIVE CHARGES

1. Bring the prepared explosive charge to the deployment box and set it down on the surface next to the flashing light. The prepared charges should never be handled or transported one-handed.
2. Carefully remove the foam stopper from the charge while ensuring the retaining cord stays in place.
3. Take hold of the explosive charge on the inside of the plastic shell through the holes at the upper edge of the tube and carefully insert the charge into the tube holder, beginning with Tube #12 and working in descending order.
4. Attach the ring on the end of the retaining cord to the cable dropper by inserting the ring into the center slot on cable dropper and push the slider to the front extended (closed) position, which holds the ring. The slider is released into the front position by pressing the metal pin at the bottom of the cable dropper.
5. Lay the cable dropper into the notches of the tube holder so that the ball bearings point to the center of the deployment box. Both recesses in the cable dropper must lie within the tube holder to prevent the cable dropper from shifting.

6. Ensure the retaining ring is correctly mounted in the cable dropper. After this check, avoid touching the cable dropper.
7. Once the deployment box is fully loaded, a quality control inspection is conducted for each charge by a second trained person, completely independent of the construction process. This inspection will confirm the charge is assembled correctly following the procedure describing the preparation of the retaining cord, the attachment of the cord sack, spring hooks and the ring.
8. The inspecting person replaces the tube holder cover and tightens the hand screws if the cover is not a snap fit.
9. The inspecting person then conducts a test run with the operating buttons on the control system (per section 12.5.1.4).

12.5.1.4 TEST RUN WITH OPERATING BUTTONS

Prior to transporting the unit, a test run is carried out using the operating switches on the control system. The display serves to indicate important information about the system.

1. Pull out the emergency stop master switch until the yellow marking is visible.
2. Press the test button until the hourglass on the display switches off again (5 seconds). The flashing warning triangle signals test operation.
3. Press the start button until the hourglass on the display turns off again (2 seconds).
4. The test run now proceeds automatically and lasts about 8 minutes, depending on the number of charges.
5. When the warning triangle switches off, the test run has been successfully concluded. **Do not switch off the control system or carry out another test run prior to transportation.**
6. Once the system test is completed, close the deployment box, attach the padlocks, and prepare for transportation.

12.5.2 TRANSPORTATION OF THE DEPLOYMENT BOX BY HELICOPTER

The transportation of the deployment box by air is regulated by WorkSafe BC and the Transportation of Dangerous Goods Regulations. Personnel performing the tasks described below will meet the training and certification requirements list in Section 12.4.1 of the procedures.

The Wyssen deployment box is a small means of containment designed and secured to prevent the accidental release and detonation of the explosives during transport. Further safety measures are described in the procedures below to minimize risk to workers and the public.

The helicopter loading area and flight corridor will be least 400 m from inhabited areas and privately travelled roads will be closed if required. This area will be secured 50m in all directions to prevent unauthorized access during the arming process. If the flight path requires that a private travelled road be crossed, specific procedures must be developed in accordance with WSBC OHSR Part 18 and the managing agency of the roadway.

12.5.2 PRE-PLANNING FOR HELICOPTER TRANSPORTATION

1. The pilot-in-command is provided with written information for each of the dangerous goods being transported, including:
    a. The shipping name, UN number and class; and
    b. The net explosive quantity (NEQ).
2. The pilot-in-command and ground crew review the operational procedures, operation of the load-carrying equipment, the flight plan, dangers when flying external loads and emergency procedures in addition to the standard pre-work tailboard (safety) meeting.
3. A long-line with an automatic electrical latch is used for transporting the deployment box. The helicopter company is responsible for ensuring good working condition of all load-bearing elements. The elements must be designed to carry loads of at least 700 kg.
4. No passengers are allowed in the helicopter during transportation of the deployment box.

12.5.2.2 HELICOPTER ATTACHMENT

1. In addition to the 400 m distance requirement, the staging area/receiving point of the loaded deployment box must be suitable for helicopter operations with appropriate approach and departure corridors.
2. Ensure weather conditions are suitable for helicopter operations.
3. The ground staff must wear an approved helmet or hardhat with chin strap, safety glasses, high visibility vest, gloves, suitable clothing and solid footwear.
4. No use of the Wyssen Avalanche Control Centre software is allowed during transportation of the deployment boxes. Use of the software is only permitted after the deployment box has been placed on the tower and the helicopter has left the danger area.
5. The Blaster of Record is responsible for a final check of each deployment box prior to transport to ensure the charge-dropping mechanism is on stand-by and the latch, padlocks and dropping hole are closed and secure.
6. During the approach to the receiving point, the pilot must establish contact with the ground staff as a communication check. If this attempt fails, the helicopter must land, and the malfunction rectified prior to transportation.
7. The electric latch is connected directly to the transport hanger of the deployment box.
8. After attaching the deployment box to the helicopter, no persons are allowed to be under the suspended load.

12.5.2.3 PLACEMENT OF THE DEPLOYMENT BOX ON THE TOWER

1. The pilot brings the insertion funnel directly over the docking spike on the top of the tower, following the range of permitted approach angle in Figure 4.
2. As the deployment box is lowered onto the docking spike, the deployment box will automatically turn into the correct alignment. A flashing light on top of the deployment box blinks for 1 minute as soon as it is correctly positioned.

3. If during the positioning maneuver, the deployment box hits the tower heavily or is positioned roughly, the internal mechanism may be damaged, and the pilot should not release the latch and must return the deployment box to the staging area for a test run.
4. Once the pilot confirms the deployment box sits firmly on the docking spike and is correctly positioned, the latch can then be released.
    a. In the case the deployment box is released but not positioned correctly (i.e. no flashing light), the deployment box must be retrieved using the HK-02 latch and returned to the staging area.

Figure 4. Range of permitted approach angle when placing the deployment box on the tower.

12.5.3 LIVE TESTING AND OPERATIONAL USE

12.5.3.1 AREA CLOSURE

An area closure will be implemented as described in existing avalanche control procedures.
The general sequence of events from initiating the closure to re-opening the area following explosive control will be as follows:

1. Initiate the area closure.
2. Proceed to a safe firing location.
3. Ensure that the closure is effective, and the danger area is clear.
4. Use the firing control system (Section 12.5.3.2) to control the selected WAT on the selected target.
5. Confirm detonation of the WAT using one or more of the following means: system detection by geophone, acoustically, or visually.
6. Misfire check.
7. Record the results.
8. Repeat steps 4 through 7 for the next target(s).

9. Notify closure control personnel that blasting has been completed.

12.5.3.2 FIRING THE SYSTEM

The WAT are controlled using a web application (control.wyssenavalanche.com) to access the firing system. Individual login credentials and a code list are used in order to maintain a high standard of safety and security. The entry of login credentials and a single-use numeric code from the code list is required prior to accessing the firing system. The firing system communicates with the towers via an encrypted radio communication system.
<u>To fire the system:</u>

1. Load the web application and enter your login credentials (internet access) or connect to the WAC.3 base (radio connection).
2. Enter the 8-digit numerical code.
3. The firing system is now activated until a charge is deployed, or until the time-out limit of 15 minutes is reached.
4. After deploying the charge, detonation must be confirmed. Detonation can be confirmed in three ways:
    a. Automatic detection by the geophone and displayed in the firing system.
    b. Acoustically.
    c. Visually.
5. The firing system will display a “Closed and Secure” status for the tower, indicating that dropping hole is sealed and the firing system connection is terminated.

12.5.3.3 SYSTEM MALFUNCTIONS

If a fault occurs during the firing sequence, it is treated as a misfire the misfire procedures in Section 12.5.3.4 are followed. The Wyssen Avalanche Control 24-hour support line should be contacted immediately.

12.5.3.4 MISFIRE PROCEDURE

A misfire occurs when detonation cannot be confirmed by any of the three methods described in Section 12.5.3.2. Four types of misfires can occur (Type A1, A2, B1 and B2). Type A misfires are those which are hanging on the cord and Type B misfires are those which are lying in the snow. All types of misfires will be handled using the following procedures:

1. Maintain the area closure.
2. Observe the minimum waiting period of 30 minutes before approaching the danger, either by foot or in a helicopter.
3. Locate and visualize the misfire. This may require the use of a helicopter for towers that are difficult to access. Consider that misfires could potentially slide away from the tower and may have the potential to trigger an avalanche and be carried downslope to access road elevation.
4. Under no circumstances may a deployment box be transported beneath a helicopter with a suspended misfire.
5. If a cord is found in the area of a misfire, it must not be pulled since this can activate the percussion fuse lighter and detonate the charge.

6. A misfire must not be moved.
7. For both Type A and B misfires, confirm the wire hooks are evident on the cord, which confirms the percussion fuse lighter was activated. If the wire hooks are not evident (i.e. still attached to the percussion fuse lighter), the percussion fuse lighter may not have been activated and extra caution is required.
8. For Type A misfires, remotely release the charge retaining cord from the deployment box.
9. Once the misfire is on the snow surface (Type B) or already on the surface (Type B), deploy a conventional explosive to detonate or destroy the misfire, as per the helicopter control or hand charging misfire procedure described in Section 8.1 Misfire Procedure. The additional explosive can be deployed either by helicopter, or if the misfire can be safely accessed on foot, by hand.
10. Confirm the detonation and perform a post-blast inspection to confirm the misfire was destroyed.

12.5.4 POST-SEASON DECOMMISSIONING

During the summer, it is preferable to house to the deployment boxes in secure, dry storage. Explosive charges that have not been used are preferably detonated prior to deployment box removal, but if this is not possible (e.g. malfunction of the deployment box), the charges must be removed from the deployment box. If approved by manufacturer, the charges can then be disassembled.

12.5.4.1 RETURN TRANSPORTATION OF THE DEPLOYMENT BOX BY HELICOPTER

The Wyssen helicopter latch is attached to the automatic electrical latch on the long line to retrieve the deployment box.
The Wyssen helicopter latch must be regularly inspected and tested for proper functioning and damage prior to each transport of the deployment box as follows:

- The latch must be free to move upwards as far as the stop;
- The latch must drop and close independently through its own weight;
- In the closed state, the notch of the latch must lie on top of the supporting bolt;
- No cracks shall be visible on the latch or handle; and
- The latch and the handle must not be deformed.

If any defects are found or if there are any uncertainties, the helicopter latch in question must not be used.
The Wyssen helicopter latch is used for the return transport of the deployment box only. This allows the attachment of the deployment box to the helicopter longline without the assistance of ground personnel. Under no circumstance may the latch be used for the lifting of other loads. During the lifting of the deployment box, no personnel are permitted to be on or near the tower.
The following procedure is used to retrieve the deployment box from the tower.

1. The pilot then flies over the deployment box and lowers the Wyssen helicopter latch over the fork of the transport hanger on the deployment box.

Once lowered far enough, the latch on the Wyssen helicopter hanger will catch the transport hanger and secure the deployment box to the helicopter longline.

2. As the pilot lifts the deployment box off the tower, they must ensure that they are lifting vertically to ensure that they do not cause damage to the tower.
3. As soon as the deployment box is lifted off the tower, the monitoring switch automatically deactivates the power supply in order to prevent an accidental release of a charge, should any charges remain in the deployment box.
4. The deployment box is transported to the staging area and set down carefully.
5. The deployment box must be resting on the ground and the helicopter longline not under tension prior to uncoupling. The latch must only be opened by the black lever on the Wyssen helicopter hanger by ground staff.
6. Once the deployment box is released, the pilot is signaled so they can depart.

12.5.4.2 UNLOADING EXPLOSIVES FROM THE DEPLOYMENT BOX

If the deployment box is returned to the staging area with explosive charges still inside, the following steps are followed when unloading:

1. Open all padlocks on the cover and turn the locking level through 90°.
2. Lift the cover using handles provided until the safety catch engages.
3. Press the emergency stop master switch to ensure the system is deactivated and to protect the batteries during summer storage.
4. Activate all sliders on the cable dropper by pressing the side of the ball bearings toward the back.
5. Ensure the retaining ring is disengaged from the cable dropper.
6. Remove the cable dropper from the tube holder.
7. Take hold of the charge through the holes at the top of the plastic shell and lift out of the tube holder.
8. The primed charge is placed and secured in the temporary storage rack until the blaster is prepared to destroy or disassemble the charge.
9. Close the deployment box.

12.5.4.3 CHARGE DISASSEMBLY

1. Charges may only be disassembled if authorized by the manufacturer.
2. Loosen the screw sleeves at the bottom of the percussion fuse lighter by one turn.
3. Remove both safety fuse assemblies from the percussion fuse lighter through the openings on the side of the plastic shell.
4. With a slow, smooth and even pressure, remove both safety fuse assemblies from the charges. If resistance is encountered, the charge should not be disabled and must be destroyed in an appropriate safe location using the misfire procedure.
5. The safety fuse assemblies may not be stored or transported because they are shorter than the 1 m minimum for length required by WSBC OHS

Regulation 21.56(2). The safety fuse assemblies must be destroyed in an appropriate safe location using the misfire procedure in Section 8.1.

6. Re-open charge containers to remove the explosive cartridges. Explosive cartridges must be re-packaged in appropriate certified and labeled boxes for transportation and storage. Expiration dates should be noted and must not be exceeded during subsequent use.
7. Plugs must be re-inserted into the percussion fuse ignitors to protect them from moisture contamination.

12.5.4.4 PREPARING THE DEPLOYMENT BOX FOR STORGE

In order to ensure that the battery survives the summer without any damage, it should be completely charged prior to being placed in storage. Connect the battery to the charger for at least 24 hours. The battery must only be charged with a designated battery charger which has temperature-controlled charging voltage. Battery chargers such as those used for car batteries are not suitable and damage the battery.

12.5.5 EMERGENCY PROCEDURE – DROPPED DEPLOYMENT BOX

In the unlikely event the deployment box is dropped during helicopter transport, it will be known to the Blaster of Record whether or not the deployment box contains explosives. If it does not, then a plan can be put in place to safely recover the deployment box. If the deployment box does contain explosives, the following procedure is followed by the Blaster of Record:

1. **Dial 911** to activate required emergency services (police, fire and/or ambulance). Plus initiate Dynyo Nobel Canada Inc. (DNCI) Emergency Response Assistance Plan (ERAP 2-1037) by calling **1-800-367- 4629**. Give name and phone number and keep the telephone connection open until they have completed the initial report.
2. Begin evacuation of the area around the deployment box to a distance of 1600 m in all directions.

3. Contact the following:
   a. Local RCMP Detachment (detachment listings can be found here: http://www.rcmp-grc.gc.ca/detach/index-eng.htm);
   b. Provincial Emergency Program (PEP) **1-800-663-3456** (24 hours)
   c. Provincial Transportation Management Centre **1-866-706-7862** (24 hours)
   d. Explosive technical advisors as necessary
   e. Wyssen Avalanche Control Inc. (Switzerland) **+41 79 628 10 83**
   f. Notify Explosives Regulatory Division – Pacific Region **604-666-0366**[1].
   g. Notify WorkSafeBC **1-888-621-7233**.

4. Assist the Emergency Response Personnel (Incident Commander and/or Accident Site Commander) in the role of Technical Advisor in order to safely and efficiently recover and dispose of explosive products.

[1] Use form F07-01 for reporting incidents to the Explosive Regulatory Division.

a. Assess explosive division type(s), quantity and conditions at the accident site to determine minimum evacuation distance.
b. Arrange for the delivery of explosives clean up materials and equipment as necessary for the severity and extent of spilled explosives.
c. Confirm with Incident Commander and/or Accident Site Commander that assistance from outside agencies (e.g. RCMP, PEP and CANUTEC) has been requested and dispatched as necessary. Ensure that essential personnel only are involved in the transfer and clean-up of spilled explosive products in order to minimize risk.
d. In consultation with external expertise (e.g. Wyssen, WorkSafeBC), advise the Incident Commander and/or Accident Site Commander of the most appropriate actions to ensure safety of all personnel involved.
e. Liaise closely with the Incident Commander and/or Accident Site Commander and outside agencies at the accident site (e.g. RCMP) to ensure that all decisions made reflect the utmost concern for safety of involved personnel.
f. Ensure that the area has been thoroughly searched to confirm that all spilled explosive materials have been removed prior to re-opening the evacuated area.

12.6 CLOSURE

These procedures have been developed for use by Pretium Resources Inc. with the Wyssen Avalanche Tower (WAT).
They describe blasting equipment used with the WAT, personnel training, the assembly and loading of explosives in the tower deployment box, flight operations for the helicopter transport of the tower deployment box, deployment of the explosives using the remote system and misfires.
Procedures are in accordance with WorkSafe BC (WSBC) Occupational Health and Safety Regulations (OHSR) Part 21 – Blasting Operations and Part 29 - Aerial Operations, Natural Resources Canada Explosive Regulations, Transportation of Dangerous Goods Regulations Part 12.12 – Aerial Work and the Wyssen Avalanche Tower LS12-5 G3 Instruction Manual (v 3.8, July 2017).
These procedures will be reviewed annually and if any changes are made, they must be approved in writing by WorkSafeBC.

WARNINGS

1. Snowtek Systems Ltd recommends for shots greater than 300PSI that remote firing be used.

2. It is manditory for shots greater than 400PSI that the electric firing option be used and high pressure regulator needs to be fitted PN AC 03. (Appendix D)

3. Never fire an Avalanche round without first checking the Avalanche round manufacturers' maximum pressure rating and never exceed this pressure.

4. The practice of extending the pneumatic firing lines to achieve remote firing is prohibited with the Nitro Xpress. This will cause uncommanded firing when the safety valve is opened. Remote firing must be either done with the lanyard system or using the optional electric firing control. (Appendix D)

Copyright SnowTEK Systems Ltd

Safety:

The Nitro Xpress is a nitrogen powered Avalauncher designed for the safe and efficient delivery of an Avalanche Explosive Round to the Intended target.

This manual addresses the safe and correct operation of the Nitro Xpress.

The Nitro Xpress has been designed with Operator and Public safety in mind.

The handling of explosives is to be carried out by a Blaster of Record only as per Governmental and or OHS Jurisdictional regulations.

It is a requirement to follow all good and safe practice when handling Explosives.

The firing of the delivery system requires 2 trained personel. One is called the Gunner and the other is called the Loader. A minimum of one operator must be a certified blaster for the OHS Juristiction.

It is essential that all staff and public are clear of the barrel when any pressure checks or firing is being carried out.

Compressed gas cylinders must be handled as per supplier's recommendations or by jurisdictional regulations.

Snowtek Systems Ltd recommends remote firing for shots with a greater charge pressure than 300 PSI.

Snowtek Systems Ltd states it is manditory to use the electric remote firing control for shots with a greater charge pressure than 400 PSI.

SnowTek Systems Ltd requires the operators of the Nitro Xpress Avalauncher to follow these operation procedures fully!

Copyright SnowTEK Systems Ltd

Terms:

Blaster of Record:
A person approved by the statutory authority to handle and use explosives.

Gunner:
The Gunner is required to be a Blaster of Record by certification as they are responsible for overseeing the co-ordination of the blasting operation while using the Nitro Xpress. They are responsible for all staff and public safety while operating the Nitro Xpress. The Gunner is also responsible for keeping a record of all firing.

Loader:
The Loader is required to be trained in the use of handling explosives as they are responsible for the safe handling and loading of the explosive avalanche round. The loader will also work with the Gunner to ensure the safe operation of the Nitro Xpress.

Main Valve:
This is the valve between the nitrogen pressure tanks and the barrel.

Pressure Release Valve:
This is the valve located on the control panel that is used to release the pressure from the Nitro Xpress pressure tanks.

Main Control Valve:
This is the valve located on the control panel that seats the main valve and allows nitrogen to flow into the Nitro Xpress pressure tanks.

Breech:
The mechanism that opens to allow loading of the Avalaunche round into the Nitro Xpress.

Breech Plug:
The plug which is removable to allow the avalanche round to be inserted into the barrel.

Firing Safety Valve:
The valve mounted on the gun as part of the interlock safety system.

Firing Valve:
A squeeze or pull valve that is actuated to release the main valve.

Interlock Safety System:
The locking system that prohibits the Nitro Xpress being fired when the breech is open or unlocked.

Shot Pressure:
The pressure required to deliver the avalanche round to its target.

Copyright SnowTEK Systems Ltd

Elevation Ram:
The mechanism for changing the elevation (angle) of the Nitro Xpress.

Directional Gearbox:
The mechanism for rotating the Nitro Xpress on its turn table.

Barrel Receiver:
The recess in the front of the Nitro Xpress the takes the machined end of the barrel.

Barrel Clamp:
The locking clamp that retains the barrel in the Nitro Xpress.

Safety Pressure Valve:
The over pressure release mechanism.

Holding Brake:
The friction device locking the turntable in place.

Copyright SnowTEK Systems Ltd

SPECIFICATIONS:

Nitro Xpress Height at 0°(minus barrel)	1040mm (40.9”)
Nitro Xpress Height at 65°(minus barrel)	1375mm (54.1”)
Barrel Length	4000mm (9.8’)
Barrel Internal Diameter’s	ID82.3mm (3.24")
Barrel Outside Diameter’s	OD99.88mm (3.93")
Round Diameter’s	80mm - 82mm (3.14" - 3.22")
Overall Length	4585mm (180.5”)
Turntable Diameter	650mm (25.5”)
Footprint (minus barrel)	1455mm x 710mm (57.2” x 27.9”)
Propellant/Gas:	Dry Nitrogen
Design Pressure:	4136KPa (600psi)
Working Pressure	200 – 3450KPa(29 – 500psi)
Design Temperature	-25°C to 50°C (-13°F to 122°F)
Tank Capacity	45 litres
Weight (excluding barrel)	235kg (518lbs)
Barrel Weight	16kg (35lbs)
Pressure Vessel Standards	ASME 8, AS1210 Category 3 Canadian CNN.....

ORDER OF OPERATION:

SnowTek Systems Ltd requires the operators of the
Nitro Xpress Avalauncher to follow the operation procedures fully!

1 NITRO XPRESS SETUP INSPECTION

1.0
Remove and store cover.

1.1
Remove lockout lock from the safety lever.
Open the pressure release valve on the main control panel to vent any residual pressure in the main tanks.

1.2
Release the brake lever.

1.3
Ensure the elevation ram and direction gearbox handles turn freely.

1.4
Remove barrel receiver cap and inspect receiver for foreign objects (e.g. ice or grit).
Wipe if necessary.

1.5
Ensure the barrel clamp is unlocked and free to move.

1.6
Open the breech and inspect the breech, breech plug and breech locking ring for foreign objects (e.g. ice or grit). If foreign objects are present carefully remove.

1.7
Inspect the safety pressure release valve for foreign objects (e.g. ice or grit) and remove if necessary.

Copyright SnowTEK Systems Ltd

1.8
Inspect the 2 pressure gauges for icing and remove ice if present.

1.9
Inspect filling hose and filler socket for foreign objects (e.g. ice or grit) and remove if necessary.

2 ATTACHING BARREL:

2.1
Remove the barrel from its storage tube.

2.2
Inspect the barrel for dents. If any are present refer to Trouble Shooting Guide.

2.3
Look through the barrel and ensure there are no foreign objects inside. Remove any objects before continuing.

2.4
Slide the recessed end of the barrel into the end of the Nitro Xpress through the barrel clamp and into the barrel receiver. Take care to avoid denting the end of the barrel.

2.5
Check the barrel is fully located into the barrel receiver and the yellow indicator ring is not showing.

2.6
Close and lock the barrel clamp. Ensure the barrel is secure and will not move under pressure.

Copyright SnowTEK Systems Ltd

3 ATTACHING THE MEASUMAX DIGITAL PROTRACTOR:

3.1
Clip the Measumax Digital Proctractor into place.
Make sure it is firmly locked in place.

3.2
Turn the Measumax Digital Protractor on as per instructions (APPENDIX: B)

4 ATTACHING NITROGEN REGULATOR AND FILLING HOSE:

4.1
Secure the cylinder to an appropriate support that prevents the cylinder from falling as per supplier's instructions.

4.2
Open the cylinder valve slightly and close. This will clear the valve of any dust, water, or dirt which could be carried into the regulator and cause damage or an accident.

4.3
Fit the regulator onto the valve and tighten as per regulator manufacturer's recommendations (Appendix A).

4.4
Insert the filler hose end into the filler socket.

4.5
Push filler socket outer collar backwards to allow the filler hose end to snap home.

4.6
Release the filler socket outer ring to lock the filler hose end into place.

4.7
Give the filler hose end a gentle pull to ensure it is locked.

5.0
Electric Firing Control Option (for shots above 400 PSI).
Refer to Appendix D

Copyright SnowTEK Systems Ltd

6.0 OPERATIONAL SAFETY CHECK:

This operation is carried out by filling the Nitro Xpress to 50psi and firing. This operation is to be carried out twice. This is to check the operation of all components of the Nitro Xpress and ensure it is in safe working order.

Seal and operation check

6.1
Close the pressure release valve on the main control panel if open.

6.2
Ensure the breech plug is inserted and the breech locking ring is fully rotated to the left to lock the breech plug into place.

6.3
Aim the Nitro Xpress in a safe direction and raise the barrel using the elevation handle.

6.4
Open the nitrogen cylinder valve SLOWLY to allow pressure to gradually build up in the regulator thus preventing damage and or injury.
(Never lean over the regulator while opening the cylinder valve).

6.5
Check the connections between the cylinder and regulator for leaks. A leak is evidenced by a hissing sound. If a leak occurs close the cylinder valve and consult the nitrogen regulators operator instructions Appendix A.

6.6
Set the nitrogen regulator to 100psi.

6.7
Turn the main control valve to the "SEAT" position.

6.8
Allow the pressure to build on the valve pressure gauge to 70psi.

Copyright SnowTEK Systems Ltd

6.9
Turn the main control valve to the “OFF” position.

6.10
Watch the valve pressure gauge for 20 seconds to see if it maintains 70psi. A slow decrease is acceptable. If it falls at a fast rate reseat the main valve (see 6.7). If it continues to fall at a fast rate consult the Trouble Shooting Guide.

6.11
Adjust the pressure on the valve pressure gauge to 70psi by repeating steps 6.7 to 6.10.

6.12
Turn the main control valve to the "CHARGE" position to allow the pressure to build in the main tanks. Watch the tank pressure gauge and turn the main control valve to the "OFF" position when it reaches 50psi.

6.13
Listen for leaks from the pipe work and watch for major pressure drops on both gauges. If a major pressure drop occurs consult the Trouble Shooting Guide.

6.14
At this point the nitrogen will equalize in the main tanks and the pressure will drop approximately 10 - 20psi. If the pressure continues to drop consult the Trouble Shooting Guide.

6.15
Allow the pressure to equalize in the tanks and then adjust the pressure returning it to 50psi using the main control valve (see 6.12).

6.16
Ensure the Breech is closed and locked.

6.17
As the gun is about to discharge from the barrel ensure the firing area is clear of all public and staff. Personnel must be behind the Nitro Xpress.

Copyright SnowTEK Systems Ltd

6.18
OPEN the firing safety valve by rotating it to the left.

6.19
If manual firing, fire the Nitro Xpress by pulling the firing valve.
If electric firing, as per Appendix D

6.20
After firing, release the firing valve and move the firing safety valve right to the closed position.
If electric firing, as per Appendix D

6.21
Repeat steps 6.1 to 6.20 for second operation check.

7 CHECKING THE UNIDIRECTIONAL SAFETY VALVE:

Unidirectional Safety Valve Test

7.1
Turn the main control valve to "SEAT" position this will close the main piston and then allow the pressure on the main valve to build up to 20 PSI.

7.2
Turn the main control valve to the “CHARGE” position, as the main presuure tanks rise above 20 PSI check to see if the main valve pressure gauge rises with the main pressure gauge.

7.3
This checks the operation of the unidirectional safety valve, if the main valve pressure gauge doesn’t rise once the tank pressure exceeds the main valve pressure the unidirectional safety valve has failed to function. Consult trouble shooting guide.

7.4
Open the Pressure release valve to vent the main tanks.

If the Nitro Xpress passes all these tests you can now proceed to fire avalanche rounds.

Copyright SnowTEK Systems Ltd

8 CHARGING THE NITRO XPRESS FOR FIRING:

Close the Breech

8.1
Ensure the Breech plug is in and the Breech is closed and locked.

8.2
Set the Nitro Xpress to the required direction and elevation.

Seat the Main Valve

8.3
Set the nitrogen regulator to 50psi above the required shot pressure.

8.4
Close the pressure release valve on the main control panel if open.

8.5
Turn the main control valve to the "SEAT"position,

8.6
Allow the pressure to build on the valve pressure gauge to a least 20psi above shot pressure.

8.7
Turn the main control valve to the "OFF" position.

Charge the Shot

8.8
Turn the main control valve to the "CHARGE" position to allow the pressure to build in the main tanks while observing the tank pressure gauge. When the Nitro Xpress reaches the required **shot pressure** turn the main control valve to the "OFF" position.

Is the Charge Holding?

8.9
At this point the nitrogen will equalize in the main tanks and the pressure will drop approximately 10 - 20psi. If the pressure continues to fall past 50psi below shot pressure and continues falling, release the main tank pressure by opening the Pressure Release Valve to release the pressure in the main tanks to leave the Nitro Xpress in a safe state. Now consult the Trouble Shooting Guide.

Copyright SnowTEK Systems Ltd

8.10
Allow the pressure to equalize in the tanks and then adjust the pressure as required to the shot pressure.

8.11
Inspect both gauges to ensure they are holding the correct pressure.

9 LOADING AND ARMING AN AVALANCHE ROUND:

9.0
Ensure the gun is holding the required pressure.

9.1
Check the Nitro Xpress is set to the required direction and elevation and make sure the brake is engaged.

Open Breech.

9.2
Move the breech locking ring handle to the RIGHT. Ensure the firing safety valve closes as it moves.

9.3
Remove the breech plug and swing it clear of the Breech.

Insert Avalanche Round.

9.4
Insert the round into the breech and arm as per the avalanche round manufacturers' instructions.

9.4A
Make sure that Wads/Arming discs are retained on the round as per round manufacturers' instructions.
2 examples are given.

9.5
Check you have removed the transport safety pin to arm the avalanche round as per manufacturers' instructions.

Close and Lock Breech.

9.6
Swing the breech plug to line it up with the breech. Care should be taken **to retain any arming mechanisms on the avalanche round.**

9.7
Push the round into the breech with the breech plug until the breech plug is fully engaged.

9.7A
Warning!!
Never pull an Avalanche Round out of the breech once it has been loaded into the Nitro Xpress. This has the potential to arm the round producing a very hazzardous condition. Once a round is inserted into the breech it must be fired.

9.8
Move the breech locking ring handle to the LEFT to lock the breech.

9.9
Pull on the breech plug handle to ensure it is engaged and locked.

Copyright SnowTEK Systems Ltd

10 FIRING:

10.1
Before firing re-check the Nitro Xpress is set to the required direction and elevation and make sure the brake is engaged.

10.2
Check the target area is clear and safe for firing. All staff and public must be aware of the firing and in a safe location.

10.3
Move the firing safety valve to the LEFT to open.

10.3A
For shots above 300psi Snowtek recommends remote firing

Firing

10.4
For electric firing consult Appendix D.
For manual firing pull and hold the firing valve until the Nitro Xpress has completely discharged. (via lanyard).
(this will open the main valve and release the nitrogen behind the round propelling it out of the barrel).
The Nitro Xpress will fire.

10.5
After firing release the firing valve and move the firing safety valve right to the closed position.
If electric firing, refer to Appendix D.

11 FLIGHT CHECK OF ROUND:

11.1
It is important to check the flight, impact and detonation of the avalanche round.

11.2
Record the direction, elevation, pressure and type of avalanche round fired.
(This information is useful to repeat the shot at a later date)

Copyright SnowTEK Systems Ltd

12 SHUTDOWN PROCEDURE:

After all firing has been completed.

Seat the Valve.

12.1
Set the nitrogen regulator to 50psi.

12.2
Turn the main control valve to the "SEAT" position.

12.3
Allow the pressure to build on the valve pressure gauge to 20psi to seat the main valve.
Then turn it to the "OFF" position.

12.4
Turn the main control valve to the "CHARGE" position to allow the pressure to build to 20psi in the main tanks.
Then turn to the "OFF" position.
(This maintains a positive pressure in the Nitro Xpress to prevent the ingress of moisture).

12.5
Lock out firing safety valve.

12.5A
Release brake.

Remove the regulator and hose.

12.6
Turn the nitrogen cylinder valve to the "CLOSED" or "OFF" position.

12.7
Relieve the pressure in the regulator by turning the adjusting knob clockwise fully. This will release any residual gas in the regulator and between the regulator and cylinder.

12.8
Remove the filler hose from the filler socket by pushing the filler socket collar ring backwards. This will unlock the filler hose end and then it can be removed.

12.9
Loosen the regulator by turning counter-clockwise and continue turning until the regulator is disengaged from the cylinder valve.

12.10
Store the regulator and filling hose carefully with inlet and outlet connections covered to avoid contamination and damage.

12.11
Replace cylinder cap on cylinder if supplied (as per cylinder supplier's recommendations).

12.12
Store the nitrogen cylinder as per supplier's recommendations.

Copyright SnowTEK Systems Ltd

Remove the Barrel.

12.13
Unlock the barrel clamp, rotate the barrel to loosen the seal, and remove the barrel from the Nitro Xpress.

12.14
Place the barrel into its storage tube, care should be taken not to damage the barrel in this process.

12.15
Replace the barrel receiver cap onto the barrel receiver.

Remove the Digital Protractor.

12.16
Turn off the Measumax Digital Protractor with its "ON/OFF" button, unclip and store in a safe dry location.
The “Measumax” must be removed from the Nitro Xpress between firings.

12.17
Cover the Nitro Xpress.

Copyright SnowTEK Systems Ltd

TROUBLE SHOOTING

Problem	Possible Cause	What to Do
Small dent on the receiver end of barrel Dent in barrel large enough to see from inside	Hitting barrel receiver when inserting barrel Mishandling	Dress outside and inside of barrel to remove minor Damage Replace Barrel Call your Nitro Xpress Service Center
Valve pressure gauge fails to rise	Nitrogen cylinder empty Nitrogen regulator is not set correctly Filling hose not connected correctly Leak in pipe work	Replace with full cylinder repeat steps 6.4 to 6.6 repeat steps 4.4 to 4.7 Call your Nitro Xpress Service Center
Sound of leak from pipe work	Fitting becoming lose with heating and cooling Crack in pipe work or gauge Main valve not seating	Release the pressure from the Nitro Xpress using release valve and tighten lose fitting with appropriate size spanner Call your Nitro Xpress Service Center Call your Nitro Xpress Service Center
Major pressure drop on main tank pressure gauge	Pressure release valve open	Close valve
	Leak in pipe work	Identifiy leak, use spanner to tighten leaking fitting or
	Main valve not seating	Call your Nitro Xpress Service Center
Main valve gauge fails to rise	Unidirectional safety valve iced up Unidirectional safety valve damaged	warm and de-ice Call your Nitro Xpress Service Center
Main tanks gauge still drops pressure	Pressure release valve open Leak in pipe work Safety pressure release valve tripped Main valve not seating	Close valve Use spanner to gently tighten fitting Call your Nitro Xpress Service Center Call your Nitro Xpress Service Center

Copyright SnowTEK Systems Ltd

APPENDIX A:

Operating Instructions for BOC Nitrogen High Pressure Regulator used in the Refrigerant Flush System
Model Number: NZRT50HP
Developed in conjunction with BOC Gases Australia Limited
Manufactured by Gasgep Pty Limited Melb

This Nitrogen Regulator has been designed for use in the BOC Refrigerant Flush System, with 0-3500 kPa (high pressure) regulated output for use with the new T50 Valve Cylinders.

Please follow the instructions provided for correct use.

SAFETY PRECAUTIONS

- Compressed gas cylinders must be handled with care and should be stored and secured in an upright position in a secure place where they will not be knocked over.
- Store and use cylinders in a well ventilated area and ensure they are not subjected to ambient temperatures above 55C or any source of radiant heat.
- Close the cylinder valve whenever the cylinder is being moved, not in use or empty.
- Cylinders should only be filled by the cylinder owner or with written permission of the cylinder owner in accordance with AS2030.I and State Dangerous Goods Regulations.
- Read and understand the instructions and labels that accompany your compressed gas equipment and cylinder. Further information s available in the BOC Gases' Material Safety Data Sheet (MSDS) No. 030 available on request from the BOC Customer Service Centre.
- Additional information for compressed gases can be found in AS4332 "The Storage and Handling of Gas Cylinders".
- Check the cylinder label for fill pressure. Only Nitrogen gas cylinders with a fill pressure of 5Mpa at 15 degrees C (20Mpa max. inlet) should be connected to this regulator.
- Always remove the regulator before moving or transporting the cylinder (see "Closing the cylinder & removing the regulator" section of this leaflet).
- Never hold the regulator to lift the cylinder.

OPERATING INSTRUCTIONS

Attaching the regulator to the cylinder

1. Secure the cylinder to prevent the cylinder from falling.
2. Open the cylinder valve slightly and close. This will clear the valve of any dust, water or dirt that could be carried into the regulator and cause damage or accident.
3. Fit the regulator into the valve and hand tighten. Do not use a spanner or over tighten as this will damage the connector o-ring.
4. Open the cylinder valve S-L-O-W-L-Y to allow pressure to gradually build up in the regulator thus preventing damage and/or injury. Never lean over the regulator.
5. Check the connections for leaks. A leak is evidenced by a hissing sound. If a leak occurs refer to the "Faulty Operation and Maintenance" section of this leaflet.

Closing the cylinder & removing the regulator

1. After use turn the cylinder valve to the "close" or "off" position.
2. Relieve the pressure in the regulator by turning the adjusting knob clockwise fully in. This will release any residual gas in the regulator.
3. Loosen the regulator by turning counter clockwise and continue turning until the regulator is disengaged from the cylinder valve.
4. Store the regulator carefully with inlet and outlet connection covered to avoid contamination and prevent damage.
5. Replace the cylinder cap on cylinder if supplied with one.

Copyright SnowTEK Systems Ltd

FAULTY OPERATION AND MAINTENANCE

In the event of a leak from a cylinder or regulator, turn off the valve and do not attempt to use the cylinder.

No maintenance is to be performed on the regulator by the user.

Do not tamper with the regulator or cylinder under any circumstances.

For further information, please contact BOC on 1300 133 286 in Australia

or 0800 262 374 in New Zealand.

MeasumaX MX

Digital Protractor 35-204

Calibration

The Measumax DP-360 Digital protractor needs to be calibrated only before being used for the first time, or if the ON/OFF button is pressed for longer than 6 seconds.

<1>

Place the unit on a flat machined surface facing you with the lettering on the face right side up. Align with an edge or a line, then press
ON/OFF button
The screen will display "-1-"

<2>

Press the ZERO button and the "-1-" will begin to flash

<3>

Wait six seconds until "-2-" is displayed

<4>

Rotate the unit in the horizontal plane 180 degrees, so that the lettering is facing away from you, but still the right side up. Align with the same edge or line Press the ZERO button and "-2-" will flash. Wait six seconds until the actual angle is displayed.. The calibration is now finished

Functions

ON/OFF Button

For measurement mode simply press the button and the angle will be displayed.
To refresh the reading press the button again.
To switch off press the button and hold for 6 seconds
NOTE! If you press the button for longer than 6 seconds the "-1-" will be displayed and the unit will have to be recalibrated as above.

HOLD Button

To freeze the display for reading where the unit has to be moved before you can see the display first ensure that the unit has been sitting in the position for more than six seconds, then press the HOLD button once. The display will show the angle and display a flashing "HOLD". Wait until the "HOLD" symbol on the LCD stops flashing and remains static, or wait at least 6 seconds, then the unit cn be moved to view the
To cancel the reading press the HOLD button once again.

ZERO Button

HORIZONTAL MEASUREMENT
When the "ABS" icon is displayed the unit is in the horizontal measurement mode

RELATIVE MEASUREMENT
If the "ABS" icon is not displayed
the unit is in relative measurement mode

HORIZONTAL MEASUREMENT

In the horizontal neasument mode the "ABS" icon will be displayed. Place the unit on the surface to be measured. Hold the unit
in place for 6 seconds and the protractor will
display the angle off the horizontal plane.

RELATIVE MEASUREMENT

Setting the alternate reference point. This function allows you to set any angle as the 0.00 reference point from which a measurement can be taken. E.G. You can set a surface that is 25 degrees off the horizontal plane as 0.00 so that you can use that surface to measure all other angles from

1. In the horizontal mode the "ABS" icon will be displayed. Put the digital protractor on a surface 25 degrees off the horizontal plane

2. Press the "ZERO" button to change to relative mode. (0.00 will be displayed)

3. Place the protractor on a surface 60 degrees off the horizontal plane and 35 degrees will be displayed

Technical Data. Full 360 degree range (90 x 4) - Resolution 0.1 degree. - Stainless Steel frame - Battery CR2032

Note ! The battery is not installed and is supplied only to test the system and may not have enough charge for nomal use

APPENDIX C:

RECOMMENDED FIRING CALLS FOR THE NITRO XPRESS

SnowTek Systems Ltd recommends the following calls be adopted by the Gunner and Loader as part of the operation of the Nitro Xpress.

Gunner selects target and calls "Target (e.g. Rockbridge)."

Loader replies "Target (e.g. Rockbridge)."

Gunner sets direction and elevation and calls (e.g. Direction 25?, Elevation 55?).

Loader confirms settings and calls (e.g. Direction 25?, Elevation 55?).

Close the Breech.

Gunner calls "Seating Valve", then when the valve is seated calls "Valve Seated".

Loader replies "Valve Seated".

Gunner calls "Pressurizing to (e.g. 150PSI)".

Loader replies "(e.g. 150PSI)".

Gunner calls when the pressure is reached and holding Pressure Holding".

Gunner calls "Opening Breech".

Loader replies Opening Breech".

Gunner calls "Load Round".

Loader calls "Loading Round".

Loader calls "Round Loaded and Armed".

Gunner replies "Round Loaded and Armed".

Gunner calls "Locking Breech, Breech Locked".

Loader calls "Breech Locked".

Gunner Calls "Firing Safety Valve Open".

Loader replies "Firing Safety Valve Open".

Gunner calls "All Clear".

Loader replies "All Clear".

Gunner Calls "Ready to Fire, 5, 4, 3, 2, 1, Fire".

Gunner Calls "Firing Safety Valve Closed".

Loader call "Wadd Or Arming Disk Away".

Gunner calls "Round Armed".

Loader confirms impact and detonation.

Gunner to record shot setting and result.

Copyright SnowTEK Systems Ltd

APPENDIX D:

ELECTRIC FIRING CONTROL:

Note: For shots above 300 PSI Snowtek recommends remote firing.
For shots greater than 400 PSI it is manditory to use the electric remote firing control.

1. Firing Valve.

2. Electric Connection.

3. Electric Firing Control.

4. Charger Unit.

Fitting Firing Control Valve.
(must be fitted with no pressure/rounds in the Nitro Xpress).

1. Pull back collar on firing line.

2. Fit Firing Valve.

3. Connect Electrical Connection.

4. Turn key on, push firing button.
(valve should be heard clicking).

5. Make sure key is turned off and removed.

Copyright SnowTEK Systems Ltd

To Electrically Fire.

1.1
Insert firing key

1.2
Turn key on, firing light will illuminate.

1.3
Push and hold firing button down until the Nitro Xpress has discharged.

1.4
Release the firing button.

1.5
Turn off the firing control and remove the firing key.

Recharge firing control every100 shots or 3 months,
or if firing light fails to light.

When Firing Completed The Electric Valve Must Be Removed.

To Remove Electric Firing System.

2.0
Turn off Firing Control and remove key.

2.1
Disconnect Electric Connection.

2.2
Pull back collar on firing coupling and remove valve.

It is not recommended to leave electric firing valve on Nitro between sessions freezing could cause problems.

2.3
Put firing valve back in tool box.

2.4
Charge firing control every 3 months or after 100 shots.

Copyright SnowTEK Systems Ltd

APPENDIX E:

RECOMMENDED MAINTENANCE

1. Charge Electric Remote Firing Control, if option taken.

2. Pre-season maintenance

2.1 Grease turntable at grease nipples on base.

3.Grease lifting cylinders.

Disconnect top clevis on cylinder while supporting tank assembly.
Wind the elevation handle to extend cyclinder until cylinder extends no further, pull on cylinder, the top section will come away.
Grease thread with a waterproof grease and re-assemble.

4. Liberally spray WD40 over all moving parts.

AT THE END OF THE SEASON liberally spray all moving parts with DW40 lubricant spray.

APPENDIX B – Classic Procedures User Manual

Classic Procedures User Manual

C·I·L / ORION

Div: EVANinc

Explosives EXPERTS Explosifs

November 14 2014

Classic Snowlauncher System
Loading Procedures

The following are procedures to be followed for loading, and firing the Classic Snowlauncher System, used for avalanche control by Snow Avalanche Programs in British Columbia Canada.

The Classic Snowlauncher system is comprised of three main parts

1) The fore-body 1.1 kg TNT pay-load
2) The arming tail fin assembly
3) CIL Avalauncher High strength detonator
4) Plastazote pillow spacer 10mm length

Parts 1 & 2 are fitted together by means of a friction fitted connection.

Additional Equipment for loading

- Dry approved container for detonators
- Dry container for tail fins
- Federally Licensed magazine for 1.1kg TNT fore-bodies
- Federally licensed magazine for detonators
- Container for transporting fore-bodies from magazine to gun site

Prepare the gun for firing with approved CIL procedures

3. **Personnel**

Two people are required to fire the Classic system. The blasting crew consists of a team leader or gunner and one assistant. **No other personnel should be in the blasting area while loading and firing these rounds**

i) **Team Leader** - is responsible for the following:

a) Safety of the entire operation
b) Operation of the gun
c) Supervision of the blast area
d) Confirming the charge detonation
e) Preparing the rounds
f) Loading and firing the rounds

ii) **Assistant** - is responsible for the following:

a) Recording the shots
b) Double checking the system assembly
c) Observing the projectile in flight
d) Confirming base plate separation in flight
e) Confirming the targets and detonation of the charge

4. **Classic Snowlauncher Loading Procedures**

Check to ensure the Classic Snowlauncher fits properly in the gun barrel. Do this by manually pushing an inert assembled round or a fitted testing gauge made of wood, plastic, brass or aluminum, through the entire length of the barrel, both ways, to ensure there are no foreign objects in the barrel and there are no restrictions in the barrel

4.1 **Preparing the Classic for Loading**

On arrival at the launching device, proceed as follows:

a) Check fore-body for external marks, protrusions, dents, and general condition. The fore-body should be smooth, clean and free of any foreign grit or objects.
b) Check to insure the nose cone is on straight and snapped on all the way
c) Check to ensure the cap well is clear of any foreign objects and proper depth
d) Take two 10 mm plastazote pillows found inside a baggy inside the tail fins box, and load them into the top of the detonator well. Using the detonator well

depth- checking tool, push the plastazote pillows all the way to the bottom of the detonator well

e) Check general condition of tail fin. There should be no dents, creases or foreign objects on the outside of the fin.

f) Check the spring tension on the bore-rider pin. The pin should depress and withdraw freely against the external washer, preventing the spring from jamming in the bore-rider pin hole, in the side of the tail fin.

g) Check to ensure the safety cotter pin is in place

h) Check to ensure the base plate is properly fixed to the bottom of the tail fin.

i) Check to ensure the arming wire is properly fitted into the pore-rider pin and properly secured to the base plate. The arming pin should be slid as far forward, towards the booster charge, as possible

j) Check to ensure the striker-pin magnet is properly secured in the bottom of the striker-pin channel

k) Check to ensure the striker-pin is properly in place in the striker pin channel

l) Check to ensure the detonator ferule is properly in place inside the top cup section of the tail fin

m) Check to ensure there is no grit or foreign objects inside the of the top cup section of the tail fin

n) Check the high strength detonator. Ensure there are no foreign objects inside the open bottom section of the detonator. There should not be any rust or condensation visible. The yellowish primary charge of lead-azide should be visible inside the detonator, well down inside the aluminum shell

o) Place the detonator over top of the ferule

p) Place the fore-body overtop of the detonator ensuring that it fits properly inside the fore-body cap well and push the two parts together.

q) Ensure the two parts are tightly pushed all the way on to each other preventing any air pressure from entering into the tail fin

r) Load the assembled charge into the barrel of the gun with the nose cone forward and the bore-rider pin facing downward

s) Positioning of the hands while loading the round is important. One hand should underneath and cupping the round in the area of the bore-rider pin. This will prevent the bore-rider pin from inadvertently ejecting from the assembled round. **Do not hold the round by grasping the base plate. If loading the assembled round into a try loader the cupping of the round is not necessary as the round can be cradled on the tray, which will also prevent the bore-rider pin from inadvertently ejecting.**

t) Remove the safety cotter pin and discard with the hand which is not cupping the assembled round. If loading the assembled round into a breach loader, using the free hand that is not cupping the assembled round, slide the entire round into the breach by pushing on the bottom of the base plate. This step can often best be done by using a fist on the bottom of the base plate to push. **Do Not Grasp the base plate and finesse the assembled round into the breach. This could cause the arming wire to inadvertently slip out of the bore-rider pin.**

The assembled charge is now ready to fire. Follow approved submitted firing procedures for appropriate gun.

u) Check to ensure base plate separates and falls off in flight after firing

v) Confirm detonation audibly and/or visually where possible

Always fire the Classic Snowlauncher from engineer approved protection and/or remote location. Never stand beside the gun and fire the Classic Snowlauncher System. Always confirm with CIL prior to firing these rounds that your firing procedures are safe

5. **Safety Precautions**

a) The team leader and assistant(s) must be in contact at all times.

b) No flammable or sparking materials may be carried in the same containers as the explosives, detonators or tail fins

c) Only approved CIL Explosives parts may be used to fire this system

d) Only personnel directly involved in the shoot should be present when firing the Classic Snowlauncher system

e) CIL Snowlaunchers should not be shot with firing pressures exceeding 350 psi

f) CIL Snowlaunchers should not be shot with firing pressures below 80 psi

g) Always check with the gun manufacturer for the maximum and minimum gun firing pressures prior to deciding on target pressures

f) Never fire a Claasic Snowlauncher with a firing pressure lower than 80 psi

g) Never fire a Classic Snowlauncher with a firing pressure greater than 325 psi

6.**Deteriorated or Damaged Product**

If any significant damage is detected, to any of the components in the assembled parts, Do NOT Use these and advice CIL Explosives of the issue.

If any of the parts appear to compromised or deteriorated to any degree, Do Not Use these, and advise CIL Explosive of the issue.

7. **Wait time for Misfired Round**

CIL insists on a 30-minute wait time before approaching any misfired avalauncher round.

8. **Misfires and Disposal**

Refer to approved procedures for the jurisdiction working in

MSDS sheets for the fore-body, detonator and tail fin are available from CIL Explosives.

CIL Explosives provides on-site technical training service for all customers using this system

APPENDIX C – Electric Firing Switch

Electric Firing Procedures for Nitro Express Avalauncher Device

APPENDIX D:

ELECTRIC FIRING CONTROL:

Note: For shots above 300 PSI Snowtek recommends remote firing.
For shots greater than 400 PSI it is manditory to use the electric remote firing control.

1. Firing Valve.

2. Electric Connection.

3. Electric Firing Control.

4. Charger Unit.

Fitting Firing Control Valve.
(must be fitted with no pressure/rounds in the Nitro Xpress).

1. Pull back collar on firing line.

2. Fit Firing Valve.

3. Connect Electrical Connection.

4. Turn key on, push firing button.
(valve should be heard clicking).

5. Make sure key is turned off and removed.

Copyright SnowTEK Systems Ltd

To Electrically Fire.

1.1
Insert firing key

1.2
Turn key on, firing light will illuminate.

1.3
Push and hold firing button down until the Nitro Xpress has discharged.

1.4
Release the firing button.

1.5
Turn off the firing control and remove the firing key.

Recharge firing control every100 shots or 3 months,
or if firing light fails to light.

When Firing Completed The Electric Valve Must Be Removed.

To Remove Electric Firing System.

2.0
Turn off Firing Control and remove key.

2.1
Disconnect Electric Connection.

2.2
Pull back collar on firing coupling and remove valve.

It is not recommended to leave electric firing valve on Nitro between sessions freezing could cause problems.

2.3
Put firing valve back in tool box.

2.4
Charge firing control every 3 months or after 100 shots.

Work Plan

Description of Work	Safe access to conduct cornice control and hazard removal. Scope of work can involve the use of explosives as well manual hazard removal • Cornice control is performed when cornices build up to unsafe proportions. This is may be accomplished with a variety of explosive techniques and each situation may require individualized treatment. • **PERSONNEL RESPONSIBILTIES** The team consists of a Blaster of Record (OHSR 21.5(3)) and Assistant. The Blaster is responsible for all aspects of the mission. There shall be a minimum of two persons, in certain instances additional personnel maybe required. • **BLASTER RESPONSIBILTIES** ☐ Safety with use of explosives, ☐ Test and inspect all equipment prior to blasting ☐ Check and test of rope safety system used ☐ Ensure road closure completion ☐ Select location of watchman ☐ Select safe priming location close to the blast site

Rope-access Methods	☐ Standard practices outlined in Guidelines for Rope Access Work Belay technique with a direct anchor belay. In the case of an emergency the system is capable to: • lower victim on dual ropes to a safe location • raise victim on dual ropes • lower a rescue rope for victim to ascend on, with a back up belay **BELAY ANCHORS** Belay anchors for cornice and/or avalanche control must meet the requirements set out in Work Safe BC Rope access (New) Part 34 Rope Access 34.13 Temporary anchors (2). • A temporary anchor for a rope access system must have an ultimate load capacity, in any direction in which the load may be applied, of a MBS 22 KN (5000 lbs.). The regulation states 12kn (2700lbs per person) all systems are designed for a 2 person load capacity in the case of rescue; therefore anchors must might a MBS 22KN standard. • For the purpose of cornice and or avalanche control an anchor may include large snow vehicles, mature trees, or appropriate snow anchors such as "deadman", snow picket, buried "T-Slot" anchors or if appropriate, ice screws. • The blaster and assistant will determine the location for the anchor making sure that the location is far enough away that cornice breaking away will not affect the integrity of the anchor. • Both will inspect the entire system to be sure it is adequate for the possible forces involved. As per Work Safe BC Rope access (New) Part 34 Rope Access 34.13 Temporary anchors (2). • Belayer will belay the person that will set and prepare the charges using a dynamic or low stretch rope. UIAA Standard 101 Mountaineering and Climbing Equipment – Dynamic Ropes or UIAA Standard 107 Mountaineering and Climbing Equipment – Low Stretch Ropes. • Once work is complete and before ignition of explosives all equipment including anchors will be removed and taken with workers to a safe location.

Individual Equipment	☐ Helmet ☐ Eye protection ☐ Foot protection ☐ Gloves ☐ Protective clothing ☐ Reflective Clothing ☐ Handle Ascender & foot loop ☐ Hearing Protection ☐ Harness ☐ Connectors ☐ Descender (I'D/RIG) ☐ Belay Device (Gri-Gri) ☐ 2 x Backup Devices ☐ Lanyards ☐ Pulleys ☐ headlamp ☐ Multi-tool ☐ other
Group Equipment	☐ Ropes (1 x 50m dyanmic rope) ☐ Edge Protection (PVC tube / steel bar/ CMC edge protection/ SMS edge protection) ☐ Rigging Straps ☐ Connectors ☐ other **EQUIPMENT: EXPLOSIVES** ☐ Detonating cord if applicable ☐ Appropriate boosters and explosives ☐ Safety fuse assemblies ☐ PVC Punch or Ice auger ☐ Pull wire igniters ☐ Blasting Log Time piece ☐ Blasting tools and accessories ☐ Hearing protection ☐ Radios on road closure frequency **EQUIPMENT: FALL PROTECTION** ☐ 2 x ANSI/ CSA Approved full body harness or sit harness ☐ UIAA approved dynamic single belay rope – 10.5-11mm diameter x 50m (enough rope to use for lower and rescue) ☐ 2 x 4' sewn slings, 6' sewn sling, 5m tubular webbing 22KN ☐ 4 x locking carabiners ☐ 1x Petzl ID or RIG with locking carabiner for direct anchor belay (Petzl Gri Gri or ATC for body belay) ☐ 1 x Petzl ID or RIG with locking carabiner for access in the case of an emergency ☐ Safety back up Petzl ASAP, or KONG back up ☐ Handle ascender with foot loop (*Mountain guides* wearing sit harness use asymmetrical dynamic lanyard with handle ascender and basic ascender, with 2 foot loops) ☐ Edge protection
Team Communication	☒ Visual (Hand Signals) ☒ Verbal (unassisted) ☒ Radio (Repeater 1 Brucejack)
Equipment/Tool Management	☐ Other...(describe... attach additional pages if necessary)

Access Zone	Access zone is well back from the cornice on solid ground, minimum 2 meters back from the last probed area of solid ground. Important to have adequate room with a large safety margin for the unpredictable characteristics of cornices 
Hazard Zone	Within 2 meters from last probed area of solid ground back from the cornice feature. Also the drop zone and runout zone below the cornice **CAUTION** It is difficult, and at times impossible, to predict the strength of cornices or the time of collapse. Some of the indicators of natural collapse are: • Fresh build up of the lip during snow storms • Moderate to high winds with snow available for transport • Rainfall: (It weakens the snows and add weight) • Rise in air temperatures (Weakens the snow) • Solar radiation input (Weakens the snow The shape of the ridges or peaks where cornices form influences the density and harness strength of the cornices. Long, uniform ridges generally produce dense and hard cornices due to high wind velocities. The same applies to cornices on peaks, sub-peaks, cliffs, outcrops and points. In bay features, between rock buttresses with low points in between them, snow is deposited easier due to lower wind velocity; this generally results in large and soft (weak) cornices. (Canadian Avalanche Association-Hazards of working on and around cornices) These many variations and characteristics have to be kept in mind when estimating where the potential fracture line is. It is also helpful to know the shape and make-up of the ground in the snow free season (summer/ Fall). Take some photos and add to Access Plan and JHA. The fact that we add the weight of the worker preparing the blast can be critical to the cornice failing. Further more we weaken the cornice considerably by tamping or drilling holes for the explosives or digging holes for large charges. If a cornice fails along the belayed worker's path it generally is of little consequence to the worker or the belayer. **If the cornice should fail behind the worker's path, behind the shot holes, even a belayed worker could be seriously hurt. Forces could be large enough (entrapment under cornice debris) as to cause failure of equipment, systems, anchors, etc… Critical importance to design systems with proper safety margins/ factor - 10:1 to account for additional forces. As well, only qualified personal trained in procedure.** A rule for cornice controllers is to do the work early in the morning because of the lower air temperature and less solar radiation n input. Avoid working on or around cornices after warm night temperatures and during, or after rainfalls.

Anchors	☒ Standard anchors outlined in Guidelines: as described by Work Safe BC rope access regulation 34.14 Temporary Anchors, (2) Create temporary access with 1/2inch x 3 3/4inch hilti expansion bolts - 22kn MBS. Minimum 2 x expansion bolts per anchor Hilti Stainless Steel KB- TZ anchors are made of type 304 or 316. ½" 8543lbs. Shear strength / 12364lbs. tension. Refer to the Hilti manufacture installation procedures. Snow anchors may be utilized into pencil density snow minimum 60cm deep. Must use 2 x independent anchors. • 3 x 3-4ft pieces of ¼"angle iron or snow stakes, stacked vertically and back tied to one another is an acceptable anchor in pencil density snow   • T-slots are highly effective in pencil density snow

	Vehicles, snow cats and heavy machinery once locked out (keys with team leader, wheels choked) can be utilized as anchor points (axles/ structural steel frame) Anchor slings around large rocks that are well seated and absolutely no chance of movement Snowmobile anchors can be utilized when well anchored into snow (rear track is submerged below the snow surface by reversing and spinning track) and a reversed incline slope (Min 10 degrees) to the access zone. (LOAD test data to follow)

Rescue and Retrieval Methods	Direct anchor belay has raise and lower capabilities. The rescue rope will be used in the case of an emergency to lower to victim/ tech so they can ascend the rope The belay rope will be long enough for a lowering system. Very important to properly prepare edge/ lip with edge protection. In the case that the worker is seriously injured the rescue rope can be used for the technician to descend on 2 ropes to assist and connect the safety back up to worker. The technician will ascend back up rope and prepare the haul system (3:1, 6:1 if 6:1 if needed) If the worker is not injured the brake hand end of the belay rope will be secured with a "figure 8 on a bite" and be long enough (50m rope) to be lowered to worker to ascend up the rope—Make sure there is a knot in the end of the rope. Very important to properly prepare edge with edge protection to prevent the rope from digging into the edge. The belay rope will be used as a safety back up while worker ascends rope. • All workers onsite allocated to this task will carry the right certification and level of training to perform a standard rope access rescue when needed. • In the case of rescue all work stops and **Av Tech** onsite team leader takes charge of situation. • The rescue plan will take into account that the majority of rescues will always be easier and faster to descend, but in case of cornice control it will most likely be advantageous to raise victim • Rescue technician will utilize standard rope access pick-off rescue technique. • There will always be a staged rescue kit, with First aid and spinal immobilization equipment, rescue ropes and rigging whenever work is commencing. • Rescuers will access incapacitated technician. Technicians always work with a minimum team of 2 workers • Rescuers will communicate any needed resources, mobilizing outside resources; patient care, first aid and packaging will commence as situation dictates. All rescues are situational dependent; **the Av Techs** trains to be prepared for worst-case scenarios. Our philosophy to work is a proactive preventative approach. With proper job planning, hazard assessment and risk management procedures, we are able to manage and mitigate hazards. ACCESS: Top EGRESS: Ascend or raise worker back up on top, and if situation dictates lower worker down slope TASK SPECIFIC RESCUE PROCEDURES: In the case of a cornice failure, there is a very good chance the belay rope will dig into the cornice edge and make it challenging to climb back up. The rescue rope will be lowered over a well prepared edge with the use of edge protection, making it much easier and safer for the technician to climb back up, and minimize exposure.

Rescue Kit	☒ First Aid Kit ☐ Patient Packaging ☐ Pulleys ☐ Rope Grabs ☐ Connectors ☐ Spare Equipment ☐ other…Rescue Ropes, 2nd descender and safety backup

○ RA Equipment: Wire & nylon industrial Slings	○ Communication: Radios, Whistle, Air Horn
○ Steel carabiners	○ Rescue headlamps
○ Rescue Ropes (Red) 2 x 125 m 12.5 mm	○ Rescue Pole
○ Access & safety lines, 11 mm ropes	○ ANSI approved Back up device
○ Basket (Cascade style) stretcher & bridal system ○ With 5m x 11mm attendant rope or 4-5m Grillon	○ Anchor plates
○ Spine board	○ Passing rescue pulleys
○ Oregon spine splint	○ 8mm cord
○ Stretcher O ring	○ Prussic minding pulley
○ Set of spider straps to package patient on spine board.	○ Canvas and Plastic edge guards, roller guards, Velcro rope guards
○ Attendant attachments (5m of 11mm rope).	○ Knot Pass Pulley
○ MPD, Petzl ID	○ Track line and tag line 11-12.5 mm rescue ropes. ○ 2 x ID's or sets of tandom prussics

1.0 Operational Objective for the Av Tech Rescue Team:

To efficiently return incapacitated worker(s) to where best patient care can be administered, rescuers will utilize standard training techniques that will be situation dependent. The Action Plan will be based upon the complexity of the rescue weighed against the subjects transport category and limitations of the subject(s) disposition.

1.1 Call received:

- Rescue Leader initiates rescue plan and contacts Dispatch, Operating HSE Supervisor.
- Radio silence is initiated, work stops and technicians return to grade.
- Crew musters at **Av Tech** Rescue Cache and awaits notification.

1.2 Scene size up:

- Location
- Number of subjects
- Nature of the injury

1.3 Mitigate or Control Hazards:
***Hazard controls and mitigation to be decided upon award**

1.4 Risk Benefit Analysis Performed:

- Hazards Identified
- Environment concerns and Extrication issues
- Urgency – Rescue or Recovery
- Subjects injury and Transport Category

1.5 Implementation:

- The Rescue Team musters
- Field Rescue leader is appointed
- Operating HSE Supervisor is notified to activate ERP

Notification **Emergency x 3**	- Radio silence and switch to channel 1 - Stand down work and return to designated muster zones
Rescue Considerations	- Rescue ropes will be of sufficient length to rappel with casualty down to the bottom. - The use of work platform is a possibility depending on situation - Orthostatic incompetence will be managed as required by the nature of the incident.
Transfer of Command	- Once the subject has been lowered safely to grade, the rescue team will administer primary first aid care and package the subject for transport. - Rescue team will assist until transfer of care is complete.
Demobilization	- Technical debrief will be completed with the Rescue Team Crew, record keeping and documentation.

	Condition Human Environment Equipment	Description of Hazards	Hazard rating: LOW MOD HIGH		Control Measures
☒	**Falling**	• Gravity-induced injury or death	HIGH	☐ ☐	Always use appropriate fall-protection or rope-access equipment when 6 feet from unprotected edge with a fall potential of 6 feet or more All personnel must be properly trained
☒	**Human Error**	• Rigging Errors	MOD	☐ ☐ ☐	Use 2-rope system when working line is primary means of support Use independent anchorages Always do 4-point check: Ropes (including anchors), Hardware, Harness, Helmet
☒	**Communication Difficulty**	• Loud ambient noise (traffic, machinery, running water, wind, etc.) • Malfunctioning or dropped radios • Conditions change	MOD	☐ ☐ ☐ ☐	Agree upon and use standardized communication signals Check communication system Designate alternate communication system in case conditions change or technical difficulties arise Review hand signals (as appropriate)
☒	**Sharp/abrasive surfaces**	• Rope or anchor damage and/or failure • Abrasions or cuts to hands	MOD	☐ ☐ ☐	Use proper edge protection and padding Use re-direct or intermediate anchors as needed Wear gloves and proper clothing
☐	**Electrical Lines**	• Inadvertent contact with energized lines • Burns or electrocution from contact		☐ ☐ ☐	Examine lines that might be contacted by wind-blown ropes Get appropriate clearances Follow lock-out/tag-out procedure
☐	**Machinery**	• Inadvertent operation of machinery • Injury sustained from machinery • Hazardous condition created (e.g. release of water)		☐ ☐ ☐	Get appropriate clearances Follow lock-out/tag-out procedure Confirm lock-out/tag-out
☐	**Injury from Tools**	• Hazards depend on tools used • Damage to rope-access or fall-protection system		☐ ☐	Follow all manufacturers instructions and keep all protective guards in place Separate suspension rope may be required for tools greater than 10 kg
☐	**Dropped Tools or Materials**	• Possible injury to personnel and public • Loss of important tools for work or egress • Damage to structures or equipment		☐ ☐ ☐ ☐ ☐	Clearly mark and barricade Hazard Zone Helmets or hard hats must be worn in Hazard Zone Keep a clean and orderly worksite All tools and devices must be tethered or secured Avoid working or standing below other workers
☐	**Rock fall or loose detritus**	• Possible injury to personnel and public • Damage to structures or equipment • Severed ropes		☐ ☐ ☐	Careful scaling or clearing of slope prior to work Loose materials or rock may need to be secured (either temporarily or permanently) Manage ropes carefully to avoid dislodging loose materials
☒	**Rain/Wet/ Wx Conditions**	• Insulating qualities of wet clothing decreases • Possible hypothermia (dangerously low body temperature) • Wet surfaces can be slippery • Decreased friction on descent and rope-grab devices • Danger of stray current near improperly insulated and grounded equipment • Decreased visibility	MOD	☐ ☐ ☐ ☐ ☐	Stop work if conditions become dangerous Wear proper footwear and clothing Waterproof rain gear should be available Be aware of slippery conditions Electrical equipment must be adequately grounded and equipped with GFCI's.
☒	**Snow/Ice**	• Insulating qualities of wet clothing decreases • Possible hypothermia (dangerously low body temperature) and frostbite	MOD	☐ ☐ ☐	Stop work if conditions become dangerous Wear proper footwear and clothing, including gloves and hat Waterproof rain gear should be available

	Condition Human Environment Equipment	Description of Hazards	Hazard rating: LOW MOD HIGH		Control Measures
		• Loss of dexterity in extremities • Wet and icy surfaces are slippery • Decreased friction on descent and rope-grab devices • Danger of stray current around improperly insulated and grounded electrical equipment • Decreased visibility		☐ ☐ ☐	Be aware of slippery conditions Use appropriate rope access equipment for conditions Electrical equipment must be adequately grounded and equipped with GFCI's. Hand warmers should be available in case of emergency
☐	**Water** (working around/over moving/standing water)	• Wet surfaces can be slippery • Potential for Drowning • Trapped in current while tied off (drowning hazard) •		☐ ☐ ☐ ☐	Stop work if conditions become dangerous Rescue boat shall be readily available if working directly over water, especially if descent is a viable method of egress. Fall protection or rope access equipment must not allow worker to fall into water (especially moving water) Personal flotation devices not required if proper fall protection in place
☐	**Sun/Heat**	• Possible dehydration, heat exhaustion or heat stroke • Burns from tools, equipment, and structural steel • Adhesives and first-aid supplies may be degraded by heat		☐ ☐ ☐ ☐ ☐	Stop work if conditions become dangerous Ample water and/or electrolytes must be on hand for workers Schedule proper breaks and work in morning or evening to avoid peak temperatures Wear gloves and proper clothing to protect hands from hot surfaces Use and frequently re-apply adequate sunscreen
☒	**Cold/Freezing Temperatures**	• Possible hypothermia, frostbite, loss of dexterity in extremities • Decrease in efficiency, adhesives and first-aid supplies may not function properly due to cold, water for drinking and work may be frozen; slippery surfaces	MOD	☐ ☐ ☐	Stop work if conditions become dangerous Wear proper footwear and clothing, including gloves and hat Warm liquids should be available to workers
☒	**Wind**	• Possible increased cooling or hypothermia risk, increased dehydration risk in dry humidity • Decrease in efficiency, hindrance to communications between team members • Danger of unsecured equipment or material being blown into the access zone • Difficulty communicating	MOD	☐ ☐ ☐ ☐	Stop work if conditions become dangerous Wear proper footwear and clothing, including gloves and hat Secure loose materials at work site Be wary of wind developing slack in ropes where they may be blown in to areas making retrieval difficult
☐	**Lightning**	• Possible electrocution due to lightning strike, loss of consciousness or life • Rope-access equipment may provide a pathway to the operative for electrical strikes		☐	Stop work when lightning threatens
☐	**Dimly lit or night work**	• Sharp or protruding objects (metal, nails, bolts, etc.) may not be visible to moving operatives, drowsiness of employees		☐ ☐	Provide adequate lighting: area lighting and/or head- and hand-lamps Provide spare batteries, light sources, and bulbs
☐	**Dust**	• Difficulty in breathing, possible allergic reaction • Possible long-term exposure hazard		☐ ☐	Provide adequate engineering controls Provide PPE where engineering controls not possible or impractical
☐	**Chemical exposure**	• Difficulty in breathing, dizziness, unconsciousness • Chemical burns to skin, eyes, internal organs		☐ ☐	Workers must have MSDS on site for all chemicals used in work Proper PPE and engineering controls must be in place

	Condition Human Environment Equipment	Description of Hazards	Hazard rating: LOW MOD HIGH		Control Measures
				☐	Respirators must be the correct type for the exposure
☐	**Confined space entry**	• Work areas may contain toxic gases or insufficient oxygen levels for work. • Space may have restricted entry/exit making access difficult,		☐ ☐	Follow confined space procedures Toxic rescue plan required and in force prior to entry
☐	**High-noise area**	• Permanent or temporary damage to hearing • Difficult Communications • High-noise levels may mask warning buzzers or other alert sounds		☐ ☐ ☐	Hearing protection required, in extremely loud environments (+120 dBA), multiple types of protection may be necessary. Agree on hand signals before work starts Workers may be equipped with sound-isolating hearing protection for radios.
☒	**Use of Explosives**	• Use of explosives on a dynamic surface • Lowering explosives over the edge of a cornice	HIGH	☐ ☐ ☐ ☐ ☐	Careful assessment of cornice size, temperatures, solar influence, snow conditions, etc… Use of gloves at all times Use of belay system with rescue system in place. Trained and qualified personal Follow SWP for explosive operations
☒	**Vehicular Traffic**	• Control work above active roads	MOD	☐ ☐ ☐ ☐ ☐	Careful delineation of access and hazard zones, Use flags, signs, guards, lighting as needed Closure points, sweep closure before going live Affective communication with dispatch and informing all personal over Repeater Ch and road ch
☒	**Cornice Failure**	• Fresh build up of the lip during snow storms • Moderate to high winds with snow available for transport • Rainfall: (It weakens the snows and add weight) • Rise in air temperatures (Weakens the snow) • Solar radiation input (Weakens the snow	HIGH	☐ ☐ ☐ ☐ ☐ ☐ ☐	Try and conduct mission first thing in the AM Do not work during heat of day Avoid after warm air temps during night or rainfall Use probe to determine solid ground The use of belay rope when necessary with rescue plan in place
☒	**Work at Height Fall Protection Equipment**	• Equipment being misused • Equipment not being used for the intendant purpose • Exposed to shock loading • Damaged equipment	MOD	☐ ☐ ☐ ☐ ☐	Inspect equipment before every use Formalized inspection records Qualified technicians Proper training on Work at height, Rope Access and Rescue Plan in place Follow manufacture speciifcations

Post-Job Debrief

Date/Time Completed		Debrief Prepared by:	
Safety Considerations	Were adequate safety measures taken to insure the safety of personnel and public? Note any additional safety measure taken or recommended.		
Anchorages Used / Special Techniques	Describe the anchorage set-up used and any special techniques used		
Near Miss or Accidents	Describe any near misses or accidents. If none, write "none". Attach additional pages if necessary.		

APPENDIX 1:

Snow Anchors: Reference ACMG TechFiles

Many factors contribute to the strength of snow anchors. The four main ones are:

The strength of the snow
The type of anchor built
The direction of pull
The strength and surface area of the equipment used to build the anchor

Tests done in recent years have focused on how snow strength affects anchor strength and the differences between traditional horizontal t-slot and vertical picket type anchors.

Terminology

Upright: Any anchor placed perpendicular or at an angle from perpendicular to the surface

Horizontal: Any anchor placed horizontally and at a right angle to the direction of load (T-Slot)

Top-Clip: Any upright anchor attached at the snow surface (see illustration below)

Mid-Clip: Any upright anchor attached at or near its mid-point below the snow surface (see illustration below)

Potential loads in snow applications

Climbing ropes are designed to keep the forces transferred to the anchor or climber to less than 12kN. Most manufacturers exceed this standard with many limiting the maximum force to 8-9kN. It is unlikely that one would use a snow anchor in situations where a climber can freefall onto the anchor without introducing other forms of friction. The friction generated while sliding on a 45° snow-slope will reduce the forces produced by a fall by as much as 30%.

Anchor strength vs. snow hardness

Tests show that if the snow is moist (able to make a snowball), it is advisable to compact it before building the anchor. If the snow if dry and cold, it is best to leave it undisturbed. It was also noted that in tests where the anchor failed at greater than 10kN, the failure involved a component of the anchor (picket, cable, sling) and not a failure of the snow structure. Most standard picket and ice axe anchors fail at ~7kN in hard snow (>1F) however, often fail at much lower loads in softer snow conditions. Snow anchor strength is directly related to four factors;

- Surface area and strength of buried anchor
- Direction of pull
- Snow harness
- Craftsmanship

Horizontal vs. Upright anchors

Although buried ice axe t-slot anchors have been a mainstay of Canadian guiding for many years, recent studies have shown that upright pickets clipped at their mid point can achieve strengths equal to or greater than many t-slot anchors. All other factors being equal, a t-slot needs to be buried the same depth as the bottom of a vertical picket to achieve the same strength. In shallow snow conditions or when using an ice axe as the buried anchor, T-slot anchors are often a preferable option to vertical mid-clipped pickets.

Considerations -Building upright anchors

Mid clipped upright anchors

Difficult to build without a purposely designed 'picket'
Sling or cable should be at least twice the length of picket
25 degrees from perpendicular to snow surface is optimal angle of placement
Runner or cable attached to picket at approximate mid point is generally much stronger than clipping top of picket at surface of snow
A 4mm swaged cable or thin sling (Dyneema) have the least affect on the integrity of the snow in front of the picket
In less than 1m of snow over a hard surface (rock slab or ice) picket may deflect when pulled deeper into snow under load. Consider using t-slot in these conditions.

Top clipped upright anchors

Can be built with ice axe or picket
Very limited anchor strength in all but hardest snow conditions
Typically only considered reliable for moderate loads when snow is sufficiently hard that the anchor must be

placed using hammer

Yates Climbing Equipment is currently making a mid clip picket with swaged cable

Upright picket with mid-clip
(25° back from perpendicular to surface)

Upright picket with top-clip
(25° back from perpendicular to surface)

Building horizontal anchors (T-Slots)

Should be placed at least 15cm below start of 1F snow and a minimum of 30cm deep

Sling must be attached as close to centre of balance as possible

Should be buried if used for rescue or if an upward pull is possible. This should be considered to add security, not strength.

Belaying from snow anchors

Great care must be taken when choosing the belay method to be used with snow anchors. Direction of pull must be considered in construction and care to avoid upward pull must be taken. Avoid shock loading the anchor. If using the anchor to back-up a body belay, ensure the belayer is positioned far enough below the anchor an upward pull on the anchor so

they will not be created when holding a load.

Strategies for building strong anchors in weak snow

In weak snow conditions, consider using the following tactics to achieve an anchor that will be strong enough to hold the anticipated load.

- Compact the snow if it is "moist"- as illustrated by temp or the "snowball test"
- Bury larger items (packs, skis)
- Build and equalize multiple snow anchors (at least 1.5m apart)
- Add other items to the anchor to provide greater surface area (Saxon Cross)

APPENDIX 2:

- Petzl Gri Gri is not designed for direct anchor belays according to the manufactures specifications
- Belaying the leader on dynamic rope using climbing techniques
- The I'D has not been certified with dynamic ropes. Outside the standards framework, it is possible to use the I'D with dynamic rope, following the usual minimum and maximum diameter recommendation.

WARNINGS

- Read the technical notice before viewing the following techniques.
- It is important to fully understand the information provided in the technical notice before using this complementary information
- Mastering these techniques requires training.
- Consult a professional before attempting to perform these techniques on your own.

I'D S performance test, fall arrest on small-diameter dynamic rope:

Rope type	Impact force	Onset of rope slippage in the I'D
Petzl CONTACT rope	3.6 kN	160 cm

In access situations using climbing technique, a dynamic rope can reduce the impact force experienced by the leader if he falls.

The belayer must always hold the brake side of the rope.

The belayer must be vigilant and anticipate the climber's movements.

Warning: though dynamic ropes can improve comfort when belaying the leader, they are generally less effective in other work situations due to their greater elasticity:

- Work positioning is less precise.
- Greater clearance is required for fall arrest.
- At each loading / unloading, dynamic rope stretches more than a semi-static rope. Rope chafing against the structure can be greater.

During progression, a special technique is required in order to smoothly give slack:

The I'D must be held between the index finger and thumb, and angled downward, while always holding the brake side of the rope. This allows rope to be fed to the climber fast enough to keep pace with his progress.

Belaying the leader

We recommend using a dynamic rope (EN 892) for belaying the leader. Dynamic ropes are designed to hold and reduce the impact of a leader fall.

Fall factor 1 tests have shown (at the climber level) shock forces less than 6 kN with dynamic ropes, and greater than 6 kN with semi-static ropes (new ropes).

When there is a risk of a fall factor 1 or greater fall, use a dynamic rope.

Warning: When there is drag (significant rubbing friction on the belay rope) the actual fall factor can be greater than 1.

Device attached to the harness (position c) – Sternum connection best practice
Verify the rope is correctly installed before use.

You belay your partner by holding the brake side of the rope in one hand, and the climber side in the other.

To facilitate rope glide, focus more on pushing the brake side of the rope into the device rather than pulling the climber side of the rope.

To stop a fall, firmly grip the brake side of the rope.

To lower a climber, the manipulation of the device is similar to the description found under "Descent".

Belaying loads up to 250 kg with the I'D S

The belay rope must hold the falling load in case of primary system failure. It can thus be subjected to a sudden load equivalent to stopping a fall.

Remember:

The energy developed in a fall increases considerably as the load increases. Above 100 kg and up to 250 kg, the user must be experienced and trained.

Precautions:

- The user must always hold the brake side of the rope.
- The belay rope should always be taut to minimize impact force if the work rope breaks.
- Be mindful of the clearance; if the work rope breaks, the load will drop to a lower level due to stretch in the belay rope.

Belay technique for raising:

The user must always hold the brake side of the rope.

Belay technique for lowering:

The user must always hold the brake side of the rope.

Tilt the I'D to facilitate the rope sliding through the device.

Fall arrest tests with 250 kg and the I'D S:
To ensure the ability of the I'D S to belay a load up to 250 kg, tests were done to simulate an unfavorable situation, on various new ropes that are compatible with the device.

This situation represents incorrect usage: brake rope not held and slack in the belay rope.

Results:

- The impact force is acceptable (around 6 kN) due to rope slippage in the device.
- Rope slippage in the device can be significant (1 to 2 m), plan for this in determining the required clearance.
- The mass could be lowered after the test.

1 General safety instructions

1.1 Presentation of the safety instructions

Safety instructions on hazards, warnings, prohibitions and commands are provided with the following pictograms in the operating instructions and marked on the products:

Please follow the instructions for use

Use safety harness

General prohibition sign

Unauthorized access forbidden

No open flames; fire, open ignition source and smoking is prohibited

Climbing is prohibited

Caution lightning voltage

Warning about explosive substances

Warning of risk of automatic start-up

Danger due to heavy lifting

Warning of risk of hand injuries

Warning of risk of crushing

First aid

First aid Unauthorized operation

1.2 Safety notes

This manual contains instructions that must be followed to ensure your personal safety, the safety of others, and to prevent damage to property. The instructions are highlighted with a warning triangle and marked according to the hazard level as described below.

Hazard
Indicates an imminent danger. If not avoided, this will result in death or very severe injuries.

Warning
Indicates a potential imminent danger. If not avoided, this can result in death or very severe injuries.

Caution
Indicates a potential imminent danger. If not avoided, this can result in slight or minor injuries.

Hint
Indicates useful or necessary user instructions.

1.3 Intended use

The Wyssen avalanche tower is used for controlled avalanche triggering by blasting. This is intended to secure avalanche-prone facilities, ski slopes, buildings, traffic routes, etc., where uncontrolled avalanches can cause personal injury or property damage.

This system is intended exclusively for the controlled triggering of avalanches and may only be operated by trained personnel in compliance with the regulations and after an accurate assessment of the situation with regard to any residual risks.

The system may also be used exclusively in conjunction with the third-party devices and components recommended or approved by Wyssen Avalanche Control AG.

Correct transportation, installation, storage and careful operation and maintenance are prerequisites for the trouble-free and safe use of the product.

1.4 Preface

The aim of the present operating instructions is to provide the user with complete information, with all the necessary data to allow the safe and correct use of the equipment.

These operating instructions are specifically intended for the personnel responsible for operation and maintenance, who have the appropriate qualifications and training with the corresponding certificates.

The construction of the foundation as well as the assembly or disassembly of the tower are explained in a separate documentation, which is addressed to the responsible engineers and the executing construction personnel.

The proposed SOP amendment listed in the annex is addressed to the heli companies that perform transport flights with the avalanche tower deployment box. In order to be able to carry out the order, they must have the SOP supplemented with this specific operation description approved by the state aviation authority.

These operating instructions must be carefully read and understood before commissioning the equipment and must be available to personnel at all times during the operation and maintenance of the equipment. If, for any reason, this document is no longer available or has become illegible, a new document must be requested or made available immediately.

Separate courses and literature are necessary for a sound analysis of the avalanche situation on-site.

1.5 Qualified personnel

The personnel who operate the Wyssen avalanche towers or the Wyssen heli link must be officially appointed by the management. They must also be in possession of a personal confirmation of a training course on the equipment conducted by the manufacturer, as well as for the operation of the Wyssen avalanche tower of a nationally valid license to handle explosives for the artificial triggering of avalanches.

Instruction by in-house colleagues is not considered a substitute for the supplier›s equipment training. Persons who have not been trained by the supplier and are not in possession of the above confirmation may not operate these systems.

Refresher training can be requested from the supplier at any time by the operator of the system

1.6 Service & support on the Internet

In addition to this documentation, we are also happy to provide you with our expertise online at the following link: www.wyssenavalanche.com

You will find the following useful information at these addresses:

- Product-specific information
- Newsletter containing current information about our products

1.7 Certifications

The Wyssen Avalanche Control Wyssen Avalanche tower LS12-5 (item No: 411.100E) is in conformity with the relevant provisions of the CE Machinery Directive (CE Directive 2006/42/EC, 2014/30/EU and 2014/53/EU)), including its amendments, as well as with the corresponding legal decree transposing the Directive into national law.

1.8 Technical Support

Our well-trained technical support team is available worldwide for answering your questions and providing solutions to problems at any time.

2 Description of the system

The Wyssen avalanche tower is used for the controlled triggering of avalanches by means of remote-controlled blasting. It can be used to secure avalanche-prone facilities, ski slopes, buildings, roads, etc., where uncontrolled avalanches could cause personal injury or property damage.

To trigger an avalanche, a command is sent from the command center to the Control of the deployment box for initiating the explosion.

The deployment box contains 12 prepared explosive charges, which can be dropped individually. By dropping the explosive charge, two detonators are pulled and the explosion is triggered after a time delay.

The charge remains suspended on a cord at a previously set height above the snow surface until the explosion, which is dropped completely after detonation. To reload explosive charges, the entire deployment box is lifted from the tower by helicopter and brought to a station building.

In addition to the function of the charge drop, a system test, a «test run», can also be performed. The test run is used to check the function of the entire mechanism and control in the deployment box as well as to determine whether explosive charges have been stolen by theft.

2.1 Advantages

Smallest residual risk thanks to the largest range of action

- Over-snow blasting with a large charge (4.2 kg) results in a maximum effective range of up to 240 m (787 ft) in diameter.
- Explosive with high-frequency, N-shaped pressure wave has been proven to lead to the best triggering effect, in particular at a greater distance from the blast point.
- The possibility to position the system on elevated places as well as two different tower heights enables effective operation of places in the pressure shadow (in corridors, behind terrain ribs).
- Smallest amounts of snow can be triggered, thanks to the best effect
- Very good stability test for estimating the local avalanche risk

Maximum reliability

- Thanks to clever planning, no critical and moving parts are exposed to the weather
- Thanks to solar power supply or wind generator no susceptible supply lines in the terrain necessary
- Thanks to annual maintenance, maximum reliability can be guaranteed

Reduced downtimes thanks to fast triggering, 24 / 7 in any weather

- Remotely controlled systems allow use around the clock.
- Speedy use and simultaneous triggering of several towers possible
- Short downtimes
- Clearance of avalanche snow is normally not necessary, thanks to shorter avalanche runout distances due to the triggering of small portions

Maximum economic efficiency

- Low investment and operating costs compared to permanent structural protection measures
- Lowest operating costs thanks to ingenious system planning
- Damage to infrastructure is avoided by triggering small portions
- Economic benefits thanks to reduced down times

Maximum safety for the operating personnel

- Thanks to remote control of triggering, no personnel in the danger zone
- Cargo preparation takes place in sheltered areas
- Thanks to the mobility of the deployment box, virtually no maintenance in the field is necessary

Very environmentally friendly thanks to the smallest possible impact on nature

- Foundation occupies only 1 m^2
- Short construction times on site simplifies planning and implementation
- Blasting over the ground prevents damage to the vegetation cover
- Easily dismantled after service life

2.2 Structure of the overall system

1. Deployment box
2. Tower
3. Transport bracket for helicopter
4. Radio antenna
5. Solar panel
6. Drop hole
7. Pick-up device
8. Charge holder cord
9. Dumped Charge
10. Foundation (option: concreteless foundation)

2.3 Technical data deployment box

2.3.1 General

Title:	Wyssen avalanche tower
Short name:	LS12-5
Weight deployment box complete incl. Load:	530 kg (older models acc. Type plate)
Dimensions charge magazine (l x w x h):	1570 mm x 1040 mm x 1300 mm / 5 ft 2 in x 3 ft 5 in x 4 ft 3 in
Height deployment box with transport bracket (w x h):	1600 mm x 1890 mm / 5 ft 3 in x 9 ft 6 in
Protection class with closed magazine:	IP43

2.3.2 Payload

Number of charges per deployment box:	12 pcs.
Net explosive mass:	4-5 kg (8.8 - 11 lb)

2.3.3 Power supply

Battery in the deployment box powered by solar panel:	12 V

2.3.4 Data transfer

- EGSM 850 / 900 / 1800 / 1900 MHz
- GSM / GPRS Protocol stack 3GPP Release 4 compilant
- Transmission in the concession-free data channels in the 430 MHz or 868 MHz range

2.3.5 Tower

Standard heights: 10 m or 12 m / 32 ft 10 in or 39 ft 5 in

Detailed information about the towers can be found in the foundation instructions.

2.3.6 Temperature

The permitted temperature range of the deployment box extends from -20°C to 40°C.
Test runs and blasting may only be carried out if the temperature is within this range.

2.4 Mass of blasting tower

Tower in summer without deployment box:

Tower in winter with deployment box:

3 General safety regulations

3.1 General principles

Warning
Incorrect operation can lead to the triggering of explosions at the wrong time, or while people are located in the danger zone, which may cause fatal injuries or property damage,
see chapter 3.6.1 Danger zone 1 (G1) on page 19

The system described here corresponds to the state of the art and the recognized safety rules. Nevertheless, dangers can arise, especially when handling explosive substances and the controlled triggering of avalanches. It must therefore be ensured that the system is only operated in perfect condition and in compliance with the present operating instructions.
The legislation applicable in the country of use for the handling of explosives must be followed in all circumstances. This applies in particular to the purchase, transport, storage, handling, use and destruction / disposal of explosives and pyrotechnic objects.

3.2 General

This operating manual must be read carefully before commissioning and the instructions contained in it must be followed strictly. If you have any doubts or if you identify any defects in the product, contact the supplier immediately.

Warning
This operating manual must be read carefully before commissioning and the instructions contained in it must be followed strictly. If you have any doubts or if you identify any defects in the product, contact the supplier immediately.

The above-mentioned danger zone may only be opened up to the access of persons when the avalanche starting area has been secured and considered to be safe.

This cannot be definitively guaranteed by blasting with the Wyssen avalanche tower described here.

The danger of avalanche must be declared safe by a local responsible avalanche expert prior to clearance for access to people.

Any liability for damage due to pressure effects or avalanche subsidence caused by or after blasting with the Wyssen avalanche tower is rejected by the manufacturer. If, for unknown reasons, blasting cannot be carried out with the equipment described in this document, or can only be carried out inadequately (e.g. if the equipment does not work), alternative securing methods must be used, or the area must be closed to people.

It is the responsibility of the local avalanche expert to determine if and at what time an explosion is carried out. However, it is also their responsibility whether and when an area endangered by avalanches can be reopened to people after blasting has taken place.

There is also the residual risk of charge failure in the Wyssen avalanche tower. These must be salvaged and defused in accordance with the statutory provisions. Any liability for personal injury or property damage due to failure is rejected by the manufacturer.

It is strictly prohibited to dismantle, bypass or override safety and monitoring devices.

An emergency response plan for emergency situations (such as the unintentional triggering of the detonating devices during charge assembly) must be developed by the person in charge of explosive operations and the operating personnel must be instructed accordingly.

3.3 Authorization and training of personnel

The personnel who operate the Wyssen avalanche tower must be officially appointed by the management and have been trained by the supplier of the system by means of training with appropriate, personal confirmation.

Persons who have not been trained by the supplier and are not in possession of the corresponding confirmation may not operate the system, even if they have been instructed to do so internally by colleagues.

The operator can order additional refresher courses from the supplier if necessary.

The personnel must also be authorized and identified to handle explosives for artificial triggering in accordance with national requirements.

Switzerland
Personnel must have a valid permit for the artificial triggering of avalanches issued by the Swiss State Secretariat for Education, Research and Innovation (SERI).

Austria
Proof of expertise for avalanche triggering blasting work according to the Proof of Expertise Ordinance

Norway
Personnel must be registered at the Norwegian Directorate for Civil Protection (DSB) and the employer has to have a sufficient amount of personnel with a technical blasting license registered at DSB

Only the service and maintenance work described in these operating instructions may be carried out on the system. Further work must be carried out by specialist personnel of the supplier.

If faults occur in the system, the supplier must be informed under all circumstances, regardless of whether they have to be rectified by the supplier itself or by specialist personnel.

It is forbidden to carry out mechanical conversions and changes to the system as well as reprogramming of the operating software independently.

3.4 Initial commissioning

The initial commissioning of the system may only be carried out by personnel of the supplier of the system.
The official handover of the system is carried out and confirmed after commissioning by the operator and the supplier in accordance with the acceptance and test protocol.

The recommissioning after the seasonal interruption of operations can be carried out independently by the personnel trained by the supplier and qualified in accordance with this manual.

3.5 Maintenance

The operator of the system is obliged to carry out maintenance for each individual system that is installed by specialist personnel commissioned by the manufacturer or its authorized representative. This includes an annual inspection with maintenance and servicing of the system by the supplier, see chapter 9.1.4 Annual maintenance work carried out by the supplier on the system before seasonal commissioning on page 47

3.6 System-specific hazards

The various sources of danger that can occur in the different areas around the system are explained below.

3.6.1 Danger zone 1 (G1)

Area during the triggering of an avalanche.
The following dangers exist when blasting with the Wyssen avalanche tower.

Danger due to avalanches
Before each blasting, checkpoints must be set up to ensure that no one is in the area of the avalanche›s descent (in accordance with national regulations).
Danger due to unexpectedly long run-out of the avalanche
Based on the snow conditions (high risk after heavy snowfalls), it must be assessed whether a controlled triggering can be carried out at all.

Danger due to remote triggering
The risk of triggering secondary avalanches must be estimated on the basis of snowpack stability, topography, propagation of seismic waves or air pressure.
Danger due to explosion
Before each blasting, checkpoints must be set up to ensure that no one is in the danger zone of the explosion. The following safety distances according to the avalanche blasting guidelines from SERI (as of 09.01.2021, [18]) for free charges with 8 kg of explosives must be observed:

- Hearing protection: 29 m (95 ft)
- Hearing unprotected: 60 m (196 ft)

Summary
To avoid personal injury, the evacuation,
blocking and securing of the entire danger area by checkpoints is a prerequisite for a controlled remote triggering of avalanches.

3.6.2 Danger zone 2 (G2)

Area for the preparation and reloading of explosive charges.
In this area, there is a risk of unintentional triggering of an explosion during handling (reloading or maintenance work). Therefore, this work may only be carried out by trained personnel.
Unauthorized access to the following areas is forbidden during this time.

Explosives storage incl. transport route to the place of assembly of the cargoes
Area around the workplace during the assembly of explosive charges
Area of short-term interim storage of the explosive after the assembly of the charge
Area on the transport route from the assembly workstation to the deployment box
Area around deployment box during loading and unloading of charges

3.6.3 Danger zone 3 (G3)

Area around a failed charge.
If a charge dropped by the Wyssen avalanche blasting tower does not detonate, there is a failure. This carries special dangers, which must be taken into account, see chapter 11 Failures on page 48.
It is possible that the detonators of the explosive charge have not been pulled, which means that the charge is still live.

Duds can potentially slide off the tower or be carried away in an avalanche. In this way, they can reach areas that are frequented by people.
Furthermore, if the holder cord of a failure is found by an uninvolved person and that person pulls on it, it can lead to the detonation of the explosive charge with severe consequences.

For these reasons, it is important that failures are located and defused as quickly as possible in accordance with national explosives legislation.

3.6.4 Danger zone 4 (G4)

Area when climbing a tower.
To carry out maintenance on the towers or to remedy faults, the tower must be climbed. There is a risk of life-threatening injuries due to falling.
As soon as the tower is climbed, the personnel must protect themselves with a safety belt and a tether from a possible fall, see chapter 4.3 Tower on page 25. The rescue plan is the responsibility of the operator.

3.6.5 Danger zone 5 (G5)

Area for heli transport.
In the area of the heli flight route during the transport of the deployment box between the pick-up / unloading point and the tower, there is a risk of the deployment box loaded with Wyssen 2K® charges falling due to an intentional or unintentional emergency drop or breakage of a load-bearing component.

Explosive material
A distance of at least 500 m (1641 ft) to uninvolved persons or public buildings must be kept. The loading areas and flight routes must be approved by the competent aviation authority. (CH: BAZL; AT: Austro Control)

Wyssen 2K®
The flight route must be selected in accordance with national regulations for underload flights. Because of the Wyssen 2K® charge, the safety radius of 500 m (1641 ft) for the flight route is inapplicable.

3.7 Safety functions

The safety of the vehicle depends on the electronic control of the deployment box. The electronic control of the deployment box includes a part in which safety functions according to ISO 13849-1:2021 have been implemented.

In summary, functional safety ensures that the vehicle does not start under any circumstances without this being desired by the operator. These basic functions, which are actually trivial and logical, must also function reliably if any component fails.

In the event of failure, all safety functions can cause unintentional avalanches to be triggered and thus cause fatal injuries to persons. Therefore, all safety functions meet the following requirement level:

ISO 13849-1:2021 Category 3 PL d

All safety functions are implemented by the electronic control. The finger switch B1 is additionally used for the safety function SIF3.

There is only one mode of operation. The override button does not bypass the safety functions, but is simply another way of enabling the supply to the motors.

3.7.1 Troubleshooting and maintenance

Troubleshooting and maintenance work may only be carried out by the manufacturer.

In the event of failure of the safety functions, the undesired start-up of the vehicle cannot be ruled out. In this case, there is a risk of undesirable triggering of avalanches by explosives. Category 3 includes single-fault safety, a single accidental fault can therefore not lead to a hazard.

Errors in safety functions are automatically displayed on the control panel. See also error 32 in the error list, see chapter 20 Error list Release V1.4.10 on page 61.

The safety functions cannot be bridged (no muting).

The safety functions are implemented in the electronic control system and designed for the following environmental conditions:

Power supply:	12 V (battery)
Temperature:	-45°C bis +70°C

ZFor easy troubleshooting, the four LEDs on the control board are used:

H11	Off	Switched off (or LED defective)
	Flashing	Safety channel 1 running, finger not detected
	Double flashing	Safety channel 1 running, finger detected
	Lights on permanently	Error in safety channel
H12	Off	Safety channel 1 is in the safe state (disconnects the supply to the motors)
	Lights up	Safety channel 1 is in the active state (supply to the motors enabled)
H21	Off	Switched off (or LED defective)
	Blinken	Safety channel 2 running, finger not detected
	Doppeltes Blinken	Safety channel 2 running, finger not detected
	Leuchtet dauerhaft	Error in safety channell
H22	Off	Safety channel 2 is in the safe state (disconnects the supply to the motors)
	Lights up	Safety channel 2 is in the active state (supply to the motors enabled)

3.7.2 SIF1 Prevent remote start-up without a valid explosive code

In order for the drive motors to be released in the deployment box, a valid explosive code must be entered and transmitted to the deployment box without errors.

When the drive motors are disconnected, they are safely disconnected from the power supply after a maximum of 15 minutes. However, they can be separated from the control unit (e.g. after successful blasting) at an early stage.

3.7.3 SIF2 Prevent unwanted start-up without intentional actuation of the override button

To enable a test run to be started even without a radio connection (e.g. during loading in the bunker), an override button (S2, test button) is provided which, when actuated, activates the actuators for a maximum of 15 minutes.

In order to prevent unintentional actuation of the button, the actuators must be actuated for 5 seconds (more precisely 4 to 6 seconds). Actuation for too short (<4 s) or too long (>6 s, permanent) a period does not unlock the motors.

3.7.4 SIF3 Preventing remote start-up during flight

During transport with a helicopter, there is a risk of an explosive charge being dropped via the control panel. An explosive charge detonating under the helicopter could endanger the helicopter and the pilot.

To reduce this risk, a switch is used to monitor whether the deployment box is placed on a tower. It is only when it is placed on a tower that the entry of explosive codes is made possible.

This effectively prevents an explosive charge from being triggered during the flight.

4 Structure of the system

4.1 Assemblies

The system basically consists of the following modules:

- Deployment box
- Tower
- Wyssen 2K® Charges or Explosive Charges
- Wyssen heli link HK-02
- WAC.3 Base (radio remote control optional)

4.2 Deployment box

The deployment box contains the prepared Wyssen 2K® or or the prepared explosive charge 07, the complete mechanics and control as well as the radio transmission elements.

1. Deployment box cover
2. Padlock 3 pieces
3. Twist lock
4. Safety latch
5. Solar panel
6. Shutter Cylinder
7. DPOS: Position switch carousel, cam-controlled
8. Lock cylinder position switch
9. LPOS2: Charge Detection Switch
10. LPOS1: Charge Drop Detection Switch
11. Drop hole
12. Radio antenna
13. GSM / GPS antenna
14. Flas light
15. Monitoring sensor of the correct position of the Deployment box on the tower
16. Rope ejector
17. Quiver tube
18. Battery 12 V
19. Seismometer
20. APOS: Angle measuring potentiometer, analogue or digital
21. RPOS: Rest position limit switch carousel
22. Drive motor
23. Entry funnel
24. Control with control buttons at the top

4.3 Tower

The toweris used to accommodate the deployment box in the terrain.
Its position is preferably located in the upper part of the fracture area of an avalanche slope.

Depending on the substrate, the tower is anchored by a conventional concrete foundation or a concreteless variant.
As a result, only a small foundation (1 m x 1 m) / (3 ft 3.4 in x 3 ft 3.4 in) is needed to secure the towers.
The tower itself is subsequently virtually maintenance-free. Only the finger requires maintenance before the start of each season, see chapter 8.2 Recommissioning before the start of the season on page 44

The climbing device consists of a ladder with fixed rungs, a locking door with a padlock, a platform and safety devices to protect against falling. In order to climb the tower, a safety harness corresponding to the nationally valid standards must be worn.

4.3.1 Safety regulations for climbing the tower

The towers may never be climbed without the supervision of a second person. This means that there must always be someone in the immediate vicinity when climbing a tower. This is to provide assistance in case of emergency or to call for rescue.

Only the ladder fixed to the tower may be used. Any liability for ladders installed by the customer or by third parties is strictly rejected.

At the foot of the tower there is a sign, which informs uninvolved and uninstructed persons about the function and the dangers that could arise from the Wyssen avalanche towers of Wyssen Avalanche Control AG.

4.3.2 Personal protective equipment

To secure against falling, a safety harness in accordance with nationally applicable standards with a fall arrester and two Y-shaped tethers with fall arresters must be worn to climb the tower.
The tethers must each be equipped with a large safety carabiner.

Only the Fallbloc 2, supplied by IMMOOS GmbH in 6414 Oberarth, Switzerland, may be used as a fall arrester.
To operate this fall arrester, it is essential to follow the operating instructions enclosed with the delivery.

4.3.3 Securing device on the tower

A steel wire rope with a diameter of 8 mm must be installed along the ladder to which the accompanying fall arrester (see description above) can be attached. Above the ladder at the small pedestal is a holding post with three recesses at the upper end. Before releasing the safety catch to the Fallbloc fall arrester and leaving the ladder, the safety carabiner must be securely hooked onto one of these openings.
At least one safety carabiner must remain hooked in for the entire duration from the ground.

Warning
The anchor point may only be used for the PPE. Attaching loads is prohibited.

4.3.4 Protection against unauthorized access

In order to prevent unauthorized persons from climbing the ladder, the ladder is equipped with a safety door. The safety door must be secured with a padlock against unauthorized opening.

4.4 Communication

Communication operates through the following elements.

- Web-enabled device with Internet connection
- WAC.3 base optional for direct connection with the Wyssen avalanche towers
- Wyssen Avalanche Control Center

DThe system can be operated from different locations via an Internet-capable device or by radio using WAC.3 Base. Due to the fact that the systems are permanently connected to the Internet, the supplier can access the system externally and therefore assist the customer at any time in the event of problems or malfunctions.

4.5 Wyssen heli link HK-02

4.5.1 Intended use

The Wyssen heli link is used to transport the deployment box of the Wyssen avalanche towers back from the tower to the depot. With the help of the Wyssen heli link, the heli pilot can lift the deployment box from the tower independently, without additional personnel assistance. The Wyssen heli link may under no circumstances be used to lift other loads.

The transport of the deployment box onto the tower is carried out without this Wyssen heli link, but is also possible without additional assistance. An electrical Heli hook must be used. Only by using this can the pilot independently unhook the deployment box above the finger.

Hazard
The orange Wyssen heli link made of round steel may no longer be used. Only the Wyssen heli link with serial number **411.600C.XXX** must be used!

Hazard
It is strictly forbidden for people to be located on and around the towers during the lifting of the deployment box.

Caution
Due to its high weight, the Wyssen heli link may be carried only by at least two people. Carrying too heavy a load can cause permanent damage to your health.

4.5.2 Safety regulations when handling the Wyssen heli link

Working with the Wyssen heli link without training and education from the supplier and the responsible helicopter company is prohibited.

The attachment of the Wyssen heli link to the swivel hook attached to the helicopter is only permitted by personnel of the helicopter company or by personnel who have been instructed by the helicopter company.

While working with the helicopter, persons who are not directly involved in the flight maneuver are prohibited from being located in the danger zone of the landing zone.

For unhooking, the Wyssen heli link may only be opened by means of the black bracket on the outside of the link. Otherwise, there is a risk of injury due to prevailing and undefinable forces.

For further safety regulations and the basic procedure for a helicopter transport, see chapter 7 Transport of the deployment box by helicopter on page 39.

Hazard
The Wyssen heli link may only be attached to the heli by means of a swivel hook. This prevents the Wyssen heli link from being unhooked on its own.
Electric heli hooks are prohibited.

4.5.3 Unhook the deployment box

The release of the deployment box may only be initiated when the deployment box is resting still on the ground, and the holder cord on the helicopter is no longer under tension.

The Wyssen heli link may only be opened by operating the black lever. Otherwise, injuries to fingers, hands or arms may occur due to prevailing forces.

After opening, the pilot can be shown that he can lift the helicopter again.

4.5.4 Maintenance

Before each flight of a deployment box with the Wyssen heli link, it must be visually checked for functionality. Please note the following points, see chapter 7.1.16 Testing of the Wyssen heli link on page 40 zu beachten.

If one of these points is not correct, the Wyssen heli link must not be used.
You must contact the supplier immediately to discuss the further procedure.

In the course of the annual service carried out by the supplier on the system, the Wyssen heli link is checked and maintained.
After 1,000 flight rotations, each Wyssen heli link is additionally subjected to a large test (magnetic crack test, new painting) by the supplier.

The maximum lifespan of a Wyssen heli link is 20 years or 5,000 transport sessions.

5 Loading and unloading the deployment box

5.1 Safety regulations for loading and unloading

The deployment box must stand on a level surface for this work.

It must be ensured that there are no objects in the entry funnel that could trigger an activation of the monitoring sensor.

The workplace during assembly of the charges, the transport path to the deployment box and the area around the deployment box must be closed off to prevent access by unauthorized persons.

The deployment box must be loaded outdoors so that it does not have to be transported more than approx. 50 m (only with pallet truck) and can be attached directly to the helicopter.

Warning
The deployment box must never be transported directly with the fork of a lifting device in the hanger. This can cause damage to the hanger and affect its breaking / and load capacity.

5.2 Preparation of the deployment box

- Open the padlocks on the deployment box lid with the key and turn the three locking levers 90°.
- Lift the lid by using the designated handles until (2) the safety latch is engaged.
- The opening and closing of the.old deployment box lid is to be performed due to the high weight in each case by two persons.
- Push all slides of the rope ejectors into the rear position.
- (3) Unhinge the plexiglass cover by sliding and remove (4) (for old versions, loosen the screws and then remove the metal cover).
- Remove rope ejectors from notches (for loading only with unloaded quiver tube)
- Keep the area near the deployment box towards the antenna unobstructed so that the prepared charges can be placed there.

Caution
There is a risk that during opening and closing, hands may be seriously injured or trapped between the lid and the hanger due to the deployment box cover falling down. Therefore, do not hold your hands over the edge of the deployment box, move the handle slowly past the hanger and make sure that the catch is correctly engaged.

1

2

3

4

5.3 Loading of Explosive Charges

The loading of the deployment box is performed according to the following work steps.

Caution
It is absolutely essential to observe the following sequence for loading the deployment box. The loading with the Wyssen 2K® is shown, it is however, the same procedure as with the charge 07.

- Transport along with the foam plugs delivered with the magazine. This prevents the cord bag from falling out.
- Carrying the charge must never be done with just one hand.
- During transport, always carry the charge as shown in the illustration.
- Bring the deployment box and place it on the surface next to the flashlight and remove the foam plug.

- Clean the standing area of the explosive charge if necessary.
- Grab the explosive charges on the inside through the holes at the top of the tube and insert them carefully into the quiver tube. Turn the recess in the direction of the rope ejector and guide the charge all the way down.
- If the deployment box is not fully loaded, the charges must be filled from the last quiver tube (No. 12) so that the controller can correctly detect the number of charges during the test run.

- (1) The retaining ring is hooked onto the rope ejector and the slider is moved to the forward, extended position so that the (2) ring is held by the rope ejector. (3) The slider moves to the front position by pressing the metal pin at the bottom of the rope ejector.

- Subsequently, the rope ejector is placed in the notches of the quiver tube so that the ball bearing points towards the centre of the deployment box. The rope ejector must be in the mounted position in the notches against displacement, i.e. both shoulders must lie within the quiver tube.

Important
After the cord ejector has been inserted, check the holding ring by hand to make sure that it is mounted properly.
After that, the cord ejector must not be touched any more as there is a risk that the holding ring might get unhooked. This would result in a dud.

At the end of the loading of the deployment box, the lid is placed on the quiver tube and in old metal versions, tightened well with hand screws.
Before the deployment box is closed again and made ready for transport, a test run according to chapter 5.5 must be carried out.
Then close the magazine with the three locks supplied by the manufacturer

5.4 Unloading of explosive charges

In the event that charges should still be present in the deployment box after the winter season, these must be removed according to the following work steps.

Hazard
When removing the charge from the quiver tube, make sure that the retaining ring and the line do not get stuck on the deployment box. (Use foam plugs!)
A pulling movement on the eyelet of the detonators SZ83 will lead to the initialization of the charge.

- Operate allthe sliders of the rope ejectors by pushing towards the rear on the side of the ball bearing.
- Open and remove the quiver tube cover.

Hazard
Before the rope ejectors can be lifted out of the quiver tube, it must be checked that the retaining rings are no longer suspended. When removing the charge from the quiver tube, make sure that the retaining ring and the line do not get stuck on the deployment box. (Use foam plugs!)
A pulling movement on the eyelet of the detonators SZ83 will lead to the initialization of the charge.

- Carefully remove the rope ejector from the quiver tube.
- Grasp the charge through the holes at the top of the tube and carefully lift it out of the quiver tube.
- Place the charge on a stable table.

Hint
Dismantling and defusing the load are described in the instructions for assembling the Wyssen 2K® / Charge 07.

5.5 Test run with control buttons in the magazine control

Der Testlauf wird mit den Schaltern auf der Steuerung durchgeführt.
Das Display dient zur Anzeige wichtiger Informationen über das System.

5.5.1 Emergency / main switch

After loading the deployment box with charges (preferably immediately before transport), this must be carried out as follows:

- Pull out the emergency / main switch until the yellow mark is visible.
- Briefly press the start button (black) to wake up the control (1-2 s)
- Press the test button (yellow) until the hourglass on the display goes out again (5 s).
- The illuminated warning triangle signals the test operation.
- Press the start button (black) until the hourglass on the display goes out (3-4 s).
- The test run now runs automatically and takes up to 8 minutes, depending on the number of charges.
- If the red warning triangle and the flash lamp go out, the test run is successfully completed.
- Do not switch off the control until transport or carry out another test run before the helicopter transport.

Operation / On

Stop / Off

Warning
As long as the red warning symbol and the flash lamp are illuminated, the deployment box is in test operation and may not be flown under any circumstances. The deployment box may only be flown in perfect condition. Likewise, the closure cylinder of the discharge hole must be completely closed.

If the system is now in perfect condition, the lid of the deployment box can be closed again and secured with the padlocks.

5.5.2 Mains disconnection device

The mains disconnection device is the battery plug X20. When working on the electrical device, always operate the emergency stop and disconnect the battery.

6 Remote control via the Wyssen Avalanche Control Center WAC.3

The Wyssen avalanche towers are controlled via an intuitive web application.
This can be accessed at https://control.wyssenavalanche.com or by using the QR code below.

After accessing the page, the login window appears. Every user of the Wyssen Avalanche Control Center WAC.3 must have a personal login with a password issued by Wyssen Avalanche Control AG, which can be changed by the user at any time.

A login must be created by the manufacturer of the system. It is forbidden to use the same login with more than one user.

Log in with your personal password at
https://control.wyssenavalanche.com

Hint
If the login data is lost, a new one can be requested at the above address.
The transfer of the login data to internal and external parties is prohibited. The login data is used for traceability and is personal.

During the normal use of the software, informative and clear assistance will be available to you at any time. The help can be found with a click on the ? symbol.

6.1 Blasting

The charge shedding is controlled in the Wyssen avalanche tower by an electronic control system. The control of the Wyssen avalanche tower is developed according to the latest standards in such a way that malfunctions cannot lead to undesired charge discharge.

In order to comply with the high security standards, a code list is used. If you are using the Wyssen Avalanche Control Center WAC.3 and you want to start an explosion or a test run, you will be asked for an explosive code. With the number of the explosive code, you read the eight-digit explosive code from the code list and enter it in the numeric field.

Hazard
By entering an explosive code, the power supply for the drive motors is unlocked by the discharge mechanism. As soon as you enter an explosive code, the controller can explode for the following max. 15 minutes.

As soon as the explosion / test run is completed, the release is automatically terminated. This is done in the Wyssen Avalanche Control Center WAC.3 by the state «Closed and secured».
In this case, a charge can no longer be dropped.

Hint
If the code list is used up or lost, a new code list can be ordered from the responsible support team.

6.2 Service und Support

Upon introduction of the Wyssen Avalanche Control Center WAC. 3, our service personnel will fully set up and thoroughly explain the system to you. If you have any questions or problems during operation, please do not hesitate to contact us at the 24/7 hotline, see chapter 1.8 Technical Support on page 10.

7 Transport of the deployment box by helicopter

7.1 Safety Regulations

7.1.1 Authorization of the helicopter company

Transport flights with the deployment box of the Wyssen avalanche tower may only be performed by helicopter companies that have described and officially approved these operations in the Mini-Standard Operation Manual (Mini-SOP).
This can be done, for example, in Switzerland or in Austria by the competent civil authority.

7.1.2 Agreements between pilot and ground crew

Before the first flight transport order, the pilot must hold a meeting with the personnel designated for this work regarding the procedure and the special hazards. The personnel must be instructed in particular about the operation of the load handling equipment, the hook and the general hazards during underload flight.

7.1.3 Communication control by radio

During the approach to the reception area, the pilot must make radio contact with the ground personnel for communication control. If this attempt fails, the helicopter must be dropped off before transport and the fault must be rectified.

7.1.4 Personal protective equipment of ground personnel

The ground staff must wear the following protective equipment to hang and unhook the charge magazine under the hovering helicopter: helmet, safety goggles, gloves, suitable clothing and sturdy shoes.

7.1.5 Conditions at the pick-up / unloading point

The pick-up / unloading location of the loaded deployment box must be flat and sufficiently large for the flight maneuver. There must be an approach and departure track available, so that no inhabited area and others with Persons occupied areas must be flown over. In the area of the pick-up / unloading location, there must be no objects which, under certain conditions, could activate the monitoring sensor in the entry funnel of the deployment box.

7.1.6 No unauthorized persons in the danger area

During the flight maneuver, no unauthorized persons or persons uninvolved in the maneuver may be present in the area of the pickup / unloading location. If the deployment box is not equipped with the Wyssen 2K®, the space must be locked with a safety distance of 500 m (1641 ft).

7.1.7 No manipulations with the Wyssen Avalanche Control Center during transports of magazines

No manipulations may be made with the Wyssen Avalanche Control Center as long as transports with the deployment box are carried out. Only after the helicopter has left the danger zone may manipulations be carried out via the Wyssen Avalanche Control Center.

7.1.8 Impeccable condition of the deployment box

Prior to any transport to or from the blasting site, the responsible blasting officer must ensure that the load-discharge mechanism of the deployment box is in the rest position, both discharge holes are closed, and the entire system is in perfect condition.

7.1.9 Weather

Wind and weather conditions must be taken into account. If conditions do not permit safe flight maneuvers, the flight transport must be postponed.

7.1.10 Passengers

No passengers may be carried during the transport of the deployment box.

7.1.11 Flight route

Wyssen 2K®.
The transport of deployment boxes that are loaded with Wyssen 2K® charges does not require any precautions or requirements that exceed the scope of other underload flights.

Charge 07
Operations operating flights to supply the Wyssen avalanche towers with original explosive charge (charge 07) shall ensure that:

A) densely populated area, busy roads as well as staffed technical facilities (e.g. mountain railways, mountain restaurants and relay stations) and ski slopes are not flown over and densely populated area, busy roads as well as staffed technical facilities (e.g. mountain railways, mountain restaurants and relay stations) and ski slopes are not flown over

B) and the routes on which magazines of the conventional Wyssen avalanche blasting system are transported are chosen in such a way that a distance of 500 m (1641 ft) from persons not directly necessary for the operation is maintained at all times in all directions from the load receiving station to the blasting tower.

7.1.12 Attaching the deployment box

If the deployment box is hit too hard against the tower during the deployment maneuver or is placed jerkily, the internal mechanics can become damaged.

7.1.13 Functional test

A test run must be carried out each time the deployment box is replaced in order to check that it is functioning correctly. The test may only be started after the helicopter has moved out of the danger zone of the explosive tower.

7.1.14 Do not stand under a suspended load

No persons may be under the suspended load after the attachment and before the deployment box is suspended from the helicopter.

7.1.15 Load hangers and load-bearing parts on the helicopter

An electric heli hook is used to transport the deployment box. The helicopter company is responsible for the perfect condition of the load-bearing elements and their functionality. These elements must be designed for a load capacity of at least 700 kg. (1545 lbs)

7.1.16 Testing of the Wyssen heli link

The Wyssen heli link must be checked regularly and before each transport of the deployment box for proper functioning and damage as follows:

- The Wyssen heli link must be lubricated annually on the grease nipple provided for this purpose, we recommend the product «Fuchs UNITEMP 2»
- It must be possible to move the link freely upwards as far as it will go
- The link must fall through its own weight and close
- In the closed state, the notch of the link must lie on the one of the support bolts.
- No cracks may be visible on the link and bracket
- Neither the link nor the bracket may be bent.
- If defects are detected or there are uncertainties about this, the said Wyssen heli link must not be used.

7.2 Moving the deployment box onto the tower

Before the deployment box is moved to the tower for operation, the maintenance work and a test run must be carried out in accordance with these operating instructions. In addition, the magazine must be closed and closed.
For the transport of the deployment box on the towers, an electric heli hook with a suspension length of approx. 10–30 m (30 - 100 ft) must be mounted on the helicopter, so that the pilot can unhook the load independently from the cockpit after correct positioning.

- The electrical heli hook is hooked directly onto the transport bracket of the deployment box.
- In order to place the deployment box on the towers, the pilot must bring the introduction funnel exactly over the finger on the tower tip. The blue markings on the funnel show the pilot the middle of the funnel.
- Then lower the deployment box. It thus rotates independently into the correct position, usually in the direction of the valley.
- As soon as the pilot ascertains that the deployment box has turned to the correct position and is firmly seated on the finger, the pilot can relieve the suspension by further lowering and releasing the helicopter hook.
  A flash lamp at the top of the deployment box starts to flash for about 1 minute as soon as it is correctly placed.

If the deployment box is not correctly positioned on the tower (flashing light does not start to flash), no test run can be carried out via the command center. According to the description, see chapter 7.3 Return transport of the deployment box from the tower on page 42, the deployment box with the Wyssen heli link must be retrieved from the tower in order to remedy the fault.

Warning
The position of the deployment box is automatically monitored with GPS. However, an error of position monitoring using GPS cannot be ruled out. Therefore, after the deployment box has been placed by a third person (not the pilot), it must be checked that each magazine has been placed on the intended tower.

Green: allowed angle of attachment

Hint
To ensure that the magazine works properly after placing it on, it is recommended to carry out a test run.

7.3 Return transport of the deployment box from the tower

If all charges have been dropped or no further detonations are carried out after the end of the season, the deployment box must be transported back from the tower by helicopter.
As soon as the deployment box is lifted from the tower, the monitoring sensor switches off, and the power supply to the system is interrupted to prevent unintentional discharge of charges. The Wyssen heli link must be connected to the helicopter by means of a swivel hook.

Before returning the deployment box, the pilot must find out whether there are still explosive charges in the deployment box.

Warning
The Wyssen heli link must be checked for proper functioning and damage before each transport of the deployment box. If defects are detected, the said Wyssen heli link must not be used.

- The pilot must then fly over the deployment box and lower the Wyssen heli link above the fork of the transport bracket. As a result, the Wyssen heli link is opened and closes again after further lowering. Thus, the deployment box is attached
- Lift off the deployment box.(Make sure that the pull on the deployment box takes place exactly vertically.
- Otherwise, it can tilt on the tower.)
- Transport the deployment box to the unloading location and park it carefully
- Release the Wyssen heli link, see chapter 4.5.3 Unhook the deployment box on page 30

8 Seasonal decommissioning / recommissioning

8.1 Decommissioning after the end of the season

8.1.1 Deployment box

The deployment box of the Wyssen avalanche tower is to be removed from the tower as soon as possible after the end of the season in order to exclude the risk of lightning damage. During the summer time it should be housed in a sheltered and dry warehouse. Unused explosive charges must be removed from the deployment box. The charges and igniters must be stored in accordance with the national explosives law / dangerous goods ordinance. See also the instructions for assembling the Wyssen 2K® or the instructions for assembling the charge 07.
To ensure that the battery does not drain after decommissioning, it is important to press the emergency / main switch and unplug the battery plug X20.

Operation / On

Stopp / Off

Hazard
When removing the charge from the quiver tube, make sure that the retaining ring and the line do not get stuck on the deployment box.
A pulling movement on the eyelet of the detonators SZ83 will lead to the initialization of the charge.

In order for the battery to survive the summertime without damage, it should be fully charged before storage with a charger provided for this purpose. Connect the charger to the battery for at least 24 hours. A corresponding charger can be purchased from Wyssen Avalanche Control AG.

Caution
The battery may only be connected to a charger provided for this purpose with a temperature-controlled charging voltage. Chargers such as those used for car batteries are not suitable and may damage the battery.
The allowed chargers, see chapter 8.3 Charging the battery on page 44.

8.2 Recommissioning before the start of the season

8.2.1 WAC.3 Base

Start up the optional WAC.3 Base according to the separate operating instructions.

8.2.2 Tower

Before recommissioning, the finger on the tower must be cleaned.
With a coarse file, even out any unevenness, raised ridges and edges and apply a thick layer of water-resistant and low-temperature-resistant (down to -30 °C) Fuchs Unitemp 2 grease (can be purchased from Wyssen Avalanche Control AG). The climbing ladder and safety devices on the tower as well as the personal protective equipment must be checked for damage and functionality before each ascent of the tower.

Warning
Risk of death as a result of a fall: As soon as the tower is climbed, the personnel must secure themselves against falling with the corresponding personal protective equipment, safety equipment and tether.

8.2.3 Charge deployment box

- Charging the battery, see chapter 8.3 Charging the battery on page 44
- Measure the battery voltage with the white plug X20 disconnected. It should be at least 12.8 V. Then reassemble the plug.
- Activate the power supply by switching on the emergency / main switch.
- Test run with the control buttons, see chapter 5.5 Test run with control buttons in the magazine control on page 36, to ensure that the magazine works properly.
- Check the connection to WAC.3 before loading the charges onto the deployment box.
- Load the magazine and then run a test run again, see chapter 5.5 Test run with control buttons in the magazine control on page 36

8.3 Charging the battery

The battery must be charged by a charger supplied by the manufacturer.

- Connect the charger to the mains
- Connect the battery to the charger with the white
- plug.
- Start the charging process according to the corresponding note below

Warning
Never charge the battery with a car charger or fast charger, otherwise the battery will be damaged! If an additional charger is required, a suitable device can be obtained from the supplier.

8.3.1 Batterieladegeräte

From 2000 to 2010

Voltcraft
The first charger used is easy to use. Only the two connecting cables have to be plugged into the corresponding ports to start the charging cycle.

When the green indicator light appears, the battery is fully charged and ready to use.

From 2011 to 2013

Voltcraft VC2000
The Voltcraft VC2000 is slightly more complex to use than its predecessor. After connecting the primary voltage 230V, the correct charging setting must be selected by means of the mode button.

After the device is plugged in, it will start to glow green. By pressing the mode button three times, the light should start to light at the battery symbol with the three bars.
Now the charger can be connected to the battery for charging.

From 2014 to today

Yu-Power YPC4A12
By connecting the two cables to the battery and the 230V, the Yu-Power charger already starts charging the battery.

When the green indicator light appears, the battery is fully charged and ready to use.

9 Maintenance

Maintenance may only be carried out by personnel in accordance with the description, see chapter 3.3 Authorization and training of personnel on page 18. To ensure the proper and safe operation of the system, the maintenance described below must be carried out in good time.

The operator of the system is obliged to carry out maintenance by the supplier. This includes an annual inspection of the system and execution of the necessary maintenance and service work.

Caution
Before maintenance work is carried out in the deployment box, the emergency / main switch in the deployment box must be set to OFF.

9.1 Maintenance plan

9.1.1 Maintenance work with each reload of the deployment box

- General visual inspection
- The Wyssen heli link must be checked for proper functioning and damage before each transport of the deployment box, see chapter 7.1.16 Testing of the Wyssen heli link on page 40
- It must be checked that all rope ejectors are functioning properly.
- Carrying out the test run with the control buttons in the deployment box, see chapter 5.5 Test run with control buttons in the magazine control on page 36 with empty deployment box to determine any faults.
- Perform the test run with the control buttons in the deployment box after loading, before the deployment box is transported back to the tower, see chapter 5.5 Test run with control buttons in the magazine control on page 36

9.1.2 Maintenance work before seasonal decommissioning

- see chapter 8.1 Decommissioning after the end of the season on page 43
- After the end of the season, the deployment box must be lifted from the tower as quickly as possible and stored in a protected dry room after the remaining explosive charges have been removed.
- Functional check / test run with control buttons and message to the supplier if malfunctions are known and special maintenance work is necessary.

9.1.3 Maintenance work before seasonal commissioning

- see chapter 8.2 Recommissioning before the start of the season on page 44
- Maintenance work before seasonal commissioning.

9.1.4 Annual maintenance work carried out by the supplier on the system before seasonal commissioning

In order to ensure trouble-free and maintenance-free operation during the season, each system must be checked once a year by specialist personnel commissioned by the manufacturer or its authorized representative.

During this work, the mechanics and the control system are checked for defects and signs of wear. In the event of a newly available update of the software or changes to the mechanics, the systems are brought up to date

In order to be able to guarantee a forwarding service, the system owner must first complete certain work steps.

- The magazines, the Wyssen heli link and, if available, the WAC.3 Base must be stored in a dry, easily accessible place.
- The batteries of all deployment boxes and, if available, the WAC.3 Base, must be charged.
- If possible, a crane or other lifting device should be present to lift the deployment box so that the maintenance work can be carried out.

10 Faults

The Wyssen avalanche tower is designed in such a way that it is as immune as possible to interference. However, since a fault can never be completely ruled out, the procedure for fault elimination is described here.

10.1 Procedure in the event of a fault

If a fault occurs during an explosion or a test run (e.g. connection interruption, error message from the magazine, etc.), the following measures must be taken in each case.

- Continue to secure and maintain danger zone G1.
- Contact the manufacturer immediately. The manufacturer will be happy to support you with its 24-hour hotline for troubleshooting.

10.1.1 Termination of the GPRS or radio connection

If after a successful command transmission to the blast tower the connection is broken, this command will be executed normally until the end. I.e. an already started test run or charge discharge is executed after the radio connection is interrupted until the carousel is turned back and the discharge hole is subsequently closed. If a connection is no longer possible, a visual check (possibly by means of a reconnaissance flight) must be made to ensure that the deployment box is completely closed before flying.

11 Failures

Hazard
If there is a failure in the area, proceed according to the regulations for the recovery and destructionof the failure in the respective country.
The deployment box may under no circumstances be transported by helicopter with a suspended failed ordinance.

In the event of failure of explosive charges, a waiting time of at least 15 minutes must be observed before salvaging the failure. Failures shall be eliminated as soon as possible by trained personnel after the expiry of this period, taking into account the appropriate safety measures.

By default, the failures remain suspended and are not automatically dropped.
For discarding, the «reset» button in the operating software must be pressed while observing from a safe distance. We use it to drop the charge and the deployment box closes again.

Hazard
If a cord is found in the zone of the possible failure, it may not be pulled under any circumstances. The charge must also not be moved from the detonators without first separating the holder cord. This can lead to the activation of the detonators and there is a possibility that the explosive charge will detonate.

11.1 Determination of a failure

Whether the detonation of a discharged charge has taken place can be determined acoustically in most cases. The detonation of a dropped explosive charge is also displayed in the operating software. If this display does not appear, it must be assumed that there is a failure in the area. In the event of uncertainties, the supplier can determine whether it is a failure with further tests.

The various variants of failures as well as the procedure for recovery can be found in the instructions for assembling the Wyssen 2K® and the instructions for assembling the charge 07.

11.2 Creation of safety schedules

As a result of a failure, the person responsible for the blasting must prepare a safety schedule describing the procedure to be followed after such a failure occurs. Appropriate procedures must be described depending on the area.
A template can be found in the instructions for assembling the Wyssen 2K® V 1.7 and the instructions for assembling the load 07 V 1.1.

12 Emergencies

12.1 General and delimitation

The following scenarios describe emergencies with the increased possibility of serious consequences such as fatalities. An emergency response plan for emergency situations (such as the unintentional triggering of the detonating devices during charge assembly) must be developed by the person in charge of explosive operations and the operating personnel must be instructed accordingly. The supplier of the Wyssen avalanche tower must be notified immediately about all accidents, even if they do not result in any damage.

12.2 Emergency due to controlled triggered avalanche

Situations related to avalanches triggered in a controlled manner, such as burials of persons and equipment, are not considered in this manual. Personnel authorized to operate Wyssen avalanche towers have learned the appropriate procedures during training and must attend refresher courses.

12.3 Crash of a deployment box during helicopter transport

As a result of the emergency situation of the helicopter, pilot›s error, technical defect of the helicopter or the load handling equipment, a crash of a deployment box loaded with or without charges cannot be excluded.
If it comes to that, no one should approach the crashed parts. The crash site must be large-scale, i.e. within a radius of at least 1 km from persons to be evacuated, cordoned off and secured by checkpoints.
The following places should be alerted immediately:

- Competent authority (police)
- Supplier of the system (Wyssen Avalanche Control AG)

These bodies must then determine the further procedure together with the explosion controller on site.

Riomon T1 (Maxam)	Not set	4.5 kg (ø115 x 480 mm)	Detonator No. 8 without booster

15 SOP "Standart Operation Manual"

1. General

A) Training of pilots and flight assistants
The pilot and flight assistant who are used in the transport of deployment boxes to the Wyssen avalanche tower must be trained by the manufacturer in advance and made aware of the existing risks.

B) Compliance with safety measures
Pilots and flight assistants are entitled and obliged to reject the flight order if no safety measures are taken, especially with regard to blocking and evacuation at the pick-up and unloading point.

C) System description
The mini-SOP (accessible to the helicopter companies) contains a detailed description of the Wyssen avalanche tower.

D) System security
A monitoring sensor in the deployment box will only turn on the main power supply of the charge discharge mechanism when the deployment box is correctly positioned on the tower. During a transport flight, therefore, no unintentional triggering can occur.

E) State of command center
As an additional safeguard to the above item, immediately prior to the flight, the pilot must obtain confirmation from the responsible blasting officer that the code list is inaccessible to all operators.

F) State of deployment box
Prior to transport, the pilot must have the responsible blasting officer of the client confirm that the load-discharge mechanism of the deployment box is in the rest position, the discharge hole is closed, and the entire system is in perfect condition.

G) State of heli link
The Wyssen heli link required to hang and lift the deployment box from the tower must be checked for proper functioning and damage such as cracks and bending before each use. If defects are detected or there are uncertainties about this, the said Wyssen heli link must not be used.

H) Regulations
The regulations of the explosives legislation (Explosives Act, Explosives Ordinance) as well as the explosives supplier must be observed.

I) Weather conditions
Wind and weather conditions must be taken into account. If conditions do not permit safe flight maneuvers, the transport must be postponed.

J) Crew
Only persons directly involved in the transport mission may be carried in the helicopter.

K) Flight route – safety corridor
The transport from the deployment box, which is exclusively loaded with Wyssen 2K® charges, does not require any precautions or requirements that exceed the scope of other underload flights.

L) Weight
The weight of the loaded deployment box is about 540 kg (empty weight about 400 kg).

M) Due diligence
It is very important that the deployment boxs are carefully placed on the blasting towers. If the deployment box is hit too hard against the tower during the deployment maneuver or is placed jerkily, the internal mechanics can become damaged. This leads to failures during subsequent operation, among other things. If the pilot or the responsible blasting personnel determines that the deployment box was jerked up or hit the tower exceptionally hard, it must be flown down again for inspection.

N) Emergency situation
If the deployment box crashes due to technical defect, faulty manipulation or emergency situation, no one should approach the crashed parts. The pilot must immediately report this event to the local explosives officer so that the necessary measures can be taken:
The competent authorities (police / WFD) and the manufacturer of the system (Wyssen Avalanche Control AG) must be informed.

2. Preparation

A) Pick-up location
The pick-up location of the loaded deployment box must be flat and sufficiently large for the flight maneuver.
In the area of the pick-up location, there must be no objects which, under certain conditions, could activate the monitoring sensor in the entry funnel of the deployment box.

B) Briefing
Before the first flight transport order, the pilot must hold a meeting with the ground personnel designated for this work regarding the procedure and the special hazards. The personnel must also be instructed in particular about the operation of the load handling equipment (the Wyssen heli link) and the general hazards during underload flight.

C) Personal protective equipment
The ground staff must wear the following protective equipment to suspend and unhook the deployment box under the hovering helicopter: helmet, safety goggles, gloves, suitable clothing and sturdy shoes.

D) Uninvolved persons
No uninvolved persons may be present at the pick-up and unloading location. It must be closed off if necessary.

E) Communication control
Before starting work, a radio check must be made between the pilot and the ground crew to ensure proper communication.

3. Moving the deployment box onto the towers

A) Load bearing capacity
The deployment box is hooked directly onto the transport bracket provided for this purpose on the electrical heli hook.

B) Placing the deployment box on the tower
The pilot brings the deployment box with the introduction funnel vertically over the finger of the tower.
By lowering this automatically rotates itself into the correct position (on the valley side).
The flash light on the deployment box starts to flash for the pilot›s information as soon as it has been correctly placed.

C) Releasing the load
As soon as the pilot has ascertained that the deployment box has turned to the correct, valley-side position, the pilot can relieve the mounting line and actuate the electrical heli hook to release it.

D) Leaving the danger zone
After correctly placing the deployment box on the tower, the pilot should quickly move out of the danger zone of the Wyssen avalanche towers.

4. Return transport of the deployment box

A) Deployment box flight readiness
The pilot must check if the deployment box is closed and secured before the return transport. The deployment box must not be flown with a dropped, suspended charge.

B) Transport hangers
For the return transport, the Wyssen heli link is suspended on the mounting line with swivel hooks, so that the pilot can attach the deployment box independently on the tower.

C) Load bearing capacity
The deployment box can be attached independently by the pilot by bringing the fork of the Wyssen heli link over the transport bracket on the deployment box. By lowering, the Wyssen heli link opens and then closes independently.

D) Lifting the deployment box from the tower
To take off, the pilot must hover exactly vertically above the deployment box and climb at least 1 m rise so that the deployment box detaches from the finger.
It may be that the mounted flashlight starts to flash, but this does not matter.

16 Instructions for dud recovery

Failure recovery for Austria
Appropriately adopted and adapted from the Austrian Explosion Protection Ordinance and the provisions for the blasting of avalanches from the helicopter.

Failure elimination:

- Failed charges shall be recovered without undue delay after at least 15 minutes of waiting.
- Failed charges must be professionally defused after salvage.
- Charges that are still attached to the cord and / or connected to the deployment box must not be touched. In this case, according to the description, see chapter 11 Failures on page 48, the charge must be deliberately dropped. A person authorized to carry out explosiions should observe from a safe distance where the charge falls, so that it is easier to find it for subsequent salvage. After the dud has been dropped, a waiting time of at least 15 minutes must be observed again.
- If the danger from avalanches is too great, personnel can be transported by helicopter on the rope to the site of the dud:
- This must be carried out by an avalanche blasting officer and a trained flight rescuer under the following conditions:
- Use of a twin-engine helicopter (performance class 1 cat. A approval) and suitable recovery equipment or officially approved hook.
- Use of a suitable standard-compliant safety harness with standard-compliant safety carabiner.
- Use of a protective helmet which is equipped with a transmitting and receiving device as well as with a microphone and receiver.
- It is forbidden to unhook the avalanche officer and the flight rescuer at the mountain site.
- If immediate recovery is not possible due to avalanche danger and bad weather conditions, the danger zone of the explosive charge as well as the possible avalanche run-off must be secured in a suitable manner against uninvolved persons.
- Any remaining explosive charges ready for ignition must be defused immediately after completion of the explosive work or after completion of the failure salvage, taking into account all necessary safety measures.

17 List of abbreviations

Austro Control
Austro Control is responsible for the safe and economical operation of air traffic in Austrian airspace, with up to 4,000 aircraft checked daily.

BAKOM
The Federal Office of Communications BAKOM is a federal agency of the Swiss Confederation.

BAZL
The Federal Office of Civil Aviation (BAZL) is responsible for aviation development and the supervision of civil aviation

FOM
Flight Operation Manual (FOM)

SBFI
The State Secretariat for Education, Research and Innovation SBFI in the Federal Department of Economic Affairs, Education and Research WBF is the federal government›s competence center for nationally and internationally oriented issues of education, research and innovation policy.

SLF
The tasks of the WSL Institute for Snow and Avalanche Research SLF are research, scientific services, teaching and public relations.
In close connection with research, the SLF offers a range of services. This includes consulting mandates, expert opinions on avalanche accidents and avalanche protection, as well as the development of warning systems for alpine natural hazards. The best-known service is the avalanche warning for the Swiss Alps, which is published twice a day in winter

SUVA
The Swiss National Accident Insurance Fund (SUVA) is the largest accident insurance company in Switzerland. The independent company under public law, headquartered in Lucerne, insures around 1.95 million working people against occupational accidents, occupational diseases and leisure accidents. Likewise, self-employed persons can insure themselves against the consequences of accidents with the business insurance.

GPRS
General Packet Radio Service. Data transmission service in GSM networks (Global System for Mobile Communications).

SIF
Safety function

GPS
Global Positioning System. Satellite positioning technology.

Appendix G

Daily Advisory Bulletin

BRUCEJACK MOUNTAIN SAFETY ADVISORY

Date Issued:	January 8, 2021	Time:	600	Valid Until:	January 9, 2021

AVALANCHE HAZARD RATING

ZONE A		Camp	ALERT
ZONE B	71.6km-73.3km	Lakeshore Drive	ALERT
	73.3km-Heavy Shop	Warehouse Slopes	CAUTION
ZONE C	Surface Ops, Enviros	VOK and Snow Cat Roads	ALERT
ZONE D	64.5km-71.6km	Glacier Access Road Cut Banks	ALERT
ZONE F	56km-60km	Knipple Corner Exit (DMZ)	CAUTION
ZONE G	37km-56km	Scott Creek-Bowser	CAUTION
ZONE H	3km-37km	Wildfire to Scott Creek	CAUTION
Wildfire Hill	2km–3km	Wildfire Hill	NORMAL

Adhere to Avalanche Safety Plan, Safe Work Procedures, Standard Operating Procedures, and Worksite Avalanche Assessments.
Note: Some avalanche paths (i.e. small road cut slopes) not marked with avalanche signage.

Avalanche Control					Notes: (expected closure times, number of shots, buildings to evacuate)
YES	Zone	B,C	Time	TBD	Timing depends on weather inputs

Brucejack Comments and Site Specific Procedures (Zones A, B, C, D)

All steep slopes and rooflines remain suspect - always check with Mountain Safety before any work in any avalanche zones.

Knipple Comments and Site Specific Procedures (Zones F,G,H)

Be wary of steep overhanging slopes along the glacier road from 70-71.6, as well as roof lines. Report any activity to Mountain Safety.

GLACIER HAZARD ROAD RATING

ZONE D	65km-71.6km	Upper Knipple Glacier	MODERATE (glacier road conditions)
ZONE E	59.5km-65km	Lower Knipple Glacier	MODERATE (glacier road conditions)

General Ice Hazards and Site Specific Procedures (Zones D and E)

Avalanches off the glacier high walls are possible. Please give these walls a wide margin and avoid driving directly underneath the slopes. Please advise Mountain Safety of any avalanche activity.
Report any unmarked hazards to Knipple Surface Op's Supervisor or Dispatch.
Recommended glacier speeds: LOW - Max 40km/hr. MODERATE - 30km/hr. CONSIDERABLE - <20km/hr.

WORKSITE AVALALANCHE ASSESSMENTS

Contact Mountain Safety prior to any work outside of normal operations, including tasks that have associated mountain or glacier hazards. We can help provide input into any JHA. The value of knowing where personnel are doing field work in case of an emergency is vital.

WEATHER

Station	Time	Temp °C	Wind		24 hr precip	Height Snow	Comments
			Value	Direction			
VOK	1600	-3	40	E	13	395

Post tower Inspection	Reassess	Update Hazard	Remove Placards

Appendix H.2

Goat Management Plan

Table 5.1-1. Mitigation Activities for Mountain Goat during Vegetation Clearing and Construction

Timing	Habitat	Mitigation Activities
Winter (November 1 to June 14)	UWRs	The preferred option is to avoid activities within 500 m of UWR habitat during winter. If work is planned in these areas during winter, then conduct pre-clearing surveys. If goats are observed within a 500 m buffer of Project activities then pause work until goats have moved outside of this buffer.

(continued)

Table 5.1-1. Mitigation Activities for Mountain Goat during Vegetation Clearing and Construction (completed)

Timing	Habitat	Mitigation Activities
Summer (May 1 – July 15)	High-quality Summer Habitat – Kidding Areas	If goats with kids are observed between May 1 and July 15 within a 500 m buffer during clearing activities then pause work until goats have moved off. Avoid construction activities within 2 km of confirmed natal/kidding areas. Pre-clearing surveys may also be conducted less than 24 hours prior to activity.
Spring/Fall (April - November	High-quality Summer Habitat – Mineral Licks	Avoid destruction of mineral licks. Minimize disturbance within 100 m of licks.
All Year	All Habitats	If goats without kids (May 1 to July 15) and goats (July 16 to October 31) are incidentally observed in proximity to operational roads or facilities, then mountain goats will be given the right away.

5.3 Avalanche Management for Mountain Goats

5.3.1 *Management Activities*

Avalanche management will be conducted in the winter during the Construction, Operations and Closure phases. Mountain goats occupy alpine areas with steep, rocky cliffs during the summer and low elevation forested areas on southern slopes during the winter. During winter, mountain goats can occupy habitat in or below areas prone to avalanches, including alpine areas above the Brucejack Access Road, near Knipple Lake, and along the Knipple Glacier (Appendix A: Figure 5.1-4). Avalanche management activities will include management to avoid mortality or abandonment of habitats by mountain goats due to avalanches.

Avalanche management procedures typically use ground-based launchers and helicopter deployment of explosives (Soucie 2012). Both procedures require the avalanche area to be clear and visible prior to deployment. However, in-place concussive devices such as Gazex® avalanche release systems that are built into the start zone of avalanche tracks can be deployed during snow events or afterwards.

Mitigation activities to limit risks to mountain goats are primarily based on conducting surveys for goats prior to avalanche control and pausing control activities until goats have cleared avalanche paths. Mitigation activities depend on the choice of avalanche control. Four methods of avalanche control are currently used for the Project; each has an associated survey protocol to ensure the site is clear of people or wildlife prior to detonation. These include:

1. Hand-based blasting is conducted predominantly at the base of the avalanche path using case charges which consist of a high explosive suspended on a bamboo pole tripod and remotely detonated. These are placed on or slightly above the Access Road. Ski-touring and throwing hand charges may also be employed up slope from the road: prior to conducting hand-based blasting the crew conducts visual confirmation the site is clear of people or wildlife along avalanche path and start zone. If goats are present, blasting will be delayed until they have left the area. Air horns or other suitable sounding devices may be used to herd goats away to a safe distance before blasting begins.
2. Helicopter-based blasting is conducted at the top of avalanche paths and most often to be used in spring to clean up sites, It includes dropping of explosive charges out of the helicopter to initiate and avalanche from above: prior to conducting helicopter-based blasting, there is a detailed sweep of the slope to determine where best to place targets ensuring a thorough survey of the path and surrounding area for hazards such as goats. If the area and area immediately adjacent (within 100 m) to the avalanche path is clear, blasting will proceed. If not, air horns, or other suitable sounding devices will be used to herd the goats away to a safe distance before blasting begins.

   Over the past 4 winters during which helicopter based blasting has been conducted for avalanche control at the Mine Site and along the Brucejack Access Road, no mountain goats have been observed within or in proximity to the avalanche control sites at the time control was being conducted. Pre-blast visual inspections have been conducted as part of standard procedure to ensure that the areas are clear of both personnel and wildlife, including mountain goat.
3. In-place concussive devices, specifically the Gazex® avalanche release systems, are being installed at three of the most problematic sites along the Brucejack Access Road. These devices may be operated remotely during any weather and are used to initiate avalanches at the top of the path. During clear weather, a ground based survey of the avalanche track will be conducted from a safe location using a spotting scope or similar device. Site specific details are described in section 6.1.3. If goats are observed and safety is not compromised, then blasting will occur once mountain goats move out of the avalanche area. Air horns or other suitable sounding devices may be used to herd goats away to a safe distance before blasting begins. If blasting is planned during a obscured conditions with low lying cloud or fog, heavy snowfall or wind events,, pre-blast surveys may not be possible.
4. Ground-based avalaunchers including the Nitroexpress® are currently used for the most problematic sites, particularly at 44 Km. This control technique is expected to be phased out with installation of the Gazex® systems. During clear weather, a ground based survey of the avalanche track will be conducted from a safe location using a spotting scope or similar device. The site specific survey goat monitoring details are provided in section 6.1.3. If mountain goats are observed in the avalanche path, the avalanche control will be paused until goats are able to clear the area. Air horns or other suitable sounding devices may be

until goats are able to clear the area. All horns or other suitable sounding devices may be used to herd goats away to a safe distance before blasting begins.

All four methods may be used for avalanche control in the Project; however the Gazex® ground-based in-place concussive devices are being installed as the primary method of avalanche control for the two sites most likely to be in conflict with goats: 44 km and 58 km, as well as a third site at 59 km. Details of the avalanche control methodology were included in the Licence of Occupation applications submitted by Pretium Resources Inc. to BC FLNRO, which were subsequently approved.

5.3.2 Risk to Mountain Goat from Avalanche Control Measures

This section evaluates the risk to mountain goats at a site level using field data on the locations of proposed avalanche control measures, goat habitat, and goat occupancy collected during 2015. There are a number of avalanche zones identified along the Access Road and near the mine site. Within these zones there are areas that will be managed for avalanches; these include areas along the Access Road at 2 km, 30 km, 44 km, 56 km, 58 km, 59 km, and area around the Brucejack Camp and Mine Site (Figure 5.3-1; see map pocket). While the event frequency and size of avalanches vary, of the areas requiring most consistent control, areas at the Brucejack Camp and mine, 56 km, and 2 km are not identified as key goat winter habitat, and goats were not observed at any of these locations during inventory (Rescan 2011). Slopes above the access road at 30 km are near UWR, however goat were not identified in this area during inventory, the UWR is at the top of the avalanche zone, and control measures are only expected to be associated with the lower slope above the road. As such goat are not expected to occupy this area when avalanche control is required. Avalanche control at this location would be hand-based with some low elevation helicopter use.

Risk to goat from avalanche control at the Brucejack Camp and mine, 56 km, 30 km and 2 km is considered very low. Directed monitoring for goats is not proposed for these sites beyond the scanning protocol that currently occurs for avalanche control using helicopter-based or hand-based blasting described in section 5.3.1. If, for exceptional circumstances, goats are observed within avalanche tracks planned for blasting, avalanche control will be halted until the goats have cleared the area. Noise will be used as necessary to herd goats out of the danger area.

Control within areas at 44 km and 58 km is the most likely to provide a risk to mountain goat. The 59 km site has also been assessed for risk to mountain goat. All four methods of control may potentially be used at these sites, however the Ground-based Remote Avalanche Control Systems (RACS) Gazex® avalanche release systems represent the avalanche control of greatest consequence to goat in size of area, potential goat occupancy, and frequency of use. The Gazex® RACS are remotely fired with a charge of compressed oxygen and propane to initiate an avalanche. The volume of compressed gas can be changed to reflect the concussion charge required, with charges from between 0.8 m^3 and 3.0 m3 to be used for the Project. The RACS used to manage avalanche hazards will be installed at three key locations along the Brucejack Access Road. The Gazex® will be permanently fixed at the top of the avalanche paths at 44 km, 58 km and 59 km (Figure 5.3-2). A monitoring plan has been identified for use with RACS avalanche control in these areas and it can be extended to include all methods of avalanche control at these problematic sites.

In order to evaluate the potential risk to mountain goats at these three sites from the installation of the RACS and other avalanche control systems, a field survey was carried out in May, 2015 (June 17, 2015 Wildlife Trip Report). The survey was conducted, in part, to evaluate the likelihood that goat

2015 Wildlife Trip Report). The survey was conducted, in part, to evaluate the likelihood that goat would occupy the areas slated for avalanche control using habitat suitability, spatial distribution of habitat, and anticipated goat use. Locations at 44 km and 58 km were identified as potentially supporting use, while goat winter use at km 59 was not anticipated. The risk to mountain goat from avalanche control at these three sites was qualitatively evaluated based on professional judgement of habitat suitability and potential occupancy during the winter. The habitat value, and therefore likelihood of habitat use and risk to goats, was referenced to a local benchmark; the UWR unit on the north side of Bowser Lake which supports substantial goat numbers (12 observed in the winter 2011 survey at this location). This UWR is located approximately XX km away from km XX of the Brucejack Access Road.

The RACS unit at 44 km is at the edge of a large UWR complex that has potential to support a number of goats. This avalanche control site is at the lower, south and eastern edge of the complex, and while goat may occupy the site during winter, there is habitat of higher quality and greater connectivity north of the site. Within the UWR, goats were observed in May, 2015 (waypoint 043, Figure 3.5-2) up slope on the mountain within the UWR. Goats were observed in a favourable area of green vegetation near the large UWR polygon during the May 2015 reconnaissance. The 2011 winter ungulate surveys (Rescan 2011), did not detected goats in this area, but identified a total of 14 goats to the north and west of the 44 km UWR polygon unit. The RACS unit will affect a large area downslope from the UWR polygon unit (Plate 3.5-1). Considering the isolation of this unit at the periphery of a larger more suitable complex, the probability of it being occupied by goat during avalanche control is low and with monitoring, risk to goat is predicted as Low as well. The km 44 avalanche control area was checked for presence of mountain goat and other wildlife as part of standard pre-blast procedures during blasting that occurred over the past 4 winters; no mountain goat were observed within the blast areas.

Plate 3.5-1. Location of RACS unit exploders at 44 km site.

The second RACS unit site is located at 58 km, above the parking lot at the southern end of the Knipple Glacier portion of the access road. One mountain goat was observed at this location during

the May 2015 reconnaissance, and goats with kids had been recorded near this site in 2011 prior to July 1 as recorded in the July 14, 2011 Vegetation and Wildlife Critical Review trip report. No goats were observed during winter 2011 survey near this location (Rescan 2011) and the survey unit associated with the site only had one goat observed during the winter 2011 surveys. The habitat was assessed as high quality winter habitat as it supports vegetation including conifer cover and shrubs adjacent to escape terrain. The area potentially affected by the RACS is at the lower elevation of the suitable habitat, where escape terrain is becoming fragmented, and connectivity to more contiguous habitat is reduced in winter (Plate 3.5-2). Considering the location at the edge of habitat and no documented winter use, it has a low probability of being occupied by goat during avalanche control, and risk to goat is predicted as Low with monitoring. As with the km 44 area, km 58 was also checked for mountain goat presence prior to blasting over the past four winters and no goats were observed within the avalanche zone.

The third RACS unit site is located at 59 km, was assessed as low quality winter habitat for goats. This site is in area recently exposed as the Knipple Glacier receded and has virtually no vegetation cover that would provide winter forage to goats. Its value as escape terrain is also marginal as it is small, and surrounded by more gently rolling topography (Plate 3.5-3), and only a small, low elevation area will be impacted by the RACS. No goats were observed near this site during the 2011 winter inventory (Rescan 2011) and only one goat was observed in SU 10. The probability of this site being used during winter by goat is very low and risk to goat is predicted as Very Low. No goats have been observed at this location during previous avalanche blasting activities.

Plate 3.5-2. Location of RACS unit exploders at 58 km site.

Appendix I

Dyno Noble Emergency Response & Assistance Plan

EMERGENCY RESPONSE ASSISTANCE PLAN

(ERAP # 2-1037)

For Dyno Nobel Canada Inc. (DNCI)

This Emergency Response Assistance Plan (ERAP) addresses incidents and potential incidents involving the transportation of dangerous goods, as required by Transport Canada's "Transportation Of Dangerous Goods (TDG) Clear Language Regulations". Actions detailed within this plan are compulsory, having received approval and authorization by Sr. Vice President - Retail Sales & Field Operations – Americas – M. Sergio Lafratta.

EMERGENCY RESPONSE ASSISTANCE PLAN
Registration #: ERAP 2-1037

TO CALL FOR EMERGENCY ASSISTANCE
(Instructions to activate DNCI's Emergency Response Assistance Plan)

In the event of an emergency, accidental release or imminent accidental release involving the transportation of explosives or other chemicals, call **911** (or the local police number) for immediate assistance plus initiate DNCI's Emergency Response Assistance Plan (ERAP) by calling the 1-800-367-4629. Callers reporting an emergency should immediately give their name and phone number, and keep their telephone connection open until they've completed their initial report.

TO RESPOND TO AN EMERGENCY CALL

DNCI Corporate contact instructions:

Upon receiving a call for emergency response assistance, keep a log of all subsequent communications and actions, and do the following:

1. Immediately obtain the name and callback number of the caller, in case the telephone line is lost.

2. Obtain information to complete the Emergency Report Form (page 8) as fully and accurately as possible.

3. **WARN FIRST RESPONDERS OF EVACUATION DISTANCES IF RISK OF DETONATION.** Should there be explosive detonations, or the risk of detonations due to the presence of fire or other detonating factors, advise the First Responders of the risk and applicable safety distances per Table 9-1, page 21 . Note: See ERAP section 14, pg 34 for Evacuation Procedures.

4. Call an ER Advisor for the applicable Region (see page 7) and report the emergency situation. In turn, the ER Advisor will phone the emergency scene caller, establish ongoing contact, assess the emergency, determine what Company resources and/or contracted emergency response services are required and organize an Emergency Response Team – ERT (see ERAP pg. 18) to proceed to the emergency scene if required).

5. Assist the Emergency Response Advisor (ERA).

6. Liaise with Company Executive / Senior Managers.

Emergency Response Advisor (ERA) instructions:

1. Call the Branch/Plant Supervisor nearest the emergency scene plus provincial & federal authorities (see applicable appendix to Annex D) to advise them of the situation and the need for an emergency response.

2. Designate, assemble and dispatch an Emergency Response Team (ERT), made up of Groups 1 & 2 personnel (see ERAP pg. 15 and Annex D) under the leadership of an On Scene Coordinator (OSC), if required.

3. Authorize the dispatching of additional resources, communications, transportation and contracted services as necessary.

4. Contact and instruct the designated Emergency Response Team (ERT) to proceed to the emergency scene with the required vehicles and equipment.

5. Liaise with the Person in Charge of the First Responders, the vehicle driver or railway official (involved in the Emergency) and/or Local Authorities to obtain a situation update.

6. Advise local Authorities as appropriate, regarding the properties, hazards and handling procedures for the explosives involved in the emergency. In particular, advise the Local Authorities of appropriate evacuation distances per Table 9-1 (ERAP pg. 21).

7. Continue to consult with the Local Authorities as appropriate, plus the Company's On-Scene Coordinator (OSC), to stabilize and eliminate the emergency.

8. Respond to media requests in accordance with the Crisis Communication Plan (CCP).

9. Contact the explosives supplier and / or transporter (if other than DNCI) to advise them of the emergency and to request their assistance if/as required.

10. Organize and direct the Company's clean-up / recovery / restoration activities utilizing third-party resources as appropriate.

11. Authorize the development and submission of immediate and follow-up regulatory reports (see Part 8 of the TDG Clear Language Regulations).

_____

EMERGENCY RESPONSE FLOW CHART

Abbreviations / Definitions:

Driver: Any person who is able to report an incident involving a DNCI road transportation delivery, be it the Driver, Driver's Assistant, a Good Samaritan or First Responder, plus, in the event of a rail transportation incident, a railroad representative, or in the event of an air incident, a member of the crew or airport authority.

DNCI Corporate contact : A DNCI corporate employee who is assigned to receive Emergency Calls at all times from the answering service.

ER Advisor: Emergency Response Advisor (ERA), who will normally be the applicable General Manager, Area Manager, or Technical Advisor (see table page 7) who will liaise with First Responders.

OSC: (DNCI) On Scene Coordinator, the Senior DNCI employee at an incident site who manages and controls DNCI resources in support of First Responders and incident recovery.

ERT: Emergency Response Team, DNCI personnel dispatched to an incident site to assist First Responders and conduct incident recovery under the direction of the OSC.

EMERGENCY RESPONSE ASSISTANCE PLAN
Registration #: ERAP 2-1037

1. INTRODUCTION

This plan is designed to meet Emergency Response Assistance Plan (ERAP) requirements under Part 7 of the Transportation of Dangerous Goods (TDG) Clear Language Regulations. Furthermore, this ERAP is designed to support the transportation operations of DNCI "and" it's associated companies, which include:

Subsidiary & Associated Companies For Which This ERAP Applies:
Denesoline Western Explosives Inc. (DWEI)
Dyno Nobel America (DNA)
Dyno Nobel North America (DNNA)
Dyno Nobel Nunavut Inc. (DNNI)
Qaaqtuq Dyno Nobel Inc (QDNI)
Dyno Nobel Transport Inc. (DNTI)
Polar Explosives Ltd. (PEL)

This ERAP will be used to ensure DNCI takes planned action to preserve and protect life & limb, the environment and property in response to an incident involving the transportation of explosives and component chemicals by road, air, rail and marine modes.

It is Company policy that all employees know the contents of this plan, know their ERAP roles and responsibilities, and are aware of others' roles and responsibilities. As well, key personnel are to be able to quickly locate and dispatch qualified explosives personnel plus recovery vehicles, equipment and operators to help First Responders / Local Authorities stabilize and eliminate explosives-related emergencies.

2. SCOPE OF OPERATION

Dyno Nobel Canada Inc. (DNCI) plus its subsidiary and associated companies manufacture and distribute explosives and accessories throughout Canada. DNCI's has manufacturing and storage facilities as listed in Annex A.

DNCI also has assorted satellite manufacturing and storage facilities associated with temporary and other projects that are licensed with NRCan/ERD, on an "as needed" basis.

DNCI's products consist of packaged explosives (paper/plastic tubes of explosive material, plus bags of Ammonium Nitrate/Fuel Oil - ANFO), ranging from 1/8 kg to 25 kg per unit, plus accessories (detonators and detonating cord). As well, DNCI manufactures and distributes bulk explosives in the form of emulsion (a mayonnaise-like fluid explosive material) and granular ANFO. Constituent bulk explosive materials, such as Ammonium Nitrate (AN), Fuel Oil and sensitizers may be carried in limited quantities in "bulk explosives-carrying" vehicles (Process Vehicles) between bulk manufacturing / storage facilities and jobsites (see Annex B for Dangerous Goods transported by / for DNCI).

The majority of packaged products, including detonators, are imported from the United States, stored at Company magazine worksites throughout Canada, then sold and delivered to licensed customers in the construction, mining, lumber and seismic industries. DNCI frequently loans or leases mobile magazines (wheeled and skid) to buyers to store their purchased explosives during the operation of their project(s).

DNCI purchases packaged explosives primarily from Dyno Nobel America which manufactures detonators in Simsbury, Connecticut; Wolf Lake, Illinois; and manufactures packaged explosives in Carthage, Missouri. Explosives are typically delivered by the manufacturer in U.S.-based tractor-trailer trucks via hazardous goods routes to DNCI's magazine sites and subsequently delivered to customers in DNCI's 5, 3, 2, 1 and 3/4 ton trucks. "When necessary", packaged explosives and accessories, and/or raw materials to manufacture bulk explosives will be flown to remote Northern locations via dedicated air transport carriers under ICAO standards and procedures. As well, products may "occasionally" be shipped via rail. On occasion, packaged products can be shipped to customers by sea-can on a barge in accordance with TDG and IMDG codes. All explosives operations are conducted in accordance with NRC / ERD and TDG standards and authorizations.

Bulk ANFO is manufactured in DNCI plants Nanaimo, BC; Flin Flon, MB ;Red Lake,ON; Ormstown, QC; Rockyford, AB plants; and is subsequently transported in either 25 kg bags or 1 ton totes to customers in local and adjacent provinces via company or third-party trucks ranging from 2,000 to 20,000 kg loads.

Bulk emulsion explosive is manufactured at DNCI's Ormstown QC; Tumbler Ridge BC and North Bay ON plants, and is delivered in tractor trailer tankers and/or bulk Pump Trucks (Process Vehicles) to customers in local and adjacent provinces. As well, emulsion is manufactured in Biwabik, Minnesota (USA) for delivery in Manitoba and NW Ontario. Emulsion may be delivered from the manufacturing plant to the end-user's worksite, or it may be distributed to customers in two stages, by way of bulk storage & redistribution sites using Pump Trucks (Process Vehicles) or in 2,000kg (tote) cubic containers transported by dedicated tractor trailers and/or 2 – 5 ton cargo vans.
Emulsion and ANFO is also manufactured at Polar's Ekati, NT; DWE's Diavik, NT; QAAQTUQ Meadowbank,NU and DNCI's Mount Wright (Fermont) QC; worksites for use in locally controlled and restricted mining operations.

Dangerous Goods that are transported by or for DNCI are listed in Annex B.

Road Transportation

Subject to approved permits and regulations, explosive shipments may occur 24 hours per day, 7 days a week, depending upon environmental conditions and industry activity. All road transport vehicles are constructed, equipped and placarded to meet explosives standards and regulations. As well, workers offering for transport, handling and transporting explosives must be first trained in accordance with NRC / ERD and TDG Clear Language Regulations. Only company personnel authorized under ERD regulation and issued with a valid TDG training certificate are allowed to handle or transport explosives. It is also the responsibility of the driver and management to ensure that handling and transportation of explosives is carried out safely and legally.

Prior to transporting explosives, the Driver must ensure that the vehicle is properly serviced and in good operating order. As well, they must ensure that required safety equipment is present and operational; that the load is properly distributed and secured in an approved cargo space; that appropriate safety mark placards are displayed while transporting explosives; that required documentation is properly completed and placed within the cab, and that a delivery route plan is provided to the dispatching worksite.

The shipping documents list the Company's 24 hour telephone number 1-800-367-4629 which can be used by third parties to initiate the ERAP, should the Driver be incapacitated.

Rail Transportation:
DNCI will occasionally transport limited quantities of explosives in dedicated railcars pursuant to TDG regulations to remote locations that are not normally accessible by road. As well, rail transportation may be used to transport large (rail car) quantities of explosives "on infrequent occasions".

Air Transportation:
Packaged explosives and/or raw materials to manufacture explosives are periodically transported to remote Northern mine sites via third party transport aircraft operating under ICAO and TDG regulations.

Marine transportation:
Packaged explosives and/or raw materials to manufacture explosives are periodically transported to remote Northern Mines via third party barge operating under IMDG and TDG regulations. Also, sometimes road tankers cross waterways on ferries to access sites.

3. POTENTIAL TYPES OF ACCIDENTS / EMERGENCIES

The types of problems (accidental release, imminent accidental release, etc.) which may occur when transporting explosives include:

Road Transportation
The types of incidents that may occur when transporting explosives by road are:

- Vehicle accident (collision or upset) involving :
    - explosion of all or portions of transported explosives due to impact, fire or extraneous detonation;
    - fire or potential for fire giving rise to potential explosives detonation;

  - scattering or spill of explosive material into / onto water body;
  - scattering or spill of explosive material on the ground or frozen water body.
- Hijacking of vehicle or theft of explosive shipment.
- Incapacitation of vehicle driver.
- Mechanical breakdown of vehicle.

Note: See Hazard Analysis Checklist, ERAP Section 13, pg 30.

Rail Transportation

- Train accident (collision or derailment) involving :
  - explosion of all or portions of transported explosives due to impact, fire or extraneous detonation;
  - fire or potential for fire giving rise to potential explosives detonation;
  - scattering or spill of explosive material into / onto water body;
  - scattering or spill of explosive material on the ground or frozen water body.
- Hijacking or theft of explosive shipment.
- Mechanical breakdown of train.

Air Transportation

The types of incidents that may occur when transporting explosives by air are:

- Diversion of aircraft to an alternate airport due to:
  - destination and departure airports being closed (due to weather or other circumstance), or
  - aircraft malfunction while en route to destination.
- Hijacking of aircraft or theft of explosive shipment.
- Aircraft accident (crash/forced landing) while en route to destination airport.

Marine transportation

The types of incidents that may occur when transporting explosives by marine vessel are:

- Diversion of vessel to an alternate port due to:
  - destination and departure ports being closed (due to weather or other circumstance), or
  - vessel malfunction while en route to destination.
- Hijacking of vessel or theft of explosive shipment.
- Marine vessel accident (sinking, collision, capsizing, etc.) while en route to destination.

Road / Rail /Air/ Marine ERAP Objectives

DNCI's response, be it advising First Responders on the scene, assembling and transporting an Emergency Response Team (ERT) & recovery equipment, and/or contracting third party services, will always be carried out with the interests of public safety and security as the foremost objective. Available resources and effort will be devoted to protecting and preserving life and limb, the environment, property, and commercial/personal activities.

4. CORPORATE ADDRESS CORPORATE OFFICERS & SENIOR MANAGEMENT

Suite 210, 48 Quarry Park Blvd SE Calgary, AB T2C 5P2. Tel: **1-800-565-8375** Tel : 1-403-720-0905 Fax: **1-403-236-5625**	General Manager Western N.A. and Arctic.	Mike T Soter (cell : 1-801-580-5919)
	Regional Operations Manager	Craig Nicolson (cell : 403-512-5127)
	Regional Operations Manager	Tom Medak (cell: 403 818-4434)
	HSEC Manager Canada	Seamus Kilcommons (cell : 403 837-2685)
350 Dupont Rd, Box 900, North Bay, Ontario, P1B 8K2, Canada **Tel :** 1- 705- 472- 1300 **Fax:** 1- 705- 472 -3416	General Manager Central Canada	Pierre Labelle (cell : 704-471-1864)
	H&S Advisor – Central Canada	Rick Chopp (cell : 705-498-2855)
3665 Boul. Grande Allée. Boisbriand, QC, J7H 1H5 Tel: 1-450-437-1441 Tel : 1-866-550-1441 Fax: 1-450-437-2085	General Manager Eastern Canada	John Vazquez 514-209-7906
	Operations Manager – Eastern Canada	Marco Giambagno (cell : 514-235-4093)
	H&S Advisor – Eastern Canada	Allen Fontaine (581) 444-1039
	Environmental Manager Canada	Benoit Choquette (cell: 514-249-6285)
	Regulatory Affairs Coordinator Canada	Pierre St-Georges (cell: 613-677-1051)

5. EMERGENCY RESPONSE ORGANIZATION

DNCI has an answering service on call 24 hours a day, who can be contacted at 1-800-367-4629 to activate this ERAP.

DNCI staffs are organized into three functional ERAP groups, as follows:

Group 1 : DNCI Corporate contact : A DNCI corporate employee who is assigned to receive Emergency Calls at all times from the answering service. The list of Corporate contacts is presented in page 6.

Group 2 : Emergency Response Advisors – management and technical staff who will provide both distant and on-scene advice to First Responders and Local Authorities regarding the threat and handling of explosive products. When warranted, a Senior ERA will be dispatched to an accident scene where they will become the **On Scene Coordinator**

(OSC), providing direct advice to local authorities and coordinating (managing) DNCI resources in the stabilization and recovery of dangerous goods involved in an incident. The list of primary ER Advisors is presented in page 7.

Group 3 Emergency Response Team (ERT - Logistical Support) – branch, plant and sales staff who routinely handle, transport or sell explosive products and operate associated equipment, and who will assist and/or conduct on-scene recovery operations. The ERT will normally be lead by an **On Scene Coordinator (OSC**) at the emergency site. The ERT personnel is listed in Annex D for the various DNCI sites.

6. DUTIES OF KEY PERSONNEL

ROAD AND RAIL TRANSPORTATION

(1) DRIVER / TRAIN CONDUCTOR / ENGINEER EXPERIENCING EMERGENCY / POTENTIAL EMERGENCY

- **CALL FOR EMERGENCY ASSISTANCE**
  In the event of an emergency, accidental release or imminent accidental release involving the transportation of explosives, eliminate potential sources of detonation where possible (eg. turn off the ignition of a vehicle), call **911** (or the local police number) for immediate assistance and initiate DNCI's Emergency Response Assistance Plan by calling 1-800-367-4629.

- **WARN PUBLIC IF RISK OF DETONATION**
  Should there be explosive detonations, or the risk of detonations due to the presence of fire or other detonating factors, advise the First Responders (or anyone within the immediate vicinity if First Responders are not at the scene) of the risk of an explosion. Help organize perimeter guards to prevent people from entering the evacuation zone. The minimal distance to evacuate for a 20,000 kg tanker is 1.2 km or 4000 feet.
  Note: See ERAP section 14, pg 34 for Evacuation Procedures.

- **EXTINGUISH SMALL FIRES IF SAFE TO DO SO**
  Do not fight fires that have reached or have heated the explosives or ammonium nitrate cargo. Flood minor fires with fire suppressant (Dry Chemical, water, dirt, CO2) and monitor the situation to ensure the fire doesn't re-ignite.

- **ASSIST LOCAL AUTHORITIES**
  Assist First Responders and Local Authorities in eliminating the emergency situation, and liaise with DNCI's On-Call Employee / ERA until relieved by the Company's Emergency Response Team (ERT), or reassigned to other duties.

(2) CORPORATE CONTACT TO RESPONSE TO AN EMERGENCY CALL

- Upon receiving an emergency call, keep a log of all subsequent communications and actions, and do the following:

- Immediately obtain the name and callback number of the caller, in case the telephone line is lost.

- Obtain information to complete the Emergency Report Form (ERAP pg. 8) as fully and accurately as possible.

- **WARN FIRST RESPONDERS OF EVACUATION DISTANCES IF RISK OF DETONATION**
  Should there be explosive detonations, or the risk of detonations due to the presence of fire or other detonating factors, advise the First Responders of the risk and applicable safety distances per Table 9-1, page 21 .
  Note: See ERAP section 14, pg 34 for Evacuation Procedures.

- Call an Emergency Response Advisor (ERA) (see table page 7) and report the emergency situation. (In turn, the ERA will phone the emergency scene caller, establish ongoing contact, assess the emergency, determine what additional resources are required and organize an Emergency Response Team (ERT) made up of regional personnel to proceed to the emergency scene if required).

- Liaise with Company Executive / Senior Managers.

- Call CANUTEC (613) 996-6666 for any transportation incident involving spills.

(3) EMERGENCY RESPONSE ADVISOR (ERA)

- Call the Branch/Plant Supervisor nearest the emergency scene plus provincial & federal authorities to advise them of the situation and the need for an emergency response.

- Designate, assemble and dispatch an Emergency Response Team (ERT) under the leadership of an On Scene Coordinator (OSC), if required.

- Authorize the dispatching of additional resources, communications, transportation and contracted services as necessary.

- Contact and instruct the designated Emergency Response Team (ERT) to proceed to the emergency scene with the required vehicles and equipment.

- Liaise with the Person in Charge of the First Responders, the vehicle driver or railway official (involved in the Emergency) and/or Local Authorities to obtain a situation update.

- **WARN FIRST RESPONDERS OF EVACUATION DISTANCES IF RISK OF DETONATION**
  Advise Local Authorities as appropriate, regarding the properties, hazards and handling procedures for the explosives or ammonium nitrate involved in the emergency. In particular, advise the Local Authorities of appropriate evacuation distances per Table 9-1.

- Continue to consult with the Local Authorities as appropriate, plus the Company's On-Scene Coordinator (OSC), to stabilize and eliminate the emergency.

- Respond to media requests in accordance with the Crisis Communication Plan (CCP).

- Contact the explosives supplier and / or transporter (if other than DNCI) to advise them of the emergency and to request their assistance if/as required.

- Organize and direct the Company's clean-up / recovery / restoration activities utilizing third-party resources as appropriate.

- Authorize the development and submission of immediate and follow-up regulatory reports (see Part 8 of the TDG Clear Language Regulations).

(4) ON-SCENE CO-ORDINATOR (OSC)

- The On-Scene Coordinator (OSC) is the Company's representative and local authority in charge of all company actions and resources at the emergency scene. Once the OSC arrives at the emergency scene, the ERA will transfer communication with First Responders/Local Authorities to the OSC. In turn, the OSC will liaise with the ER Advisor as required. Throughout the Company's emergency response, the OSC will ensure that Company personnel (employees and contractors) observe all safety and regulatory standards and procedures.

- The OSC may revise / adjust the composition of the Emergency Response Team (ERT) and supporting resources as required. The OSC may, in consultation with the ER Advisor, contract commercial services to assist in addressing and restoring the emergency situation.

- The OSC will oversee the Company's local involvement with emergency services, government (municipal & provincial) and public interests until the emergency is fully resolved. Post-emergency activities (clean-up, restoration, etc.) may be delegated to an appropriate Branch, Plant or Area Manager.

(5) EMERGENCY RESPONSE TEAM (ERT)

- Selected emergency response personnel will take their direction to assemble and proceed to the emergency scene from the ERA or their representative. While preparing for and en route to the emergency scene, ER Team members will maintain periodic communication (at least every two hours) with the ERA. Upon arriving at the emergency scene, Team members will immediately report to the On-Scene-Coordinator and advise ERA of their arrival.

- The primary role of the ERT is to provide a competent and trained / certified workforce plus specialized equipment and material to assist First Responders / Local Authorities in the stabilizing and elimination of an 'explosives emergency', and to retrieve / recover, repackage and remove to safe and secure storage, non-detonated explosives.

- While at the emergency scene, ERT members will take their direction from the Company's OSC and remain available until released by the OSC.

NOTE:

ONLY INDIVIDUALS WHO HAVE RECEIVED TRAINING AS REQUIRED UNDER THE TRANSPORTATION OF DANGEROUS GOODS (CLEAR LANGUAGE) REGULATIONS, OR WHO ARE WORKING UNDER THE DIRECT AND CONTINUOUS SUPERVISION OF AN EMPLOYEE WHO HAS BEEN TRAINED FOR CLASS 1 DANGEROUS GOODS UNDER TDG, MAY PARTICIPATE IN SITE CLEAN-UP ACTIVITIES SUCH AS PICKING UP, REPACKAGING AND TRANSPORTING EXPLOSIVE MATERIAL.

(6) PILOT EXPERIENCING EMERGENCY OR UNPLANNED EVENTS DURING AIR TRANSPORTATION

Pilots experiencing emergencies or unplanned events may activate DNCI's ERAP.

- Call CANUTEC (613) 996-6666 and the nearest Regional Civil Aviation Office of the Department of Transport for any air transportation incident.

7. EMPLOYEE TRAINING, PLAN PREPARATION & ACTIVATION AND ON SCENE COMMUNICATION

(7.1) Employee Training

All employee's called upon to participate in / support DNCI's ERAP must have current training and qualification in WHMIS, TDG, DNCI's ERAP & Crisis Communication Plan (CCP) and Take 5 Hazard Assessment. Person's providing advices as an Emergency Response Advisor (ERA) will be management / supervisory personnel with significant experience and training in the manufacturing, handling and regulation of explosives. Personnel responding to incidents to assist in the recovery and removal of explosives will be experienced operations and/or sales personnel with knowledge and competency in handling the explosives involved in the incident.

(7.2) Plan Preparation

All Work Site Supervisors (Area, Branch & Plant) will ensure that:

- Staff review and/or conduct an exercise of DNCI's emergency plans (including this ERAP) at least annually.

- A transportable emergency cache of packaging, spill and safety materials, safety equipment, explosives placards and shipping documents is maintained in ready and good order to take to an emergency scene.

- Individual worksite plans are developed to: provide transportation of emergency response personnel and materials to an emergency scene; establish emergency response communications; and retrieve & transport explosives from an emergency scene.

- The emergency phone numbers will be tested at least annually and a record sheet of the test will be kept. A drill should be organized once a year.

(7.3) Plan Activation

When activated, the OSC and designated members of the Emergency Response Team (ERT) will proceed to the emergency scene as quickly as possible, using chartered air service, if distances and travel timeframes are excessive (note: Transport Canada expects organizations to be able to satisfactorily address an emergency within six hours of an incident).

(7.4) On Scene Communication

Company personnel that are dispatched to an emergency scene shall be provided with communication equipment that provides reliable contact with other ERT personnel/ vehicles /ER Advisor/ Corporate Contact. All emergency response personnel / units will normally report their progress to ER Advisor every two hours, until they arrive at the emergency scene, at which time they will take their direction from the OSC.

The On-Scene Coordinator will normally provide a situation update to the Emergency Response Advisor every hour, until the emergency situation is stabilized. While at the emergency scene, members of the Emergency Response Team will report to and take direction from the OSC.

EMERGENCY ACTIONS

9. WHAT TO DO IN CASE OF:
I. CLASS 1 EXPLOSIVE MATERIALS
(Emergency Response Guidebook reference: Guides #112 and #114)

(1) Explosions / Potential Explosions

Class 1 explosive material can be detonated by sparking, heat (fire), impact (shock), friction, lightning and electromagnetic (radio transmitter) activity. Accidents involving Class 1 **materials which are exploding or are likely to explode due to the presence of detonating influences require everyone to be evacuated from the area**. The initial response should therefore be to clear and secure the area of all personnel, setting up roadblocks, barriers and / or guards as appropriate. Personnel within or near the evacuation area should seek protection behind high terrain or large solid obstructions, taking care to stay away from windows and material that may shatter. Evacuation distances are based on the amount of explosive present, as outlined in Table 9-1.

Table 9 – 1
Evacuation Distances
(Based on NRCan Quantity-Distance Principles Table 1 : D8)

Explosive Quantity		Metric Distance		English Distance
700 kg or less		400 Meters		1315 Feet
1,000 kg		445 Meters		1460 Feet
2,000 kg		560 Meters		1840 Feet
2.500 kg		610 Meters		2,000 Feet
5,000 kg		760 Meters		2,500 Feet
7,500 kg		890 Meters		2,920 Feet
10,000 kg		960 Meters		3,150 Feet
14,000 kg		1,080 Meters		3,545 Feet
16,000 kg		1,120 Meters		3,675 Feet
20,000 kg		1,220 Meters		4,000 Feet

Upon resolution of the emergency, take a careful inventory of all remaining material, assess the likelihood of the missing material having been destroyed, and incorporate the information in applicable reports. Clean-up shall be as outlined under spill/scattered explosives procedures.

(2) Fire / Potential For Fire

In general, accidents involving fire and explosives should be treated as an impending explosion, which calls for the immediate evacuation of people from the area according to the evacuation distances. **Never fight fires that are likely to detonate explosives or ammonium nitrate. Evacuate and secure the area.**
Note: See ERAP section 14, pg. 34 for Evacuation Procedures.

Minor fires which do not immediately threaten the explosives cargo should be extinguished as quickly as possible using plenty of fire suppressants (flood the area with Dry Chemical, water, CO2 or dirt). Where possible and without undue risk, First Responders should use unmanned hose holders to suppress a fire and / or prevent it from spreading to the cargo area (monitor fire hose nozzles from a safe distance). Once the fire is extinguished, the area should be monitored to ensure re-ignition doesn't occur.

The decision to remove or separate explosive cargo from a detonating source must be made on a case by case basis, taking into consideration the risk of detonation. **Do not move explosive cargo or the vehicle if the cargo has been exposed to heat.**

Upon resolution of the emergency, take a careful inventory of all remaining material, assess the likelihood of the missing material having been destroyed, and incorporate the information in applicable reports. Clean-up shall be as outlined under spill/scattered explosives procedures.

(3 Scattering / Spill Of Explosive Material On Ground / Frozen Water

In the event explosive material has been scattered or spilled onto the ground, the area should be cleared of people and restricted to First Responders. The immediate concern should be; (1) to prevent detonation and fire; and (2) to prevent unauthorized removal of /tampering with explosive product. ER actions should therefore be:

- Eliminate all ignition sources (turn engines off, no smoking, do not use flares, sparking equipment or radio transmitters and turn-off cell phones in immediate area)
- Secure the area (restrict access by unauthorized people)
- Do not touch or walk through scattered / spilled material
- Do not operate radio transmitters within 100 meters / 330 feet of electric detonators
- Do not clean-up or dispose of scattered / spilled explosives except under the supervision of a specialist
- Ensure all equipment used in handling explosives is grounded or is made of non-sparking material
- Upon resolution of the emergency, take a careful inventory of all remaining material, assess the likelihood of the missing material having been destroyed, and incorporate the information in applicable reports.

Explosive material spilled or scattered on the ground will be in one of three forms. The three forms of explosives are (see ERAP Annex B for explosives characteristics):

- Packaged Products in cardboard containers (sticks/cartridges of explosives, and boosters (Class 1.1D); detonators (Class 1.1B); and detonating cord (Class 1.4*).
- ANFO (Granular) in 25 kg bags or 1000 kg totes (Class 1.5D).
- Bulk Emulsion in pump trucks, tanker trailers or 1000kg totes (Class 1.5D).

Packaged Products:

Packaged products scattered on the ground may be loose units of explosive material plus broken cardboard boxes/cases, or intact boxes/cases of explosive product, depending upon the situation. The primary concern will be to eliminate detonating influences to prevent explosion, and to secure the area to prevent theft or unauthorized handling of the material. Ground contamination is unlikely, but may require the removal/reclamation of a minimum

amount of soil/snow. In turn, members of the ER Team will retrieve the product, take inventory, repackage the explosives as necessary, and transport the explosives to a magazine for quality assessment and disposal/resale as appropriate.

ANFO (Granular):

ANFO is a mixture of granular Ammonium Nitrate and Fuel Oil, usually packaged in 25 kg plastic bags or 1000 kg totes. Spillage will most likely consist of broken and unbroken bags, resulting in granular product scattered upon the ground. The primary concern will be to eliminate detonating influences to prevent explosion and fire, and to secure the area to prevent untrained / unauthorized handling of the material. Surface soil contamination is likely, through minor leaching of fuel oil and chemicals into the ground. The product will also dissolve in water, thereby increasing the depth and area of contamination. Spills should therefore be covered with waterproof tarps in the event of rain and prevented from entering watercourses or drainage systems by forming dykes or dams to eliminate the possibility of runoff. In turn, the ER Team will recover the spilled ANFO from the ground, transferring the material with plastic or non-ferrous shovels into clean plastic containers.

The amount of recovered material should be recorded and the plastic containers labeled accordingly, prior to shipping the product to a magazine for quality assessment and disposal. Appropriate safety/environmental clothing (rubber gloves & boots) needs to be worn during the operation. As well, it may be necessary to remove/reclaim contaminated surface soil from the accident scene, sending it by contracted service to a reclamation facility.

Emulsion

Emulsion is a thick mayonnaise-like fluid that is transported in bulk, usually in a tanker trailer, pump truck, or rigid tote (cubic large container). A spillage will therefore amount to the fluid being spread across the surface of the ground, sticking to surface matter. Otherwise, ground contamination should be minimal.

Spilled emulsion should be prevented from entering watercourses, drainage systems or flowing onto lower ground by building dykes or dams out of nearby earth or sand. Emulsion will be recovered by using vacuum pumps and air compressors to pump the emulsion into another tanker or holding tanks. Limitations of pump suction are approximately 8 feet, with a pump discharge of approximately 30 feet. Therefore several pumps and additional hose will be required. Small amounts of spilled emulsion may be transferred into a clean plastic container with a plastic shovel. Emulsion may be neutralized (made non-explosive) by mixing it with sand or clay to the point that the mixture is granular (or there are no more globules), or by mixing it with liquid detergent to the point where the mixture is uniformly liquid. The amount/volume of recovered material should be recorded and the replacement containers labeled accordingly, prior to shipping the product to a magazine for quality assessment and disposal. Appropriate safety/environmental clothing (rubber gloves & boots) needs to be worn during the operation. As well, it may be necessary to remove/reclaim contaminated surface soil from the accident scene, sending it by contracted service to a reclamation facility.

(3) Scattering / Spill Of Explosive Material Into Water Body

The environmental effect and emergency response to explosives spilled / scattered into a water body will depend upon the form of explosive involved in the accident. The three forms of explosives are (see ERAP Annex B for explosives characteristics):

- Packaged Products in cardboard containers (sticks/cartridges of explosives, and boosters (Class 1.1D); detonators (Class 1.1B); and detonating cord (Class 1.4*).
- ANFO (Granular) in 25 kg bags or 1000 kg totes (Class 1.5D).
- Bulk Emulsion in pump trucks, tanker trailers or 1000 kg totes (Class 1.5D).

All three forms of explosives will sink in water . The degree of lateral scattering and settling will depend on whether the water is calm or how strong the current is, how large and deep the body of water is, and how long it takes the product to sink due to trapped air within the product container and water turbulence.

Packaged Products:
The greatest concern is to recover and remove packaged products from the water body. While there may be slow and minor leaching of chemical ingredients, the environmental effect should be minimal. If water movement is swift, it will be prudent to locate river-bed barriers downstream to prevent products being moved downstream by the current force of the water. Depending upon water depth, commercial divers may be required to retrieve the packaged product from the water bottom. In turn, retrieved product must be repackaged, loaded into authorized vehicles, and returned to a magazine for salvage or disposal by the ER Team.

ANFO (Granular)
ANFO is a mixture of granular Ammonium Nitrate and Fuel Oil, typically packaged in 25 kg bags or 1000 kg totes. The product is likely to sink quite quickly, however, the 25 kg bags have a fold-over closure mechanism that is not sealed or watertight. Therefore, water will seep into the bags through the closure, or more quickly through rips and tears in the bag. Upon contact with the water, the fuel oil will leach out of the ANFO and rise to the surface, creating an oil slick. At the same time, the AN will dissolve and contaminate the surrounding water body. The degree/extent of water contamination will depend upon the amount of ANFO spilled into the water body and the rate at which the ANFO dissolves (which in turn depends upon whether the water is calm, turbulent, or fast moving; plus if the bag is ripped and/or if the bag closure is opened). Emergency response will consist of (1) addressing the contaminated water and (2) retrieving the ANFO bags.

Surface booms located downstream will help contain an oil slick. In turn, the slick may be removed through the use of absorbent materials, which must be appropriately recovered, stored, transported and disposed of as a Class 4 waste material. Given that the AN contaminated water is not a small body that can be drained or chemically neutralized, response to dissolved Ammonium Nitrate will essentially consist of downstream monitoring, to determine the extent of the AN contamination, the effect on water organisms, and to forewarn water users of the hazard. Retrieval of un-dissolved bags of ANFO and/or empty/partially filled bags may require the assistance of commercial divers. In turn, the product in retrieved bags must be separated from contaminated water in the bags, the 'waste water" collected and stored in suitable containers (eg. settling tanks), the

recovered product repackaged, and both materials returned to authorized storage and disposal facilities by the ER Team and contracted services.

Emulsion:
Emulsion is a thick mayonnaise-like fluid that will sink in water. Constituent chemicals will slowly leach out into the water, and if the water is turbulent or flowing, globules of emulsion will break away from the main deposit and get moved about by the force of the water. As in the case of granulated ANFO, placement of down-stream surface booms and river-bed barriers will capture or restrict the spreading of surface slicks and globules of emulsion moving along the bottom. Generally, chemical contamination of the water will be minimal and localized. Pumps will be required to vacuum the emulsion from a submerged tanker trailer or the riverbed into holding/settling tanks, where the emulsion will be separated from vacuumed waste water. In turn, both materials will require appropriate (bulk) containment and transportation to authorized storage and disposal facilities by the ER Team and contracted services. In each of the three scenarios, an attempt should be made to measure/take an inventory of the recovered material and to account for lost product in subsequent reports.

(5) Hijacking / Theft Of Explosives

The hijacking of an explosives vehicle, or theft of explosives material, must be reported to the Police, DNCI's "on call employee" and Government Authorities as soon as the incident is discovered. While subsequent action by DNCI will be as directed by the Police/Authorities, DNCI will make preparations to provide personnel, vehicles and equipment to help retrieve and transport recovered explosives, if called upon. When the emergency is resolved, take a careful inventory of all recovered material, calculate the amount of missing material and incorporate the information in applicable reports.

(6) Mechanical Breakdown Of Vehicle

In accordance with government regulations, explosives can not be left unattended unless they are stored in a licensed magazine. In the event of a vehicle breakdown, the Driver is to alert the Police (911) of his situation and phone the on-call employee to initiate the ERAP (in this case, the appropriate response will involve organizing a replacement vehicle). Depending upon the circumstances (weather plus distance and time for a replacement vehicle to travel to the disabled truck, etc.), DNCI may have to send a qualified person in advance of the relief vehicle to assist in the safeguarding of the explosives cargo. If necessary, assistance may also be requested of the local police, until Company relief arrives.

(7) Incapacitation Of Driver

Should anyone learn that a Driver has become incapacitated while hauling explosives, they are to (1) immediately advise the Police of the situation and the need to safeguard the explosives in the vehicle, and (2) initiate the ERAP by calling the answering service. (The immediate reaction by the ER Advisor should be to verify/ensure that the Police are safeguarding the explosives (directly or through a third party). As well, in addition to sending a relief Driver by the fastest means available to take charge of the truck, it may be prudent to send an additional vehicle and Driver to help ensure the safe recovery and delivery of the explosives).

II. OTHER DANGEROUS GOODS

(1) Ammonium Nitrate Liquid (Solution) Spill / Release
(Emergency Response Guidebook reference Guide #140.

AN solution is shipped at approximately 200 degrees F. In the event of a spill, eliminate all sources of ignition and dyke the spill with dirt to prevent run-off to water-ways and drainage systems, making sure not to be exposed to the product which can cause serious burns. Prevent the product from mixing with organic material and allow it to cool below 120 degrees F, at which time it will change to a crystalline form. Shovel the crystalline material into non-combustible containers with non-sparking implements and label containers, wearing chemical-protective clothing. Recycle product, if possible; otherwise, dispose of waste according to prevailing environmental regulations / direction.

(2) Ammonium Nitrate Prill Spill / Release
(Emergency Response Guidebook reference Guide #140.

In the event of a spill, eliminate all sources of ignition and dyke the spill with dirt to prevent run-off to water-ways and drainage systems. As well, cover the spilled material with tarpaulins to prevent mixing and run-off in the event of rain or wetting from fire hoses. Prevent the product from mixing with organic material and shovel the material with non-sparking implements into non-combustible containers and label containers. Recycle product, if possible; otherwise, dispose of waste according to prevailing environmental regulations / direction.

(3) Fuel Oil Spill / Release
(Emergency Response Guidebook reference Guide #128.

In the event of a spill, eliminate all sources of ignition and dyke the spill with dirt to prevent run-off to water-ways and drainage systems. If the spill consists of a large amount of pooled liquid, recover the material with a pump and transfer it to an appropriate tank for removal and disposal. If the amount of pooled liquid is small, recover the liquid with an inert absorbent material and transfer the waste material into sealable plastic containers for removal and disposal. Contaminated earth will also require removal via sealable plastic containers. In turn, all waste will be disposed of according to prevailing environmental regulations / direction.

MISCELLANEOUS INFORMATION, GUIDELINES & PROCEDURES

10. EXPLOSIVES CLASSIFICATIONS & CHARACTERISITICS

A list of Dangerous Goods (and their characteristics) transported by or for DNCI is outlined in Annex B.

11. EMERGENCY RESPONSE KITS & MATERIAL

All DNCI worksites will maintain the following emergency response equipment, that is appropriately packaged, stored and easily loaded onto a pick-up truck and / or aircraft for immediate transfer to an accident scene:

I - Spill Recovery Material
1000 ft. of 3 inch fluorescent yellow security tape
3 explosion-proof lanterns / flashlights
1 roll (200 ft.) of 10 mil. clear plastic for ground or product cover
3 "explosives" signs plus assorted 1.1 / 1.5 "placards and labels"
4 polyethylene / non-ferrous 45 gal. drums with removable lids
1 doz. large heavy duty garbage bags (to line drums and for trash)
3 non-ferrous shovels
1 spill kit containing 1 - 25 lb. bag of granular absorbent material
30 ft. of 5 in. sorbent booms
10 ft of 3 in. sorbent socks
1 case of sorbent pads
1 - 3 ft. x 3 ft. neoprene sheet (drain seal)
6 heavy-duty cardboard boxes for repackaging broken boxes
2 rolls of 3" duct tape
2 rolls of 3" packing tape
1 push broom
6 blank (TDG) shipping documents

II – Personal Protective Equipment
6 reflective safety vests
6 safety "goggles"
6 particulate respirators (dust masks)
1 doz. disposable ear plugs
6 pr. nitrile gloves
6 pr. cotton gloves
Industrial First Aid Kit

(Note: all DNCI Emergency Responders must wear CSA approved protective footwear and Type II (lateral protection) hard hats when on the job. As well, a camera should be readily available to photograph the scene of an accident and remedial measures for inclusion in the accident investigation report).

An inventory list of the emergency response kit/material will be kept with the cache, which must be inspected quarterly, to ensure the contents are present and in good working order (note: Emergency response kit cache may be witness/lock-wired closed, in which case only an annual verification that the contents are present and in good working order is necessary, so long as the witness/lock-wire is present and unbroken).

List of sites with bulk emulsion spill handling capabilities

The following DNCI Worksites (see pointers on image) should maintain or have timely access to the following equipment and material:

Site	Province
Tumbler Ridge	BC
North Bay	ON
Sudbury	ON
Flin Flon	MB
Ste-Sophie	QC
Quebec	QC
Bedford	Nova Scotia

- Either a back-up emulsion tanker,
  pump/mix truck(s) or several (3 or more) emulsion tote bins
- 2 air compressors and 200 ft. of 1 in. hose
- 3 diaphragm pumps with 100 ft of 3 in. hose and camlock couplers
- Emergency lighting

12. CONTRACT / SUPPLEMENTARY SERVICES

Depending upon the complexity and severity of an incident, DNCI may have to contract the services of third parties for ERAP assistance. As well, DNCI has agreed to provide ERAP assistance to several customers and associates. The names and phone numbers of third parties who have a standing agreement with DNCI for mutual ERAP assistance are identified in the workplace appendices.

DNCI has standing agreements with the following emergency response services:

National (Cross Canada)
NEWALTA (PSC) INDUSTRIAL SERVICES INC.
North American Spill Line
1-800-567-7455
Administration (Stoney Creek, ON.)
1-888-737-2911

13. HAZARD ANALYSIS CHECKLIST

Packaged Explosives

RISK	ACCIDENT SCENARIOS	CONSEQUENCES OF ACCIDENT	ACTION AT SCENE	BY WHOM
Low/modest frequency, Low consequences	SIMPLE MOTOR VEHICLE, RAILWAY, AIRCRAFT OR MARINE ACCIDENT, NO SCATTERED EXPLOSIVE	* POSSIBLE INJURIES OR DEATH FROM ACCIDENT	* MEDICAL ATTENTION	FIRST RESPONDERS
		* POSSIBLE TRAFFIC DISRUPTION	* DETOUR/HALT VEHICULAR, RAILWAY OR AIR TRAFFIC	DRIVER / RAILROAD REP. / AIRCREW / AIRPORT AUTHORITY / OSC
		* QUESTIONS RE PACKAGING	* PROVISION OF INFORMATION RE: PACKAGING OF EXPLOSIVES	ERA / OSC
		* PERCEIVED RISKS BY FIRST RESPONDERS FROM EXPLOSIVE	* ADVICE TO FIRST RESPONDERS REGARDING TRUE HAZARDS	ERA
		* POTENTIAL FOR THEFT	* CONSTANT SECURITY PROTECTION AGAINST THEFT	POLICE / OSC / ERA / ERT
			* TRANSFER LOAD OF EXPLOSIVE TO OPERATIONAL VEHICLE FOR SAFE AND LEGAL TRANSPORT	OSC / ERA / ERT
Consequences increase as accident escalates	MOTOR VEHICLE, RAILWAY ,AIRCRAFT OR MARINE ACCIDENT WITH SCATTERED EXPLOSIVES	* POSSIBLE INJURIES OR DEATH FROM ACCIDENT	* MEDICAL ATTENTION	FIRST RESPONDERS
		* INCREASED RISK TO PUBLIC SAFETY FROM SCATTERED EXPLOSIVES	* POSSIBLE EVACUATION ORDER BY CIVIL AUTHORITIES	ERA / OSC
		* QUESTIONS RE PACKAGING	* PROVISION OF INFORMATION RE: PACKAGING OF EXPLOSIVES	ERA / OSC
		* POTENTIAL FOR THEFT	* CONSTANT SECURITY PROTECT AGAINST THEFT	ERA / OSC / ERT
		* POSSIBLE EVACUATION	* ADVICE TO FIRST RESPONDERS REGARDING TRUE HAZARDS	ERA / OSC
		* TRAFFIC AND COMMERCE DISRUPTED UNTIL EXPLOSIVES PICKED UP AND REMOVED	* RECOVER SCATTERED EXPLOSIVES * SEARCH * LOCATE * INSPECT * ANALYZE DAMAGED EXPLOSIVES * RECOVER * REPACKAGE AND SHIP * DISPOSE IF NECESSARY	OSC / ERA / ERT

13. HAZARD ANALYSIS CHECKLIST

RISK	ACCIDENT SCENARIOS	CONSEQUENCES OF ACCIDEN	ACTION AT SCENE	BY WHOM
Low frequency with potentially severe consequences	MOTOR VEHICLE, RAILWAY, AIRCRAFT OR MARINE ACCIDENT WITH FIRE BUT NO DETONATION	* POSSIBLE INJURIES OR DEATI FROM ACCIDENT	* MEDICAL ATTENTION	First Responders
		* FIRE	* FIRE SUPPRESSION	First Responders/ Driver / Railway Representative / Aircrew / Airport Authority
		* EVACUATION OF HAZARD ZONE WELL BEYOND TRANSPORTATION CORRIDOR IMPLEMENTED	* EVACUATION ORDERED BY CIVIL AUTHORITIES	ERA
		* TRAFFIC AND COMMERCE DISRUPTED UNTIL THREAT OF DETONATION ELIMINATED	* TRAFFIC HALTED/DETOURED BUSINESSES CLOSE AND PEOPLE LEAVE HOMES	First Responders/ Driver / Railway Representative / Aircrew / Airport Authority / OSC
		* QUESTIONS RE PACKAGING	* PROVISION OF INFORMATION RE: PACKAGING OF EXPLOSIVES	ERA/OSC
		* POTENTIAL FOR THEFT	CONSTANT SECURITY PROTECTION AGAINST THEFT	ERA/OSC/ERT
		* SIGNIFICANT RISK TO PUBLIC SAFETY, POSSIBLE EVACUAT	* ADVICE TO FIRST RESPONDERS REGARDING HAZARDS, FIR FIGHTING OPTIONS AND ZONE LIMITS FOR EVACUATION	ERA/OSC
		* TRAFFIC AND COMMERCE DISRUPTED UNTIL EXPLOSIV PICKED UP AND REMOVED (I APPLICABLE)	* RECOVER SCATTERED EXPLOSIVES (SEARCH, LOCATE, INSPECT, ANALYZE DAMAGED EXPLOSIVES, RECOVER REPACKAGE AND SHIP, DISPOSE IF NECESSARY	OSC / ERA / ERT
Low frequency Severe consequences	MOTOR VEHICLE, RAILWAY , AIRCRAFT OR MARINE ACCIDENT WITH FIRE AND DETONATION	* INJURIES AND DEATH FROM FROM MVA AND FROM DETONATION	* MEDICAL ASSISTANCE	First responders
		* FIRES FROM DETONATION	* FIRE SUPPRESSION	First Responders
		* MAJOR DISRUPTION TO TRAFFIC AND COMMERCE	* TRAFFIC HALTED/DETOURED AND BUSINESSES FORCED CLOSED	First Responders/ Driver / Railway Representative / Aircrew / Airport Authority / OSC
		* PROPERTY DAMAGE POTENTIALLY VERY SIGNIFICANT	* PEOPLE'S HOMES NOT HABITABLE ARRANGE ALTERNATIVE HOUSING	Civil Authorities
		* HIGHEST RISK TO PUBLIC SAFETY, POSSIBLE EVACUATION	* ADVICE TO FIRST RESPONDERS REGARDING HAZARDS, FIRE FIGHTING OPTIONS AND ZONE LIMITS FOR EVACUATION	ERA / OSC
		* QUESTIONS RE PACKAGING	* PROVISION OF INFORMATION RE: PACKAGING OF EXPLOSIVES	ERA/OSC

13. HAZARD ANALYSIS CHECKLIST

Bulk Explosives

RISK	ACCIDENT SCENARIOS	CONSEQUENCES OF ACCIDENT	ACTION AT SCENE	BY WHOM
Low/modest frequency, Low consequences	* Vehicle / railroad car / Marine ship involved in a minor incident / accident	* Possible injuries or death from accident	* Medical Attention	First Responders
	*The tank / trailer / container is upright and appears undamaged.	* Possible traffic disruption	* Detour / Halt traffic	First Responders/ Driver / Railway Representative / OSC
	* No leak detected	* Questions regarding container integrity	* Provision of information regarding inspection of container	ERA/OSC/ Carrier Representative
		* Perceived risks by First Responders from explosives	* Advice to First Responders regarding true hazards	ERA/OSC
		* Potential for leak	* Conduct damage assessment	OSC/Carrier Representative
		* Vehicle damaged, unsafe to transport container / IBC	* Conduct product transfer to an approved tanker/container/vehicle to provide safe and legal transport if container/tanker deemed unsafe.	OSC/Carrier Representative/ ERT
Low/modest frequency, Modest consequences	* Vehicle / railway car/ Marine ship involved in an accident	* Possible injuries or death from accident.	* Medical Attention	First Responders
	* Truck / container are off the road / rail on its side	* Possible traffic disruption	* Detour / Halt traffic	First Responders/ Driver / Railway Representative / OSC
	* Valves accessible & operable	* Questions regarding container integrity	* Provision of information regarding inspection of container	OSC / Carrier Representative
	* Truck / tanker / container appear undamaged	* Perceived risks by First Responders from explosives	* Advice to First Responders regarding true hazards	ERA / OSC
		* Potential for leak	* Conduct damage assessment	OSC / Carrier Representative
		* Increased Risk to public / environment from potential spill of product	* Possible evacuation ordered by Civil Authorities. Contain spilled product to immediate area	OSC / ERA
		* Potential of theft	* Constant security protection against theft	Police / ERA / OSC / ERT
		* Questions re cleanup if spill occurs during transfer	* Provision of information regarding recovery of spilled product due to transfer and conduct transfer to an approved container to provide safe and legal transport	OSC / ERA / ERT/ Environment Contractor

13. HAZARD ANALYSIS CHECKLIST

RISK	ACCIDENT SCENARIOS	CONSEQUENCES OF ACCIDEN	ACTION AT SCENE	BY WHOM
Low/modest frequency, Modest to severe consequences	* Vehicle / rail car / Marine ship involved in an accident	* Possible injuries or death from accident	* Medical Attention	First Responders
	* Truck / container are off the road / rail on its side	* Possible traffic disruption	* Detour / Halt traffic	First Responders/ Driver / Railway Representative / OSC
	* Valves are NOT accessible or operable and the truck / container cannot be uprighted	* Questions regarding container integrity	* Provision of information regarding inspection of container	OSC/Carrier Representative
		* Perceived risks by First Responders from explosives	* Advice to First Responders regarding true hazards	ERA/OSC
		* Increased Risk to public / environment from potential leak during the transfer of product	* Possible evacuation ordered by Civil authorities. Prepare containment of spilled product in the immediate area	OSC/ERA
		* Potential of theft	* Constant security protection against theft	Police / ERA/OSC
		* Questions re cleanup if spill occurs during transfer	* Provision of information regarding of spilled product due to transfer.	ERA/OSC

			* Conduct cleanup and decontamination of area affected and dispose of all waste	OSC/ ERT / Emergency Response Contractor
Low/modest frequency, Severe consequences	* Vehicle / rail car / marine ship involved in accident	* Possible injuries or death.	* Medical Attention	First Responders
	* Truck / container are off the road / rail on its side	* Possible traffic disruption	* Detour / Halt traffic	First Responders/ Driver / Railway Representative / OSC
	* Catastrophic failure of container and product spilled .	* Perceived risks by First Responders from explosives	* Advice to First Responders regarding true hazards	ERA/OSC
		* Increased Risk to public / environment from product leak	* Possible evacuation ordered by Civil authorities. Contain spilled product and monitor any spill beyond immediate area	OSC/ ERT/ Emergency Response Contractor
		* Media attention	* Provide trained media relations	DNCI Regional Manager
		* Potential of theft	* Constant security protection against theft	Police / ERA/OSC/ ERT
		* Questions re cleanup and transfer	* Provision of information regarding recovery of spilled product	OSC/ ERT/ Emergency Response Contractor.
			* Conduct transfer to an approved container to provide safe and legal transport	OSC/ERT/Emergency Response Contractor
			* Conduct cleanup and decontamination of area and dispose of all waste	OSC/ERT/ Environmental Contractor

14. EVACUATION PROCEDURES

Along public highways or within municipalities, advise the first emergency responders at the scene (police or fire) of the need to evacuate using the guidance in the Emergency Response Assistance Plan. It is the responsibility of municipal authorities to initiate such action but it is vitally important they understand the circumstances and take the appropriate evacuation actions if there is danger of a detonation. Employees at the scene should assist local emergency services to the best of their ability to accomplish this. However, if action is immediately required and there are no emergency services on scene, enlist the help of other motorists to prevent access into the hazard zone until such time as the fire department or police arrive. For incidents within a worksite such as a mine, quarry or construction operation, in most cases access is radio controlled. The quickest way of alerting people, therefore, is by site radio. Clearly state your location, situation and call for assistance in evacuating the area.

DO NOT FIGHT EXPLOSIVES FIRES. EVACUATE THE AREA AND LET THE FIRE BURN ITSELF OUT.

THE MINIMUM EVACUATION DISTANCE IS AS OUTLINED IN TABLE 9-1 (Pg. 21) FOR ALL DIRECTIONS (which is based on a higher traffic / risk / population density within the area, without benefit of protective features such as berms and hills. Distances may be extended to a minimum of 1,600 meters for situations that involve high risk surroundings).

15. INITIAL ON SITE RISK ASSESSMENT

In order to assure the highest level of safety at the scene of an accident the Truck Driver, Aircraft Crew Member, Railroad Representative, First Responder or Emergency Response Advisor (ERA) should follow this checklist before commencing any cleanup procedures.

ALWAYS ASSESS / APPROACH A SCENE FROM UPWIND

- Check for injuries and account for personnel involved in the accident (drivers and helpers, aircrew, train crew, third-party personnel)
- Determine probability of fire or chance of fire. Shut off electrical systems (disconnect batteries and auxiliary equipment if possible). Eliminate all sources of ignition.
- Determine the severity of the situation and order the evacuation of the scene if necessary.
- Assess the area for immediate safety and environmental risks and hazards such as equipment stability, downed power lines, evidence of smoke or fumes, potential for product or waste water from fire hoses to run downhill into a drainage system or enter a nearby water body.
- Alert and assemble a DNCI Emergency Response Team (ERT).
- Establish work zones or personnel exclusion zones.
- Consider Wind, Temperature, Precipitation (what's the weather forecast? – *it may have an effect on handling conditions*)
- Consider traffic control, site access, and proximity to public. (*defer to police as soon as they arrive)*
- Implement containment procedures if safe to do so. Stop flow of spilled material.
- Assess equipment requirement (transfer pumps, compressor, hoses, non-sparking tools, lighting, packaging, containment booms).
- Consider ERT requirements (food & fluids, warm up area, accommodation, etc).

- Consider safety equipment (rubber gloves, rubber boots, coveralls, hardhats, eye protection, dust masks, etc. – see ERAP section 11 pg. 27.
- Consider outside sources of aid, such as technical consultants, spill recovery specialists, transportation requirements, special equipment, etc.

16. ESTABLISHMENT OF WORK ZONES

In instances where high risk factors have been identified by the On Scene Coordinator (OSC) during his initial assessment, he will need to establish work zones to provide the highest level of safety for response personnel and the public, as follows:

Exclusion Zone/Hot Zone
This is the zone posing the highest hazard. This area is to be cordoned off using "Caution" tape, to keep response workers out of this area. This zone may require specialized equipment or tasks assigned to specially trained or designated personnel.

Contamination Zone/Warm Zone
This is the zone where containment, cleanup and repackaging activities will be conducted. This area will be contaminated with explosives or ingredients and only people that are trained in the handling of those products will be allowed access. Protective equipment is necessary in this zone such as rubber gloves, rubber boots and eye protection. Only non-sparking tools are to be used in this zone.

Support Zone/Cold Zone
This is the zone where no contaminants are present and must remain so.
No protective equipment is necessary. This is the area where a command post could be established for communications, storage of special equipment, rest & food area and other such functions. Operations within the support zone should always be upwind of the incident scene.

Establishment of Work Zones

17. GUIDELINES FOR THE RECOVERY OF "BULK" EXPLOSIVES AND OTHER MATERIALS

The hauling of bulk explosives and explosives feedstock is most frequently carried out by contract trucking firms. However, DNCI also hauls bulk explosives in company pump trucks and cargo trailers and vans. **Because every accident scene and situation is different the following information will serve as a guideline for recovery crews.**

17.1 GUIDELINES FOR RECOVERY OF AMMONIUM NITRATE PRILL

Ammonium Nitrate Prill when mixed with any organic material such as fuel, oil, sawdust, coal dust etc. becomes an explosive product. Ammonium Nitrate Prill is extremely soluble in water and extremely toxic to fish.

Ammonium Nitrate in prilled (pelletized) form is commonly transported on public highways in bulk (grain-type) carriers, end dump trucks, one metric tonne fabric totes and 25 Kg. plastic bags. It is also transported in pump/mix trucks

Containment.
The single most important task in containing Ammonium Nitrate prill is to keep spilled fuel or any other organic material from mixing with the prill, and keeping it dry. Oil absorbent pads or Floor Dry type materials must be used to control and soak up spilled fuel and oil at the site. Fuel and oil sources can be from leaking tractor fuel tanks, power train components and in the case of pump/mix trucks, from the fuel mix tank.

Barricades of earth or sand should be used to dam/isolate fuel and other organic material, thereby preventing it from mixing with spilled AN prill. As well, the spilled AN prill should be covered with plastic to stop rain or water from dissolving the product, and dammed to prevent any run-off to adjacent drainage system or water way.

Recovery of Product.
Ammonium Nitrate prill is easily handled using non-sparking shovels and brooms. In the case of large spills front-end loaders can be used to load the material into an alternate means of transportation such as an end dump truck. Fabric totes may also be suitable as temporary packaging for transport to the disposal site.

Final cleanup of equipment and ground is carried out with brooms and approved vacuum cleaners. If water is used as a fire deterrent, it is to be kept to a minimum and every effort needs to be made to contain and collect the resulting solution.

The shipping document will indicate how much product is to be recovered, and will be valuable for shipments of Totes or 25 Kg bags. It is unlikely that 100% of the material will be recovered, however, an attempt should be made to estimate the amount of lost product.

Product Disposal and Environmental Remediation
Recovered AN prill that is contaminated with dirt and/or organic material will be loaded in boreholes and detonated or burned. In the event of a major spill, an environmental contractor should be hired to assess the level/degree of ground contamination and to make recommendations for remediation and disposal of contaminated soil.

17.2 GUIDELINES FOR RECOVERY OF BULK EMULSION EXPLOSIVES

Bulk emulsion is an explosive product. All caution must be taken to eliminate heat, impact or friction when working with this material.

Bulk emulsion explosives are transported on public roads by highway tanker (class MC 307 or MC 407) in quantities of around 20 metric tones, or in lesser quantities of around 10 metric tonnes in specialized pump/mix trucks.

Product Rheology
The rheology of bulk emulsion is such that when spilled it will not easily run or soak into the ground, and it is not water soluble. Therefore, containment of a bulk emulsion spill is simply achieved by containing it with a dyke or dam of sand or dirt.

Method of Recovery
The recovery of bulk emulsion explosives will vary depending on the severity of the accident, condition of the tanker and site conditions. Crews should consider up righting an overturned tanker first to stop further spillage if safe to do so. This may involve the recovery of some of the product from the overturned tanker first either through the valve system, hatch or exposure created through damage to the trailer. In extreme situations where no access to the product is available through the valve system or hatch, an opening may have to be created near the highest point in the damaged tanker using a hand-powered (manual) metal cutting hacksaw through which a hose can be inserted to pump the emulsion product from the tanker with a DNCI approved air operated diaphragm pump and hoses. The majority of spilled emulsion explosives will be cleaned up using a diaphragm pump. Such pumps are safe and efficient for the transfer of emulsion products, as they are air driven (requiring an air compressor of at least 100 CFM).

Location of Backup Equipment.
DNCI worksites listed in page 27 should maintain a list of sources where emergency back-up equipment can be obtained in short notice, should it be necessary to offload emulsion from one vehicle to another. Back-up equipment is to include:

- An approved tanker, vacuum pump truck(s), pump/mix truck(s) or emulsion tote tanks
- Air Compressor (of at least 100 CFM) and 1 inch hoses (at least 200 feet) to drive (diaphragm) pumps with 3" inlet/outlet.
- 3" (diaphragm) air driven pumps
- 100 feet of 3 inch hose with camlocks
- emergency lighting
- Other equipment as outlined in section 11, pg. 27-29.

Emergency / backup equipment may be sourced from:

- The trucking contractor's inventory
- DNCI's worksite inventory
- Customer's inventory (eg. the mine site receiving the emulsion deliveries)
- Commercial services/rentals

Recovery of Product.
Only clean emulsion product should be sucked up using the diaphragm pump, transferring the material to the backup vehicle/container. To transfer the emulsion:

- Position plastic/tarps under areas where there is the potential to leak, to collect product during transfer process
- Bond and ground disabled and recovery vehicles/containers
- Position diaphragm pump near the disabled vehicle, connect pump inlet hose to disabled vehicle's outlet, or place hose inside tank (to be emptied) through the hatch.
- Connect hose to outlet of pump and inlet of receiving vehicle/container or use top hatch.
- Connect compressor air line to diaphragm pump and start transfer slowly at first, increasing pump flow after a visual check for any leaks is complete.
- Squeegee all products possible from the damaged vehicle.
- Remove tarps and decontaminate any spilled emulsion with liquid detergent
- Transport disabled vehicle to worksite for complete decontamination of residual emulsion, before releasing vehicle for repair/scrap.

Contaminated emulsion product will be cleaned up using non-sparking scoop shovels and placed in non-sparking containers such as plastic garbage cans, plastic totes or garbage bags that can be properly marked for transport to a disposal site. *The use of garbage bags (clear if available) is the preferred method for gathering spilled product as they are easily dropped down a borehole for destruction.*

- Clean up spilled product and contaminated soil and place in buckets or drums.
- Decontaminate surfaces (black top, pavement) that cannot be removed by removing as much as possible with non-sparking shovel, then spread sand or clay on the spill, brush with a broom and collect waste in buckets or drums for return to the worksite for disposal.
- Label all containers **For Salvage – Explosives, Blasting, Type E, UN 0332, hazard label and markings, N.O.S.** per NRCan (use felt pen)

Product Disposal and Environmental Remediation
Contaminated emulsion will be loaded in boreholes and detonated or burned. In the event of a major spill, an environmental contractor should be hired to assess the level/degree of ground contamination and to make recommendations for remediation and disposal of any contaminated soil.

Assessment of Disabled Vehicles
DNCI's trucking contractors will normally be requested to provide their expertise in assessing damage and roadworthiness for their disabled tanker trailers and hauling equipment. This assessment will require a trucking representative to travel to the site before the damaged unit is moved on the road. Similarly, DNCI will normally arrange for a qualified mechanic to assess a disabled Company vehicle for road-worthiness, prior to allowing it back on the road. In the event that a vehicle is assessed as not being roadworthy, the unit will be placed on a trailer and moved to a site where it can be decontaminated prior to being repaired.

17.3. PROCEDURE FOR TRANSFERRING EMULSION TO ANOTHER TANKER (TRAILER UPRIGHT, NO DAMAGE)

17.3.1. Position tarp(s) under hatches or leaking areas to collect product escaping from trailer
17.3.2. Bond and ground tanker
17.3.3. Position diaphragm pumps near the trailer, connect loading hose to damaged tanker outlet and to inlet of pump. Secure with whip checks to avoid injury.
17.3.4. Connect hose to outlet of pump and inlet of spare trailer
17.3.5. Connect compressor air line to diaphragm pump and start transfer
17.3.6. Squeegee all product possible from the damaged tanker (DO NOT ENTER TANKER)
17.3.7. Clean all loose product from the damaged tanker area on trailer and collect in suitable containers (plastic buckets, etc…). Label containers as **For Salvage, Product Name, UN #, hazard label and markings, N.O.S.** per NRCan (use felt pen)
17.3.8. Collect all loose product on tarp and place in buckets
17.3.9. Clean all loose product on the ground with plastic shovel; collect all contaminated soil and place in buckets or drums.
Ship scrap to a DNCI plant site for treatment.

17.4. PROCEDURE FOR TRANSFERRING EMULSION TO ANOTHER TANKER (TRAILER ON SIDE, VALVES NOT OPERABLE OR ACCESSIBLE)

17.4.1. If trailer can be uprighted and valve can be operated, follow procedure 1 above
17.4.2. If trailer can be uprighted and the valve is not operable
17.4.3. Upright trailer
17.4.4. Bond and ground tanker
17.4.5. Insert loading hose from Wilden pump through hatch into emulsion
17.4.6. Connect compressor air line to diaphragm pump and start transfer to second tanker
17.4.7. Wipe all loose product from damaged areas of the trailer and collect in buckets
17.4.8. Collect all loose product on the ground wit plastic shovel and collect all contaminated soil and place in buckets
17.4.9. Label containers as **For Salvage, Product Name, UN #, hazard label and markings, N.O.S.** per NRCan (use felt pen)
17.4.10. Ship scrap to a DNCI plant for treatment.

17.5. PROCEDURE FOR TRANSFERRING EMULSION TO ANOTHER TANKER (TRUCK ON ITS SIDE, HATCH/VALVES NOT ACCESSIBLE OR NOT OPERABLE/CANNOT BE UPRIGHTED)- LAST RESORT PROCEDURE.

17.5.1. Position tarps under hatches or leaking area to collect as much product escaping from the trailer as possible
17.5.2. Bond and ground tanker
17.5.3. Under DNCI supervision, create an opening near the highest point in the damaged tanker using a hand-powered (manual) metal cutting hacksaw through which a hose can be inserted to pump the emulsion product from the tanker with a DNCI approved air operated diaphragm pump and hoses. If another hole must be subsequently cut to permit pumping of the emulsion (as in the case of the emulsion level too far from the hole for the pump to lift the emulsion), use this first hole as an inspection and measuring port so another access hole can be cut *above* the emulsion level in the tanker using the same hacksaw technique as above. Do not cut into the tanker *below* the emulsion level in the tank. Note that a hacksaw with the blade flush with its frame bottom will work best to penetrate the tank and a one-handed (or one-ended) hacksaw can then be used to finish the cut to make a hole in the tanker. Cutting first on the tanker curve or at the tanker ends on the curves with several new hacksaw blades could make the cutting process easier."
17.5.4. Place hose in hole and siphon remaining emulsion with the Wilden pump into another tanker or IBC's
17.5.5. Wipe all loose product from damaged areas of the trailer and collect in buckets
17.5.6. Collect all loose product on the ground wit plastic shovel and collect all contaminated soil and place in buckets
17.5.7. Label containers as **For Salvage, Product Name, UN #, hazard label and markings, N.O.S.** per NRCan (use felt pen)
17.5.8. Ship scrap to a DNCI plant for treatment.

ANNEX A To DNCI's ERAP 2-1037

Location of DNCI Factories (that are staffed by DNCI Employees/Reps)
(NRCan License Legend: F – Factory (manufacturing &/or bulk storage);

EC = Emergency Contractor

(2) Divisions & Compatibility Groups Of Explosives
(Explosives are categorized as "Class 1" Dangerous Goods; and subdivided into 6 Divisions)

Class . **Division**
Class 1.**1** – **Mass Explosion Hazard**
Class 1.**2** – Projection Hazard (but not a mass explosion hazard)
Class 1.**3** – Fire Hazard and either a Minor Blast Hazard or Minor Projection Hazard (but not a mass Explosion hazard)
Class 1.**4** – No significant hazard beyond the package in the event of ignition or initiation
Class 1.**5** – Very Insensitive Substance with **Mass Explosion Hazard**
Class 1.**6** – Extremely insensitive article with no mass explosion hazard

Compatibility Group
B – Substances which are expected to explode or detonate en masse very soon after fire reaches them.
D – Substances which may explode en masse accompanied by a blast and fragment hazard, but may be exposed to fire for some time before exploding.
S – Packaged substances that, if accidentally initiated, produce effects that are usually confined to the immediate vicinity.

(3) Properties Of Explosives
IMPORTANT: Class 1.1 and 1.5 explosives will burn and may detonate en masse at any time. (Class 1.1 and 1.5 essentially cover all the explosives used by DNCI)

Class1.1B Detonators
Dyno Nobel Products: Electric Seismic Detonators, Non-electric, Electronic, Safety Fuse Assemblies, and MS Connectors

Packaging: Cardboard boxes, plastic bags

Hazards: **Explosion with Shrapnel**
Although blasting caps are carried in small quantities in separate and confined areas, they are capable of explosion from heat, concussion, abrasion, and lightning. When detonated, the danger of flying metal fragments is very likely.
Toxic Fumes
Burning may produce irritating, corrosive and/or poisonous gases.
Scattered / Spilled Material
Clear area of personnel and wait for assistance from trained personnel before handling or removing detonators.
Water Contamination
Usually a minor problem. Containing and retrieving packages from water body is an important requirement for public safety and security reasons.

Class1.1D Cap Sensitive Explosives

Dyno Nobel Products: Unigel, Unimax, Dynomax, Dynosplit, Dyno AP, Dyno SL, Blastex, Vibrogel, Trojan Geoprime.

Packaging: Waxed paper or plastic tubes/cartridges, chubs or coil packed in heavy cardboard boxes.

Hazards: **Explosion**
This is the most important concern because of the possibility of a major detonation. Detonation could be triggered by heat, impact or lightning.

Hazards: **Toxic Fumes**
Burning explosives give off toxic fumes (irritating, corrosive &/or poisonous gases). The area should be evacuated before this is a problem.
Scattered / Spilled Material
Clear area of personnel and wait for assistance from trained personnel before handling or removing explosive material.

Water Contamination
Usually water contamination is a very minor problem with Class 1.1D material. Containing and retrieving explosives packages from the water body is an important requirement for public safety and security reasons

First Aid: Remove contaminated clothing and shoes immediately.
In case of contact with material, immediately flush skin or eyes with running water for at least 15 minutes.
Obtain immediate medical attention. Ensure that attending medical personnel are aware of identity and nature of product(s) involved, and that they take precautions to protect themselves.

Dyno Nobel Products: Boosters

Packaging: Paper or plastic tubes/cartridges, packed in heavy cardboard boxes.

Hazards: **Explosion**
This is the most important concern because of the possibility of a major detonation. Detonation could be triggered by heat (fire), friction, impact (shock) or lightning.
Toxic Fumes
Burning explosives give off toxic fumes (irritating, corrosive &/or poisonous gases). The area should be evacuated before this is a problem.
Scattered / Spilled Material
Clear area of personnel and wait for assistance from trained personnel before handling or removing boosters.
Water Contamination
Usually water contamination is a very minor problem with Class 1.1D material. Containing and retrieving explosives packages from the water body is an important requirement for public safety and security reasons

First Aid: In the event of irritation, remove contaminated clothing and shoes and access fresh air. In case of contact with material particulates or dust, flush eyes with running water for at least 15 minutes and/or wash skin with soap and water. If irritation/adverse symptoms persist, seek medical attention and ensure that attending medical personnel are aware of identity and nature of product(s) involved

Class 1.4* No Significant Blast Hazard

Dyno Nobel Products: NONEL Lead-Line (non-electric detonating cord)

Hazards: **Fire or Explosion**
When subjected to heat, shock or friction, explosives of Division 1.4 (including 1.4S in the same shipment), may burn vigorously with localized detonations and projection of fragments. Risks are limited to the immediate vicinity. The effects of accidentally initiating packaged explosives of Division 1.4S should be confined to the immediate vicinity of the package.

Hazards: **Toxic Fumes**
Fire may produce irritating, corrosive and/or poisonous gases.
Scattered / Spilled Material
Clear area of personnel and wait for assistance from trained personnel before handling or removing explosive material.
Water Contamination
Usually water contamination is a very minor problem. Containing and retrieving explosives packages from the water body is an important requirement for public safety and security reasons

First Aid: In the event of irritation, remove contaminated clothing and shoes and access fresh air. In case of contact with material particulates or dust, flush eyes with running water for at least 15 minutes and/or wash skin with soap and water. If irritation/adverse symptoms persist, seek medical attention and ensure that attending medical personnel are aware of identity and nature of product(s) involved.

Class1.5D Stick Sensitive, Cap Insensitive

Dyno Nobel Products: ANFO, bulk EMULSION (Titan, Dyno Gold) or packaged products (Blastgel, Blastex).

Packaging: Plastic chubs, 25 kg. bags or bulk material (granular or thick fluid) in bulk containers .

Hazards: **Fire and Explosion**
Ammonium nitrate (AN) is an oxidizing agent therefore it will supply its own oxygen (O_2) to feed a fire. It can explode violently if overheated in a confined space, particularly if mixed with organic material such as fuel oil, which is what ANFO is made of.
Toxic Fumes
Will emit toxic fumes (yellow, red, or brown) of nitrogen oxides.
Scattered / Spilled Material

Clear area of personnel and wait for assistance from trained personnel before handling or removing explosive material.

Water Pollution

Ammonium nitrate is toxic to aquatic life in concentrations as low as 10-100 parts per million. AN can melt at 170 degrees C and begin to flow.

If there is no fire, contain or control any leakage or run off by digging a pit or corralling with dirt, using non-ferrous shovel. Cover prills with plastic to avoid dissolving by rain water. Call for assistance by trained personnel to assist in clean up.

First Aid: Remove contaminated clothing and shoes immediately.

In case of contact with material, wash with soap and water and/or flush eyes with running water for at least 15 minutes. If irritation /adverse symptoms persist, obtain medical attention. Ensure that attending medical personnel are aware of identity and nature of product(s) involved.

Avalanche Rescue Cache Contents and Locations

AVALANCHE RESCUE CACHE LOCATIONS

BRUCEJACK CAMP

Fire hall, ERT mine avalanche mine rescue storage

- Avalanche Rescue Pack x2 – located inside hall with ERT gear
- Glacier Rescue pack (brown seacan)
- Survival Kit (brown seacan)
- Rope Rescue equipment (brown seacan)

KNIPPLE CAMP

Inside ambulance bay, first aid building

- Avalanche Rescue Pack x2
- Survival Kit
- HETS rescue gear (Av-tech seacan)
- Rope Rescue equipment

Avalanche Rescue
Bag #1
1 First Aid Kit (Level 1)
4 Avalanche Probes
4 Shovels
4 Headlamps
1 Sleeping Bag
1 Foamie
1 Set of Flags

Gear Arriving with First ERT		
☐	**1)**	Avalanche rescue party pack #1
☐	**2)**	Vacuum mattress #1, Vacuum splints and Scoop stretcher
☐	**3)**	Jump kit, oxygen and AED
☐	**4)**	RECCO unit
☐	**5)**	2 extra avalanche packs for Surface Ops personnel (Loader, Cat Driver)
☐	**6)**	6 steel shovel,
☐	**7)**	2 x helicopter stakes
☐	**8)**	Forward Staging Checklist

Gear Arriving with Second ERT		
☐	**1)**	Rescue toboggan #1 (with warming kit) - Brucejack
☐	**2)**	Megaphone
☐	**3)**	Avalanche rescue party pack #2
☐	**4)**	Rescue toboggan #2 (with warming kit) - Brucejack
☐	**5)**	At night – headlamps, light plant (Pinto hitch) For deep snow conditions – snow shoes
☐	**6)**	6 steel shovels

Incident Analysis and Report Forms

Brucejack Incident Investigation Checklist

Supervisor Field guide for data collection to support the incident investigation.

People

- ☐ Preserve evidence at the scene and secure. Cordon off area with yellow perimeter tape as needed or required
- ☐ Drug and Alcohol test required? Discuss with your Superintendent/Manager, or Safety Advisor.
- ☐ Interview all those involved either directly, or indirectly with the incident. Interview witnesses and workers involved as soon as safely possible after the event.
- ☐ Interview individuals separately, in a quiet and appropriate place away from other co-workers. Never interview in a group setting.
- ☐ Written statements by witnesses or those involved are acceptable and can support the investigation as a record. Date, time, name clearly and signed by the interviewee, or person writing the statement.
- ☐ Copy and date/sign your notes and scan/deliver to the HS Department Advisors.

Positions

- ☐ Drawings assist in visualizing the incident. Simple top down drawings are sufficient.
- ☐ Note location of people involved, key facilities or landmarks, equipment placement, etc.
- ☐ Take photos of incident. Photos from all sides. Take photos in 3's. Far/near/close-up for perspective. Send all photos to safety@Pretivm.com
- ☐ Use a pencil, or object of known size for close-up photo's for correct perspective.

Parts

- ☐ Analyse the tools or equipment and materials that people were using.
- ☐ Worn/improper equipment used? Equipment in useable condition per manufacturer specs?
- ☐ Guards in place? Safety features bypassed? Hazard warning labels noted on equipment?
- ☐ Is technical expertise required to analyse a mechanical failure?

Papers

- ☐ Assemble any written data for the Safety Advisors.
- ☐ Training records for affected employees of the incident? Obtain from training department.
- ☐ Maintenance logs or records as applicable? Planning schedules reviewed?
- ☐ Personal JHA's completed by all workers involved in the incident. Obtain these records.
- ☐ Work Instructions (WI's) that apply to the specific task.

**Assemble all documents and provide to the HS Department Advisors (Safety@Pretivm.com). All information is reviewed and supports the incident analysis. Questions? Contact the HS Advisors.

Appendix M

Conceptual Model for Avalanche Hazard

Conceptual Model of Avalanche Hazard

(Revised October 2012)

This workbook describes a conceptual model of avalanche hazard, and provides detailed reference material for use when evaluating avalanche hazard. The model was developed by systematically deconstructing avalanche hazard into its critical component pieces. Each piece was then further deconstructed to accommodate a detailed analysis. The model was then reassembled, and represents the analysis process for an avalanche hazard evaluation.

This model was developed by committee through the ADFAR2 project by Parks Canada and the Canadian Avalanche Centre. Committee members are: Grant Statham, Karl Birkeland, Pascal Haegeli, Ethan Greene, Chris Stethem, Bruce Tremper, Clair Israelson, John Kelly, Bruce McMahon and Brad White.

Avalanche Hazard Evaluation

Avalanche Hazard; Avalanche Danger is the potential for an avalanche(s) to cause damage to something of value. It is a function of the likelihood of triggering and the destructive size of the avalanche(s). It implies the potential to affect people, facilities or things of value, but does not incorporate vulnerability or exposure to avalanches. Avalanche hazard is commonly expressed using relative terms such as high, moderate and low.

Avalanche Risk is the probability or chance of harm resulting from interactions between avalanche hazard and a specific element(s) at risk. Avalanche risk is determined by the exposure of that element, and its vulnerability to the avalanche hazard.

Establish the Context

The first step in any avalanche hazard analysis is to **formulate the problem** for the analysis.

1. Operational application
2. Spatial scale
3. Temporal scale

Scale

SPATIAL SCALE	TEMPORAL SCALE
- Terrain feature	- Now
- Path/Run	- Hours
- Mountain	- Days
- Drainage	- Weeks
- Range	- Years
- Region	- Other: _____
- Other: _____	

Evidence and Data

Avalanche hazard factors (examples of commonly used factors)

The strength and weight given to these factors is a judgemental assessment with no hierarchy of data type

AVALANCHES

Observed and potential

-Character

-Type

-Trigger type

-Trigger size

-Size – destructive

-Size – relative

-Number & distribution

-Water (moisture)

-Runout distance

SNOWPACK

-Spatial/Temporal variability

-Weak layer/interface presence

-Weak layer type (storm/persistent)

-Weak layer depth

-Weak layer strength/stress

-Bed surface

-Slab thickness

-Slab stiffness

-Load on weak layer(s) – H20

-Snow surface condition

-Snow available for transport

-Snowpack temperatures

-Moisture content

-Propagation potential

-Compaction

WEATHER

Scale – space/time

-Current and future

-Precip (type, intensity, duration)

-Wind (speed, direction, duration)

-Temp (magnitude, trend)

-Energy balance (solar radiation)

-Humidity

-Sky condition

TERRAIN

Spatial Scale

-Incline

-Aspect

-Shape

-Forest cover

-Ground roughness

-Terrain size

-Elevation (vegetation band)

-Traps (terrain complexity)

-Overlapping terrain

-Glaciation

Avalanche Character

Identify the Avalanche Character(s) that best represents the avalanche problem(s) within the defined Location. When multiple characters exist, they should be prioritized in order of importance.

Character	Weak Layer / Interface	Slab Properties	Persistence	Weak Layer Location	Propagation Potential	Relative Size Potential (1-5)
Loose Dry	Various (no cohesion)	None	Hours/days	Near the surface	Down slope entrainment	R1-2
Loose Wet	Various (no cohesion)	None	Hours/days	Any level	Significant down slope entrainment	R1-3
Wind Slabs	PP, DF	4F-K Wind transported	Hours/days	Upper pack	Terrain feature	R1-3
Storm Slabs	PP, DF	F-P Soft – stiff	Hours/days	In or just below storm snow	Path	R1-4
Wet Slabs	Various Grains	4F-P Wet grains	Hours/days	Mid pack to deep	Path	R1-5 (climax)
Persistent Slabs	PWLs such as SH, FC, CR, FC/CR combo	4F-P Stiff-Hard	Weeks/months	Upper to mid pack	Path to adjacent paths	R2-4
Persistent Deep Slabs	PWLs such as DH, FC, CR, FC/CR combo	1F-K Hard	Weeks/months	Deep or basal	Path to adjacent paths	R3-5 (climax)
Cornices	~	~	Months with short peaks	~	~	~
Comment	Typical failure plane	Typical kind of slab	Typical duration of instability	Relative to HS	Typical expectation	Typical range of size relative to path

Location

Specifically describe where in the terrain a particular Avalanche Character is expected to be found.

Location
Describe the terrain using: Aspect Elevation Vegetation bands Operating zones Terrain features

Sensitivity to Triggers

Determine the Sensitivity to Triggers based on what kind of triggering will initiate avalanches of any size within the defined location.

Sensitivity	Natural Triggers	Human Triggers	Explosive Triggers		Cornice Triggers
			Size	Result	
Unreactive	No avalanches	No avalanches	Very large explosives	No slab	No slab from very large cornice fall
Stubborn	Few	Difficult to trigger	Large explosives & air blasts	Some	Large
Touchy	Several	Easy to trigger	Single hand charge	Many	Medium
Very Touchy	Numerous	Triggering certain	Any size	Numerous	Any size
Description of observation	Natural avalanche occurrences	Ease of triggering by a single human	Size of explosive and effect		Size of cornice fall that will trigger a slab

Spatial Distribution

Determine the density and distribution of the instability within the defined location.

Distribution	Density	Evidence
Isolated	The instability is spotty and found in few locations.	Evidence is rare and hard to find.
Specific	The instability exists in portions of terrain.	Evidence exists but is not always obvious.
Widespread	The instability is found in many locations.	Evidence is everywhere and easy to find.
Comment	How is the evidence distributed within the location identified?	How hard is it to find?

Likelihood of Triggering

Determine the Likelihood of Triggering within the defined location. This is a judgemental combining of both Sensitivity to Triggers and Spatial Distribution.

Likelihood of Triggering
Almost Certain
Very Likely
Likely
Possible
Unlikely

Destructive Size

Determine the destructive potential of the avalanche(s) resulting from a specific Avalanche Character within a defined location.

Destructive Size	Avalanche Destructive Potential (definition)	Typical mass	Typical impact pressure	Typical path length
1	Relatively harmless to people.	<10 t	1 kPa	10 m
2	Could bury, injure, or kill a person.	10^2 t	10 kPa	100 m
3	Could bury and destroy a car, damage a truck, destroy a wood frame house, or break a few trees.	10_3 t	100 kPa	1000 m
4	Could destroy a railway car, large truck, several buildings, or a forest area of approximately 4 hectares.	10_4 t	500 kPa	2000 m
5	Largest snow avalanche known. Could destroy a village or a forest area of approximately 40 hectares.	10_5 t	1000 kPa	3000 m

VERSION CONTROL

Version #	Date Released	Amendment/Details
1	May 2015	Original
2	February 2017	Mill Reagent and WTP updated
3	March 2018	Mill Reagent, WTP, and STP updated
3a	December 2018	Version control table updated
4	March 2021	GHS classification, Table 6-1 updated
5	November 2022	Table 6-1 updated
6	January 2023	Updates to chemicals and related quantities (Table 6-1). Document format updated to NCM Brucejack template.

ACKNOWLEDGEMENTS

The May 2015 version of the Chemical and Materials Storage and Handling Plan was prepared by Ray Hollenberg, R.P.Bio. of NorthWest Response Ltd. and reviewed with input from Lauri Solsberg, P.Eng. of Counterspill Research Inc. The February 2017 revision was prepared by Scott Laliberte,. of Pretium Resources Inc., with updates in March 2018 completed by Brett DeHay-Turner with Pretium Resources Inc. March 2021 updates completed by Richelle Sussbauer with Pretium Resources Inc. January 2023 revision was prepared by Scott Laliberte Mill Operations Superintendent, Cameron Edwards, Mill Operations Superintendent, Richelle Sussbauer M.Sc., P.Chem, Environmental Coordinator and reviewed by Torence Sandhals M.Sc., P.Ag, Principal, Environment.

Mill Reagent Storage Plan

1 PURPOSE

The purpose of this plan is to describe the chemicals and materials storage and handling practices that will be used at the Brucejack Mine to achieve worker health, safety and environmental protection. The plan is focused on identification and implementation of best practices that comply with applicable regulatory requirements, are suitable for the particular application, and which will help prevent potential for spills of all chemicals and materials used at the mine. Note that this plan addresses the management of hazardous materials (including toxic substances) and dangerous goods. The management of wastes, including from the on-site incinerator and the sewage treatment plant, are covered in the Waste Management Plan.

2 PERFORMANCE OBJECTIVES

This Chemicals and Materials Storage and Handling Plan (C&M S&H Plan) is designed to meet the following primary performance objectives:

1. Identify the applicable legislative requirements that relate to chemicals and materials storage and handling. This includes both Provincial and Federal legislation and codes of practice. This C&M S&H Plan outlines the key components that Brucejack will adhere to. From these key legislative components site-specific procedures for storage and handling will be further developed.
2. The C&M S&H Plan will identify the existing chemicals and materials (including toxic substances) that are transported to the Brucejack Mine site. As this is an evolving list, the C&M S&H Plan will require frequent updates. The list of chemical products is supplemented with WHMIS and dangerous goods classifications, a summary of storage (including incompatibilities) and handling procedures, via Pretium's online SDS management database.
3. Expand Pretium's existing Workplace Hazardous Materials Information System (WHMIS) at Brucejack to cover additional requirements during Operations.
4. Pretium has adopted the Globally Harmonized System of Classification and Labelling of Chemicals (GHS). Health Canada is in the transition phase of aligning the GHS with WHMIS. GHS is a globally recognized system that defines and classifies the hazards of chemical products, and communicates health and safety information on labels and Safety Data Sheets (SDSs).
5. Develop an inspection procedure that confirms the adequacy and effectiveness of storage and handling equipment, facilities and procedures, including with respect to means of containment and transportation.
6. Outline a Prevention Plan for potential spills of chemicals and fuels. Additional procedures will be developed as site specific facilities are developed at the Brucejack Mine. The Prevention Plan will focus on preventing significant adverse environmental effects related to the transportation, on-site manufacturing, storage and handling of chemicals and, materials (including toxic substances).
7. The C&M S&H Plan will also identify the legislative criteria for storage and handling of hazardous and non-hazardous waste. As waste streams and volumes are identified, procedures will be further developed to ensure that the storage and handling, means of containment, transportation and disposal meets the legislative criteria.

To date Pretium has developed numerous plans and procedures to ensure that health, safety, and environmental protection are priorities during mineral exploration, construction, production, and closure.

Spill prevention measures are presented in Appendix A.

3 SCOPE

This Plan applies to all aspects and facilities associated with the Brucejack Mine, including the Brucejack mine site, Brucejack access road, Knipple Transfer Area, Bowser Aerodrome, Brucejack transmission line, and Wildlife and Bowser camps. The plan is applicable to all phases of mine development including construction, operation and closure and is relevant to any employees handling, using or transporting hazardous chemicals and materials.

Specifically, the scope of the Plan is to:

1. Identify the list of chemicals and materials used, stored or transported to the Brucejack Mine, including:
   - WHMIS applicable products;
   - Hazardous wastes which Pretium has currently included or will need to add to its hazardous waste generator registration; and
   - Any other chemicals and materials deemed sufficiently hazardous in the quantities to be used at Brucejack.
2. Use existing site plans and procedures when applicable.
3. Address transportation handling from Highway 37 to the Brucejack site via Brucejack Access Road for all applicable liquids and other materials; address differences, if any, between construction and operations.
4. Detail storage and handling requirements and procedures at the Wildfire Camp, Bowser aerodrome, Knipple Transfer Area, and Brucejack Mine Site.
5. Identify training in storage and handling for chemicals and other substances of concern.
6. Establish procedure to ensure current Plan is up-to-date and in accordance with applicable legislation, regulations and guidance documents.

4 RELEVANT LEGISLATIONS, REGULATIONS, AND EAC CONDITIONS

This Chemicals and Materials Handling Plan for the mine will adopt as a minimum standard compliance with the following federal and provincial legislation regarding hazardous, dangerous, or controlled substances, and general materials storage and handling:

4.1 FEDERAL

- *Transportation of Dangerous Goods Act* and Regulation;
- *Canadian Environmental Protection Act* and Regulation;
- Canada Occupational Health and Safety Regulation; and
- *Explosives Act* and Regulation.

4.2 PROVINCIAL

- BC Fire Code:
  - Sections 3.1, 3.2, 3.3, 4.1 and 4.2.
- BC *Environmental Management Act* and its regulations, including:
  - Petroleum Storage And Distribution Facilities Storm Water Regulation;
  - Spill Reporting Regulation; and
  - Hazardous Waste Regulation.
- BC *Mines Act* and Health, Safety and Reclamation Code for Mines in BC (Code);
- *Workers Compensation Act*:
  - Occupational Health and Safety Regulation.
- Other Best Management Practices/Guidelines; and
- 2014 BC Fuel Guidelines (for Class 3 products).

Natural Resources Canada (NRCan) is responsible for regulating the use of explosives under Part 7(1)(a) of the *Explosives Act*. Significant revisions were made to the regulation of explosives in 2013. As per the requirements of the *Explosives Act*, an Explosives Handling Plan will be completed by the explosives contractor. Additional plans required under the 2013 regulations will also be prepared as required: Security Plan, Fire Safety Plan, and Key Control Plan.

The BC Mine Code also regulates the transportation, use, care and handling of explosives. An Explosives Storage and Use Permit is required from the BC MEM before a magazine is located,

erected, built, put into service, or modified, or before carrying out any maintenance work, including the installation of lighting or heating.

Disclaimer: This plan is not a legal document. Acts, Regulations and Codes always take precedence over any interpretation given in this plan.

4.3 RELEVANT EAC CONDITIONS

Pretium was granted an Environmental Assessment Certificate (#M15-01) on March 26, 2015 that included a series of conditions. This management plan fulfills Condition #2, in relation to a Component Plan for mine emergency response planning, presented within Schedule B of the Certificate and copied below.

> *Condition 2*
>
> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*
> - *Effects mitigation measures;*
> - *Monitoring programs;*
> - *Monitoring schedules; and*
> - *Reporting requirements.*
>
> *The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.*
>
> *The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."*

5 PRODUCT CLASSIFICATIONS

5.1 DANGEROUS GOODS CLASSIFICATION

All hazardous materials or dangerous goods in Canada follow the international agreement on classification. This system allows dangerous goods to be transported around the world using a similar regulatory and identification system. Nine classes divide all dangerous goods into specific chemical categories according to their characteristics (Table 5.1-1: Hazardous Goods Classification System).

Table 5.1-1. Hazardous Goods Classification System

Hazardous Products Classification	Placard	Divisions Explanations	Compatibility Group Packing Group	Additional Information
Class 1 Explosives	 	1.1 Mass Explosion Hazard 1.2 Projection Hazard 1.3 Fire Hazard 1.4 Minor Hazard 1.5 Very Insensitive 1.6 Extremely Insensitive	COMPATIBILITY GROUP: A, B, C, D, E, F, G, H, J, K, L, N or S	
Class 2.1 Flammable Gases		2.1 Flammable Gases • Flammable	No Packing Groups	
Class 2.2 Non-Flammable, Non-Toxic Gases	 	2.2 Non-Flammable, Non-Toxic Gases	No Packing Groups	• The only hazard associated with these is that they are compressed gases • A special label and placard must be used for certain oxidizing gases. They are Class 2.2 and a subsidiary Class 5.1
Class 2.3 Toxic Gases		2.3 Toxic Gases • Poisonous or Corrosive	No Packing Groups	
Class 3 Flammable Liquids		No Divisions	<u>Packing Group:</u> I Great Danger II Moderate Danger III Minor Danger	<u>Associated Flash Point:</u> Any Less than 23°C 23°C to 60°C

(continued)

Table 5.1-1. Hazardous Goods Classification System (continued)

Hazardous Products Classification	Placard	Divisions Explanations	Compatibility Group Packing Group	Additional Information
Class 4.1 Flammable Solids		4.1 Flammable Solids • Catches fire easily • Friction sensitive • Difficult to extinguish	Packing Group: I Great Danger II Moderate Danger III Minor Danger	
Class 4.2 Spontaneously Combustible		4.2 Spontaneously Combustible • Ignites without warning • Friction Sensitive	Packing Group: I Great Danger II Moderate Danger III Minor Danger	
Class 4.3 Dangerous When Wet		4.3 Dangerous When Wet • Highly reactive with water	Packing Group: I Great Danger II Moderate Danger III Minor Danger	
Class 5.1 Oxidizers		5.1 Oxidizers • Will burn without oxygen	Packing Group: I Great Danger II Moderate Danger III Minor Danger	• Contains large amounts of readily available oxygen that will feed a fire
Class 5.2 Organic Peroxide		5.2 Organic Peroxides • Unstable and Reactive	Packing Group: I Great Danger II Moderate Danger III Minor Danger	
Class 6.1 Toxic Substances			Packing Group: I Great Danger II Moderate Danger III Minor Danger	
Class 6.2 Infectious Substances		6.2 Infectious Substances Categories: A - Most Hazardous B - Less Hazardous	Category A: • Affecting Humans • Affecting Animals	Category B: • Biological Substances
Class 7 Radioactive Materials		Category III: ***High Risk***, requires special handling	Category II: ***Medium Risk***, requires little special handling	Category I: ***Low Risk***, requires no special handling
Class 8 Corrosive Material		No Divisions	Packing Group: I Great Danger II Moderate Danger III Minor Danger	Associated Skin Damage: Rapid, severe, permanent Severe - moderate contact Severe - long contact
Class 9 Miscellaneous Dangerous Goods		No Divisions	Packing Group: II Moderate Danger III Minor Danger	No PG I - Great Danger

5.1.1 Transportation of Dangerous Goods

In Canada, all the Provinces have adopted the *Transportation of Dangerous Goods Act* and Regulation (with some minor alterations), federally coordinated legislation for the transportation of dangerous goods. The shipment of Dangerous Goods outlines a number of criteria including:

- Classification System for the Nine Classes of Dangerous Goods;
- Means of Containment to ensure good engineering standards are used for the product being transported;
- Placarding of Vehicles criteria based on volumes and product;
- Appropriate Marking of containers, tanks and other means of containment;
- Shipping Documents; and
- Training requirements.

5.2 WHMIS CLASSIFICATION

5.2.1 Workplace Hazardous Materials Information System (WHMIS)

WHMIS (2015) in Canada is now aligned with the Global Harmonized System (GHS) which is divided into class and category. WHMIS (2015) has 3 hazard classes: Health Hazards, Physical Hazards, and Environmental Hazards. There are 16 physical and 10 health hazards which are further divided in accordance to their severity levels (Table 5.2-1)

Table 5.2-1. WHMIS (2015) Classification System and Pictograms

Physical Hazards		Health Hazards		Environmental Hazards	
Hazard Class	**Associated Hazard Category**	**Hazard Class**	**Associated Hazard Category**	**Hazard Class**	**Associated Hazard Category**
Explosives	Divisions 1.1-1.6 (with 1.1 being the most hazardous, 1.6 the least hazardous)	Acute toxicity	Categories 1-4 (with 1 being the most dangerous)	Acute Aquatic Toxicity	Categories 1 -3
Flammable gases	Categories 1 and 2	Skin corrosion	Categories 1A, 1B, 1C, and 2	Chronic Aquatic Toxicity	Categories 1 - 4
Flammable aerosols	Categories 1 and 2	Skin irritation	Categories 1A, 1B, 1C, and 2	**Pictograms** Explosive Flammable Compressed gas Oxidizing Reactive Acute Harmful Health Hazard	
Oxidizing gases	Category 1	Eye Effects	Categories 1, 2A, and 2B		
Gases under pressure	4 Groups include: Compressed gas, Liquefied gas, Dissolved gas, and Refrigerated liquefied gas	Sensitization (Skin or Eye)	Category 1A and 1B		
Flammable liquids	Categories 1 - 4	Germ cell mutagenicity	Categories 1A, 1B, and 2		
Flammable solids	Categories 1 and 2	Carcinogenicity	Categories 1A, 1B, and 2		
Self-reactive substances	Types A-G	Reproductive toxicity	Categories 1A, 1B, 2, and additional category for effects on or via lactation		
Pyrophoric solids	Category 1	Target organ systemic toxicity: single and repeated exposure	Single: Categories 1-3 Repeated: Categories 1 and 2		
Pyrophoric liquids	Category 1	Aspiration toxicity	Category 1 and 2		
Self-heating substances	Categories 1 and 2	Biohazardous infectious materials	Category 1		
Substances which in contact with water emit flammable gases	Categories 1 - 3				
Oxidizing liquids	Categories 1 - 3				
Oxidizing solids	Categories 1 - 3				
Organic peroxides	Types A-G				
Substances corrosive to metal	Category 1				

Note that the *Workers Compensation Act* - Part 2 Section 108 (2) (a) exempts mines from the *Workers Compensation Act* as WHMIS is covered separately under the *Mines Act*.

In Canada, certain products are controlled by other regulations/legislation and are therefore exempt from the WHMIS legislation with regards to labeling and SDS requirements. These products are not, however, exempt from training requirements. Still other products are neither WHMIS-regulated nor controlled under any other legislation yet require training to ensure safe handling.

The products that are exempt from WHMIS legislation include:

- Hazardous Materials in Transit (regulated by the *Transportation of Dangerous Goods Act* and Regulation);
- Hazardous Waste (regulated by the *Environmental Management Act* and Hazardous Waste Regulation);
- Explosives (regulated by the *Explosives Act*);
- Pesticides (regulated by the *Pest Control Products Act*); and
- Radioactive Materials (regulated by the *Nuclear Safety and Control Act*).

5.2.2 WHMIS Regulation (Mines Act)

Applies to employers and workers with respect to controlled products used, stored or handled at a place of employment. The WHMIS framework includes these basic topics:

- Worker Education/Training;
- Labeling: Supplier/Workplace/Laboratory;
- Placarding;
- Identifiers: Pipes/Vessels/Tanks; and
- SDS Information.

5.3 HAZARDOUS WASTE CLASSIFICATION

As defined under the Hazardous Waste Regulation (BC *Environmental Management Act*) Part 1 Interpretation and Application, Hazardous Waste means:

- Dangerous goods if they:
  - are no longer used for their original purpose, and
  - meet the criteria for Class 2, 3, 4, 5, 6, 8 or 9 of the federal dangerous goods regulations, including those that are recycled, treated, abandoned, stored or disposed of, intended for recycling, treatment or disposal or in storage or transit before recycling, treatment or disposal;

- PCB wastes;
- Biomedical wastes;
- Wastes containing dioxin;
- Waste oil;
- Waste asbestos;
- Waste pest control product containers and wastes containing pest control products, including wastes produced in the production of treated wood products using pest control products;
- Leachable toxic waste;
- Waste containing tetrachloroethylene;
- Wastes listed in Schedule 7; and
- Waste containing polycyclic aromatic hydrocarbon.

5.3.1 Hazardous Waste Registration

In accordance with *Environmental Management Act* requirements under the Hazardous Waste Regulation, the Brucejack exploration site was registered for specified volumes of hazardous waste (waste oil and batteries) in September 2013. Pretium's Waste Generator Number for Brucejack is BCG 10829. This registration will be updated as required during Operations.

The following excerpt of the Hazardous Waste Regulation outlines the requirements. See Table 5.3-1 for Registration Quantities.

Table 5.3-1. Waste Regulation: Schedule 6 Registration Quantities

Ref.	Column I Category of Hazardous Waste	Column II Quantity
1	Dangerous Goods Meeting the Criteria for Class 2.1 of the Federal Dangerous Goods Regulation	500*
2	Dangerous Goods Meeting the Criteria for Class 2.2 of the Federal Dangerous Goods Regulation	1,000*
3	Dangerous Goods Meeting the Criteria for Class 2.3 of the Federal Dangerous Goods Regulation	50*
4	Dangerous Goods Meeting the Criteria for Class 3 of the Federal Dangerous Goods Regulation	500
5	Dangerous Goods Meeting the Criteria for Class 4.1 of the Federal Dangerous Goods Regulation	1,000
6	Dangerous Goods Meeting the Criteria for Class 4.2 of the Federal Dangerous Goods Regulation	100
7	Dangerous Goods Meeting the Criteria for Class 4.3 of the Federal Dangerous Goods Regulation	100
8	Dangerous Goods Meeting the Criteria for Class 5.1 of the Federal Dangerous Goods Regulation	100
9	Dangerous Goods Meeting the Criteria for Class 5.2 of the Federal Dangerous Goods Regulation	5
10	Dangerous Goods Meeting the Criteria for Class 6.1 of the Federal Dangerous Goods Regulation	100

17	Waste Oil Whether Or Not Contaminated With Lead	5,000
18	Waste Asbestos	1,000
19	Pest Control Product Containers	500
20	Waste Pest Control Product	100
21	Leachable Toxic Waste	500
22	Waste Containing Tetrachloroethylene	200
23	Waste Containing Polycyclic Aromatic Hydrocarbon	5
24	Waste Listed In Schedule 7	100
25	Batteries That Are Hazardous Waste	2,000

**Total Liquid volume of containers (kg or L as appropriate)*
From: Environmental Management Act; Hazardous Waste Regulation [en. B.C. Reg. 261/2006, s. 32.] Schedule 6

Administrative Requirements

- Registration of Hazardous Waste:
  - A person who,
    - within a 30 day period, produces, or
    - at any time, stores at an onsite facility a quantity of a category of hazardous waste greater than the quantity set out in Column II of Schedule 6 (see Table).

Additional Requirements

- Spill Protection and Reporting:
  - Provide and maintain a Spill Contingency Plan to contain on site any release of spilled hazardous waste.
  - Inspect the facility monthly, and where free liquid hazardous waste is stored at the facility:
    - Provide and maintain 24 hour spill alarm system; and
    - Inspect the facility weekly for any irregularities.
  - Maintain at the facility a record of inspection including:
    - Inspection dates;
    - Irregularities and maintenance; and
    - Corrective Action and dates.
- Contingency Plan:
  - Prepare and maintain in up-to-date readiness a contingency plan with the following:

    - Shut down procedures;
    - Communication networks;
    - Notification procedures;
    - Evacuation procedures;
    - Abatement measures; and
    - Inventories of spill response and cleanup equipment.
  - Appoint an Emergency Response Coordinator and an alternate with authority to carry out action in accordance with the contingency plan.
  - Provide copies of the Contingency Plan to:
    - Emergency Response Coordinator;
    - Alternate Emergency Response Coordinator; and
    - Director (regulatory).
  - Proved cleanup equipment, sorbents and other material and protective equipment and clothing, for all emergency staff at the facility, appropriate for all the hazardous wastes managed at the facility.

- Closure Plan:
  - A hazardous waste facility may not operate the facility unless a written closure plan has been approved by the director (regulatory). The closure plan must include:
    - A schedule of how and when the facility will be closed;
    - A description of the decontamination procedures to be followed; and
    - A description and estimate of the quantity of any hazardous waste residues which will remain at the site after closure.
  - Any changes to the facility, time frames, operational plans, closure dates, etc., must be submitted in an amendment to the plan for approval.

- Mixing and Dilution:
  - A person must not mix or dilute hazardous waste with any solid or liquid, including waste, water or rain water, or otherwise take action by dividing a hazardous waste to evade the Hazardous Waste Regulations or any other regulations.

6 PRODUCT INVENTORY AND SUMMARY

The current product inventory (Table 6-1) includes the chemicals and materials that are transported, stored, and consumed as well as waste materials generated at the Brucejack Mine. As the Operations phase continues, the chemicals and materials in Table 6-1 will continue to evolve and the table will be updated accordingly.

Table 6-1. Chemicals and Materials for Mine Operations

Item/ Description	Material	Quantity			
		Supply		Waste	
Reagents - Lab	Litharge (PbO)	4,000	kg/yr	-	kg/yr
	Pre-mixed flux (55% PbO)	66,000	kg/yr	-	kg/yr
	Pre- mixed flux (70% PbO)	11,000	kg/yr	-	kg/yr
	Borax ($Na_2B_4O_7$)	1,000	kg/yr	-	kg/yr

Tailings to lake		t/yr	899,685	t/yr
Waste Rock		t/yr	720,000	t/yr
Soda Ash for potential spill cleanup	2	t/stored		

Product summaries, including product name, the classification and placard, the WHMIS classification and label, and the storage and handling procedures are stored in Pretium's online SDS management system. This database is accessible to all Pretium staff and is the primary resource for product information at Brucejack.

7 STORAGE STANDARDS

The storage standards at Brucejack Mine will follow the Federal and Provincial legislative criteria, where applicable. The three specific legislative criteria that address storage standards for chemicals, hazardous and toxic substances can be found in the following:

1. BC Fire Code (Section 7.1);
2. Workplace Hazardous Information System (Section 7.2); and
3. *Transportation of Dangerous Goods Act* (Section 7.3).

Storage standards for dangerous goods are addressed in detail in the BC Fire Code. The Fire Code specifically details fire safety and chemical compatibility of indoor storage and outdoor storage. Requirements for stationary tanks for flammable and combustible products are noted in the Fire Code. The BC Fire Code requires dangerous goods to comply with secondary containment stipulations when stored on site. These storage standards are not chemical specific (except for compressed gases and ammonium nitrate).

Workplace Hazardous Information System (*Mines Act*) outlines the requirements for Safety Data Sheets (SDS). The supplier must prepare and send an SDS with all controlled and uncontrolled products that are shipped to the site. Storage criteria for each product are listed under a separate section of the SDS. The most significant aspect of storing dangerous goods is that they are separated from incompatible products.

The *Transportation of Dangerous Goods Act* (TDG) addresses the specific means of containment for dangerous goods. The means of containment under TDG are specific to mobile tanks; however, the requirements are also acceptable for stationary tanks.

7.1 FIRE CODE (PART 3) STORAGE REQUIREMENTS

Pretium will implement all of the applicable requirements to the indoor and outdoor storage of chemicals and materials at the Brucejack Mine, as per the BC Fire Code.

7.1.1 Indoor Storage

General Requirements for All Chemical and Material Stored Indoors

- Access aisles of 1 m wide will be maintained. Main access aisle will be 2.4 m wide with two (2) access points.
- Clearances of 1 m to top of ceiling will be maintained in buildings without sprinkler systems.
- Combustible pallets storage will not exceed 1.2 m in height by 7.5 m in width.
- Fire Safety Plan will identify:
  - Product classification and where it is stored;
  - Method of storage, aisle widths, heights and size;
  - Contact information of key personnel and suppliers in the event of an emergency;
  - Hazards associated with chemicals stored and any potential incompatibilities;
  - Cross reference to Spill Response Plan; and
  - Personal Protective Equipment and other precautions.
- Smoking will not be permitted in an indoor storage area with dangerous goods.
- Storage arrangements will be determined based on stability of the stored products.

Indoor Storage of Dangerous Goods

- Ignition sources will be eliminated and only intrinsically safe electrical systems will be used where storing Dangerous Goods.
- Ambient conditions will be dry and cool with adequate ventilation:
  - Ambient temperature – dangerous goods will not be stored in areas where ambient temperatures may cause them to become unstable or susceptible to undesirable reactions.
  - Ammonium nitrate (Class 5.1) and Compressed gases (Class 2) will not be stored in an area where ambient air temperature is higher than 52°C.
- Good housekeeping practices will ensure that the storage area will remain free of clutter and accumulation of products that are not used.
- Storage arrangements – only compatible dangerous goods will be stored together and incompatible dangerous goods will be separated.
- Packages and containers will be made of materials that are compatible with the product they contain and of a durable construction and design to resist damage from normal handling activities.
- Separation from other Dangerous Goods will conform to:
  - Table 7.1-1: Separation Chart for Storage of Dangerous Goods; and
  - SDS Information.

- Corrosion Protection – measures will be taken to prevent or minimize corrosion due to contact with specific corrosive products.
- Flooring material will be constructed and maintained as an impervious membrane.
- Fire suppression system will consist of a sprinkler system or other fire suppression system, designed in conformance with good engineering practice with respect to the specific dangerous goods stored.
- Smoke and toxic gas venting is required where the collective individual storage areas for the dangerous goods exceed 10 m² in a fire compartment. Table 7.1-1. Dangerous Goods Classification – Storage Separation Chart

Class	2.1	2.2	2.3	3	4.1	4.2	4.3	5.1	5.2	6	8
2.1	-	P	X	P	P	A	DS	X	X	X	X
2.2	P	-	P	P	P	P	P	P	P	P	P
2.3	X	P	-	X	A	A	DS	A	X	DS	A
3	P	P	X	-	P	A	A	X	X	DS	A
4.1	P	P	A	P	-	A	DS	X	X	DS	A
4.2	A	P	A	A	A	-	DS	X	X	DS	A
4.3	DS	P	DS	A	DS	DS	-	X	X	DS	X
5.1	X	P	A	X	X	X	X	-	X	A	X
5.2	X	P	X	X	X	X	X	X	-	X	X
6	X	P	DS	DS	DS	DS	DS	A	X	-	A
8	X	P	A	A	A	A	X	X	X	A	-

X = Incompatible goods: do not store goods together in the same fire compartment.
A = Incompatible goods: separate goods by a horizontal distance of not less than 1 m.
P = Permitted: goods are permitted to be stored together.
DS = Refer to Material Safety Data Sheet.
Source: BC Fire Code Section 3.2.7.6

- Spill control – measures to control spilled liquid or solid dangerous goods will be provided in conformance with Subsection 4.1.6 of the Fire Code.
  - Materials or liquids used in the cleanup of spills and leakages of dangerous goods will be compatible and non-reactive with the dangerous goods being cleaned up and disposed of in conformance with Subsection 4.1.6 of the Fire Code.
  - A spill will be prevented from flowing outside the spill area and from reaching waterways, sewer systems and potable water sources by constructing a non-combustible barrier capable of containing the spill or by grading the site or sloping the floor to divert the spill to a drainage system.
  - Barriers capable of containing a spill will conform to the requirements for secondary containment as outlined in Section 4.3.7 of the BC Fire Code.
- Fire/Emergency response access will be maintained at all times:
  - Access will be free of obstructions; and

  - Access includes windows, roof, building and response equipment stored at the site.
- Labels will be used to properly identify the classification of dangerous goods or waste product.
- Placards will be used for storage areas:
  - for a single product only a UN number will be posted;
  - for multiple products with the same class, the individual class and driving placard will be posted; and
  - for more than one class of products, a placard for each individual class will be posted at the entrance to the storage area.
- Training in the following areas will be provided for all employees involved in the storage and handling of dangerous goods:
  - safe storage and handling procedures;
  - personal protective equipment;
  - product inventory and SDS information; and
  - correct response to an emergency situation.
- Security and unauthorized access will be maintained where storage of chemicals require personal protective equipment and trained personnel.

Indoor Storage of Compressed Gases (Fire Code Section 3.2.8)

- Flammable Gases:
  - Class 2.1 gases will be stored in a room that is separate from the building;
  - along an exterior wall of the building;
  - that can be entered from the exterior;
  - is designed with good engineering practices to prevent critical structural or mechanical damage from an interior explosion;
  - is provided with natural or mechanical ventilation so that flammable vapours do not exceed 25% LEL; and
  - is provided with natural or mechanical ventilation capable of exhausting at least 18 $m^3/h/m^2$ of room area, but not less than 250 m^3/h.
- Indoor Storage of Poisonous, Corrosive or Oxidizing Gases
  - Class 2.3 toxic or corrosive gases or Class 2.2 (2.5) oxidizing gases will be stored in a room that is separate from the building;
  - along an exterior wall of the building;
  - that can be entered from the exterior;
  - is provided with ventilation to the outdoors; and
  - will not be stored in the same room as combustible materials.

Indoor Storage of Ammonium Nitrate (Class 5.1)

- Storage buildings with ammonium nitrate mixtures (Class 5.1 oxidizing substances) in quantities exceeding 1,000 kg inside buildings will:
  - meet venting requirements;
  - have flooring constructed of non-combustible materials;
  - meet specific building codes as outlined in Section 3.3.6.6 Division B of the BC Building Code; and
  - have ambient temperatures not exceeding 52˚C.
- Industrial trucks used to transport ammonium nitrate will:
  - not remain in the building with engine on;
  - not be refueled inside the building; and
  - be cleaned of any remaining product.
- Portable extinguishers with pressurized water having a rating of 2-A or larger will be installed:
  - dry chemical extinguishers are not permitted to fight fires involving ammonium nitrate.

7.1.2 Outdoor Storage

General Requirements for All Products including Dangerous Goods

- Height restrictions for outdoor storage must be stable, and not exceed limits specified in Subsection 3.3.3 (BC Fire Code*: Division B, Part 3, Section 3.3*).
- Individual storage areas and clearances are specified in Subsection 3.3.3 (BC Fire Code*: Division B, Part 3, Section 3.3*). Outdoor storage of any product covered in the BC Fire Code must be no less than 30 m between stored product and brush or forested areas and; no less than 6 m between stored product and uncontrolled grass or weeds.
- Storage Beneath Power Lines is prohibited.
- Fire access will be maintained at all times.
- Fencing will be installed to prevent accidental or unauthorized entry to a storage area containing dangerous goods.
- Maintenance requirements
  - any access route, gateway or clear space will be:
    - maintained to allow access by emergency response personnel; and
    - kept clear of obstructions and piles of snow.
- No ignition sources, open flames, sparks, or heat will be permitted in an outdoor storage area for dangerous goods.
- Fire Safety Plan will identify:
  - Product classification and where it is stored;

  - Method of storage, location, heights and volumes;
  - Contact information of key personnel and suppliers in the event of an emergency;
  - Hazards associated with chemicals stored and any potential incompatibilities;
  - Cross reference to Spill Response Plan; and
  - Personal Protective Equipment and other precautions.
- Portable extinguishers are required for on-site buildings and mobile equipment operating in an outdoor storage area.
- Site preparation will be level and solid ground or paved with asphalt, concrete or other hard surface material.
- Fuel dispensing will conform to Section 4.6 (Fuel Dispensing Stations):
  - 6 m clear spacing will be maintained between the stored product and fuel dispensers.
- Spill control – measures to control spilled liquid or solid dangerous goods will be provided in conformance with Subsection 4.1.6 of the Fire Code:
  - materials or liquids used in the cleanup of spills and leakages of dangerous goods will be compatible and non-reactive with the dangerous goods being cleaned up and disposed of in conformance with Subsection 4.1.6 of the Fire Code.
  - a spill will be prevented from flowing outside the spill area and from reaching waterways, sewer systems and potable water sources by constructing a non-combustible barrier capable of containing the spill, or grading the site or sloping the floor to divert the spill to a drainage system.
  - barriers capable of containing a spill will conform to the requirements for secondary containment as outlined in Section 4.3.7 of the BC Fire Code.
- Fire separation:
  - It is permitted to reduce the clearance space between individual storage areas if a non-combustible fire separation or dirt berm, not less than 1.5 times the height of the stored product, is provided.
- Fire protection:
  - The prescribed height and size of an individual storage area (BC Fire Code: *Division B, Part 3, Section 3.3, Subsection 3.3.3* and *3.3.4)* may be increased, if fire suppression/ extinguishing measures, conforming to good engineering practices, are provided.

Outdoor Storage of Dangerous Goods

- Individual Storage Areas and Clearances:
  - storage area for dangerous goods will not exceed 1,000 m^2.
  - 6 m clearance will be maintained around individual storage area of dangerous goods.
  - storage of dangerous goods will not exceed 6 m in height.

- Incompatible dangerous goods will be stored with a minimum horizontal distance of 3 m.
- Dangerous goods and other combustible products will not be stored in the same individual storage area.
- Labels will be used to properly identify the classification of dangerous goods or waste product (see Handling Standards).
- Training will be provided as follows for all employees involved in the storage, handling of dangerous goods:
  - safe storage and handling procedures;
  - personal protective equipment;
  - product inventory and SDS information; and
  - correct response to an emergency situation.
- Safety precautions will be taken when storing dangerous goods outside to ensure that undesirable reactions do not occur as a result of environmental exposure and atmospheric conditions.
- Intermodal Shipping Containers and their contents will be stored in conformance to the segregation requirements outlined in IMO 2006, "International Maritime Dangerous Goods Code."

Outdoor Storage of Compressed Gases

- Supported on a raised concrete or other non-combustible platform and located in a fenced enclosure.
- Clearances of cylinders of Class 2.1 flammable gases and Class 2.3 toxic or corrosive gases will be stored 15 m from any building opening if the aggregate capacity of expanding gas is 500 m^3 or more (see BC Fire Code - Part 3, Section 3.3.5.3 for more details).

7.2 WORKPLACE HAZARDOUS MATERIALS INFORMATION SYSTEM REGULATION (*MINES ACT*) STORAGE REQUIREMENTS

SDS (Safety Data Sheet) provides details on specific products. The SDS for each product is stored in Pretium's online SDS management database. The SDS is provided by the product supplier, however it is usually developed by the manufacturer.

WHMIS requires the following information to be included in every SDS:

- Identification
- Hazard Identification
  - Classification including pictograms, signal words and precautionary statements
- Composition/Information on ingredients
- First-aid measures

- Fire-fighting measures
- Accidental release measures
- Handling and storage
    - Precautions for safe handling, conditions for storage, including any incompatibilities.
- Exposure controls/Personal protection
- Physical and chemical properties
- Stability and reactivity
- Toxicological information
- Ecological information*
- Disposal considerations*
- Transport information*
- Regulatory information*
- Other information
    - Date of latest revision of the SDS

*headings are required to be present but the supplier has the option to not provide information

7.3 SDSS ARE REQUIRED TO BE ACCURATE AT THE TIME OF SALE. AN SDS WILL BE REQUIRED TO BE UPDATED WHEN THE SUPPLIER BECOMES AWARE OF ANY SIGNIFICANT NEW DATA. THE REQUIREMENT TO UPDATE EVERY 3 YEARS NO LONGER APPLIES UNDER WHMIS (2015).TRANSPORTATION OF DANGEROUS GOODS (TDG) STORAGE REQUIREMENTS

Table 7.3-1 outlines the most common means of containment for dangerous goods. Although these containers fall under the Transportation of Dangerous Goods Regulation, they do apply to storage of all dangerous goods. The TDG Regulations outline five sections that address means of containment:

- Explosives – Compatibility Chart;
- Gases;
- Small Means of Containment (<450 L);
- Large Means of Containment (≥450 L); and
- Radioactive Materials.

Table 7.3-1. Summary of the Most Common Means of Containment

Hazardous Products Classification	Small Containers (<230 L) Mobile and Stationary –secondary containment not required	Small Means of Containment (<450 L) Mobile	Large Means of Containment (>450 L and <3,000 L) Mobile	Aboveground Storage Tank (>230 L) Stationary – secondary containment is required	Other Acceptable Means of Containment and Exemptions or Special Packaging Instructions
Class 1, Explosives					CGSB-43.151 for Class 1, Explosives
Class 2, Gases		• CGSB-43.123 including Class 2.1 or 2.2	• CGSB-43.123 including Class 2.1 or 2.2	• CAN/CSA-B149.1-05 installations • CAN/CSA-B149.2 Propane Storage and Handling Code	• Other Standards • CSA B340 • CSA B342 • CSA B622 • CSA B625 • TP14877
Classes 3, 4, 5, 6.1, 8, and 9, Dangerous Goods	• TP14850	• CGSB-43.146 • TP14850	• CGSB-43.146 UN 31A and 31B IBC Portable Tanks • CSA B621 • CSA B625-13 UN Standardized Portable Tanks • TP14877 • ULC/ORD 142.13 (TC *Equivalency Permit no longer required*)	• ULC-S601 AST Horizontal Tanks • ULC-S602 AST Steel Tanks • ULC-S630 AST Vertical Tanks • ULC-S653 AST Steel Tanks	• CSA B376-M Portable Containers for Gasoline and Other Petroleum Fuels • ULC/ORD-30 Safety Containers • CSA B620
Diesel Class 3 UN1202					• Diesel Exemption: Small means of containment (<450L) a non-spec tank may be used
Class 7 Radioactive Materials					• Means of containment as per "Packaging and Transport of Nuclear Substance Regulations."

8 HANDLING STANDARDS

The Handling Standards provides an overview of the legislative criteria for labeling and marking the means of containment for the chemicals and materials on site. In addition, there are legislative criteria for spill preparedness, prevention and training.

The Transportation of Dangerous Goods Regulation (C&M S&H Plan - Section 8.1) specifically addresses how a means of containment will be marked and labeled and the responsibilities of consignor and consignee. Training requirements focus on the selection of proper means of containment for the product being transported as well as the classification system. Additional training is required for chemical specific substances.

The Workplace Hazardous Materials Information System - *Mines Act* (C&M S&H Plan - Section 8.2) addresses safe handling procedures under the Safety Data Sheet (SDS). The supplier will prepare and send an SDS with all controlled and uncontrolled products that are shipped to the site. Proper labeling, physical/chemical properties, product specific training, personal protective equipment, firefighting, first aid, and spill prevention and response are main focuses of the SDS.

The *Environmental Management Act* (C&M S&H Plan - Section 8.3) addresses spill prevention as a requirement in relation to managing the environment. Procedures for handling a substance capable of causing pollution will address the method for reducing or controlling the risk. The spill response plan will address control measures, safety measures and cleanup methods for substances capable of causing pollution.

The BC Fire Code (C&M S&H Plan - Section 8.4) requires all dangerous goods to be properly labeled and placarded. In addition, spill prevention and control is required for all dangerous goods.

Inspections (C&M S&H Plan - Section 8.5) are required for dangerous goods including flammable and combustible materials. The focus of the inspection process is on prevention, awareness and continual improvement. Inspections provide a tracking mechanism for ensuring that the operational procedures are adequate and functioning, that action items are being developed and that the risk to health, safety and the environment are managed. The inspection procedures at Brucejack Mine are risk based. The higher the risk, the more frequent the inspection.

8.1 TRANSPORTATION OF DANGEROUS GOODS REGULATION (TDG) HANDLING REQUIREMENTS

8.1.1 Marking and Labelling under the TDG

- A person will not offer for transport or import a means of containment that contains dangerous goods unless it displays the appropriate safety mark.

- The consignor (shipper) who prepares the dangerous goods for shipment is responsible for determining the following:
  - The correct classification of the dangerous goods being shipped;
  - Ensure the packaging is compatible with the dangerous good and secure the correct placards/markings or labels on the means of containment;
  - Complete the applicable shipping documents or waste manifest; and
  - Provide placards for the transport unit, if required.
- The consignee (receiver) who accepts, handles or unloads the dangerous goods has the responsibility to:
  - Understand the hazards of each class of dangerous goods;
  - Recognize the hazards shown by the labels and placards;
  - Carry a valid TDG Training Certificate;
  - Handle the dangerous goods carefully to prevent spills and leaks; and
  - Take appropriate emergency response actions in the event of a spill or leak.

8.1.2 Training Requirements under the TDG

- Everyone who handles, prepares for transport or carries dangerous goods will be trained and certified. The employer is responsible for determining the type and level of training that each person or position is required to maintain.
- Training will include:
  - Safety equipment for personal and environmental protection;
  - Selecting appropriate packaging;
  - How to classify a dangerous good;
  - Safe loading and unloading procedures; and
  - Product specific training for dangerous goods that require special attention including:
    - Explosives;
    - Radioactive Materials;
    - Unstable or Reactive Materials;
    - Peroxides; and
    - Corrosives with Subsidiary Classifications.

8.2 WHMIS REGULATION (*MINES ACT*) HANDLING REQUIREMENTS

8.2.1 Labels/Identifiers under WHMIS

- Includes a mark, sign, device, stamp, seal, sticker, ticket, tag or wrapper that identifies the product, brand name, chemical name, common name, generic name or trade name;

- All controlled products received at the workplace shall be labeled with a supplier label. If the supplier label is illegible, damaged, torn or missing, the employer shall replace the label with a supplier label or workplace label (if supplier label is not available);
- Bulk shipments shall be labeled with a supplier label or workplace label;
- Containers used for controlled products that are not from a supplier will be labeled with a workplace label;
- Piping systems, valves, conveyors, tank cars/trucks and vessels containing or transferring controlled products will be identified by the employer by color coding, label, placards or any other mode; and
- Workplace labels shall include:
  - Product name/identifier;
  - Classification and associated hazards;
  - Reference to SDS availability;
  - Risk phrase/Safe Handling Procedures;
  - Precautionary measures;
  - First aid; and
  - Personal Protective Equipment.

8.2.2 Safety Data Sheets (SDS) under WHMIS

- Preventative measures should provide clear direction on measures to protect worker health and safety during transportation, storage, use (handling) and disposal of the product as well as emergency procedures related to accidental release.
- Handling procedures may be needed for protection against primary and special hazards of controlled products.

8.2.3 Safety and PPE Requirements under WHMIS

- Employers must ensure that employees are trained to properly use, maintain and store PPE.
- Employees must have training with "hands on" instruction in the fit, use and maintenance of assigned PPE:
  - Understand the limitations of the PPE and know what to do in the event of exposure or device failure (e.g., how to use emergency showers, eyewash stations, first aid).
  - Understand when to discard/replace PPE (e.g., end of shift, every hour).
  - Report any missing or defective devices to the supervisor.

8.2.4 Education and Training Requirements under WHMIS

- Training requirements have been outlined in other Procedures and Plans. The following is a summary of these training requirements:
  - WHMIS (Workplace Hazardous Materials Information System);
  - TDG (Transportation of Dangerous Goods including Packaging);
  - PPE (Personal Protective Equipment);
  - Proper/Suitable Industrial Hygiene Procedures;
  - Safety Equipment:
    - First Aid
    - Eyewash Station
    - Fire Extinguisher
    - Spill Response Material
  - Emergency and Spill Response Procedures;
  - Safe Waste Storage and Handling Procedures;
  - Safe Solid and Liquid Waste Sampling and Characterization Procedures;
  - Inspection and Assessment Procedures; and
  - Record Keeping.
- Personal Protective Equipment. There are several sources outlining appropriate protective equipment (Table 8.2-1: *PPE Standards and Related WHMIS Symbols*).

Table 8.2-1. PPE Standards and Related WHMIS Symbols

Personal Protective Equipment (PPE)	Standards	WHMIS Symbol*
Chemical Splash Goggles	Follow CSA Standard Z94.3-M1982 for "Industrial Eye and Face Protectors"	
Face Shield	Follow CSA Standard Z94.3-M1982 for "Industrial Eye and Face Protectors"	
Protective Apron	Identify the appropriate chemical resistant material: Neoprene, nylon, PVC, polyurethane, etc.	
Disposable Dust Mask	Follow CSA Standard Z94.4-M1993 for the "Section Care and Use of Respirators"	
Chemical Cartridge Respirator	Follow CSA Standard Z94.4-M1993 for the "Section Care and Use of Respirators"	

Supplied Air Respirator	Usually required when product is known to be IDLH (immediately dangerous to life and health)	
Chemical Resistant Gloves	Identify the chemical hazard Identify the appropriate chemically resistant material	
Chemical Protective Footwear	Identify the chemical hazard Identify the appropriate chemically resistant material	

(continued)

Table 8.2-1. PPE Standards and Related WHMIS Symbols

Personal Protective Equipment (PPE)	Standards	WHMIS Symbol*
Full Body Protective Clothing	Usually required when product is known to be IDLH (immediately dangerous to life and health)	
Lab Coat	Example of appropriate chemical clothing for a specific hazardous or controlled product	
Fume Hood	Are engineered control systems that control the problem at the source, like exhaust ventilation	
Additional PPE may be related to specific activities or hazards	• Safety Headgear • Limb and Body Protection • High Visibility and Distinguishing Apparel • Buoyancy Equipment • Flame Resistant Clothing	

** Symbol supplied by WHMIS PPE and TRU.ca H&S*

8.2.5 WHMIS Procedures Outline for Handling Hazardous Chemical

WHMIS requires written safe work procedures to be prepared for hazardous operations, including work methods involving hazardous chemicals and spill response. Workers must be adequately instructed in and follow the procedures. Every worker required to handle hazardous chemicals will be trained in the safe work procedure including spill prevention and response.

8.3 BC *ENVIRONMENTAL MANAGEMENT ACT* (EMA) HANDLING REQUIREMENTS

Spill prevention requirements under EMA are listed in point form. When developing handling procedures, the following points will be addressed:

- Maintain and follow good handling procedures;

- Maintain inventory control;
- Assess and manage risk;
- Maintain proper means of containment;
- Maintain equipment and records;
- Good housekeeping – ongoing;
- Continual training requirements;
- Written roles and responsibilities;
- Record keeping; and
- Inspections and audits.

8.3.1 Spill Response Requirements Outlined under EMA

The following points are to be included in the Spill Response Plan for Brucejack Mine:

- Spill Response Plan that is approved and signed-off by the Mine Manager;
- Training requirements for all response personnel and staff involved in hazardous material response;
- Roles and Responsibilities for response personnel;
- Risk assessment of spill potential;
- Mitigation measures for all high risk spill potential;
- Assessment of the Spill:
  - Product identification through use of Placards, Manifest and Vehicle type;
  - Potential volumes;
  - Mixed loads or single product; and
  - Spill behavior under different environmental conditions (cold, hot, wet, dry, windy, etc., environmental conditions).
- Assessment of Environmental Impacts:
  - Knowledge of the receiving environment;
  - Knowledge of fish and wildlife within the high risk areas; and
  - Risk management and control measures.
- Assessment of Safety:
  - Hazards associated with the spilled product;
  - Response Strategy and Safety Plan; and
  - Required PPE and appropriate decontamination requirements.

- Stabilize, contain, remove and clean up the hazard or threat;
- Evacuation procedures for all persons;
- Recover and rehabilitate wildlife;
- Restore wildlife habitat; and
- Take other steps to address the long term impacts on the environment resulting from the spill.

8.4 FIRE CODE HANDLING REQUIREMENTS

8.4.1 Spill Control Requirements Outlined under the BC Fire Code (Section 3.2.7.11)

Measures to control spilt liquid or solid dangerous goods shall be provided in conformance with the Fire Code Subsection 4.1.6 – Spill Control:

- Materials or liquids used in the cleanup of spills and leakages of dangerous goods shall be compatible and non-reactive with the dangerous goods being cleaned up and disposed of in conformance with Subsection 4.1.6 of the Fire Code.
- A spill shall be prevented from flowing outside the spill area and from reaching waterways, sewer systems and potable water sources by constructing a non-combustible barrier capable of containing the spill, or grading the site or sloping the floor to divert the spill to a drainage system.
- Barriers capable of containing a spill shall conform to the requirements for secondary containment as outlined in Section 4.3.7 of the BC Fire Code.

8.4.2 Labelling Requirements under the BC Fire Code (Section 3.2.7.13)

Products classified as dangerous goods shall display appropriate identifying labels from the time they enter a facility until they are issued as finished products or waste material.

8.4.3 Placard and Marking Requirements under the BC Fire Code (Section 3.2.7.14)

- Individual storage areas used for the storage of dangerous goods shall be clearly designated as such by posted placards that conform to the TDG Regulations.
- Where storage consists of a single product, only the UN number need be posted.
- Where storage consists of multiple products within the same class, the individual class and division placard shall be posted.
- Where storage consists of more than one class of products, a placard for each individual class shall be posted at the entrance to the storage area.

8.5 INSPECTIONS

The following items will be inspected, at the frequency indicated.

8.5.1 Fuel and Chemical Handling Facilities

- Stationary fuel and dispensing stations shall be visually inspected on a daily basis by:
  - Assessing pipes, valves, flanges, connections and pumps;
  - Noting any leaks, discoloration, corrosion;
  - Written and Posted Procedures;
  - Secondary containments should be dry and clean of residue;
  - High-level alarms, leak detection, low pressure alarms, vacuum monitoring gauges have been tested, are functioning and correct; and
  - Document inspections, develop action plans and keep a record of inspection.
- Chemical transfer shall be visually inspected and assessed on a daily basis by:
  - Assessing pipes, valves, flanges, connections and pumps;
  - Noting any leaks, discoloration, corrosion;
  - Ensuring secondary containment systems are inspected:
    - Continuously, dry and clean of product.
  - Confirming alarms and gauges are functioning and correct:
    - High-level alarm, leak detection, low pressure, vacuum monitoring gauge.
  - Documenting inspections, developing action plans and keeping a record of inspections.
- Generator Facility and Fuel Storage Facility require daily inspection by:
  - Assessing Pipes, Valves, Flanges, Connections and Pumps;
  - Noting any leaks, discoloration, corrosion;
  - Ensuring secondary Containments are dry and clean of residue;
  - Confirming high-level, leak, low pressure and vacuum monitors are functioning and correct; and
  - Documenting inspections, developing action plans and keeping a record of inspections.

8.5.2 Spill Response Kits

- Spill Response Plan (dated);
- Containment products and procedures;
- Absorbent product;
- Neutralizing product;
- Safety and PPE products; and
- Additional specialized equipment for specific response capabilities.

8.6 PREVENTION

A prevention document is attached as an appendix. The prevention document reviews the high-risk activities at the Brucejack Mine. These include:

- Fuel Storage, Dispensing and Delivery; and
- Chemical Storage and Handling.

Prevention relies on the identification of risk. Risk is based on consequence and probability. Understanding the high-risk activities, provides an opportunity to manage risk.

The most common way to manage high-risk activities is by developing and implementing Standard Operating Procedures (SOPs). SOPs focus on reducing or managing the consequence and/or probability.

Prevention, as outlined in the appendix also relies on:

- Inspections;
- Maintenance;
- Housekeeping; and
- Training.

9 WASTE STORAGE AND HANDLING PROCEDURES

The waste storage and handling procedures are addressed through the *Environmental Management Act* and the Hazardous Waste Regulation. The production of a certain quantity of hazardous waste within a specific time frame is the qualifying factor that defines whether a waste requires a permit or registration or is exempt of both. The administrative requirements for storing, handling, transporting and disposing of hazardous wastes are prescriptive and are outlined below (C&M S&H Plan Section 9.1).

The Contaminated Sites Regulation outlines procedures for treating non-hazardous hydrocarbon contaminated soil (C&M S&H Plan Section 9.2). The outline is provided as a contingency plan as a means of addressing potential on-site soil contamination from any source of petroleum hydrocarbons including spills and leaks. Soils that are contaminated by petroleum hydrocarbons are defined as a waste. This section addresses the procedure that will be adopted by Brucejack Mine should it encounter waste soils contaminated by petroleum hydrocarbons.

9.1 BC *ENVIRONMENTAL MANAGEMENT ACT*

9.1.1 Hazardous Waste – Confinement (Part 2, Section 7)

- A person who produces, stores, transports, handles, treats, recycles, deals with, processes or owns a hazardous waste must keep the hazardous waste securely confined:
  - Containers must be designed and compatible with the specific waste product;
  - Containers used for hazardous waste must:
    - be clean, washed or new, and compatible with the hazardous waste;
    - be kept securely closed during storage and transport;
    - contain no residual product that might be incompatible with the waste product; and
    - be clearly labeled with Classification, Shipping Name of hazardous waste, and UN number.
- Except to the extent expressly authorized by a permit, an approval, an order, a waste management plan or the regulations, a person must not release a hazardous waste from the confinement into the environment.

Hazardous Waste Management Facility (EMA - Part 2, Part 8)

- A person must not construct, establish, alter, enlarge, extend, use or operate a facility for the treatment, recycling, storage, disposal or destruction of a hazardous waste except in accordance with the Hazardous Waste Regulation.

Administration of Hazardous Waste (EMA - Part 2, Part 7)

- Generator Registration Number is required for anyone who produces within a 30-day period, hazardous waste in quantities greater than the quantity set out in Column II of Schedule 6 of the Hazardous Waste Regulations:
  - The Generator Registration Number must be added to the Waste Manifest.
- Provincial ID Number is required for anyone who accepts hazardous waste for disposal or storage and is an authorized hazardous waste consignee:
  - The Provincial ID Number must be added to the Waste Manifest.
- Licence to transport hazardous waste is required by a carrier and the driver must be trained and show a valid certificate:
  - The licence number must be added to the Waste Manifest.
- Classification of Hazardous Waste is required to:
  - Verify that the waste is classified as hazardous;
  - Ensure the means of containment is acceptable; and
  - Clearly label the means of containment with shipping name, UN number, class and packing group (if applicable).

- Hazardous Waste Manifest must be completed prior to transport for all hazardous waste products leaving the site in accordance with the instructions on the waste manifest. Maintain copies of the Waste Manifest for a period of 2 years. The following general quantities of hazardous waste production will require Manifesting:
  - Solid Hazardous Waste: 5 kg;
  - Liquid Hazardous Waste: 5 L;
  - Waste Batteries: 1,000 kg; and
  - Waste Paint and Waste Oil: 210 L.
- Loads from Multiple Consignors may be transported by a carrier provided:
  - The hazardous waste has the same shipping name.
  - The carrier completes the multiple consignor's form and attaches it to the waste manifest.
  - The consignor completes the waste manifest accordingly for multiple consignors.
- Multiple Carrier Shipments; and
- Shipments of Multiple Different Wastes.

Hazardous Waste Storage and Disposal (EMA - Part 2, Section 9)

- A person must not store more than a prescribed amount of a hazardous waste except in accordance with any of the following that apply:
  - the regulations in relation to storing hazardous waste;
  - an order that requires the person to store that kind of hazardous waste; and
  - an approved waste management plan that provides for storage of hazardous waste.
- Any changes to the production, storage or disposal of Hazardous Waste must report the changes to the Director as per Hazardous Waste Regulation.

Transportation of Hazardous Waste (EMA - Part 2, Section 10)

- A person who produces or stores a hazardous waste
  - must not cause or allow more than a prescribed quantity of the hazardous waste to be transported from the property unless:
    - a Waste Manifest is properly completed; and
    - the manifest is filed in the manner prescribed.
  - must ensure that the carrier transporting more than the prescribed quantity of the hazardous waste from the place where it is produced or stored has a valid licence, is trained and has a valid Certificate.
  - must not cause or allow more than the prescribed quantity of the hazardous waste to be transported to a place unless:
    - an order, waste management plan or regulation authorizes or requires it to be stored at that place;

- a permit, approval, order, waste management plan or regulation authorizes or requires it to be introduced into the environment or treated at that place; or
- storage of the hazardous waste at that place is otherwise not prohibited under section 9 *[hazardous waste storage and disposal].*

9.2 PROCEDURE OUTLINED FOR WASTE CHARACTERIZATION AND TRANSPORTATION OF DANGEROUS GOODS

Characterize the Waste:

- Background information of waste generation:
  - Source of waste generation;
  - Classification;
  - Analytical Data for confirmation; and
  - Volume.
- Means of Containment:
  - Analytical data to determine waste characterization;
  - Check Packaging Instructions of Containment Standards; and
  - Select appropriate container standard and document.
- Potential Incompatibilities of Hazardous Waste.

Prepare for Shipment:

- Storage and Handling Requirements (Procedures);
- Verify appropriate packaging;
- Confirm labels and placards; and
- Documentation: shipping document or waste manifest.

Other Requirements:

- Training requirements;
- Storage and disposal permits/approvals; and
- Spill Response Plans.

9.3 TREATING HYDROCARBON CONTAMINATED SOIL

The outline is provided as a summary of the legislative criteria that must be addressed when treating non-hazardous soils contaminated with petroleum hydrocarbons.

Hydrocarbon Contaminated Soil

- Hydrocarbon contaminated soil (Hazardous Waste Regulations Section 41.1):

- Hydrocarbon contaminated soil is authorized for treatment and storage on the site where the hydrocarbon contaminated soil was generated, if the hydrocarbon contaminated soil meets all the following specifications:
- A person must not store, treat or use hydrocarbon contaminated soil unless:
  - prior written notification of any proposed storage or treatment is provided to a Director and the storage and treatment is carried out in accordance with the Director's requirements;
  - the hydrocarbon contaminated soil is a hazardous waste due only to the presence of one or more items listed in Table 9.3-1;
  - the hydrocarbon contaminated soil is spread in single layers not exceeding 0.3 metres in thickness per year or a greater thickness approved by the director, which approval must specify a method of aeration to be used with the greater thickness;
- Hydrocarbon contaminated soil which has been treated so that it is no longer a hazardous waste may be disposed of in a landfill.

Table 9.3-1. Standards for Management of Hydrocarbon Contaminated Soil

Parameter	Maximum Value
Total benzene	25 mg/kg
Total ethylbenzene	250 mg/kg
Total toluene	150 mg/kg
Total xylene	250 mg/kg
Total oil	10%

9.3.1 Protocol 15 for Contaminated Sites

This protocol is intended to provide provincial standards for the treatment of non-hazardous hydrocarbon contaminated soil. The protocol includes some key points:

- Siting Requirements refer to locations where a soil treatment facility may not be constructed:
  - Slope is greater than (>) 5%;
  - Seasonal high water table is less than (<) 1 m below ground surface; and
  - Boundaries of the facility would be within any area specified as a wildlife management area, wildlife area or sanctuary, ecological reserve or bird sanctuary.
- Site Access and Security to prevent unauthorized access into the treatment area;
- Treatment Facility Design:
  - Liner or equivalent barrier to prevent potential leaching into the subsurface;
  - Berms that will prevent runoff from the soil to enter the environment;
  - Cover the treatment piles to minimize leachate, erosion, fugitive dust and air emissions;

  - Leachate collection by sloping the base of the treatment area by 1% to 5% towards one or more collection sumps; and
  - Aeration measures by mechanical tilling or ventilation piping is required where soil is greater than 0.3 m.

- Operation and Maintenance:
  - Kept in good working order;
  - Inspected monthly and more frequently after major storm events;
  - Aerated every four (4) weeks if tilling during the operational period;
  - Monitor and maintain leachate collection; and
  - Optimize biodegradation of hydrocarbon contaminated soil.

- Monitoring and Sampling:
  - Baseline sampling should be taken of soil and groundwater upstream and downstream of treatment facility;
  - Take representative soil samples during treatment and prior to disposal. Parameters should be consistent with the contaminants of concern;
  - Annual groundwater samples should be taken:
    - One upstream of treatment facility; and
    - Two downstream sample locations.

- Decommissioning of the soil treatment facility must be completed once the facility is no longer active:
  - Confirmatory soil and groundwater samples of the site; and
  - Site re-contoured to original site; and
  - Treated soil should be reused where it originated or used as landfill cover or other means acceptable as per the *Environmental Management Act*.

- Record Keeping and Reporting:
  - Maintain a record of:
    - Background on site location and choice;
    - Facility design, drawings, etc.;
    - Source of contaminated soil and volumes;
    - Dates of scheduled treatment;
    - Monitoring/sample results;
    - Records of maintenance and inspections; and
    - Records of disposal locations based on soil treatment results.

Appendix A

Spill Prevention Measures

SPILL PREVENTION MEASURES

This appendix summarizes spill prevention measures outlined in BC regulations and guidelines that apply to Pretium's Brucejack Mine. The measures also reflect best operating practices. For additional site specific fuel storage and dispensing prevention measures refer to the Spill Response Plan, Appendix D (Storage Tanks & Fuelling Facilities). Fuels and chemical reagents have been addressed separately.

FUELS

Health and Safety (sites are equipped with minimum Level 2 first aid kit)

- Signage at fuel storage and dispensing areas clearly indicate:
  - No Smoking within 25 m
  - Turn off ignition
  - Operator always in attendance
  - Ground tanks
  - Emergency contact numbers
  - No operation of electronic devices
- Spill response kits are stocked according to the Pretium Spill Response Plan (see Spill Response Plan, Appendix B, for a complete inventory list that includes equipment and materials).
- Appropriately rated fire extinguishers are kept near all fuel storage and dispensing areas (a minimum 20 lb dry chemical).
- Spill response training emphasizes health and safety (Spill Response Plan, Appendix E).
- All site personnel are familiar with personal protective equipment (PPE).
- Electrical switchgear for the control of fuel dispensers and emergency shutoffs are installed at a safe distance away, clearly identified, and shielded from fires that may occur in the dispensing area.
- Mobile tanks are secured with certified tank tie-downs.
- There are vehicle speed restrictions along the Brucejack Access Road.

Fuel and Oil Storage

- Fuel and lube oil storage are located greater than 30 m from stream, lake or wetland. The exception is in the event of a fire when there is a need to fuel fire-fighting equipment.
- Storage sites do not drain to a watercourse.
- Fuel storage is located away from areas that may be impacted by natural hazards (e.g., rock falls, earthquakes, washouts, windfall trees).
- Containers greater than 230 L capacity meet BC Fire Code specifications (see secondary containment below).
- Containers are maintained in good condition.
- Containers are sealed with proper fitting lids, caps, bungs or valves.
- All containers are labelled in accordance with WHMIS and the *Fire Code*.
- Maximum fill level is 75% for cubes transported on Knipple Glacier. All other containers are

filled to a maximum 90% capacity.

- A clean and tidy site is maintained.
- Containment for tanks is always provided by secondary containment, including the following options:
  - double-walled tanks or single-walled fuel tanks with vaulted second outer tank
  - pre-cast concrete surfaces and sumps
  - perimeter berms
  - oil/water separators.

Spill Protection

- Absorbent spill pads and containment are kept at all pumps and fuel storage and transfer areas as part of a Spill Response Kit – see Spill Response Plan, Appendix B (Response Equipment).
- Absorbent spill pads or other spill sorbent materials are used to contain and recover spills that occur while field equipment is being fuelled.
- An emergency spill response kit is located at all active sites and at fuel storage and transfer sites.
- Spills are prevented from entering waterways, drains and ditches through:
  - secondary containment
  - diversion (storage/fueling site graded away from waterways or a trench to a holding area)
- Secondary containment is provided for containers greater than 230 L using:
- double-walled containers
- steel or concrete containment that holds 110% of the storage volume
- earth or clay dyke, lined with impermeable material that holds 110% of the storage volume, site sloped to divert spills into a collection system lined with an impervious geo-membrane to prevent subsurface contamination.
- Double-walled fuel tanks are protected from vehicle collision or impact by impact prevention concrete median blocks or equivalent on all sides.
- Training is provided for all individuals involved in the handling, transportation, and storage of fuels and lubricants.
- Site-specific plans or other spill containment techniques are used when and as necessary to contain fuel spills from off-loaded truck tanks, and to prevent the entry of spilled substances into soil and watercourses.

Fuel Delivery

- Fuel is delivered in compliance with all applicable regulations related to highway and off-highway roads and vehicles.
- Fuel delivery trucks carry Transportation of Dangerous Goods (TDG) documentation and placards.
- WHMIS and TDG placards are displayed where total capacity of a container in or on a vehicle warrants it. Relevant WHMIS signage is identifiable on all containers.
- Fuel truck drivers receive a site orientation and are apprised of the relevant sections in the *B.C. Mines Act*, WCC safety requirements, and site traffic protocol.
- Fuel delivery trucks carry initial spill response procedures.

- Drivers are familiar with the appropriate fire and spill response protocol and emergency equipment available.
- Diesel and gasoline fuel are delivered in approved containers.
- Bills of Lading to identify fuel type, quantity, and date of all deliveries to the Mine Site are retained on file at the contractor's head office for a period of two years following the completion of the contract.

Fuel Dispensing

Fuel dispensing procedures and requirements at both the Mine Site and other facility sites include the following directives that are followed by all Pretium employees and contractors:

- Only persons with knowledge of WHMIS and TDG requirements, and training on how to safely handle fuels, implement procedures for spill containment and safely dispose of contaminated materials will be authorized to dispense fuel.
- Select a fuel dispensing site that does not drain to a watercourse, is readily visible, and is located away from vehicle traffic.
- Do not refuel or service ground-based machinery within 70 m of watercourses.
- Establish and post maintenance and operating procedures to prevent spills.
- Do not fill containers beyond their safe filling level (90% capacity).
- The use of 'hold open' devices on delivery nozzles will NOT be permitted.
- Pretium and contractor employees will remain at the dispensing nozzle for the duration of the fuel transfer.
- Use an electric or manual fuel pump when dispensing from a drum or slip tank. Store and secure the fuel hose above the drum to prevent siphoning. Follow proper grounding procedures.
- If drums of Jet fuel are ever used (in addition to the Jet A double-walled tanks) these must be stored on their sides so that the bung is at the top to help prevent leaks.
- A daily fuel balance check is conducted at all fuel depots and a log of quantities of all fuel delivered and dispensed is maintained.
- Diesel fuel delivery vehicle tanks will be fitted with fail-safe equipment. Multi Cam-lock coupler systems should not be used on hoses for the purpose of loading and dispensing fuel. Hoses used for dispensing fuel from tanks over 2000 L will be fitted with a Breakaway valve.
- Propane fuel delivery vehicle tanks will be manufactured and certified in accordance with all relevant regulations and equipped to ensure the safe discharge of propane to a receiving tank.

Maintenance

Maintenance of Pretium facilities at Brucejack must conform to the following directives:

- Pretium contractors and employees will visually inspect all fueling depots daily. They must immediately report evidence of leakage, nozzle malfunction, or spillage to their Supervisor and the Health and Safety Coordinator, and record any malfunctions.
- Conduct regular written formal inspections. Keep all records and/or journal entries.
- Maintain spill response equipment and fire extinguishers in a condition to ensure that they are available for immediate use.
- Restock spill response kits after use.
- Post maintenance procedures.
- Maintain a clean and tidy site.
- Check dispensing equipment regularly to ensure it is in good working order.
- Repair faulty equipment promptly, using proper replacement parts and materials.

Inspection

Pretium's Environmental Department and Health and Safety Department or qualified designate will:

- Determine the cause of all spill incidents.
- Inspect the site of any spill incident over 100 L or where fuel has entered a watercourse and advise senior management of actions taken and recommendations.
- Inspect all locations where fuel is stored and/or dispensed at intervals not exceeding fifteen days (*Site Assessment Guide below*). Maintain a record of all such inspections, of any deficiencies observed and of remedial actions implemented.
- Ensure that all actions taken related to fuel management are satisfactory and complete.
- Ensure that all equipment used for transporting, storing, and dispensing fuel, and replacement parts comply with all regulatory requirements and company standards.
- Ensure that the manufacturer's approved specifications are maintained for all tanks to ensure their certification and compliance.
- Submit to the Mine Manager inspection reports on matters related to fuel management.

CHEMICAL REAGENTS

Inventory & Risk Assessment

An inventory of hazardous material quantities and locations is presented in the Chemicals and Materials Storage and Handling Plan. It is kept up-to-date and is supplemented with Pretium's online SDS management database. Should there be a spill or fire, the former information can be referenced to quickly identify resources at risk and the amount of material and packaging that could be involved.

Inspections of reagent storage are completed routinely, and include observations of the condition of containers and storage areas (e.g., potential ignition sources, signage, and other housekeeping aspects), evidence of leaks, and any related safety concerns.

Storage and Handling Requirements

General

- Facility design must include the selection and placement of piping, pumps, pallets, totes, and other containerization that reduces the potential for spills, fires, and other incidents.
- Hazardous materials must be segregated from incompatible chemicals, including fuels. Flammable products must be stored away from potential sources of ignition such as non-approved electrical equipment or heaters.
- Ventilation must be adequate to ensure vapours and dusts do not become concentrated enough to ignite.
- Ensure an emergency spill kit is readily available that includes neutralizers and sorbents.
- Hazardous materials must be stored and handled in a manner to reduce the potential risk to human life and critical assets. Do not store hazardous products near exits.
- If removed from its original container, a material must be placed in a container that is not damaged, is appropriate for the material, and is clearly labeled as such, in contrast to other printed labeling.
- Check and follow SDSs for any specific storage precautions.

Containers

- Containers used to store flammable or combustible liquids, having a capacity of not more than 230L, must be fully intact, undamaged, and conform with one of the following:
  - Transportation of Dangerous Goods Regulations
  - CSA B376-M (R2003) "Portable Containers for Gasoline and Other Petroleum Fuels" (up to 5 gallons/25L)
  - ULC/ORDC30 "Safety Containers"
  - CSA-B306, "Portable Fuel Tanks for Marine Use"
  - Section 6 of CSA-B620, "Highway Tanks and Portable Tanks for the Transportation of Dangerous Goods"
  - Note: original (untampered/undamaged) containers such as drums and totes are adequate
- Containers of not more than 1L capacity used for flammable liquids (5L for combustible liquids) are exempt from the above requirement.
- Ensure that all containers have WHMIS supplier labels affixed to them.
- Never use plastic or glass containers for storing flammable liquids unless storage in metal containers would affect the required liquid purity or if the liquid would cause excessive

corrosion of the metal container.

- Provide approved containers that close for the collection and disposal of cleaning or solvent soaked rags and used sorbents.

Storage Cabinets

Up to 250 L of flammable liquids (500 L of flammable and combustible liquids), in closed containers, may be stored in a metal cabinet. A total quantity of 750 L of Class 1 liquids as defined in the BC Fire Code (1,500 L of flammable or combustible liquids) may be stored in a group of cabinets in a single fire compartment. Quantities stored can be increased by using additional groups of cabinets, but there must be a minimum distance of 30 m between groups of cabinets. Cabinets must:

- Conform to ULC Standards C1275 "Storage Cabinets for Flammable Liquid Containers."
- Be labeled in conspicuous lettering to indicate that the cabinet contains flammable materials.
- Be isolated from open flames.

If the storage cabinet has ventilation openings, ensure that the ventilation openings are sealed or that the cabinet is vented outdoors. The sealant material or the vent piping must provide fire protection equal to that required for the construction of the cabinet.

Fire Extinguishers

- As a minimum, one 3A,10-B:C rated fire extinguisher must be located in the vicinity of a designated flammables/combustibles storage area.
- Vehicles (i.e., forklifts) operating within a designated storage area must be equipped with a fire extinguisher having a minimum rating of 2A, 10-B:C (a 3A,10-B:C is recommended).
- Vehicles used to transport drums and containers must have a 3A, 10-B:C fire extinguisher

Product Separation

- Flammables and combustibles must be separated from toxic or corrosive substances, oxidizers by a minimum of 2 m.
- Hazardous products must be segregated by chemical group, as possible, in all storage areas.
- Do not store compressed gases beside flammable and combustible material containers.

Access/Clearance

- Maintain a minimum of 1 m width for storage aisles.
- Access to fire-fighting panels and equipment must be kept clear.
- Aisles should be accessible from two different points.
- At least 400 mm clearance must be maintained between the containers and a wall.
- Individual Storage Areas must be separated by aisles of at least 2.4 m.

Containment

- Ensure that storage areas are designed to contain spills, including water used for fire-fighting purposes, and that they are liquid-tight where the walls join the floor.

- Do not store hazardous material containers directly over a drain. Drains must remain unobstructed for spilled product to flow into.
- Any accessible drains must terminate at a location where a spill will not create a fire hazard or any risk to public health or safety.
- The US National Fire Protection Association (NFPA) has published guidelines that Canadian companies must follow as part of insurance requirements. NFPA stipulates various means of spill containment to prevent the spread of a fire:
    - Non-combustible liquid-tight raised sills, curbs or ramps of suitable height at exterior and interior openings; interior openings can utilize other flow-diverting structures
    - Sloped floors (toward drainage if practical)
    - Open-gate trenches or floor drains connected to a properly designed drainage system, (i.e., one engineered in terms of materials, capacity, and safety (no fire risk)
    - Wall scuppers that discharge to a safe location or to a properly designed drainage system
    - Other means acceptable to the authority having jurisdiction
    - Where sills, curbs or ramps are used, the appropriate height will depend on the maximum expected volume, floor area, and the existence of any drainage system
    - Curbs and sills are often a standard 100 mm (4 inches) high
    - Note: 1 m^2 of water at a depth of 25 mm equals 25 L
    - Where open-grate trenches are used, the volume of the trench should contain the maximum expected spill volume or otherwise be connected to a properly designed drainage system

Ignition Sources

- Heating appliances are not permitted in a fire compartment used to store flammable and combustible liquids unless installed in a manner that will not create a fire or explosion hazard.
- Smoking is not permitted within an area used for storing flammables and combustibles.
- Wiring in a hazardous material storage area must conform to the BC Safety Standards Act -
- Electrical Safety Regulation (s.18, 20, 22).
- Any electrical equipment must meet requirements and approval for hazardous locations (FM Global standard 5-1 "Electrical equipment in hazardous locations").
- Precautions should be taken to prevent open flames, sparks or electric arcs – and otherwise prevent the introduction of any potential ignition source to storage areas.
- Do not store compressed gases beside flammable material containers.
- Dispensing must take place not less than 6 m from potential sources of ignition or be separated by fire separation (including the prevention of the passage of vapours).
- Self-closing faucets and safety bungs must be in place on all containers used for dispensing.
- Ground and bond all work and ignition-proof equipment within 6 m of flammable liquids or flammable liquid operations.
- Follow all hot work procedures when performing work that produces open flames, heat and/or sparks.

Housekeeping

- Ensure that storage areas for all chemical reagents are cool and dry
- Do not store combustible materials other than those used for the packaging of flammable or combustible liquids in the same individual storage area with such materials.

Signage

- Signs must be posted and be clearly visible indicating:
  - the presence of flammable and combustible products stored in that room or area
  - no smoking
  - emergency contact numbers

Ventilation and Exhaust

- Ensure that storage rooms have properly designed ventilation systems that are regularly maintained.
- Ventilation for flammables and combustibles storage areas must conform to the BC Building Code and the BC Fire Code (and NFPA) except if only closed containers are used and there is no dispensing.

Human Element/Change Management

Fire prevention and hazardous material management will be reviewed as part of the existing change management process. This will include:

- New product screening for hazardous properties and subsequent storage requirements (use new product SDS information as appropriate)
- For new projects, ensure proper design to prevent introduction of hazardous products to production processes, water treatment or areas that may generate a fire or other hazard.
- Reinforcement of the Hazard Identification procedure during maintenance and construction activities near designated hazardous material storage areas

SITE ASSESSMENT GUIDE

Many forms of site assessment that focus on spill prevention and response are currently in place at Pretium facilities and will continue to be used and updated throughout Operations. Examples of observations included in an assessment are presented below.

Perimeter Review	☐ indications of leaks and losses leaving the site ☐ blockage of any drainage systems • discoloured, oily or odorous liquid discharges • discoloured or dying vegetation
Fuel Storage & Transfer Areas	☐ spills or stains on the ground and contaminated runoff ☐ spill and drip collection during fuelling • spillage of waste oil from drums or tanks • unreconciled losses from storage tanks or drums • functioning shut-off systems • proper operational procedures posted • signage posted and visible
Spill Response	☐ equipment available matches list of equipment in kit • proper spill equipment (oil versus universal sorbents) • good access to spill equipment • storage drums, tanks well labelled • emergency response plan posted • spill prevention and response plan in place, up-to-date and tested
Waste Management	☐ wastes sorted and stored in one or more areas ☐ scrap steel, drums, equipment parts kept neatly • hazardous materials, paints stored separately • recycling program implemented for antifreeze, waste oils • oil filters crushed, spent batteries returned • waste containers properly labelled, manifested for transport • waste disposal conducted on regular basis • use of small containers minimized • all necessary permits obtained
Due Diligence Items	☐ Spill Response Plan ☐ Chemicals and Materials Storage and Handling Plan • Spill Response and Cleanup Training (see Spill Response Plan Appendix F) • Regular inspection program • Written documentation / recording of spills and inspections

Site Assessment Guide

TANK FARMS

- Double-wall tanks
- Single- wall tanks with dyke that holds 110% of contents or one of:
  - o Perimeter berm
  - o Oil/water separator (serviced)
  - o Pre-cast concrete block corral
- Collision protection steel pipe, logs, concrete, other barriers
- Covered containment with impervious floor
- Retractable hoses, drip holders lighting, remote shutoff
- Mark 90% of maximum fill volume

DRUMS

- Fuel drums stored on side
- Caps, bungs, drains tightly closed.
- Segregate fuels from solvents
- Ensure proper ventilation if sheds are used.
- Keep drums out of harm's way.

Location

- Does not drain to waterways, drains, ditches
- Locate >30 m from stream, lake or wetland.
- Does not allow sediment to enter water

Condition of Tanks and Area

- No corrosion, dents, significant damage to tanks or drums
- Maintain clean tidy site – no garbage, packaging in storage area
- No vegetation that obscures tanks, drums, piping, valves and fittings

Emergency Response

- Unobstructed access to emergency measures:
  - o Spill response kit with PPE
  - o Fire extinguisher
  - o First aid kit

Labelling and Signage

- Signage: No Smoking
  Operator always in attendance
  Report all spills
  Emergency contact numbers
- Label contents type and (for tanks) volume

Appendix B

Mill Reagent Storage Plan

Mill Chemical Reagent Storage Plan

The plan for storing reagents inside the mill is outlined in this section. Practices outlined in the Chemical Materials Storage and Handling plan are being implemented as part of the mill reagent storage plan.

Criteria Used for Storage

The following criteria was used for the determination of reagent transportation and storage inside the mill building. The reagents are transported and stored in the standard shipping containers until they are required for consumption.

Compatibility

Chemical and physical properties of all reagents are considered for allocation, details of incompatibility and storage procedures (refer to Pretium's SDS management database for details). Lab reagents are stored in corrosive cabinets, located inside seacans outside the mill in a designated laboratory supplies area and are kept away from other reagent storage. Special caution is taken for four main chemicals as they were identified as incompatible with other reagents that are also to be stored in the Brucejack mill:

- Vancol PAX 90% – Incompatible with acids, strong oxidizers, and metal salts (Class 4.2 Flammable substance). This chemical is incompatible with Sulfuric Acid and ferric sulphate and each will be stored away from the others.
- Flocculant - AN 910 PWG - Incompatible with metallic salts and moisture. This chemical is not compatible with Ferric Sulphate and will be stored away from each other.
- Sulfuric Acid – Incompatible with water, alkalis and sulfides. This is a liquid reagent and it will be stored separately in a custom-built shipment container with secondary containment.
- Hydrated lime – Incompatible with acids.

Warehouse delivery and stock holding times

The warehouse at Smithers will deliver reagents upon request. The metallurgy department monitors each reagent's consumption, and is responsible for ordering the required quantity of reagents once per week. An order for reagent delivery is placed with the warehouse allowing a minimum of 3 days' notice prior to expected delivery. Reagents are stored at Brucejack Camp, as well as Knipple Camp and Bowser aerodrome. Typically, a one week of supply of reagents is on-hand at Brucejack, and two week's supply is at the Bowser staging area. Consumption rates of each individual reagent, as well as restrictions of container availability are taken into consideration in the definition of the inventory period.

Location of Reagents

Reagents are primarily stored in the. Minor quantities of reagent are stored outside the mill in seacans. The sea-cans are stocked and positioned to ensure that only compatible reagents are in close proximity. PAX, Vanfroth, Sulphuric Acid are stored outside in seacans.

Reagent storage accommodates for safe retrieval by operators, primarily by skid steer loaders. Distribution of the sea-cans and the designated mill storage locations allow for sufficient maneuverability at the time of retrieval and deposit.

Laboratory reagents are stored in seacans located on the east side of the mill, south of the bulk gravity lab. A 20′ seacan with other non-hazardous supplies contains multiple locked corrosives cabinets containing HCl, HNO3, and HF acids. A 10′ seacan contains a corrosives cabinet and will store a single 2.5 liter bottle of $HClO_4$.

Four totes of Sulfuric Acid will be stored in a separate specially designed container with a secured containment tray (Figure B1). Outdoor sea-can storage is organized as per Figure B2.

Figure B1. Special container with secure containment tray for Sulfuric Acid.

Pax is stored in a special sea-can purposely built for PAX storage. This sea-can is elevated, kept dry and has an explosion proof fan, Figure B2.

Figure B2. Special Container for PAX Storage

The desired reagent storage holding time is calculated based on the volumetric capacity of each reagent container and the consumption rate. Results of the calculations are shown in Table B1.

Table B1. Calculated Reagent Storage Holding Time.

					Unit Weight	**Storage Unit Volume (m2)**			
			Storage Unit	**Consumption (kg/day)**	**(kg/unit**	***Floor Area**	**Duration (Day/Unit)**		
#Item	Reagent Name	Unit						Stored Area	Indoor storage area
1	Vancol PAX 90%	SS	SS	311	950	1.49	3.1	PAX Specific outdoor Seacan	PAX preparation area
2	Vanfroth 250	Tote	Tote	80	1000	1.12	12.5	Outdoor seacan	Dewatering Floor
3	Flocculant - Thick	SS	SS	366	750	1.49	2	Outdoor seacan	Dewatering Floor
4	Millsperese - Anitscalant	Tote	Tote	17	1270	1.12	75.4	Not Stored outside	Safety Screen Area
5	Flocculant - WTP	bag	Pallet	9	800	1.24	86.5	Not Stored outside	WTP flocculant prep area
6	Hydrated Lime	SS	SS	359	800	1.49	2.2	Outdoor seacan	Lime preparation area
7	Microsand	bag	Pallet	11	800	1.24	73.9	Outdoor seacan	Top floor WTP
8	Ferric Sulphate - Double Stk	SS	SS	704	1000	1.49	1.4	Outdoor seacan	Ferric sulphate preparation area
9	Sulphuric Acid	Tote	Tote	15	1740	1.12	116	Outdoor special seacan	Not stored inside
10	Sodium Sulphide	SS	SS	0	800	1.49	0	Outdoor seacan	Not used
11	Pre-mixed Flux	SS	SS	180	500	1.49	2.8	Outdoor seacan	Assay lab sample area

Table B2. Reagent Outside Storage Map – Seacan/Storage Rows

Sulfuric Acid + Miscellaneous IN THIS ROW	Ferric Sulfate + Miscellaneous IN THIS ROW	Ferric Sulfate + Miscellaneous IN THIS ROW	Floc 910 IN THIS ROW	Lime IN THIS ROW	PAX IN THIS STORAGE

Reagents in Use

The reagents currently in use in the mill process are located as follows:

PAX – When PAX solution is prepared, a supersac is moved from the storage sea-can to the reagent transfer room, where an overhead crane lifts the supersac to the upper floor of the PAX preparation area. PAX is not stored in the mill, and is only retrieved from the PAX sea-can as needed.

Frother – Frother is stored as liquid in totes, with one tote located at the frother transfer location and one additional tote stored at the concentrate bagging station.

Flocculant – When flocculant is prepared, a supersac is moved from the storage location to the flocculant preparation tank using an overhead crane. Additionally, seven bags of flocculant is stored at the concentrate bagging station.

Anti-scalant – Only one anti-scalant is stored within the mill at the safety screen area. The tote is stored on a spill containment pallet until ready.

Hydrated Lime – When the lime slurry is prepared, a supersac of hydrated lime is removed from the storage shelves and taken to the reagent transfer room. An overhead crane lifts the supersac to the lime preparation area. Seven bags of lime are stored near the lime preparation crane on shelving.

Ferric sulphate - When ferric sulphate is prepared, a supersac is removed from the storage location and taken to the ferric sulphate overhead crane, where the supersac is lifted to the ferric sulphate preparation area. Seven supersacs of ferric sulphate are stored in the mill on shelving.

Anionic Polymer (AN905) – A pallet of 40-25kg bags is kept at the anionic polymer preparation area.

Microsand – Up to two pallets of 40-25kg bags of Microsand are kept on the top floor of the Operations Water Treatment Plant near the primary Actiflo unit.

ChemTreatCT788 – Corrosion inhibitor – Only one tote of CT788 is stored in the mill located near the gland water tank on a spill containment pallet.

Pre-mixed flux is used in the assay laboratory and is located on

ng area.

Reagent preparation and use locations are identified in Figure B3:

Figure B3. Mill Reagent and Preparation Locations.

UPDATES ON INVENTORY INFORMATION

Every week, a reagent inventory is completed, as well as a re-evaluation of reagent consumption by the Metallurgy Department. Any changes regarding practices for storing reagents in the mill are recorded and documented accordingly.

PREFACE

The Economic and Social Effects Mitigation Plan (ESEMP) was originally developed in October 2015 and is updated annually. This document updates and replaces the latest version of the ESEMP produced in March 2021. Updates reflect changes due to the completion of the construction phase in 2017, and the first four years of mine production between 2018 and 2021. It also provides for changes anticipated in 2022 as the Mine continues with production activities.

Notable updates to the ESEMP include:

- References to Newcrest Mining Limited, the new parent company of Pretium Resources Inc and the Brucejack Mine. Pretium Resources Inc is a member of the Newcrest Group of Companies effective March 9, 2022.
- Roles and responsibilities have been adjusted to align with Pretivm's corporate structure at this time.

1 MINE OVERVIEW

1.1 THE BRUCEJACK MINE

Pretium Resources Inc. ("Pretivm"), a member of Newcrest Group of Companies, operates the Brucejack Mine (the Mine), an underground gold and silver mine in northwest BC. The Mine is located at 56°28′20″ N latitude by 130°11′31″ W longitude, which is approximately 950 km northwest of Vancouver, and 65 km north-northwest of Stewart. The Mine is located in the Kitimat-Stikine Regional District. Portions of the Mine and associated infrastructure lie within the traditional territories claimed by the Tahltan Nation and Tsetsaut/Skii km Lax Ha (TSKLH), and in the Nass Area of Nisga'a Nation as defined in the Nisga'a Final Agreement (NFA; Government of Canada Government of BC and Nisga'a Nation 2000).

The mine site area is located near Brucejack Lake. The Mine is accessed by a 73.5 km road connecting with Highway 37 approximately 30 km south of Bell II. The road is used year-round to mobilize personnel, equipment and supplies to the mine site and to truck concentrate to port facilities. A transmission line connects the mine site to the provincial power grid near Stewart.

1.2 DEVELOPMENT SCHEDULE

Construction of the Mine began in 2015 and was completed in 2017. Commercial mine production commenced in 2017, with a planned operational mine life of 18 years. During operations, the Mine was originally planned to produce approximately 16.5 Mt of ore at a rate of approximately 2,700 tonnes per day. In December 2018, Pretivm received an amended EAC and permit amendment to increase the average daily production rate to 3,800 tonnes per day and a total production of 18.5 Mt. At the accelerated production rate, the Mine has a planned operational life of thirteen years to the year 2032. Closure is expected to occur over approximately five years and will include decommissioning, abandonment, reclamation activities, and monitoring.

<u>Summary of Work to Date (as of March 2022)</u>

2021 marked the fourth full year of operations at the Mine, and the third year of operations following approval for the Mine to increase the production rate by 40% to an annual average of 3,800 tonner per day (1.387 million tonnes per year). In 2021, Pretivm was able to maintain steady-state production at the increased production rate set in 2019, despite the ongoing challenges presented by the COVID-19 pandemic. Through 2021, the company took a number of steps to protect the Mine's workforce and limit the risk of COVID-19 exposure for workers, their families, and communities. Protocols were implemented to manage access to the Mine and camp, crew transportation, social distancing, hygiene, health checks, on-site medical services and communication. Throughout the year, however, numerous COVID-19 positive, and close contacts of COVID-19 positive individuals were managed at site.

Pretivm continues to work closely with Indigenous groups including the Nisga'a Nation, Tahltan Nation, Tsetsaut Skii km Lax Ha (TSKLH), and Gitanyow Hereditary Chiefs. In April 2015, Pretivm and the

Nisga'a Nation established a Cooperation and Benefits Agreement, and in October 2017, a comparable agreement was reached with the Tahltan Nation. Pretivm also maintains strong relationships with local communities. Through the challenges of the pandemic, Pretivm adapted its engagement activities and communication strategies to maintain strong ties with all Indigenous groups.

At the end of 2021, Pretivm's workforce comprised 894 direct employees, 44% of whom were residents of northwestern BC, and 29% of whom self-identified as Indigenous.

1.3 BENEFITS OF THE MINE

The Mine provides positive economic benefits to local communities as a result of direct training and employment opportunities generated by the Mine. Pretivm is committed to making local employment a priority, and to engaging educational and training institutions and other organizations to enhance the ability of local and regional residents to obtain employment related to the Mine. Pretivm is also committed to sourcing local contractors and supplies from northern BC where possible.

The actual benefits realized by the Mine—including local and Indigenous employment, procurement, training, and engagement—are monitored and reported annually as part of the ESEMP Annual Report (described in Section 11 of this report). Based on this information, Pretivm can adjust and adapt activities to ensure that local benefits are achieved, and that other impacts are appropriately managed.

1.4 PROPONENT CONTACT

Contact information for Newcrest Brucejack is provided below.

2 PURPOSE OF THE ESEMP

2.1 CONTEXT

The Mine has been designed to minimize, mitigate and/or manage potential adverse effects on communities while systematically seeking to enhance positive effects. In support of the Mine's Environmental Assessment Certificate (EAC) #M15-01 and conditions issued by the BC Environmental Assessment Office (EAO) on March 26, 2015, this document presents the Economic and Social Effects Mitigation Plan (ESEMP) that Pretivm will follow concurrent with the operation of the Mine.

The ESEMP has been developed in accordance with government regulatory requirements and internal company standards. It has been further informed by community-based research and a review of literature discussing the lessons learned of other proximally located mine projects, as well as the current efforts of service delivery organizations (including education and training institutions) operating in northwestern BC.

Pretivm is committed to managing the social and economic effects of the Mine and enhancing benefits to local and regional communities and Indigenous groups. To this end, the following ESEMP has been developed to guide the Mine's operation and eventual closure phases.

2.2 ENVIRONMENT ASSESSMENT CERTIFICATE CONDITION NO. 10

The Mine's EAC is subject to a number of conditions. The Minsters' decision (BC EAO 2015) noted the following considerations with respect to economic, health and social effects:

> *EAO acknowledged a wide range of potential economic, health and social effects that may occur due to Project development. EAO determined that increased demand for health, social and/or emergency services as well as the predicted increase in transient workers were the most plausible residual effects after mitigation.*
>
> *There are legally binding conditions that will require a Health Services Management Plan, consistent with guidelines established with the Northern Health Authority (NHA) as well as an Economic and Social Effects Mitigation Plan. These plans will demonstrate how the Proponent will mitigate potential impact on regional health services, communicate Project related activities and benefits for regional Aboriginal and non-Aboriginal communities and support regional training initiatives.*
>
> *We are confident that these are sufficient to ensure potential economic, health and social effects identified in the environmental assessment will be mitigated.*

These considerations are addressed through Condition No. 9 (Health Services Monitoring Plan) and Condition No. 10 (Economic and Social Effects Mitigation Plan) of the Certificate. A Health Services Monitoring Plan is under a separate cover from the ESEMP, and it is complementary to the ESEMP.

Condition No. 10 of the EA Certificate states that the ESEMP should include, at a minimum:

- Mine development schedule;
- communication protocol;
- summary of Mine contracting opportunities;
- summary of Mine employment opportunities;
- strategy for Mine-related training programs; and
- Mine contractor and employee transportation schedule.

The ESEMP meets the requirements of EAC Condition No. 10 and presents a number of management strategies developed to respond to, manage and/or mitigate the potential social and economic effects identified in the Application. The management strategies included within the ESEMP include the following:

- Employment Strategy (Section 6).
- Procurement Strategy (Section 7).
- Training Strategy (Section 8).
- Transportation Strategy (Section 9).
- Communications Protocol (Section 10).

In addition, Pretivm must consult with NLG, Tahltan Nation and TSKLH on the content and implementation of the ESEMP in accordance with the Aboriginal Consultation Plan (ACP). Pretivm was required to implement the ESEMP prior to the start of the Construction Phase (as achieved in 2015), and comply with the ESEMP during the construction, operations, and closure phases of the Mine. Ongoing implementation and reporting requirements are described in Section 11.

Sections 6 to 10 of this document address specific requirements identified in Condition No. 10 of the EA Certificate. Also included are the scope and objectives of the overall ESEMP (Section 2.3); a summary of stakeholders (Section 3), and effects and mitigation (Section 4); the proponent's approach to implementation and management of the ESEMP (Section 5); and associated annual reporting (Section 11).

2.3 ESEMP SCOPE AND OBJECTIVES

The purpose of the ESEMP is to reduce, manage and mitigate Mine-related economic and social impacts, while strategically supporting community benefits and engagement. The ESEMP provides guidance regarding community engagement and communications for the purposes of sharing information and maximizing the potential for local and regional residents to benefit from the Mine, while demonstrating the Mine's contribution to community development.

The ESEMP includes a number of specific strategies describing Brucejack's approach to employment, procurement, and training, along with expected opportunities for local and regional residents. The ESEMP is designed to tie together other plans, policies and commitments related to these subjects; where relevant, these documents are referenced and/or appended. The ESEMP is aligned with these documents but does not take their place; any changes in related plans, policies or other commitments will need to be reflected in the ESEMP. The ESEMP is a 'living document' and will be periodically updated based on management reviews, regulatory changes, consultation with the public and Indigenous groups or other Mine-related changes (e.g., changes to Mine activities or schedule).

Considering the above, and the requirements of Condition No. 10, the ESEMP has the following objectives:

- to describe the social and economic opportunities related to the Mine, including employment, procurement, and training, and the processes for applying to or accessing these opportunities;
- to provide a clear and transparent plan for how these opportunities will be communicated to local and regional communities—and, where relevant, developed in partnership with these communities—so as to enhance local and regional benefits;
- to provide information about the Mine schedule, progress, and plans for employee and contractor transportation through regional hubs, to local government and service providers, so as to reduce potential risks or adverse effects associated with the Mine; and
- to clearly identify roles and responsibilities, monitoring and reporting requirements, and points of contact, to be applied over the life of the Mine.

3 COMMUNITIES AND INDIGENOUS GROUPS

The ESEMP pertains to the communities and Indigenous groups as defined in Schedule B of the EAC:

- The "**Local Study Area (LSA)**" communities include the Nisga'a villages, Tahltan Indian Reserve communities, the Hazeltons (Hazelton and New Hazelton), Stewart, Smithers, Terrace, and Dease Lake.
- "**Indigenous Groups**" include the Tsetsaut Skii km Lax Ha (TSKLH), Nisga'a Nation (as represented by the Nisga'a Lisims Government [NLG]), and Tahltan Nation.

For the purposes of this document, "**Local Communities**" are defined to include the communities of the Local Study Area other than the Nisga'a villages and Tahltan on-reserve communities. As such, the Local Communities include:

- Hazelton and New Hazelton;
- District of Stewart;
- Town of Smithers;
- City of Terrace; and
- Dease Lake (unincorporated).

The "**Indigenous Communities**" include the four Nisga'a villages and the three Tahltan Indian Reserve communities. The Nisga'a villages include Gitlaxt'aamiks, Gitwinksihlkw, Laxgalts'ap, and Gingolx. The Tahltan[1] communities include the on-reserve communities in Telegraph Creek (Telegraph Creek IR 6 and IR 6A, and Guhthe Tah IR 12), Iskut (Iskut IR 6), and Dease Lake (Dease Lake IR 9; approximately 4 km north of the unincorporated community of Dease Lake). Tsetsaut/Skii km Lax Ha do not have reserve or treaty lands or a formal band structure under the *Indian Act* (1985); they have asserted rights and title over the Mine area, most members are based in and around Hazelton and New Hazelton.

Portions of the Mine and associated infrastructure are located within the asserted traditional territories of the Tahltan Nation and the TSKLH, and partially within the Nass Area (subject to treaty rights under the Nisga'a Final Agreement).

[1] The Tahltan Nation includes the Tahltan Band (based in Dease Lake and Telegraph Creek) and the Iskut First Nation (based in Iskut).

4 SOCIAL AND ECONOMIC EFFECTS AND MITIGATION

The ESEMP has been developed to promote the inclusion of local and regional residents in employment, procurement, and training opportunities. These actions contribute best practices in social responsibility as it relates to community engagement, capacity building, and realization of benefits from the Mine. Equally, engagement and consultation activities coupled with maintenance of existing relationships will provide relevant and timely information to enable Mine managers and community leaders to respond proactively to potential risks and socio-economic effects.

The Mine requires a skilled workforce for operation, and needs to procure goods and services. Maximizing the number of workers hired locally, and goods and services procured through local businesses, reduce costs, and support the economic viability of the Mine. However, the existing skilled labour supply within the region is limited and subject to competing demands from other industrial projects. To improve participation of the local and regional workforce, Pretivm advertises job opportunities locally and engages local education and training organizations to identify and plan appropriate training.

Table 4-1 summarizes the potential social and economic effects identified in the EAC Application for the Mine, as related to the objectives of the ESEMP, along with the mitigation measures presented for each effect.

The mitigation measures proposed within the EAC Application largely inform the content of Condition No. 10 and the ESEMP, which includes a communications protocol, Mine development and transportation schedules, summaries of Mine employment and contracting opportunities, and a training strategy.

Table 4-1. Social and Economic Effects Addressed by the ESEMP

Valued Component	Effect	Mitigation
Labour Market	Mine employment and expenditures will contribute to competition for skilled labour and induce wage inflation pressures.	Communications with Indigenous and non-Indigenous communities; communications with educational institutions, human resources policies and programs.
	Closure of the Mine will result in loss of employment; this may increase unemployment in LSA communities.	Communications with Indigenous and non-Indigenous communities; workforce transition programs.
Education Skills Development and Training	Increased demand for educational programs. Change in the educational profile of the LSA. Decreased demand for educational programs in the LSA (at closure).	Communicate Mine development and workforce schedule with communities in the LSA and with educational institutions.
Community Infrastructure, Services, and Housing	Increased demand for infrastructure and housing as a result of population in-migration. Increased demand on health and social services. Decreased demand for infrastructure and housing as a result of population out-migration (at closure).	Communicate Mine development and workforce schedule with communities in the LSA.
Worker and Family Well-being	Increase in transient workers in LSA communities.	Communication and information sharing on use of the camp, manage the work camp and behaviour of workers.
	Increased levels of stress and anxiety on workers and families at Mine closure.	Communicate Closure Plan, transition assistance for employees.

Source: Pretivm (2014)

5 PLAN IMPLEMENTATION AND MANAGEMENT

5.1 CORPORATE PLANS AND POLICIES

The ESEMP is currently informed by Pretivm's corporate plans and policies and will be reviewed against Newcrest corporate plans and policies in 2022. The core principles for the ESEMP are guided by Pretivm's **Social Responsibility Policy** (Appendix A), which at a high level defines the company's policy standard for its relationship with communities. The Social Responsibility Policy recognizes the importance of building and maintaining relationships with Indigenous groups, communities, and key stakeholders. The Social Responsibility Policy integrates the following objectives into the company's business activities:

- Assess the environmental and social effects of the Mine's projects and activities and develop appropriate corresponding management plans.
- Disclose mine-related information and pursue meaningful and culturally appropriate dialogue on mine-related effects with local First Nations and communities and key stakeholders early in the development phase of projects. Continue to engage First Nations, communities, and key stakeholders throughout the life of the Mine.
- Protect employee and community health and safety by supporting health and safety protection programs and by working cooperatively with those who may be affected by mine operations.
- Foster a workplace environment that is safe, free of discrimination and builds on a strong foundation of ethical behaviour, respecting human rights and ensuring equal access to employment opportunities for all.
- By incorporating local knowledge and building capacity, work cooperatively with local First Nations and communities to develop and support sustainable strategies to maximize the long-term benefits of mine development.
- Work with First Nations and relevant government authorities to protect or preserve heritage and cultural resources where they may be affected by mine operations.
- Establish management and monitoring systems that will provide opportunities for continual improvement to Pretivm's environment, health, safety, and social programs.

The ESEMP is further informed by Pretivm's **Environmental Policy** which contains the following provision for stakeholder engagement with respect to environmental concerns:

- Encourage dialogue on environmental issues with employees and the public and be responsive to concerns.

Pretivm may establish several operating rules and practices related to employment with the Mine. These rules and practices will apply to all mine employees, contractors, and subcontractors both at the Mine site and while in transit to the Mine site. Company rules and practices will govern activities and behaviour at the Mine site including, but not limited to, the use of drugs and alcohol, access to and from the site, use of land around the site, external communications, discrimination and harassment, and firearms.

5.2 AGREEMENTS WITH INDIGENOUS GROUPS

In addition to the strategies outlined with the ESEMP, Pretivm is engaged in agreements with Indigenous groups that are complementary to this strategy.

5.2.1 Nisga'a Nation: Cooperation and Benefits Agreement

In April 2015, Pretivm announced a comprehensive Cooperation and Benefits Agreement with the Nisga'a Nation. Under this agreement, the Nisga'a Nation will provide ongoing support for the development and operation of the Mine in an environmentally sound manner, with commitments from Pretivm regarding communication, employment, business, education, training, and other socio-economic opportunities. The Agreement also provides for communication, collaboration, and cooperation between Pretivm and the Nisga'a Nation. Highlights include:

- Nisga'a Nation collaboration with Pretivm in support of the completion of the operational permitting process for the Mine and subsequent regulatory authorizations;
- financial payments by Pretivm to the Nisga'a Nation upon the achievements of certain Mine milestones, and annual production payments based on a percentage of net profits;
- Pretivm's commitment to education and training of Nisga'a citizens so that they will be better able to take advantage of the economic benefits the Mine offers;
- a framework for the Nisga'a Nation and Pretivm to work together to achieve employment targets to ensure Nisga'a businesses will have preferred access to contracting opportunities; and
- mutual cooperation on responding to the social impacts which Nisga'a Villages may experience as a result of the Mine.

In 2021, Pretivm continued to work with the Nisga'a Lisims Government to build capacity in the local labour force through a new Workplace Essential Skills Training Program launched in 2020. The program was developed through a Memorandum of Understanding (MOU) with Nisga'a Employment Skills and Training (NEST).

5.2.2 Other Indigenous Groups

In October 2017, Pretivm and the Tahltan Nation established a Benefits Agreement. Pretivm also signed a Cooperation and Benefits Agreement with the Gitanyow Hereditary Chiefs in June 2016.

Pretivm continues to work with other First Nations to determine the best approach to providing long-term benefits that reflect their unique circumstances.

Pretivm will comply with the provisions of existing or future agreements with Indigenous groups, in addition to the provisions described in the ESEMP.

5.3 INDIGENOUS CONSULTATION

Pretivm has developed an Aboriginal Consultation Plan (ACP) in accordance with EAC Condition No. 3. The ACP describes how Pretivm will share information, engage, and consult with the TSKLH, NLG, and Tahltan Nation throughout the Operations and Closure phases of the Mine.

The ESEMP is complementary to the ACP and other component plans, as described in Condition No. 2 of the EAC which states that the content and implementation of each component plan is subject to consultation with the Indigenous groups in accordance with the ACP. As such, the content of this ESEMP has been shared with the TSKLH, NLG, and Tahltan Nation for review and comment.

5.4 ROLES, RESPONSIBILITIES, AND REPORTING

The overall implementation of the ESEMP – including communication and consultation with Indigenous groups, communities, and other stakeholders, as well as annual reporting – is led by Pretivm's Community Relations Group. The Community Relations Group is also responsible for responding to comments and queries and providing regular reports on the activities contained in this plan. The Community Relations Group may delegate responsibility for specific aspects of the ESEMP to other personnel. In particular, the Community Relations team is responsible for engagement and relationships with communities and Indigenous groups, including discussions and programs related to hiring, employment, and training. Other supporting roles and responsibilities will be identified during implementation based on needs.

Specific responsibilities for each component are identified in the respective sections below. In general, although overall responsibility for the implementation of the ESEMP lies with the Community Relations Group, the following positions assume responsibility for specific subject areas:

- Local hiring, employment and training: Human Resources Manager and Talent Acquisition Specialists with support from the Community Relations team.
- Site management: General Manager
- Procurement: Director, Supply Chain
- Indigenous Relations: VP Government Relations and Social Performance, with support from Community Relations team

5.5 CHANGE MANAGEMENT

Significant changes or alterations to Mine activities will be actively managed and may have implications for the ESEMP and other plans. Changes will be communicated to Indigenous groups, communities, and key stakeholders in accordance with the Communications Protocol and the Aboriginal Consultation Plan. Changes may include:

- planned changes to Mine activities, design and/or production during the remainder of the Operations Phase;
- planned transition from the Operations Phase to decommissioning, closure and post-closure activities; and/or
- temporary closure.

In addition, ongoing monitoring, and reporting (as described in Section 11) and feedback from Indigenous groups, communities and other stakeholders may identify areas for improvement. Changes will be made with appropriate consultation with regulators, local government, service providers, and/or Indigenous groups, and will be reflected in the ESEMP. This approach ensures the objectives and associated actions are relevant and appropriate. Updates will be made as necessary to better achieve desired outcomes.

6 EMPLOYMENT STRATEGY

6.1 PURPOSE

The purpose of the Employment Strategy is to identify activities undertaken to promote local and regional employment. The overall approach is to increase awareness of Mine-related employment opportunities and support local and regional residents in their ability to respond to these opportunities. The Employment Strategy is closely related to the Training Strategy (described in Section 8), which provides for job-related training and coordination with regional training institutions.

6.2 SCOPE AND OBJECTIVES

The Mine has the potential to enhance the employment, work experience, education, and skill levels of the regional workforce. These capabilities also help promote the retention of workers within the region and contribute to regional development of human capital. Workforce training to achieve these ends will also support the development of a workforce capable of meeting Mine-related needs (as described in the Training Strategy in Section 8).

The objectives of the Employment Strategy are to:

- describe the types of anticipated employment opportunities;
- identify the educational and skills requirements associated with the above employment opportunities;
- provide a transparent account of the general requirements of mining employment;
- describe considerations for local and regional recruitment; and
- comply with employment provisions defined in agreements with Indigenous groups.

The Employment Strategy provides an overview of employment opportunities including available positions, timing, necessary qualifications, commitment to local and regional hiring, how to apply, and contact information for enquires. This strategy applies primarily to the Operations Phase of the Mine, as most workers in the Construction Phase were employed through contractor companies.

Hiring and training is conducted with consideration for cultural awareness and sensitivity, gender equity, and non-discrimination. Equal opportunities and career advancement is provided to all individuals employed with the Mine.

6.3 EMPLOYMENT OPPORTUNITIES

Construction Phase Employment

Mine-related employment during the Construction Phase is detailed in the ESEMP Annual Reports for years 2015 to 2017. As anticipated in the original ESEMP (October 2015), the majority of hiring during the Construction Phase was done by site contractors. The predicted level of construction employment was shown to be accurate as, during the summer of 2016, construction activities utilized more than 900 contractors and employees.

Operations Phase Employment Opportunities

The feasibility study for the Mine predicted that Operations Phase employment would peak at approximately 500 workers. Pretivm exceeded this estimate with 619 direct employees and 280 contractors employed as of December 2018. As the approved production increase was implemented in 2019, the workforce continued to grow through 2019-2021 to reach 894 direct employees and 626 contractors employed as of December 2021.

Pretivm's recruitment and hiring efforts continue to focus on providing opportunities for workers from the northwest BC region and Indigenous groups.

Detailed employment (including Pretivm and on-site contractors) by department and/or contractor is provided in the ESEMP Annual Report, which also describes the participation of Indigenous and regional workers in the workforce. A wide range of positions and departments are staffed at the mine site, and in Pretivm's offices, including:

- Underground mining;
- Mill operations;
- Surface operations;
- Camp maintenance, housekeeping, and catering;
- Mill maintenance and surface maintenance;
- Technical services; and
- Health and safety.

Most positions at the mine site are based on a two-week on/two-week off shift schedule. Where employment requirements are met, preference for hiring is given to the Indigenous groups and local and regional residents (as described in Section 6.4).

6.3.1 Qualifications and Requirements

6.3.1.1 General Employment Requirements

There are a number of standard requirements for employment within the mining industry that promote safe work and optimize the working environment. Requirements for all applicants seeking employment with Pretivm include:

- Canadian citizenship or otherwise eligible to work in Canada;
- applicants must be 18 years of age or older;
- completion of a pre-employment drug and alcohol test;
- pre-employment medical; and
- criminal record check.

Other considerations are dependent on the type of position sought. A valid driver's licence (additional classes maybe be required) and driver's abstract may be required for some positions. The requirements associated with employment opportunities will depend on the position. For entry level (unskilled) positions, requirements may include completion of high school (or equivalent) and/or some level of work experience.

Once the basic employment requirements are met, the applicant's work experience and suitability to the position will also be considered.

Employees of the Mine (including workers employed by contractors) are required to comply with the Mine's code of conduct and company policies including non-discrimination, Fitness for Duty (covering drug and alcohol use), and safety, among others.

6.3.1.2 Education and Skills Requirements for Select Positions

Typical training requirements for a selection of specific job titles are provided in Appendix B, including whether a Red Seal trades certification is applicable. The availability and timing of forthcoming employment opportunities will be provided to regional educational institutions to inform course offerings and prepare the local workforce, in accordance with the Training Strategy described in Section 8.

Appendix B lists employment opportunities typically associated with mine operation, and includes the specific education, training, and certifications or designations required of each position. This general information will be communicated to education and training organizations to inform programming.

6.3.2 Job Postings and Applications

Employment opportunities are posted online on Pretivm's website (www.pretivm.com/Careers). The online postings include job-related information such as:

- a summary of the Mine and location;
- a stated preference for local candidates;
- a description of the position including tasks and duties;
- a description of the position requirements including education and training, experience and skills, certificates, and designations.
- a description of the type of capabilities sought (e.g., attention to details, strong math skills);
- details describing the physical requirements of the position;
- a summary of compensation and benefits; and
- a summary of travel arrangements (i.e., days on/off, compensation for travel days).

The online job postings also provide a means through which to apply for a posted position (i.e., an online form). Applications may also be sent to resumes@pretivm.com. If prospective applicants need help with computers or online access, Pretivm staff can help to identify resources to provide assistance (e.g., local agencies such as WorkBC, NEST, and TahltanWorks). Pretivm's contact information is provided in Section 1.

6.3.3 Preparation for Closure

In advance of the Closure and Decommissioning Phase, Pretivm will prepare a plan for communicating closure plans and schedules, and related implications (and opportunities), to employees. Closure planning will include support to help workers transition out of Mine employment and find new positions. This may include documentation of training and experience, and provision of references for employment.

6.4 SPECIAL CONSIDERATIONS FOR LOCAL AND REGIONAL RECRUITMENT

Pretivm supports the recruitment of local and regional workers by advertising available positions locally and providing local communities, Indigenous groups, and service providers with information about upcoming jobs and recruitment efforts. Although there is no strict target for local/regional employment, the following regional preferences are applied after basic requirements are met:

1. Members of Indigenous groups including the TSKLH, Nisga'a Nation, Tahltan Nation, and Gitanyow;
2. Individuals who reside within LSA communities (as described in Section 3);
3. Residents of northwestern BC; and
4. Residents of BC.

Workers are generally expected to live in, or arrange their own travel to, hub communities in northwest BC, including Smithers, Terrace, and nearby communities (e.g., along highways 16 and 37 en route to the mine site). However, transportation from other hub communities may be added or

adjusted depending on employment numbers. Transportation from various communities is described further in Section 9 (Transportation Strategy).

Awareness of Mine opportunities is enhanced through communication of job postings with relevant local institutions. Table 6.4-1 describes some of the avenues by which Pretivm communicates employment opportunities, including local employment offices, the Newcrest office in Smithers, and direct communications with Indigenous groups. Positions are also posted on a variety of online job boards.

Table 6.4-1. Recruitment and Job Posting Resources

Type	Job Posting Information
Pretivm	Online at: https://www.pretivm.com/careers/current-job-postings/default.aspx
	Newcrest office in Smithers
	Brucejack Mine Site (for existing employees)
Websites related to the mining industry	Various, including: • InfoMine • Mining Association of BC • Association for Mineral Exploration BC • Association of Professional Engineers and Geoscientists • Canadian Institute of Mining, Metallurgy & Petroleum • Environmental Operators Certification Program
Community resources	WorkBC online and offices: • Smithers • Terrace • Houston • Hazelton
	BC Construction Association (BCCA), notably through the Skilled Trades Employment Program (STEP) – Terrace Office
	General job boards: • Indeed.ca • BC Jobs
	Upper Skeena Development Centre
	Nisga'a Employment, Skills and Training (NEST): Prince Rupert, Terrace, and Gitlaxt'aamiks
	OnTrack, Tahltan Database, TCG
	Gitanyow Education and Training Institute
Websites targeted at Indigenous job seekers	Aboriginal Job Board
	NationTalk (national Indigenous news, employment, and tender network, www.nationtalk.ca)
	Tahltan and Nisga'a employment departments also advertise open positions on their webpages and social media

Prospective employees need to apply online for posted positions. Pretivm works with Indigenous groups to ensure that all interested applicants can efficiently access the online applications. If potential barriers to applications are identified (e.g., lack of computer access), Pretivm works with Indigenous groups to implement solutions. The Community Relations Manager works closely with employment contacts at Indigenous groups to connect job postings with eligible individuals in the communities, and to proactively identify and mitigate challenges. When a new position becomes available, Pretivm's Community Relations Manager emails the employment contacts at the Nisga'a Nation, Tahltan Nation, and Gitanyow. This notification is provided prior to an online job advertisement and is intended to give an advantage to local and Indigenous applicants.

Pretivm is committed to providing early and clear communications of hiring schedules and skill/certification requirements for positions via the Pretivm website and the contacts identified in Table 6.4-1. The Mine website provides public access to information about Mine-related employment, including the type of jobs that are available, a description of responsibilities, and the requirements for that type of employment, such as education and experience. Where possible, jobs will be posted and communicated at least two weeks prior to the application deadline.

Pretivm maintains regular contact with First Nations' employment representatives to communicate job postings, provide information about required skills and experience, and organize recruitment events.

6.5 RECENT ACTIVITIES

A summary of recent activities is provided in the ESEMP Annual Reports. At the time of writing, Annual Reports have been prepared for all calendar years from 2015 to 2021.

6.6 EVALUATION AND REPORTING REQUIREMENTS

The Employment Strategy is regularly reviewed and updated to ensure that it continues to be relevant and appropriate and facilitate the increased participation of local and regional residents in Mine employment. The strategy is reviewed annually and reported through the ESEMP Annual Report (described in Section 11). The following factors are reviewed and reported:

- a summary of Mine employment (number of applicants, number of people hired, duration of employment, type of employment [e.g., full-time, temporary]) for the following groups/areas:
  - Indigenous groups (and associated communities): TSKLH, Nisga'a Nation, Gitanyow and Tahltan Nation;
  - local communities: Smithers, Terrace, the Hazeltons, Stewart, and Dease Lake; and
  - northwest BC;
- comparison with preceding years to highlight trends;
- a summary of feedback from Indigenous groups, communities, and other stakeholders regarding employment process and/or outcomes; and

- upcoming actions or changes to the Employment Strategy.

6.7 ROLES AND RESPONSIBILITIES

Pretivm's Community Relations Manager is responsible for the implementation of the Employment Strategy including efforts for local and Indigenous hiring. Responsibilities include communication of employment opportunities to Indigenous groups and LSA communities. The Community Relations Manager is also responsible for the annual review of activities related to the Employment Strategy. The Community Relations Manager is supported by the Director, Human Resources, and the Talent Acquisition Specialists.

6.8 SUMMARY

Employment Strategy	
Purpose	To promote local and regional engagement in Mine employment.
Objectives	• Describe the type of employment opportunities that are anticipated to be available; • Identify the educational and skills requirements associated with the above employment opportunities; • Provide a transparent account of the general requirements of mining employment; • Describe considerations for local and regional recruitment; and • Comply with employment provisions defined in agreements with Indigenous groups.
Key Activities	Employment opportunities will be advertised locally and communicated to local communities, Indigenous groups, and other organizations to enhance local and regional employment.
Responsible	Community Relations Manager (Pretivm)
Timing and Schedule	Ongoing throughout Operations Phase.
Reporting	Annual ESEMP Report

7 PROCUREMENT STRATEGY

The Procurement Strategy summarizes Pretivm's procurement and contracting process, including the purpose, objectives, implementation, monitoring and reporting activities for the Mine.

7.1 PURPOSE

The Procurement Strategy describes Pretivm's overall procurement process and the activities that will be undertaken to maximize the number of local and regional businesses engaged in business contracts (and sub-contracts) associated with the Mine's procurement of goods and services. The involvement of suitable local and regional businesses enhances the economic benefits to local communities, Indigenous groups, and the broader region, and optimizes the economic viability of the Mine.

Pretivm recognizes that the Mine has the potential to positively affect local and regional economic development and is committed to enhancing this potential through both the direct and indirect expenditures through the purchase of goods and services on a competitive basis.

7.2 SCOPE AND OBJECTIVES

The Mine has the potential to attract and retain businesses in the local and regional area, and support the development these businesses, through contracts for goods and services. The involvement of local and regional businesses will further support indirect and induced employment and economic development associated with the Mine.

The Procurement Strategy has been developed to promote contract and subcontract opportunities for local and regional businesses, including Indigenous businesses. This will be achieved by ensuring businesses are aware of the Mine and understand Mine procurement practices and opportunities and are ultimately able to respond to procurement notices and become suppliers to the Mine.

The objectives of the Procurement Strategy are to:

- highlight existing commercial relationships with Indigenous businesses, and businesses located in the LSA communities;
- describe the types of anticipated business/contract opportunities;
- describe the processes and tools that will be used to manage procurement opportunities and suppliers;
- describe considerations for local and regional content; and
- comply with the business and contracting provisions defined in agreements with Indigenous groups.

7.3 PROCUREMENT OPPORTUNITIES

The Procurement Strategy is primarily relevant to the Operations Phase of the Mine rather than the Closure Phase.

7.3.1 Contracting Opportunities

Construction Phase

Mine supply and service contracts during the Construction Phase are listed in the ESEMP Annual Reports for years 2015 to 2017. As anticipated in the original ESEMP (October 2015), major contracts during the Construction Phase were managed by the EPCM contractor. However, several local and Indigenous business contracts were established or maintained throughout 2016 and 2017, including contracts with businesses in Smithers, Terrace, and other northwest BC communities. Local sourcing included food, fuel, office supplies, vehicles rentals/leases, road maintenance, transportation services, medical services, trades, environment, drilling, steel supply, and camp supplies.

Operations Phase

A variety of supply and service contracts are required during the Operations Phase, including but not limited to contracts related to: information and communication technology; legal, accounting, insurance, recruitment, and other services; medical/first aid services; travel and transportation; road maintenance; training; safety; camp catering; building maintenance; security; environmental monitoring; mill maintenance and supplies; underground mining equipment and supplies; underground mining services; consumables; waste management; and mobile equipment and maintenance.

Contracts for on-site services during mine operations include underground mining, drilling and on-site medical services. The current contract for medical services was awarded to Iridia (a Nisga'a-affiliated company) for the services of Registered Nurses and Advanced Care Paramedics at the mine site. The current underground mining contract was awarded to Procon Mining and Tunnelling Ltd. (based in Burnaby, BC); the contractor company is committed to hiring First Nations and local workers. Security services are currently contracted to Western Protection Alliance Inc. (WPA), based in Richmond BC; and the current drilling contract was awarded to Hy-Tech Drilling (based in Smithers, BC). Further detail about supply and service contracts is provided in the ESEMP Annual Reports.

7.3.2 Procurement and Contracting Process

Pretivm's procurement and contracting process begins with the provision of a request for expressions of interest (RFEOI) and invitation for bidders to submit their qualifications. Pretivm is then able to pre-qualify interested bidders, and then provides qualified bidders with a request for proposal (RFP). An evaluation of proposals is based on the technical and commercial components. Bidders are shortlisted for negotiations. Following negotiation, the contract is awarded. This process typically occurs over a two-month period.

Pretivm will maintain contact with First Nations to provide information about upcoming procurement opportunities and processes. First Nations are provided with advance notice of upcoming contracts to allow opportunities to develop joint ventures or partnerships with other companies, if needed. To date, First Nations have been actively engaged in the procurement process.

7.4 SPECIAL CONSIDERATIONS FOR LOCAL AND REGIONAL PROCUREMENT

Pretivm invites interested contractors to express interest in Mine work directly to Pretivm. In addition, the company's website lists current notifications for upcoming contracting opportunities, as well as notification of work awarded, to promote transparency and accountability. Where local firms have expressed an interest in working with the Mine, Pretivm may request a skills and experience inventory to match that company with current and potential future Mine contracts. Pretivm will support the procurement of supplies and services from local and regional businesses by considering local content in the evaluation of bids and proposals, including plans for partnerships and joint ventures. All other factors being equal, bidders that employ local residents will have an advantage over bidders who employ non-residents.

Although a strict target for local/regional content has not been established, the following regional preferences are anticipated after basic requirements (including safety) are met:

1. Indigenous businesses, including Nisga'a Nation, Tahltan Nation, Gitanyow and TSKLH;
2. Businesses based within LSA communities (as described in Section 3);
3. Businesses based in northwestern BC; and
4. Businesses based in other areas of BC.

As noted in Section 7.3.2, Pretivm provides advance notice of upcoming supply and service contracts to First Nations, to provide an opportunity for interested First Nations businesses to find partners, if needed.

In the evaluation of all bids, the extent of local content (e.g., the degree to which local employees/ business are included) is a weighted criterion. All other factors being equal, pre-qualified suppliers that employ local residents will have an advantage over suppliers who employ non-residents. In addition, those awarded contracts with the Mine will be encouraged to use local suppliers or subcontractors where possible. This provides a full and fair opportunity for suitable and registered local and regional companies to bid for the supply of good and services to the Mine.

Pretivm values relationships with Indigenous businesses and has established commercial relationships with local First Nations. Pretivm will continue to seek to engage in mutually successful commercial arrangements with the TSKLH, Nisga'a Nation, Tahltan Nation, and other regional First Nations. Where appropriate, early notice of opportunities will be provided so that Indigenous businesses have an extended period to develop proposals and/or identify potential business partners. Examples of contracts with Indigenous businesses to date include camp construction, access road maintenance, medical services, and waste rock disposal.

Awareness of Mine-related opportunities for Indigenous businesses will be enhanced through communications with the Indigenous groups, as per the Aboriginal Consultation Plan.

7.5 RECENT ACTIVITIES

A summary of recent activities is provided in the ESEMP Annual Reports. At the time of writing, Annual Reports have been prepared for all calendar years from 2015 to2021.

7.6 EVALUATION AND REPORTING REQUIREMENTS

The Procurement Strategy is regularly reviewed and updated to ensure that it continues to be relevant and appropriate and facilitate the increased participation of local and regional residents in Mine procurement. The strategy is reviewed annually and reported through the ESEMP Annual Report (described in Section 11).

The following factors are reviewed and reported annually:

- a summary of Mine procurement (number of bids received, number of contracts, duration, type of activities [e.g., road maintenance, catering]) for the following groups/areas:
  - Indigenous groups (and associated communities) including TSKLH, Nisga'a Nation, and Tahltan Nation;
  - local communities: Smithers, Terrace, the Hazeltons, Stewart, and Dease Lake; and
  - northwest BC;
- comparison with preceding years to highlight trends;
- a summary of feedback from Indigenous groups, communities, and other stakeholders regarding business involvement, procurement process, and/or outcomes; and
- upcoming actions or changes to the Procurement Strategy.

7.7 ROLES AND RESPONSIBILITIES

Pretivm's **Director of Supply Chain** is responsible for the implementation of the Procurement Strategy. Responsibilities include implementation of the Procurement Strategy, including communication of contracting opportunities and requirements to Indigenous groups, communities, and training institutions, with support from the Community Relations Manager. The General Manager is also responsible for the annual review and reporting of activities related to the Procurement Strategy.

7.8 SUMMARY

Procurement Strategy	
Purpose	To maximize the involvement of local businesses in Mine contract work.
Objectives	• Highlight existing commercial relationships with Indigenous businesses, and businesses located in the LSA communities; • Provide a description of the types of contract opportunities that are expected to be available; • Describe the processes and tools that will be used to manage procurement opportunities and suppliers; • Describe considerations for local and regional content; and • Comply with the business and contracting provisions defined in agreements with Indigenous groups.
Responsible	Director of Supply Chain (Pretivm)
Key Activities	Procurement contracts will consider the level of local content (including local, regional, and Indigenous businesses), in order to enhance local economic benefits.
Timing and Schedule	Ongoing throughout Operations Phase.
Reporting	Annual ESEMP Report

8 TRAINING STRATEGY

The Training Strategy outlines the purpose, objectives, implementation, monitoring and reporting activities for training activities related to the Mine.

8.1 PURPOSE

The purpose of the Training Strategy is to support the capacity of the local labour force and Mine workforce to meet the needs of the Mine, as well as to support regional educational and training organizations to develop and plan timely and relevant training programs. The strategy includes job-related training to enable employees to work safely and effectively, and supports the development of capacity within the local labour force through communication with local post-secondary education and training institutions. These actions are expected to enhance the number of local and regional residents with the specific skillsets required by the Mine, thereby enhancing local and regional employment and broader economic development. Support for training may also reduce potential competition for skilled labour by increasing the availability of skilled workers.

8.2 SCOPE AND OBJECTIVES

The Mine has the potential to enhance the work experience, education, and skill levels of the regional workforce. The Training Strategy seeks to maximize these benefits while also ensuring that Mine workers have the training and skills required to conduct their jobs safely and effectively. In order to promote local employment, experience, education, and skill levels, Pretivm will provide relevant on-the-job training and may also utilize services through external training institutions. Career development opportunities will also be provided to Mine employees to encourage internal advancement and to meet the demands of the Mine. To support the broader regional workforce and enhance the ability of residents to attain Mine-related employment, relevant information will also be provided to local and regional training institutions to support program planning and development.

The objectives of the Training Strategy are to:

- provide the necessary on-the-job training for Mine workers to conduct their jobs safely and effectively;
- provide information describing the educational and skills requirements of Mine employment to education and training organizations in order to inform course offerings;
- share information about employment and training opportunities with communities, Indigenous groups, and institutions;
- contribute to the further development and diversification of the regional labour force; and

- comply with education and training provisions defined in agreements with Indigenous groups.

These activities are expected to enhance prospects for local employment and retention within the Mine workforce. Pretivm will undertake a number of activities aim to communicate employment requirement and support training initiatives.

8.3 EDUCATION AND TRAINING OPPORTUNITIES

There are a number of education and training opportunities typically provided to a Mine's workforce to ensure a safe and effective working environment (e.g., Workplace Hazardous Materials Information System, or WHMIS). Certain training and certifications are expected to be provided on-the-job, while for some positions specific training and certifications are a pre-requisite to employment (see Appendix B). Apprenticeship opportunities will be available for applicable trades on a case-by-case basis. Pretivm will also work with local and regional training institutions to support mining-related training and education programs for prospective Mine employees, as described in Section 8.4.

In 2017, activities at the mine site progressed from construction into mine commissioning and production. Since 2018, as the first full year of operations, mine-related training has focused on operations-centric themes, and an increase in permanent employees corresponded with a reduction in the number of site orientations.

8.3.1 Job-related Training and Development

Training of the workforce at the Mine is on-going and job specific. Pretivm will ensure that all employees receive the necessary training to complete their work safely and effectively. On-the-job training will be provided to Mine employees depending on their job position, and may include:

- Bear Aware;
- WHMIS;
- Transportation of Dangerous Goods;
- Basic First Aid;
- Avalanche Training;
- Food Safe;
- Lock-out/Tag-out processes;
- Fire extinguisher training;
- Equipment training related to the use of heavy equipment, light vehicles, ATVs; and
- Other task-specific on-the-job training.

In addition, staff in supervisory positions receive training related to communication, conflict management, bullying and harassment, performance review processes, and additional health and safety training (e.g., identification of drug/alcohol use on the job). Pretivm may also utilize external training programs to achieve specific job-related training needs, either on-site or at an external facility.

To support the development of underground mining skills, Pretivm has partnered with the underground mining contractor to establish an entry-level Underground Mine Training Program. This program provides new workers with on-the-job training to build skills and experience related to a career in underground mining.

All workers using equipment will require confirmation from Pretivm that the necessary training has been completed.

8.3.2 Apprenticeships

The Mine will facilitate apprenticeship opportunities where possible and will work to increase the availability of these types of opportunities throughout the life of the Mine. During the Operations Phase, apprenticeships may cover the following areas, among others:

- Culinary services;
- Heavy duty technicians;
- Welding;
- Warehouse management; and
- Millwright.

8.4 SPECIAL CONSIDERATIONS FOR LOCAL AND REGIONAL EDUCATION AND TRAINING

8.4.1 Working with Local and Regional Educational Institutions

Support for locally available education and training programs relevant to the mining industry is expected to enhance the skills of the local labour force and maximize the number of local residents employed by the Mine. Pretivm will work with local educational institutions by sharing information about Mine-related employment opportunities (and related requirements for education and training) to inform future programming. Future discussions may lead to the development of more formal partnerships or other forms of support.

As information about employment needs becomes available, Pretivm will share information about positions, timing, and associated requirements for education, training and/or work experience. It is expected that this information, among other factors, will inform the course offerings provided by these

institutions. Information is shared with the following local and regional institutions and Indigenous groups (and others that may be later identified):

- Coast Mountain College, campuses in Smithers, Terrace, Hazelton, and Houston, including the School of Exploration and Mining in Smithers;
- Northern Lights College, campus in Dease Lake;
- Wilp Wilxo'oskwhl Nisga'a Institute (WWNI) in Gitwinksihlkw;
- Nisga'a Employment Skills and Training (NEST);
- Tahltan Works; and
- TSKLH.

Pretivm notifies regional educational institutions of the standard types of training provided to Mine employees at site (e.g., WHMIS, safety) to inform future course offerings. Communications with regional education institutions will be guided by the Communications Protocol (see Section 10).

8.4.2 Youth and Communities

In partnership with local service providers, Pretivm participates in educational sessions with youth at local and regional schools and training institutions. Participation can include speaking to students about mining employment, providing materials and other available information about careers in mining, and describing potential opportunities available with the Mine (e.g., support for apprenticeship programs, summer employment, scholarships). These activities aim to provide background and context about the mining industry, the types of employment available in the mining industry, and what it is like to be at a mine site. Information about training opportunities may also be provided.

Similar activities may also be conducted outside of schools, including Indigenous communities and rural locations such as Dease Lake. These events are designed to help people understand the opportunities associated with the Mine, the benefits, and challenges of mining employment (including family and cultural challenges), life in a mining camp, shift rotations, and the skills and training requirements for various types of positions. Where possible, connections with local and regional training institutions are made to enhance these events and connect prospective workers with relevant training.

8.5 RECENT ACTIVITIES

A summary of recent activities is provided in the ESEMP Annual Reports. At the time of writing, Annual Reports have been prepared for all calendar years from 2015 to 2021.

8.6 EVALUATION AND REPORTING REQUIREMENTS

The Training Strategy is regularly reviewed and updated to ensure that it continues to be relevant, appropriate and facilitate the increased participation of local and regional residents in mine

employment. The strategy is reviewed annually and reported through the ESEMP Annual Report (described in Section 11).

The following factors are reviewed and reported annually:

- a summary of on-the-job training courses (e.g., safety orientations, equipment training) attended by the Mine workforce (number of courses, number of attendees, etc.);
- a summary of external training courses conducted for Mine workers or otherwise supported by the Mine, as well as the number of course registrants for each. Indication of courses offered will include those offered for the following groups/areas:
    - Indigenous groups (and associated communities): TSKLH, Nisga'a Nation, Tahltan Nation; and
    - Local communities: Smithers, Terrace, the Hazeltons, Stewart, and Dease Lake;
- comparison with preceding years to highlight trends;
- a summary of feedback received regarding training programs, approach, course offerings and/or outcomes; and
- upcoming actions or changes to the Training Strategy.

8.7 ROLES AND RESPONSIBILITIES

Pretivm's **Community Relations Manager** is responsible for the implementation of the Training Strategy. Responsibilities include communication of upcoming and future employment opportunities and skills/training requirements to local and regional training institutions and Indigenous groups. The Community Relations Manager is also responsible for the annual review of activities related to the Training Strategy.

8.8 SUMMARY

Training Strategy	
Purpose	To enhance the number of local individuals engaged in Mine employment through communications with and support for the education and training organizations offering relevant programming.
Objectives	• Provide the necessary on-the-job training for Mine workers to conduct their jobs safely and effectively; • Provide information describing the educational and skills requirements of Mine employment to education and training organizations in order to inform course offerings; • Share information about employment and training opportunities with communities, Indigenous groups, and institutions; • Contribute to the further development and diversification of the regional labour force; and • Comply with education and training provisions defined in agreements with Indigenous groups.
Key Activities	To ensure suitable training for all workers, and to provide information about upcoming and future labour needs to regional education and training institutions so that they can develop relevant programming.
Responsible	Community Relations Manager (Pretivm)
Timing and Schedule	Ongoing throughout Operations Phase.
Reporting	Annual ESEMP Report

9 TRANSPORTATION STRATEGY

The following is a summary of Pretivm's Transportation Strategy, issued under a separate cover, dated December 2016, with additional updates, all distributed to stakeholders (including RCMP, LSA communities, Indigenous groups, Northern Health, and the Environmental Assessment Office).

9.1 PURPOSE

The purpose of the Transportation Strategy is to plan Mine-related workforce transportation (including employees and contractors) to and from the mine site and share this information with emergency response providers and other services in the region so that potential effects can be proactively identified and managed.

9.2 SCOPE AND OBJECTIVES

The Transportation Strategy outlines the planned workforce travel arrangements for the transportation of Mine workers to and from the mine site. This information includes routes, methods and timing of travel. The Strategy applies to Mine contractors and employees and has been established to minimize the effects of worker transportation on local community infrastructure and services. The objectives of the Strategy are to:

- provide information as to the routes, methods, and timing of workforce transportation;
- minimize the time spent by workers in local communities (e.g., travel hubs) while in transit between the Mine and their home community;
- ensure that local communities and service providers are informed of plans and schedules related to workforce transportation, so that they can plan accordingly; and
- comply with transportation provisions defined in agreements with Indigenous groups[2].

9.3 TRANSPORTATION ROUTES AND SCHEDULE

Workers are transported along standard routes by either bus or plane, or a combination, depending on their home community. Workers are responsible for getting to the appointed "pick-up points" for onward transportation to the site. As such, workers may live across BC or Canada, but—in general—will be responsible for their own transportation to one of the following pick-up points:

- ground travel (shuttle bus) from Terrace and Smithers, with pick-up points enroute including Kitwanga and Meziadin Junction; and

[2] At the time of writing, there were no transportation provisions in agreements with Indigenous groups.

- air travel based out of Terrace.

The same locations are be used on the return trip (i.e., returning home from site). The majority of Mine contractors and employees work shifts of two-weeks on, followed by two-weeks off.

9.3.1 Ground Travel

Workers are responsible for getting to the appointed "pick-up points" for onward transportation to the site by bus. The primary pick-up points, in south-north orientation, are:

- Western route (chartered bus):
  - Kitimat;
  - Terrace-Kitimat Regional Airport (to meet inbound flights);
  - Terrace;
  - Kitwanga;
- Eastern route (shuttle bus):
  - Smithers, with pick-ups along Highway 16 to Kitwanga;
  - Passengers transfer to chartered bus at Kitwanga;
- Highway 37 north of Kitwanga (chartered bus):
  - Meziadin Junction (to meet workers from Stewart and area); and
  - Wildfire Camp.

From the Wildfire Camp (at Kilometer 1 of the Brucejack access road, near the junction with Highway 37), workers are transported by bus to the site via the access road. The same points, in reverse, are used as drop-off points for buses transporting workers home from the site.

Workers residing outside of the Highway 16 and Highway 37 routes described above are responsible for their own travel to the nearest pick-up point. Workers from the Nisga'a villages typically meet the bus in Terrace, and workers from Stewart travel to Meziadin Junction.

9.3.2 Air Travel

Due to the Mine's proximity to Highway 37, and to reduce the risk of travel delays due to adverse weather conditions, Pretivm expects that the majority of workers will travel to the mine site by bus. Employees from outside of northwest BC travel by air to Terrace, using chartered flights from Vancouver and interior locations. Out of province employees take commercial air travel to Vancouver. Flights typically arrive in Terrace in mid-morning (around 10:30 am). Personnel are met at the Terrace Airport by the contracted bus company, for transportation by bus to the mine site (described in Section 9.3.1).

Where workers arriving at or departing from the mine require flight connections in Terrace, connections are generally made the same day. If overnight stays are required (e.g., to accommodate weather delays), workers will be expected to continue to abide by the Mine code of conduct, as expected when they are on-duty at the site.

9.4 COMMUNICATION AND CHANGE MANAGEMENT

9.4.1 Communication of the Transportation Schedule

Pretivm shares the transportation schedule (including timing and routes) for the Mine workforce with the emergency service providers and local governments in the LSA, particularly with those in Smithers and Terrace as the planned hub communities for workforce transportation. The schedule identifies the days of the week travel will occur as well as the number of Mine employees expected to be in transit.

9.5 RECENT ACTIVITIES

The majority of transportation to and from the Mine is by bus from Smithers and Terrace. There is no regular schedule of personnel flights. Transportation activities are included in the ESEMP Annual Reports. Roles and Responsibilities

Pretivm's **General Manager** is responsible for the implementation of the Transportation Strategy. Responsibilities include scheduling of transportation services and routes, communication of the transportation schedule to local communities and emergency service providers, and management and communication of any changes to this schedule.

9.6 SUMMARY

Transportation Strategy	
Purpose	To minimize the potential for Mine effects on emergency and other services in local communities associated with the transit of workers through communities during travel to/from the mine site.
Objectives	• Provide information as to the routes, methods, and timing of workforce transportation; • Minimize the time spent by workers in local communities (e.g., travel hubs) while in transit between the Mine and their home community; • Ensure that local communities and service providers are informed of plans and schedules related to workforce transportation, so that they can plan accordingly; and • Comply with transportation provisions defined in agreements with Indigenous groups.
Key Activities	Share plans and schedules for workforce transportation with local communities and service providers.
Responsible	General Manager (Pretivm)
Timing and Schedule	Ongoing throughout Operations Phase.
Reporting	None identified at this time.

10 COMMUNICATIONS PROTOCOL

The Communications Protocol complements the Mine's Aboriginal Consultation Plan and Pretivm's corporate communication policy. This Protocol outlines the purpose and objectives of Mine-related communications with communities and Indigenous groups, planned activities, monitoring and reporting.

10.1 PURPOSE

The purpose of the Communications Protocol is to guide communications between Pretivm, and the various communities, Indigenous groups, and other stakeholders involved in the Mine, and to establish a framework for effective response to all requests, issues, suggestions, and feedback. These activities will ultimately support positive and mutually beneficial relationships within the local and regional area and help Pretivm and the Mine maintain a positive public image.

As noted in Section 4, many of the mitigation measures designed to address potential social and economic effects (as identified in Section 4) are related to communications and the sharing of information about the Mine. Provisions for communication are also integrated into the employment, procurement, training and transportation strategies described above. This Communications Protocol describes the overarching process by which these communications will be conducted.

10.2 SCOPE AND OBJECTIVES

This Protocol is intended to guide communications related to the Mine—including those about potential employment procurement, training, or other opportunities—between Pretivm and the following communities and groups:

- the Local Communities (Stewart, Smithers, Terrace, Dease Lake, and the Hazeltons);
- Indigenous groups including TSKLH; the NLG and the Nisga'a villages; and the TCG and the Tahltan communities of Dease Lake, Telegraph Creek and Iskut;
- regional educational and training institutions including Coast Mountain College (and the School of Exploration and Mining), Northern Lights College, and Wilp Wilxo'oskwhl Nisga'a Institute; and
- health and emergency service providers including the RCMP and Northern Health.

Additional groups and organizations may be identified as Mine development progresses.

Pretivm is committed to working with residents, communities, and stakeholders to maintain and enhance current community relations. The objectives of the Communications Protocol are to:

- ensure communication processes are clearly identified;

- effectively manage issues as they arise by proactively identifying and addressing issues and concerns;
- share timely, relevant information about the Mine in a transparent and useful manner; and
- comply with consultation and communication provisions defined in agreements with Indigenous groups.

The Protocol defines the types and frequencies of communication and also describes the means by which communities, Indigenous groups and other stakeholders can provide input to the Mine and/or submit questions or concerns.

10.3 OUTGOING COMMUNICATIONS

Pretivm will utilize a number of different communication methods to convey information about the Mine, including milestones in Mine development, employment and procurement opportunities, transportation schedules, and other information. Table 10.3-1 lists some of the primary ways by which this information will be shared. Pretivm also welcomes communications from Indigenous groups, local communities, and other stakeholders at any time, as discussed in Section 10.4.

Table 10.3-1. Task Description and Implementation

Method	Implementation	Timing / Frequency
Website	Content provided on Pretivm's website will include employment and contracting opportunities, Mine milestones and updates, and other relevant information. Opportunities postings will include specifications (e.g., timing, requirements, etc.). The website may also be used for announcements including, for example, contracts awarded to local and regional businesses and other Mine highlights.	Ongoing
Regional Office	A regional office in Smithers will continue to be a source for information about employment, procurement, and other opportunities. Inquiries can be made in person or by phone or email. Information about mine-related training and education may also be available in partnership with regional training institutions. Questions and concerns can also be submitted at the office.	Ongoing
Newsletter	An annual newsletter describing highlights of the past year and a look ahead at the coming year will be produced. The newsletter will summarize notable achievements (and upcoming opportunities) in terms of employment, procurement, training, stakeholder engagement, and contributions to local economic development. It will also provide up-to-date contact information for the company. A PDF of the newsletter will be posted to Newcrest's website and emailed to community and/or Indigenous contacts; hard copies may be provided upon request.	Annual

(continued)

Table 10.3-1. Task Description and Implementation (completed)

Method	Implementation	Timing / Frequency
Open Houses	When appropriate, Pretivm will participate in events such as open houses or career fairs.	As warranted
Community Events	Pretivm will provide Mine updates and will answer questions about the Mine at relevant community events such as industry or business exhibitions, job fairs, or other events.	As warranted
Newspapers	Pretivm will advertise available jobs in local newspapers including the Smithers Interior News and the Terrace Standard, as well as other forums identified in Section 6.	As warranted
Information for service providers	As identified above, specific information will be shared with certain groups of stakeholders in order to facilitate broader planning and development and the effective management of socio-economic effects. This includes: • providing regional educational and training institution with indication of the types of employment opportunities associated with Mine work, as well as a description of the skills and educational requirements for each type of position; and • providing health and emergency service providers with information about transportation plans and schedules (for the transportation of the Mine-related workforce through LSA communities). Information will be shared by email unless otherwise requested.	As warranted
"Intro to Mining Employment" seminars	If there is interest amongst the LSA communities and/or Indigenous groups, Pretivm will hold local seminars/discussion sessions to help people understand the opportunities associated with the Mine, the benefits, and challenges of mining employment (including family and cultural challenges), life in a mining camp, shift rotations, and the skills and training requirements for various types of positions. Connections with local and regional training institutions may enhance these events.	As warranted

Preparation for Closure

In advance of the Closure and Decommissioning Phase, Pretivm will prepare a communication plan to engage communities and Indigenous groups and provide information about closure plans and related implications (and opportunities) for employees and contractors. Similar engagement will occur around any temporary shut-down that may be required. Further detail will be included in the Mine's forthcoming Reclamation and Closure Plan.

10.4 INCOMING COMMUNICATIONS

Pretivm welcomes communications from the public, local communities, government, Indigenous groups, and other stakeholders at any time, including questions, comments, suggestions, requests, concerns, or complaints. These communications can be expressed in person (e.g., at the Newcrest

regional office in Smithers, or at a company event), or by email, telephone, or post; contact information is provided in Section 1. Queries can also be submitted online via Newcrest's website.

Pretivm endeavours to respond to all questions, comments, or concerns to either provide an answer or explanation, or demonstrate how the information provided has been considered. Communications will be documented and tracked (as described in Section 10.5) to ensure that appropriate actions are taken in a timely manner.

10.5 COMMUNICATIONS MANAGEMENT

A record of Mine-related communications and feedback received from community members through all forums, including email, the website, community events, and via the Newcrest office in Smithers. The company's current communications/engagement tracking and management software, StakeTracker, will continue to be used for the foreseeable future.

Pretivm endeavours, where possible, to respond to incoming communications within five (5) business days. With the response, Pretivm provides the name of a contact person and their contact information (email, telephone). If the required information is not provided in the initial response, an estimated timeline for the complete response is provided.

All communications is treated with respect and attention. For complaints or grievances (e.g., unsafe driving, unauthorized emissions, discriminatory hiring practices), Pretivm will ensure that prompt and objective investigations are conducted and documented in a transparent manner, and that this information is communicated back to the person (or group) who registered the complaint/grievance. Updates are regularly provided to keep all parties informed until a solution is developed, agreed by all parties, and implemented.

10.6 EVALUATION AND REPORTING REQUIREMENTS

The Communications Protocol is regularly reviewed and updated to ensure that it continues to be relevant and appropriate and facilitate the increased participation of local and regional residents and businesses in the Mine. The strategy is reviewed annually and reported through the annual ESEMP Report (described in Section 11).

The following factors will be reviewed and reported annually:

- a summary of events, newsletter editions, workshops and other communications that occurred over the course of the year;
- a summary of feedback from Indigenous groups, communities, and other stakeholders, including key issues and how they were addressed; and
- upcoming actions or changes to the Communications Protocol.

10.7 ROLES AND RESPONSIBILITIES

Pretivm's **Community Relations Manager** leads communication and consultation with Indigenous groups, communities, and other stakeholders. Responsibilities include implementation of the Protocol and associated external communications (incoming and outgoing), annual reporting and review of the Protocol, and updates or revisions on an as-needed basis. The Community Relations Manager, who is based in Smithers, is also responsible for engagement related to employment, training, and procurement.

10.8 SUMMARY

Communications Protocol	
Purpose	The purpose of the Communications Protocol is to guide communications between Pretivm, and the various communities, Indigenous groups, and other stakeholders involved in the Mine, and to establish a framework for effective response to all requests, issues, suggestions, and feedback.
Objectives	• Ensure communication processes are clearly identified; • Effectively manage issues as they arise by proactively identifying and addressing issues and concerns; • Share timely and relevant information about the Mine in a transparent and useful manner; and • Comply with consultation and communication provisions defined in agreements with Indigenous groups.
Key Activities	Share information about the Mine with communities, Indigenous groups, and other stakeholders, and promptly and transparently respond to questions, comments, concerns, and complaints.
Responsible	Community Relations Manager (Pretivm)
Timing and Schedule	Ongoing throughout Operations Phase.
Reporting	Annual ESEMP Report

11 ANNUAL ESEMP REPORT

This section of the ESEMP outlines the reporting schedules and activities related to the Mine, for all the aspects described in the preceding sections, which are reported through an annual ESEMP Report. This annual report is shared with the BC EAO, Indigenous groups and LSA communities.

11.1 PURPOSE

The purpose of ESEMP reporting is to share information about the topics contained within this plan (e.g., employment, procurement, and training) with the communities and Indigenous groups of the LSA, and the BC EAO, in compliance with Condition No. 10 of the Mine's EAC. The Mine's performance in relation to each strategy and protocol will be monitored and included in the annual ESEMP Report. Monitoring and reporting enable Mine managers, governments, and community leaders alike to assess the extent to which the intended outcomes of the ESEMP are achieved.

11.2 SCOPE AND OBJECTIVES

An annual ESEMP Report was prepared each year throughout construction and will be prepared throughout operations and closure. The objectives of the ESEMP Report are to:

- document and share information pertaining to the ESEMP (including employment, procurement, and training) and the Mine's activities and performance, with the BC EAO, Indigenous groups, and LSA communities;
- summarize engagement with, and feedback from, local and regional residents;
- provide this information on an annual basis; and
- review and considerate the activities outlined in the ESEMP and make updates or modifications as needed.

11.3 REPORTING SCHEDULE

As outlined in the Condition No. 10, Pretivm will submit an annual ESEMP Report to the BC EAO, Indigenous groups, and the LSA communities, no later than January 31 each year, and will update the ESEMP no later than April 1 each year, for the duration of all the phases of the Mine. As such, a schedule for one reporting cycle is provided in Table 11.3-1.

11.4 REPORTING CONTENT

Specific content for the annual ESEMP Report is described, as relevant, for each strategy in the preceding sections. Table 11.4-1 provides a summary of all reporting requirements contained herein.

Pretivm may also choose to highlight additional information, such as sustainability or community investment achievements.

Table 11.3-1. Reporting Schedule

Date	Description
December	Compile information, feedback, and indicators from the calendar year.
January	Prepare annual ESEMP Report. Evaluate performance of ESEMP and related strategies and consider potential for improvement.
January 31	Submit annual ESEMP Report to the BC EAO, Indigenous groups and LSA communities.
February/March	Update ESEMP as needed.
April 1	Submit updated ESEMP to BC EAO.

Table 11.4-1. ESEMP Report – Example Content

Topic	Description
Introduction	Update of Mine development and achievements in the past year and expected highlights of the year ahead.
Employment	Summary of employment achievements for the past year, including: • total number of employees (current/peak, including Pretivm and direct contractors) • number of new hires, number of applicants, and duration/type of employment (e.g., seasonal) • number of workers from Indigenous groups and LSA communities, and northwest BC • comparison with preceding years to highlight trends • highlights of feedback received regarding employment processes and/or outcomes • proposed changes to the Employment Strategy or related processes
Procurement	Summary of procurement achievements for the past year, including: • number of contracts, duration, type of activities (e.g., road maintenance, catering) • number of contracts held/completed by Indigenous businesses, number of bids received, and businesses from the LSA and northwest BC • comparison with preceding years to highlight trends • highlights of feedback received regarding business involvement, procurement process and/or outcomes • proposed changes to the Procurement Strategy or related processes
Training	Summary of training achievements for the past year, including: • a summary of on-the-job training courses (e.g., safety orientations, equipment training) attended by the Mine workforce, including number of courses, number of attendees, etc. • a summary of external training courses conducted for Mine workers or otherwise supported by the Mine, including the number of registrants and number of completions for those offered for Indigenous groups and LSA communities • comparison with preceding years to highlight trends • a summary of feedback received regarding training programs, approach, course offerings and/or outcomes

	• proposed changes to the Training Strategy or related processes

(continued)

Table 11-4-1. ESEMP Report – Example Content (completed)

Topic	Description
Communications and Engagement	• A summary of events, newsletter editions, workshops and other communications that occurred over the course of the year; • a summary of feedback from Indigenous groups, LSA communities and other stakeholders, including key issues and how they were addressed; and • proposed changes to the Communications Protocol or related processes.
Contact and Request for Feedback	Contact information for questions, comments or concerns. Open request for feedback on the ESEMP or any of its components, to inform annual updates/revisions to the plan.

11.5 ROLES AND RESPONSIBILITIES

Newcrest's **VP Government Relations and Social Performance** is responsible for preparation of the ESEMP Report and all related activities.

11.6 SUMMARY

Annual ESEMP Report	
Purpose	To share information about the topics contained within this plan (e.g., employment, procurement, and training) with the communities and Indigenous groups of the LSA, and the BC EAO, in compliance with Condition No. 10 of the Mine's EAC.
Objectives	• Document and share information pertaining to the ESEMP (including employment, procurement, and training) and the Mine's activities and performance, with the BC EAO, Indigenous groups, and LSA communities; • Summarize engagement with, and feedback from, local and regional residents; • Provide this information on an annual basis; and • Review and considerate the activities outlined in the ESEMP and make updates or modifications as needed.
Key Activities	Prepare an annual ESEMP Report and share with the EAO, Indigenous groups, and communities by January 31 of each year. Make annual updates to the ESEMP, by April 1 of each year.
Responsible	EVP Corporate Affairs and Sustainability (Pretivm)
Timing and Schedule	Ongoing throughout Operations Phase.
Reporting	Annual

Appendix A — Social Responsibility Policy

PRETIUM RESOURCES INC.

Social Responsibility

Pretium Resources Inc. recognizes that the success of its operations relies on establishing positive, trusting relationships with our employees, local First Nations and communities and key stakeholders. We believe that these relationships are developed by working cooperatively to understand respective interests and concerns in order to maximize the benefits from mineral resource development. Pretium Resources Inc. will ensure social responsibility is integrated into its business activities in the following manner:

- Assess the environmental and social effects of our projects and activities and develop appropriate corresponding management plans.

- Disclose project information and pursue meaningful and culturally appropriate dialogue on project effects with local First Nations and communities and key stakeholders early in the development phase of projects. Continue to engage First Nations, communities and key stakeholders throughout the life of the project.

- Protect employee and community health and safety by supporting health and safety protection programs and by working cooperatively with those who may be affected by our operations.

- Foster a workplace environment that is safe, free of discrimination and builds on a strong foundation of ethical behavior, respecting human rights and ensuring equal access to employment opportunities for all.

- By incorporating local knowledge and building capacity, work cooperatively with local First Nations and communities to develop and support sustainable strategies to maximize the long term benefits of mine development.

- Work with First Nations and relevant government authorities to protect or preserve heritage and cultural resources where they may be affected by our operations.

- Establish management and monitoring systems that will provide opportunities for continual improvement in our environment, health, safety and social programs.

Appendix B — Potential Employment Positions and Requirements

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Laborer – Yard/ Surface/Shop	Construction Operations	Physically fit, able to follow safe work practices.	√	√	√		No
Camp Maintenance Worker	Construction Operations	Two years' experience in a similar position; proficient in word, excel, email, excellent written and verbal communications skills.	√	√	√		Preferred red seal in building trades
Housekeeping Manager	Construction Operations	Completion of secondary school, university degree or college diploma in hospital management, hotel management, or business administration is an asset.	√				High school, university, or college diploma
Camp Attendants (Housekeeping)	Construction Operations	Previous experience an asset, on the job training.	√				No
Executive Chef	Construction Operations	Completion of secondary school, Cook's trade certification, or equivalent credentials, training, or experience.	√				Red Seal, preferred
Kitchen Helper	Construction Operations	On the job training, food safe level 1, experience an asset.	√				Food Safe Level 1
Heavy Equipment Operator	Construction Operations	Previous experience with mine specific experience. Some high school, college, or industry courses in heavy equipment operating combined with on-the-job training. Heavy Equipment Operator certification is an asset.	√	√	√		Experience
Cook	Construction Operations	Completion of secondary school, completion of a three-year apprenticeship program for *or* completion of college or other program in cooking *or* several years of commercial cooking experience are required. Food Safe Level 1.	√				High school, post-secondary, or experience. Food Safe Level 1
Site Administrator/ Logistics	Construction Operations	Office administration certificate, previous related experience in logistics, ability to problem solve , prioritize, and multi-task, advanced computer skills , prior Mine Administration experience, experience with radio communications.					Office Administration certificate

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Controller/ Accountant	Construction Operations	Bachelor's degree in business administration, economics, commerce or a related field is required, a recognized accounting designation (CA, CMA, or CGA) may be required. A master's degree in business administration (concentration in finance), or another masters' level management program. Several years' experience.					University Degree, other
Human Resources Manager	Construction Operations	Bachelor's degree in a personnel management (e.g., business administration, industrial relations, commerce, or psychology) *or* a professional development program in personnel administration. Several years of experience in a similar position in the mining field.			√		University Degree, other
Human Resources Coordinator	Construction Operations	A university degree in a field related to personnel management (e.g., business administration, industrial relations, commerce, or psychology) *or* a professional development program in personnel administration, previous experience.			√		University Degree, other
Community Relations Coordinator	Construction Operations	Post-secondary education in human resources, education, or administration, *or* an equivalent combination of education and experience with planning, organizing, and coordinating activities in these areas. Communication, interpersonal, and organization skills. Computer literacy.			√		Post-secondary education, experience, other
Crane Operator	Construction Operations	Completion of a one-to-three-year apprenticeship program *or* high school, college or industry course in crane operating. Experience in construction and mine setting. May require provincial licence, internal company certification.			√		Red Seal, preferred
Grader Operator	Construction Operations	Previous experience in remote site. Some high school, college or industry courses in heavy equipment operating combined with on-the-job training. Heavy equipment operator certification would be an asset.	√	√	√		Experience

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Ironworkers	Construction Operations	Completion of a two-to three-year apprenticeship program *or* over three years work experience in the trade and some high school, college or industry courses in ironworking usually required for trade certification.	√		√		Red Seal, preferred
Maintenance Superintendent	Construction Operations	Several years' experience in the occupation supervised is required. Journeyman/woman trade certification in a relevant trade required.	√		√		Journeyman/woman trade certificate
Master Mechanic	Construction Operations	Completion of a three- to four-year apprenticeship program. Five years' experience in the trade and in industrial machinery repair or millwrighting.	√	√	√		Red Seal
Heavy Duty Mechanics	Construction Operations	Trade qualification as a Heavy-Duty Equipment Mechanic (Technician). Minimum four years' experience in the maintenance of diesel and gasoline mobile and stationary equipment, preferably in an industrial or heavy industry setting.	√	√	√		Red Seal
Welder	Construction Operations	Completion of high school and a three- to four-year apprenticeship program *or* a combination of over four years of work experience in the trade and some college or industry courses in structural steel and platework fabrication.	√	√			Red Seal
Industrial Electricians	Construction Operations	Trade qualification as a Journeyman Electrician. Minimum four years' experience in an underground mine setting, milling and site environment. Record of safety leadership. Proficient is Microsoft Office programs.			√		Red Seal
Instrument Technicians	Construction Operations	Completion of a four- or five-year apprenticeship program in industrial instrument repair. Four years work experience in a mine setting.			√		Certified Instrument Repair
Plumbers	Construction Operations	Completion of a four- or five-year apprenticeship program. Four years work experience in the trade, in a remote site.	√	√	√		Red Seal

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Gas Fitters	Construction Operations	Completion of a two- to three-year gas fitter apprenticeship program. Four-year experience in a pipefitting trade, a provincial gas fitter licence,	√	√	√		Certified Gas Fitter
Carpenters	Construction Operations	Journeyman/woman trade certificate as a carpenter. Experience as a qualified carpenter.	√	√	√		Certified Carpenter
Geotechnical Engineer	Construction Operations	Master's degree or doctorate in a related engineering discipline may be required. Geotechnical engineering degree or a mining or geology degree specializing in 'rock mechanics'. Three years' experience. P. Eng. certification. Five years practical and related experience in underground mine operations.	√	√	√		University Degree, P.Eng.
Senior Engineer	Construction Operations	Bachelor's degree in mining engineering or related engineering discipline. A master's or doctor in related engineering discipline may be required. Three years' experience in a similar position. P. Eng. certification.	√	√	√		University Degree, P.Eng.
Engineers	Construction Operations	A bachelor's degree in mining engineering or in related engineering discipline. Three years' experience in the mining field. P. Eng. certification.			√		University Degree, P.Eng.
Surveyors	Construction Operations	Bachelor's degree in geomatics engineering or survey engineering *or* college diploma in survey science or geomatics technology with additional academic credits and successful completion of equivalent examinations. Successful completions of professional land surveyor examinations. A federal or provincial land surveyor's licence. Three years' experience at mining site.			√		University Degree, other combination of education and experience
Senior Geologist	Construction Operations	Geology related university degree and eight years' experience, superior communication and safety skills, cost-effective innovation is expected.			√		University Degree

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Production Geologists	Construction Operations	B.Sc. in Geology or Geological Engineering. Five years' underground experience. Provincially registered Geologist. Knowledge of raw materials and production process. Highly developed communication and computer skills.			√		University Degree, provincial certification
Geological Technologist	Construction Operations	Two- to three-year college program in related field. Three years' experience in underground mining. Level 2 first aid ticket.			√	√	Certification in geological and mineral technology
Environmental Superintendent	Construction Operations	BS degree in environmental, biological or earth sciences. Five years' experience. Working knowledge of regulations, water quality monitoring and treatment systems. Ability to develop review and implement closure plans, proficient computer skills. Level 2 first aid.	√	√	√	√	University Degree,
Environmental Technician	Construction Operations	Certificate or diploma in Environmental Technology/ Management, Biological Sciences, or related field with two to three years' experience. Experience with remote site, ATVs, and snowmobiles. Level 2 first aid. Proficient computer skills.	√	√	√	√	Certificate or diploma in Environmental Technology/Management, Biological Sciences
Miners	Construction Operations	Formal training followed by specialized training, previous experience, provincial blasting licence and trade certification for miners may be required, level 2 first aid.	√	√	√	√	Formal training, other
Underground Service and Support Workers	Construction Operations	Formal training followed by specialized training, previous experience as a mine labourer, certified in basic common core program is an asset, level 2 first aid.	√	√	√	√	Formal training, other
Underground Mine Trainer	Construction Operations	Four years of underground training experience, ability to manage demands, various skills including leadership, presentation, communication, and computer. Level 2 first aid.	√	√	√	√	Four years of underground training experience
Mine Dry Labourer	Operations	Physically fit, able to follow safe work practices, may require drivers licence, level 2 first aid	√	√	√	√	None

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Mine Planner and Scheduling	Construction Operations	Mine engineering related university degree. Three years' experience, computer literate, underground experience, level 2 first aid.				√	University Degree
Core Splitters	Construction Operations	Completion of high school, introductory training, physically fit. Basic common core program an asset. Level 2 first aid.	√			√	High School
Water/Wastewater Treatment Plant Technician	Construction Operations	College, high school, or industry training courses in water distribution or treatments (Levels I, II, or III). Safety courses may be required. Previous experience an asset. Level 2 first aid.	√	√		√	Certification in water distribution or treatments
Backfill - Operators	Construction Operations	Completion of high school. Formal training with on-the-job training. Previous experience as a mine labourer. Basic common core program an asset. Equipment operator experience or certification. Level 2 first aid.			√	√	High School, experience
Underground Production and Development Crews	Construction Operations	Completion of high school. Formal training with on-the-job training. Previous experience as a mine labourer. Basic common core program Trade certification for miners. Level 2 First aid.			√	√	Basic common core, trade certification for miners
Helpers	Construction Operations	Experience operating a forklift, Level 2 fist aid.	√	√	√	√	Experience
Safety Coordinators	Construction Operations	Diploma for a Mining Technologist and a CSRP designation or actively pursuing CSRP, three to ten years' experience, Basic Joint Health Safety Certification training, Fall Protection, knowledge of TapRoot, Level 3 first aid.	√	√	√	√	Mining Tech Diploma, Basic Joint Health Safety Certification
Safety Training Coordinator	Construction Operations	Safety trainer certification, BC WCB supervisor certification. Five to seven years' experience. Knowledge of TapRoot, Supervisor's Common Core Certificate, Fall Protection, other experience, on-the-job training, level 3 first aid.	√	√		√	Certifications: Safety trainer, BC WCB supervisor, Supervisor's Common Core

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Site Administrator	Operations	One to two years' experience, computer skills, other experience and skills, level 3 first aid.					Experience
Paramedic	Construction Operations	Completion of a recognized paramedical or emergency medical technology program. Must be licenced.	√		√	√	Paramedic licence
Security Personnel	Construction Operations	One to year college, hospital-based or other paramedical or emergency medical technology program. Must be licenced. Experience, level 3 first aid.			√	√	Security or other law enforcement training
Warehouse Supervisor	Construction Operations	Post-secondary training in materials management/ purchasing. Ten years relevant experience. Computer, communication, and safety skills. Level 2 first aid.	√	√		√	Post-secondary education, experience
Inventory Handler	Construction Operations	Purchasing or inventory management courses, computer skills, experience operating forklift, bobcat, and telehandler.	√	√	√		Purchasing or inventory management
Warehouseperson/ Warehouse Yard Person	Construction Operations	Relevant training, three years' experience including forklift, bobcat, other operator. Level 2 first aid.	√	√	√	√	Relevant training, experience
Accounts Payable	Construction Operations	Accredited training or practical experience. Computer, communication, and organization and system skills.					Accredited training/practical experience
IT & Communications	Construction Operations	University degree in computer science, business administration, commerce, or engineering. Experience, level 2 first aid.			√	√	University Degree
Avalanche Control Tech	Construction Operations	Avalanche Operations Level 2 Certification or equivalent. Association of Canadian Mountain Guides Assistant Ski Guide certification or equivalent. Other certification, five to seven years' experience. Valid Blasting ticket, level 3 first aid.			√	√	Certified Mountain Guide, Avalanche Operations Level 2 and Assistant Ski Guide Certification or equivalent, Valid Blasting ticket

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Glacier Technician	Construction Operations	Bachelor of Science honors degree in geology. Five to seven years' experience. Level 3 first aid.			√	√	Relevant University Degree, Apprentice Alpine Guide or better
Surface Operations Superintendent	Construction Operations	Post-secondary education in mechanical or civil engineering or technology. Ten years' experience, heavy equipment maintenance management and supervision. Computer skills, level 2 first an asset.	√	√	√	√	Post-secondary education
Road Forman	Construction Operations	Journeyman/woman trade certification in relevant trade may be required, heavy equipment operator certification, Five to seven years of experience in similar position, computer skills, first aid.	√	√	√	√	Trade certification, heavy equipment operator
Mill Manager	Construction Operations	University degree in mining engineering, seven to ten years' experience.	√		√		University degree
Mill Superintendent	Construction Operations	Six to eight years' experience, floatation circuit and concentrate experience, leadership, communication and problem-solving skills.	√				Experience
General Mill Foreman	Operations	Experience, safety leader, good mechanical aptitude, computer, and communication skills.	√	√	√	√	Experience
Mill Shifter	Operations	Post-secondary education in metallurgy, sciences, or related field an asset, five to seven years' experience in similar position. Previous supervisory experience.	√				Experience
Millwrights	Construction Operations	Red Seal certification and underground mine experience, fabrication, and welding skills.	√	√	√	√	Red Seal
Mill Clerk	Operations	Completion of college business program, experience, level 2 first aid, experience in remote mine setting.	√	√	√	√	College

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Mill Trainer	Operations	Seven to ten years' experience in milling metal recovery, effective procedure writing, other experience, computer, organization, and communication skills.	√	√	√		Experience
Mill Operators	Operations	Experience in a similar position, experienced forklift, and bobcat operator.	√	√	√	√	Experience
Mill Labourers	Operations	Previous experience working at a remote camp setting as asset, experience operating forklift and bobcat.	√	√	√		None
Mill Maintenance Supervisor	Operations	Seven years' experience as a qualified journeyman/woman trade certification preferably millwright, five years' experience in a similar role.	√	√	√		Experience
Maintenance Planner	Operations	Completion of formal Computerized Maintenance Management System (CMMS), three to five years' experience, Red Seal Industrial ticket an asset	√	√	√		CMMS certification, experience, Red Seal preferred
Metallurgist	Operations	Bachelor of Science of Metallurgy or Materials Science, five years' experience, tertiary qualifications in metallurgy, other requirements, computer, communication, and other skills.	√	√	√		University Degree
Chief Assayer	Operations	University degree in Analytical Chemistry, Extractive Metallurgy, or related field, six to eight years' experience, other experience, and skills.	√	√	√		University Degree
Senior Assayer	Operations	University degree in degree in Analytical Chemistry, Extractive Metallurgy, or related field, experience in a supervisory role, other skills, and experience.	√	√	√		University Degree
Junior Assayer	Operations	College diploma/certificate or university degree in chemistry, geochemistry or other. One to three years' experience, computer skills, other skills and experience required.	√	√			College diploma/ Certificate or University degree
Gold Room Operator	Operations	University degree, three to five years' experience. Level 2 first aid an asset.	√	√	√	√	University Degree

APPENDIX B. POTENTIAL EMPLOYMENT POSITIONS AND REQUIREMENTS

Job Title	Phase(s)	Example Requirements	WHMIS	TDG	Driver Licence	First Aid	Designation
Sample Buckers	Construction Operations	Experience, math skills, ability to lift 40 pounds unassisted, other skills and requirements. Level 2 first aid an asset.	√	√		√	
Lab Technicians	Operations	Previous experience in an assay lab. Certifications, licences, designations an asset. Other skills and requirements.	√	√			Experience
Drivers	Construction Operations	Must have drivers licence relevant to any vehicle used for job (may include Classes 1 through 7)			√	√	Experience

Notes:
WHMIS – Workplace Hazardous Materials Information System certification.
TDG – Transportation of Dangerous Goods certification.
Driver licence – Valid driver's licence for any vehicle that may be utilized for the job.

Brucejack Heritage Chance Find Procedure

GLOSSARY AND ABBREVIATIONS

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

AIA	Archaeological Impact Assessment – An assessment carried out under a *Heritage Conservation Act* Heritage Inspection Permit to determine the impact of a development on archaeological sites.
Archaeology Branch	The Archaeology Branch of the British Columbia Ministry of Forests, Lands and Natural Resource Operations that administers the *Heritage Conservation Act*.
BC	British Columbia
CE	Common Era
CMT	Culturally Modified Tree – A tree that has been altered by Aboriginal people; for the purpose of this report only pre-1846 alterations are considered.
HCA	*Heritage Conservation Act* (1996) – The provincial law that authorizes and mandates British Columbia to manage heritage resources.
Heritage Inspection Permit	Heritage Inspection and Heritage Investigation Permits are issued under Section 14 of the *Heritage Conservation Act* subsequent to Archaeology Branch review and authorization.
Legacy Site	A site which has a record maintained in RAAD by the Archaeology Branch but is not protected by legislation. Examples include post-1846 CMT sites, non-designated historic sites (e.g., wagon roads), and prehistoric archaeological sites that have been completely destroyed and/or mitigated.
LSA	Local Study Area
M	Metre(s)
Plan	Heritage Management Plan
Pretium	Pretium Resources Inc.
Project	Pretium Resources Inc.'s Brucejack Project
RAAD	Remote Access to Archaeological Data; a web-based application, maintained by the Province of British Columbia, that enables authorized users to access data housed in the British Columbia Archaeological Site Inventory.
RSA	Regional Study Area

1 PURPOSE

The protection afforded to archaeological sites in British Columbia (BC) by legislation (refer to Section 4) applies to known and as yet unrecorded sites. Consequently, developments such as the Brucejack (the Project) that will involve surficial disturbance have the potential to affect archaeological sites. Certain types of sites, such as culturally modified trees (CMTs), can also be affected by logging or clearing of vegetation. For the Project, it is anticipated that earthwork activities (blasting, cutting, and filling) and vegetation clearing related to access road upgrades and transmission line construction will be the principle types of disturbances. As such, archaeological sites that may be present within or adjacent to the proposed Project development area could potentially be adversely affected.

The purpose of the Heritage Management Plan (the Plan) is to describe the protection of heritage resources and provide a framework to mitigate potential Project effects. This builds on extensive baseline heritage studies conducted for the Project (ERM Rescan 2014) that were conducted to enable implementation of mitigation measures at the planning stage, as appropriate. The Plan includes both heritage resources which have been identified adjacent to the planned work zone, as well as any that have not yet been identified but which could potentially be encountered during the course of the Construction, Operation, Closure, and Post-closure phases of the Project. Two heritage sites protected under the *Heritage Conservation Act* (HCA) have been identified within 1,000 m of the Project development footprint (refer to Section 5.1.1). There are no currently known heritage resources within the development footprint.

2 PERFORMANCE OBJECTIVES

The objective of the Plan is to reduce any potential adverse Project effects on archaeological sites to negligible significance through the implementation of management and mitigation measures, including avoidance or systematic data recovery.

Avoidance is the preferred management and protection measure for all archaeological sites within or adjacent to the planned work zone, whether known or as-yet unknown. It may be possible to achieve this by modifying the Project design. Where Project redesign is not feasible for the avoidance of archaeological sites, the management and mitigation strategies outlined in Section 5.3 will be followed.

3 SCOPE

During the Construction phase, activities such as clearing and grubbing, earthworks, excavations, and blasting have the potential to cause direct effects to protected archaeological sites, as well as protected paleontological sites, if present. As archaeological sites in this northwest BC often contain cultural materials present on the surface, archaeological sites can also be affected by increased human presence in the area during all Project phases. Thus, this Plan applies to all Project phases, components, and activities. The primary risk to heritage resources, however, will be during ground altering activities associated with the Construction phase.

4 RELEVANT LEGISLATION, REGULATIONS, AND EAC CONDITIONS

4.1 RELEVANT LEGISLATION AND REGULATIONS

In BC, the primary legislation protecting archaeological resources (both recorded and unrecorded) is the *Heritage Conservation Act* (HCA; 1996), which protects all sites predating 1846 CE on Crown and private land. Sites such as burials and Aboriginal rock art sites are protected regardless of age. The Archaeology Branch of the Ministry of Forests, Lands and Natural Resource Operations (Archaeology Branch) is the provincial ministry responsible for the administration of the HCA, issuing permits for heritage inspection, investigation, and site alterations, and maintaining a database of known archaeological sites. Burials and gravesites are also protected in BC by the *Cremation, Interment, and Funeral Services Act* (2004).

There is currently an open Heritage Inspection Permit (2014-0277) granted under Section 14 of the HCA for the Project. This permit is valid until March 31, 2016.

4.2 RELEVANT EAC CONDITIONS

Pretium was granted an Environmental Assessment Certificate (#M15-01) on March 26, 2015 that included a series of conditions. This management plan fulfills Condition #2, in relation to a Component Plan for management of heritage sites, presented within Schedule B of the Certificate and copied below.

<u>Condition 2</u>

> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*

- *Effects mitigation measures;*
- *Monitoring programs;*
- *Monitoring schedules; and*
- *Reporting requirements.*

The Holder must consult with the Nisga'a Lisims Government (NLG), Tahltan and Tsetsaut / Skii km Lax Ha Nation (TSKLH) on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.

The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."

5 ENVIRONMENTAL PROTECTION AND MANAGEMENT

The planned work zone considered in this Plan as well as the relevant Regional Study Area (RSA) and Local Study Area (LSA) are illustrated in Figure 5-1. Due to the sensitive nature of archaeological sites, locational information is not provided in this document but will be illustrated on construction maps. This section provides the mitigation measures and best management practices for archaeological sites within 1,000 metres (m) of the planned work zone. Sites that are within the RSA but are more than 1,000 m from the planned work zone will not be affected and are not considered further in this plan.

5.1 MITIGATION MEASURES AND BEST MANAGEMENT PRACTICES

This section provides mitigation measures for the two known protected archaeological sites and those sites that may be identified as a result of changes to the planned work zone and/or chance finds. It provides information on the steps required to conduct systematic data recovery at an archaeological site, if necessary.

5.1.1 Mitigation for Known Archaeological Sites

There are four archaeological sites documented in the Archaeology Branch's Archaeological Site Inventory database which are located in the Project's LSA, within 1,000 m of the planned work zone. These sites, their general locations, and their protection status are summarized in Table 5.1-1. Two of these sites, HbTm-2 and HcTn-1, have been designated as Legacy Sites by the Archaeology Branch and are no longer protected by the HCA; they will not be discussed further. HbTm-1 and HcTk-1 are the only known archaeological sites protected by the HCA which fall within 1,000 m of the planned work zone.

Table 5.1-1. Archaeological Sites within the Local Study Area

Archaeological Site	Antiquity	Site Type	General Location	Overall Site Significance Evaluation	Distance to Closest Project Component	Protection Status and Legislation
HcTk-1	Pre-contact	Culturally Modified Tree	Brucejack Access Road	Low	15 m	Protected by the HCA
HbTm-1	Pre-contact	Prehistoric Lithic Scatter	Summit Lake	Low	453 m	Protected by the HCA
HbTm-2	Recent Historic	Aircraft Wreckage (associated with a movie production)	Summit Lake	Low	525 m	Legacy Site – Not protected by the HCA
HcTn-1	Pre-contact	Prehistoric Lithic Scatter	Brucejack Lake	Moderate	603 m	Legacy Site – Not protected by the HCA

Figure 5-1. Regional and Local Study Areas for Heritage Resources in the Brucejack Project

5.1.1.1 HbTm-1

Archaeological site HbTm-1 is approximately 525 m west of the Brucejack Transmission Line, and approximately 165 m from the Granduc Access Road between the road and Summit Lake. The site is located outside the proposed construction footprint and therefore no direct effects are anticipated. The site may be subject to potential indirect effects due to increased human presence during the installation of the transmission line and associated towers and use of the Granduc Access Road; therefore, the following mitigation measures have been developed:

- the site area will be marked as a "No Work Zone" on construction maps;
- the site will be inspected periodically to determine if impacts have occurred; and
- if, due to changes to the footprint, direct impacts are anticipated, or monitoring identifies impacts from increased human presence, mitigation measures will be required (see Section 5.1.4).

5.1.1.2 HcTk-1

Archaeological site HcTk-1 is a CMT located approximate 15 m from the centreline of the Brucejack Access Road. To protect HcTk-1 from effects associated with use and maintenance of the Brucejack Access Road during Operation, continued avoidance of the site is recommended. In addition, the area should be marked as a "No Work Zone" on construction maps and the trees marked/flagged as such.

Continued avoidance of the site is recommended. If avoidance is not possible and/or if the trees become a safety hazard, a site alteration permit issued under Section 12 of the HCA would be required (see Section 5.1.4). Issuance of a Section 12 Site Alteration Permit may require that additional study at HcTk-1 be conducted.

5.1.2 Mitigation Measures for As-yet Unknown Archaeological Sites

During the lifetime of the Project, additional archaeological sites may be discovered while conducting activities associated with the Project. These sites may be discovered through Archaeological Impact Assessments (AIAs) carried out for revisions to the planned work zone or through chance finds during construction, operation, and closure. Mitigation measures for currently unknown archaeological sites, if discovered, are discussed below.

5.1.2.1 Revisions to Planned Work Zone during Construction, Operation, and Closure

Any revisions to the planned work zone that have not been previously subject to an AIA will be assessed to determine if additional archaeological studies, Archaeological Overview Assessments, or AIAs are required. If necessary, AIAs will be carried out under an HCA Heritage Inspection Permit, issued by the Archaeology Branch. Any new archaeological sites within 1,000 m of the planned work zone will be subject to the same level of management and mitigation afforded to the currently known archaeological sites outlined in Section 5.1.

The transmission line corridor has been changed from the route assessed during the original AIAs of the Project area (Jollymore and Walker 2013). An Archaeological Overview Assessment has been conducted and an AIA has been recommended along the revised alignment prior to commencement of Construction phase activities.

5.1.2.2 Chance Finds

The Heritage Chance Find Procedure developed for the Project (Appendix A) provides a standard operating procedure should heritage sites not identified during baseline studies be discovered. Pretium will arrange for site orientation and training of construction personnel (including contractors) involved in new site surficial disturbance, with regards to compliance with the HCA. Training and site orientation will be provided for these construction personnel during their induction, with refresher training provided at the beginning of the second year of construction. Training will also be provided to Pretium environmental staff, with periodic refreshers during mine life. This training will focus on not disturbing known archaeological sites; the procedures in place for responding to newly identified sites, as outlined in the Project's Heritage Chance Find Procedure; and how to report these sites or observed site impacts. Copies of the Project's Heritage Chance Find Procedure will be kept on site for reference and on file by Pretium. In general, if personnel suspect archaeological materials or human remains have been discovered they will:

- immediately contact a Pretium or Contractor Environmental Monitor, Pretium Environmental Coordinator/Superintendent, or Pretium Construction Manager to implement a stop work order to reduce/minimize impacts to the site;
- leave the material in place and protect and/or mark the area around the site, and will not disturb or collect any archaeological materials or human remains; and
- report the discovery to the supervisor. The Mine Manager, the Principal, Environment, and the Project Archaeologist will also be notified. The Archaeology Branch and local Aboriginal groups/organizations will be advised of the discovery.

5.1.3 General Archaeological Management and Mitigation Strategies

If additional archaeological sites are identified during AIAs carried out for revisions to the footprint or through chance finds, the following general archaeological management and mitigation strategies are recommended. Final mitigation measures will be determined through consultation with the Archaeology Branch.

Note that the stipulations provided herein are generic and would only be activated if required. Specific management and mitigations measures for known heritage resources are described in Section 5.1.1.

Where an archaeological site is located within:

- **0 to 50 m** of ground-altering activities, direct impacts from Construction phase activities with a high potential for adverse impacts are anticipated;

- **50 to 500 m** from Project components, indirect impacts through increased human presence during the Construction, Operation, and Closure phases, with a low to moderate potential for adverse impacts are anticipated; and
- **500 to 1,000 m** from Project components, no impacts are anticipated and therefore are not considered.

Where sites fall within **0 to 50 m** of proposed ground altering activities, the risk of direct impacts from Construction activities is high. Areas within 50 m of archaeological site boundaries will be marked as "No Work Zones" on construction maps. Typically, site avoidance through Project redesign is the recommended management option. If avoidance is not possible, mitigation will be conducted prior to Construction phase activities. Mitigation measures will be determined in consultation with the BC Archaeological Branch and carried out by the Project Archaeologist under an HCA Heritage Investigation Permit. Mitigation may involve detailed mapping, photography, and systematic data recovery through surface collection and controlled excavations of evaluative units if subsurface deposits are present. The steps involved in permitting the alteration of an archaeological site are outline in Section 5.4. If the site will not be directly impacted then Construction Monitoring may be adequate within the "No Work Zone" (Section 6.1.1).

Where sites fall within **50 to 500 m** from Project components, the risk of indirect impacts through increased human presence during the Construction, Operation, and Closure phases is moderate. Sites may be inspected on a case-by-case basis to determine if impacts have occurred. If direct impacts at these sites are anticipated during construction and/or have occurred, mitigation measures will be required (Section 5.1.4). Archaeological site monitoring will occur during Construction phase activities near archaeological sites and/or site boundaries will be flagged or fenced to limit any indirect impacts (Section 6.1.2). Typically, site boundary flagging involves the use of rebar or wooden stakes with snow fencing or another visible barrier, running around the outside of the site boundary. Similarly, brightly coloured stakes installed at intervals around the boundaries of the site can be used if snow fencing or other visible barriers are impractical or constitute a barrier for wildlife. In either case, fencing will be visible above the anticipated snowline, particularly where sites are located adjacent to areas where construction will be undertaken when snow is still present. Caution will be exercised during construction activities near the site. Reporting pertaining to archaeological monitoring activities is described further in Section 7.1.2.1.

Sites which fall within 500 to 1,000 m from Project components are at low risk of direct and/or indirect impacts from construction and/or human presence, unless the planned work zone is revised during the Construction and/or Operation phases.

5.1.4 Mitigation through Systematic Data Recovery

Mitigation through systematic data recovery is not currently recommended at any of the known archaeological sites within the LSA. However, if mitigation through systematic data recovery is required due to revisions to the footprint or chance finds a final methodology will be determined in

consultation with the Archaeology Branch. The work will be carried out by a Professional Archaeologist under an HCA Section 14 Investigation Permit.

In order to impact an archaeological site the following steps are required.

1. Issuance of an Archaeological Investigation Permit under Section 14 of the HCA, by the Archaeology Branch.
2. Conduct the field investigations during snow-free conditions required to satisfy the provisions of the Section 14 Archaeological Investigation Permit.
3. Complete the permit report including recommendations to the satisfaction of the Archaeology Branch.
4. Apply for a Site Alteration Permit under Section 12 of the HCA.
5. Upon reception of the Section 12 Site Alteration Permit, impacts may proceed subject to any conditions stipulated in the permit.

All of the permit applications and approvals include an allowance by the Archaeology Branch for Aboriginal input and comments. Approval for impacts to archaeological sites is given, or not given, at the sole discretion of the Archaeology Branch. The process leading to a decision on issuance of a Site Alteration Permit generally takes at least one year to complete and therefore should be scheduled to begin well in advance of the Construction phase. From both an archaeological and permitting perspective, avoidance of a site is usually the preferred approach.

6 ENVIRONMENTAL MONITORING

This section describes how and when site monitoring will take place at the previously identified site (HbTm-1), as well as the use of the Project's Heritage Chance Find Procedure (Appendix A) for new site discoveries.

6.1 ARCHAEOLOGICAL MONITORING

This section described construction monitoring carried out by an archaeologist under an HCA Heritage Inspection Permit (Section 6.1.1) and archaeological site monitoring carried out by an Environmental Monitor (Section 6.1.2).

6.1.1 *Construction Monitoring*

If work is to occur within the "No Work Zone" around an archaeological site, an archaeologist will be present to communicate and work with operations personnel to ensure that unanticipated impacts to the site do not occur. This work will be carried out under an HCA Section 14 Heritage Inspection Permit by a qualified archaeologist. The archaeologist will examine soils being excavated and, should archaeological materials be encountered during monitoring activities, all work will cease in the immediate area of the find and the Archaeology Branch will be notified to determine next steps.

6.1.2 *Archaeological Site Monitoring*

If construction activities are between 50 to 100 m of archaeological site boundaries, an Environmental Monitor will be present or flagging/temporary fencing will be installed to serve as a visible barrier. Prior to the start of planned work activities, known archaeological sites within 100 m of a planned work zone will be located by an Environmental Monitor and a First Nations representative using available GPS coordinates and Project construction maps. The site will be checked to confirm that it is intact and then fenced or flagged to create a visible barrier. Upon completion of work, the site will be checked again to confirm that the site remains intact and was unaffected by work activities. Flagging/fencing will also be removed at this time to avoid drawing unnecessary attention to the archaeological site. The exception to the removal of fencing/flagging will be for a site within close proximity to an active Project area (i.e., known CMT along the Brucejack Access Road). In this case, fencing/flagging will be checked annually by the road maintenance crew to ensure it is still in place and visible.

Should impacts be observed at known archaeological sites, the Project Archaeologist and the Archaeology Branch will be contacted and notified of the impacts. Post-impact mitigation plans will be developed in consultation with the Archaeology Branch and local Aboriginal groups/ organizations on a case-by-case basis.

6.2 PERFORMANCE MONITORING

Once a site has been flagged/fenced, it will be visited during and after construction activities to determine if impacts have occurred. While fencing is in place Environmental Monitors will inspect and maintain these flagged/fenced boundaries on an annual basis.

7 REPORTING AND RECORDING

7.1 REPORTING

7.1.1 *Compliance Reporting*

This section details the reporting requirements for activities carried out under the HCA.

7.1.1.1 Archaeological Impact Assessment Reporting

For archaeological work conducted under a Section 14 Inspection Permit, a final permit report will be prepared as per the *British Columbia Archaeological Impact Assessment Guidelines*.

7.1.1.2 Mitigation Reporting

For currently unknown archaeological sites which are discovered within 0 to 50 m of Project impacts, mitigation will be conducted prior to construction (see Section 5.3.1). In this case, BC Site Inventory Forms must be updated detailing the mitigation measures and submitted to the Archaeology Branch for inclusion in the Archaeology Branch's Archaeological Site Inventory database.

If mitigation is required and completed under an HCA Heritage Investigation Permit provided by the Archaeology Branch, reporting relating to the mitigation will be completed and will meet the submission date and be provided to Aboriginal groups as outlined in the permit. Approval to proceed in the area of the site is given by the Archaeology Branch, to allow for work to be conducted within the site boundaries under a Section 12 Site Alteration Permit. If work proceeds under a Site Alteration Permit, a report will be submitted to the Archaeology Branch, outlining the work carried out within the site boundaries.

7.1.1.3 Construction Monitoring Reporting

Construction monitoring will occur if avoidance of the "No Work Zone" is not feasible. This will be done under an HCA Heritage Inspection Permit and will be included in a final permit report prepared as per the *British Columbia Archaeological Impact Assessment Guidelines* (Archaeology Branch 1998). Details on the location, the extent of impacts, and the results of the monitoring will be included in the Permit Report.

7.1.1.4 Archaeological Site Monitoring

Pretium will work in collaboration with the Project Archaeologist and Environmental Monitor to coordinate archaeological site monitoring and site inspection, as required. If the monitoring activities outlined in Section 6.1.2 identify impacts to an archaeological site, the results will be summarized in an Archaeological Site Monitoring Report to be provided to the Project Archaeologist and the Archaeology Branch.

7.1.2 *Incident Reporting*

Pretium will work in collaboration with the Project Archaeologist to coordinate the documentation of chance finds or impacts to archaeological sites. Pretium will maintain documentation regarding archaeological monitoring and any chance finds which may be discovered during the course of the Construction and Operation phases, and will report any impacts to archaeological sites to the Project Archaeologist and the Archaeology Branch (see Section 5.3.2 and Appendix A).

The Environmental Monitor will document, by means of photographs and field notes, the type of construction and disturbance occurring near a site, weather conditions, personnel present, and other pertinent details.

Chance finds will be reported on using the Heritage Chance Find Procedure and will involve internal reporting to Pretium Management, the Project Archaeologist, and the Archaeology Branch.

7.2 RECORD KEEPING/TRACKING

The Environmental Monitor will document, by means of photographs and field notes, the type of construction and disturbance occurring near a site, weather conditions, personnel present, and other pertinent details. It is imperative that detailed field notes are recorded during monitoring activities. This information will be summarized in an Archaeological Site Monitoring Report to be provided to the Project Archaeologist and the Archaeology Branch if an archaeological site is impacted.

7.2.1 *Field Monitoring Data*

The following data will be collected during field monitoring and may be required for inclusion in compliance reports:

- site photographs;
- UTMs for any disturbances;
- details of any actions taken to protect the archaeological sites; and
- recommendations for any changes to the protective measures, if required.

7.2.2 *Continuous Improvement, Follow-up, and Adaptive Management*

The Plan will be reviewed and updated on an as-needed basis as the Project proceeds through detailed design, Construction, Operation, Closure, and Post-closure.

7.2.3 *Incident Response Records*

Archaeological sites discovered during Project activities will be reported through the Heritage Chance Find Procedure.

7.2.4 Permit Database and Amendments

Previous and current AIA permits issued under the HCA for the Project include:

- 2010-0255 (closed);
- 2011-0245 (closed);
- 2013-0174 (closed); and
- 2014-0277 (active).

Additional permits or permit amendments will be added on an as-needed basis.

Brucejack Heritage Chance Find Procedure

BRUCEJACK

Heritage Chance Find Procedure

1 INTRODUCTION

This Heritage Chance Find Procedure has been developed for the Brucejack Project by ERM Consultants Ltd. (ERM) for Pretium Resources Inc. (Pretium) to be used by Project personnel during ground altering activities.

The purpose of this document is to provide guidance for Project personnel who believe they may have discovered archaeological, historical, or paleontological materials or human remains during Project activities. Procedures outline best practices for protecting and reporting heritage chance finds and the protocols to follow in such cases.

This procedure will be included as part of the site orientation and training program during the Construction phase for personnel involved in new site surficial disturbance, so that they are trained and informed regarding compliance with the *Heritage Conservation Act* (1996) and the use of the this procedure. Training and site orientation will be provided for these construction personnel during their induction, with refresher training provided at the beginning of the second year of construction. Training will also be provided to Pretium environmental staff, with periodic refreshers during mine life. This training will outline relevant legislation in place to protect heritage resources and will focus on the protection of known heritage sites (including protected archaeological, historic, and paleontological sites), the procedures in place for responding to newly identified sites, and how to report these sites or observed site impacts. Copies of this document will be kept on-site for reference and on file by Pretium. The use of this procedure will promote the preservation of archaeological data while minimizing disruption of project schedules.

1.1 RELEVANT LEGISLATION

In British Columbia, the *Heritage Conservation Act* (1996) protects all heritage sites, whether on Provincial Crown or private land, that predate AD 1846. Burial and rock art sites are protected regardless of age. Burials and gravesites are protected in British Columbia by the *Cremation, Interment, and Funeral Services Act* (2004). Additionally, provincial legislation also protects significant paleontological sites (i.e., fossils).

A permit is required for any subsurface investigation of a heritage site or investigation with the intent to locate a site. The BC Archaeology Branch is the provincial government agency responsible for administering the *Heritage Conservation Act*, issuing permits, and maintaining a database of recorded heritage sites in the province. Disturbance and/or removal of artifacts from a site may result in penalties.

1.2 REMEDIES AND PENALTIES

The *Heritage Conservation Act* provides for heritage inspection or investigation orders, temporary protection orders, and civil remedies and penalties to limit contraventions. These powers provide:

- the Province with the ability to inspect a site or halt work to prevent site alteration; and
- the Courts with the ability to issue an injunction to restrain contravention of the Act or, where there has been a breach of the Act, impose penalties of not more than:
  - a fine of $50,000 and 2 years imprisonment for an individual;
  - a fine of not more than $1,000,000 for a corporation; or
  - a fine of $50,000 or 2 years imprisonment for an employee, officer, director or agent of the corporation.

1.3 HERITAGE SITE TYPES

In British Columbia, the material culture of the earliest cultures can be found on today's landscape which can relate to resource gathering, habitation, tool making, and ritual and ceremonial sites. Such sites can be discovered during Project activities and may become exposed as a result of cut-banks, excavation, eroding shorelines, or melting glacial ice. Some site types known to be present in northwest BC include:

- Culturally Modified Trees (CMTs) such as bark stripping, blazes, and removal of planks;
- rock art, including petroglyphs and pictographs;
- surface features such as cache pits, pit house depressions, and rock cairns;
- stone artifacts and the waste material from stone tool manufacture (flakes/chipped stone). Such artifacts can be found on the surface or subsurface and are often made from material such as obsidian, chert, or basalt;
- historic cabins related to significant historic events; and
- paleontological fossil sites.

2 HERITAGE CHANCE FIND PROCEDURE

If you believe that you may have encountered archaeological, historical, or paleontological materials, follow the procedure below:

- Immediately contact a Pretium or Contractor Environmental Monitor, Pretium Environmental Coordinator/Superintendent or Pretium Construction Manager to implement a stop work order, to **stop** all construction activities in the vicinity of the find to avoid damaging the site.
- **Do not disturb or remove any heritage material you may encounter**. Take a photo instead.
- Report your discovery to your supervisor. If unavailable, contact the Pretium Environmental Coordinator or Pretium Mine Manager to obtain further instructions.
- If possible, isolate and protect the area by hanging flagging tape, etc.
- Note the location of the find (GPS coordinates/sketch map/etc.), and leave the find in place.
- Prepare an initial Chance Find Reporting Form (see below) and provide this to the Mine Manager, who will also provide a copy to the Environmental Manager.
- Pretium Resources Inc. will contact the Project Archaeologist.

Once the Initial Chance Find Reporting Form has been submitted:

1. The Project Archaeologist will assess the potential significance of the find. If it is determined to be archaeological in nature, the Archaeology Branch will be contacted, as well as, the appropriate local First Nation.
2. The Project Archaeologist, in consultation with the Archaeology Branch, will determine what further steps are required.
3. If additional work is required, an investigation will be carried out under a Heritage Inspection Permit.
4. The Project Archaeologist will work with Pretium Resources Inc. and the Mine Manager to prepare instructions to recommence work in the area.
5. A site form and permit report will be submitted to Pretium Resources Inc., the Archaeology Branch, and local First Nations.

3 FOUND HUMAN REMAINS PROCEDURE

If you believe that you have discovered human remains, follow the procedure for *Found Human Remains*[1], summarized below:

1. Immediately contact a Pretium or Contractor Environmental Monitor, Pretium Environmental Coordinator/Superintendent or Pretium Construction Manager to implement a stop work order, to **stop** all construction activities in the vicinity of the find to avoid damaging the site.
2. **Do not disturb any possible human remains that you encounter**. Treat it like a crime scene.
3. Report your discovery to your supervisor. If unavailable, contact the Pretium Environmental Coordinator/Superintendent or Pretium Mine Manager to obtain further instructions.
4. Pretium Resources Inc. will contact the Project Archaeologist.

Once the initial report has been submitted:

1. The Coroner's Office and local policing authority will be notified as soon as possible by the Project Archaeologist.
2. The Coroner's Office will determine whether the matter is of contemporary forensic concern.
3. If the Coroner's Office determines the reported remains are not of forensic concern, the Archaeology Branch will attempt to facilitate disposition of the remains.
4. If a cultural affiliation for the remains can be reasonably determined, the Archaeology Branch will attempt to contact an organization representing that cultural group.
5. If remains are determined to be of aboriginal ancestry, the Archaeology Branch will attempt to contact the relevant First Nation(s).
6. Generally, if remains are still buried and are under no immediate threat of further disturbance, they will not be excavated or removed.
7. If the remains have been partially or completely removed, the Archaeology Branch will facilitate disposition.

[1] This is based largely on the Archaeology Branch's Found Human Remains Procedure with some changes to reflect Project specific conditions. Source: http://www.for.gov.bc.ca/archaeology/policies/found_human_remains.htm (accessed December 2013).

The Brucejack Mine is located approximately 65 km north-northwest of the town of Stewart. The distance by helicopter is approximately 77 km if the route flown follows the Granduc Road, Bowser River Valley and Knipple Glacier.

The mine is located approximately 245 km by air and 390 km by road from Terrace BC. Road access from Terrace is via Highway 16 to Kitwanga, then north via Highway 37N to the Brucejack access road intersection. The Brucejack access road intersection is located 62 km beyond Meziadin Junction, just south of Highway 37N km 215 marker board. Road travel to the mine is then westward for an additional 73 km via the access road.

ACKNOWLEDGEMENTS AND LIMITATIONS

This Health Services Monitoring Plan (HSMP) has been compiled by Pretium Resources Inc. (Pretium) a member of the Newcrest Group of companies and authored by Sarah Glover, Principal Health & Safety Manager, Brucejack Mine. The HSMP was reviewed, and inputs provided, by Andrew Adam, Camp Manager, Brucejack Mine, Vicki Thistle, Senior Industrial Hygiene Advisor, Brucejack Mine, Torence Sandhals, Principal, Environment, Brucejack Mine, Chad Hopkins, Environmental EIT, Brucejack Mine, Breann Hallstrom, Manager Medical Services, Ben Wither VP HSE & Permitting and CCI International.

Any use of, or reliance on, this Plan by any third party is at that party's sole risk.

1 BRUCEJACK MINE INFORMATION

1.1 OBJECTIVES

The objectives of the Health Services Monitoring plan are to outline the on-site medical services and programs to be delivered for the Brucejack Mine workforce and describe the measures to coordinate health service delivery with Northern Health. Given the remote location of the mine, distance to public health care, and limited health care resources in the surrounding communities, Pretium Resources Inc. (Pretium) recognizes the need to move beyond the minimum legislative WorkSafe BC requirements and develop a comprehensive Health Services Monitoring Plan (HSMP) for the Brucejack Mine. Pretium's overall goal is to not only minimize the impact on local resources, but to provide a better work environment for those employed by the company and to work in partnership with Northern Health to find ways to improve the healthcare of the community at large.

1.2 BRUCEJACK MINE INFORMATION

1.2.1 General

Mine Name:	Brucejack Mine
Mine Type:	Underground gold and silver mine
Mine Scope:	The Brucejack Mine has been in commercial production since July 3, 2017. Underground mining methods are used to extract gold and silver containing ore. The process plant extracts gold and silver in the form of both doré and flotation concentrate.
Company Name:	Pretium Resources Inc., a member of the Newcrest Group of companies
Healthcare provider:	Newcrest employee staff the medial clinics, with full time Occupational First Aid Level 3, Advanced Care Paramedics, and Registered Nurses [Remote certified] at Brucejack, Knipple and Wildfire camps. The medical services are overseen by the Manager Medical Services [Nurse Practitioner].
Camp provider:	Pretium provides food, accommodations, housekeeping and laundry facilities, and (for mine-supplied linens) laundry services.

1.2.2 Mine Location and Access

Address:	73 km by road from access road turnoff at KM 215 on Hwy 37N
Legal address:	800 – 1066 Hastings Street West Vancouver, BC V6E 3X1
GPS Coordinates:	Camp coordinates are provided below in Table 1-1

Table 1-1. Camp Coordinates

Locations	UTM NAD 83 Zone 9		WGS 84	
	Easting	Northing	Latitude	Longitude
Brucejack Mine Site	427,080	6,258,695	N 56°28′01″	W 130°11′01″
Wildfire Camp	469,101	6,264,071	N 56°31′12″	W 129°30′8″
Knipple Camp	437,957	6,251,097	N 56°24′01″	W 130°0′19″

The start of the Brucejack Access Road is located near km marker 215 on Hwy 37N, approximately 62 km north of Meziadin Junction (Figure 1-1).

Distances from populations centers are shown in Table 1-2 and highway distances from the start of the site access road to local population centers are shown in Table 1-2.

The mine site is located at the terminus of the Brucejack access road, approximately 73 km from Hwy 37. The access road (Figure 1-2) consists of the following sections:

- Kilometre 0 to 59 is a gravel road from the security gate at Hwy 37.
- Kilometre 59 to 71 traverses the Knipple Glacier. This is a snow road for much of the year and an ice road in the summer months.
- Kilometre 71 to 73 is a gravel road between the top of the Knipple Glacier and the Brucejack Mine Site.

The mine is in operation with activities ongoing both on surface and underground.

Table 1-2. Distances including Population Sites and Northern Health Services

City or Landmark	Highway Distance to Start of Access Road (km)
Bell II (north)	33
Meziadin Junction (south)	60
Stewart Health Centre (south)	120

Terrace - Mills Memorial (south)	300
Smithers - Buckley Valley (south)	326
Prince George Regional Hospital	697
Vancouver	1,476

Figure 1-1. Brucejack Mine Location

Figure 1-2. Access Road Extent

1.2.3 Brucejack Mine Camps

The Brucejack Mine has three camps: Wildfire Camp at km 1 of the access road, Knipple Camp at km 56, and Brucejack Camp at the mine site (km 73).

Camp populations vary, but the current bed space capacities are as follows: Wildfire Camp (25), Knipple Camp (142), and Brucejack Camp (746). The mine as currently defined will operate until the end of 2032. Table 1-3 summarizes the facilities at the smaller Wildfire and Knipple Camps.

1.2.3.1 Wildfire Camp

Located just off Highway 37 at km 1 of the access road, Wildfire Camp is used to maintain security of the access road and house road maintenance staff. Wildfire Camp has a modular construction permanent dormitory with 25 beds that was built in 2021. Rooms are single occupancy with ensuites. Wildfire Camp will be operational for life of mine.

Table 1-3. Camp Facilities Summary (Wildfire and Knipple Camps)

Facilities	Wildfire Camp	Bowser West	Knipple Camp
Bathroom and Shower Facilities	X		X
Kitchen	X		X
Dining Room	X		X
Camp Admin Office	X	X	X
Gym	X		X
First Aid Room	X		X
Security Checkpoint	X		
Security Screening Station	X		
Diesel Power Generators (back-up at Knipple)	X	X	X
Diesel, Gasoline and Jet-A Fuel Storage	X		X
Helicopter Pad	X	X	X
Maintenance shop			X
Laydown Yards		X	X

1.2.3.2 Knipple Camp

Knipple Camp is located at the km 56 of the access road and is currently used as a transfer point for incoming/outgoing freight and personnel working at the mine site. Freight is brought in via the access road on highway trucks and then offloaded and transferred to rubber tired off-highway trucks. Personnel travel in buses or vans which are chained up to travel across the Knipple Glacier to Brucejack. Knipple Camp has a modular construction permanent 142-person dormitory that was built in 2021, with similar amenities as Brucejack and Wildfire camps. Rooms are single occupancy with ensuites. The Knipple Camp and work area will operate for life of mine.

2 BRUCEJACK CAMP INFRASTRUCTURE

2.1 ACCOMMODATIONS

2.1.1 Introduction

Brucejack Camp accommodations infrastructure is comprised of two permanent dormitory complexes (Upper Camp and Lower Camp) and two modular mobile structures (bunkhouses 7 and 8). Combined total bed capacity is 746 persons.

2.1.2 Permanent Dormitories

Brucejack Camp has Upper and Lower Camp dormitory complexes, each with internally connected dormitory wings. All of the rooms are single occupancy with ensuite washrooms. Most of the Lower Camp was constructed in 2016, including three wings of 110 rooms each over 3 floors, kitchen, recreation facilities, housekeeping services area, and offices. A fourth wing was added to the Lower Camp in 2021, bringing its total bed capacity to 434 persons. The Upper Camp, with a bed capacity of 216, was also constructed in 2021. The Brucejack Camp permanent dormitories at site are built to the same modern standard, with the following best practices incorporated into the design:

- provide maximum access to natural daylight and views to the outdoors,
- provide superior ventilation;
- control sources of indoor air contamination;
- prevent unwanted moisture accumulation; and
- enhance the psychological and social aspects of space.

See Figure 2-1 for a schematic of the rooms.

The Brucejack Camp kitchen is located in the Lower Camp complex, and was expanded in 2021 when the permanent dormitory additions were constructed. Dry area and entry improvements were also part of the 2021 construction work.

Figure 2-1. Construction / Operations Camp Room Rendering

Each room is single occupancy and includes:

- 90.9 ft² of floor space (11'-1" × 8'-9 7/8");
- one bed (39" × 80") with high quality memory foam mattress;
- wardrobe closet with drawers;
- workstation including desk, padded chair, desk lamp, and internet connection;
- electric baseboard heater;
- television; and
- vanity sink.

Each room has its own ensuite bathroom which includes a shower enclosure and toilet. The bathroom has 25.3 ft² of floor space.

A rendering of the rooms is shown in Figure 2-1.

2.1.3 *Bunkhouses 7 and 8*

These modular structures each have 48 single occupancy rooms and common washroom facilities. The dry areas consist of coat hooks and benches, and there are washers/dryers in Bunk 8 to serve occupants of both bunks for both street and work clothes. There is also a separate laundry area for linens and towels (housekeeping use only).

2.2 LAUNDRY SERVICES

Separate laundry facilities, including washers and dryers, are provided for each of the following functions:

- Bedding and other linens: Housekeeping staff washes bedding and other catering supplied linens in dedicated washers and dryers. The general workforce is prohibited from using these laundry facilities. Bedding is provided by Pretium. It is changed and cleaned by the housekeeping staff each time personnel rotate out on days off. Fresh linens are available if personnel wish to have them changed more frequently.
- Work Clothes: Dedicated washers and dryers are provided for personnel to wash their own dirty work clothes. Work clothes are not permitted to be washed in any other washing machines.
- Non-work Clothes: Personnel have access to laundry facilities for washing their non-work, "street" clothes. Laundry soap is provided by Pretium.

Heated "mine and mill drys" are provided in the Lower Camp for personnel to store their work clothes, outerwear, and boots. This allows the clothing to dry and prevents dirt and grease from being tracked into the living areas. Dries are equipped with benches and either hooks or hanging baskets to store their gear as well as lockers, showers, toilets, and wash sinks. Personnel are encouraged to use slippers or other clean indoor footwear in the living areas. Boot covers are provided if personnel wish to cover their outdoor footwear.

2.3 POTABLE WATER SYSTEM

2.3.1 *Potable Water Monitoring*

The Ministry of Health as per the *Drinking Water Protection Regulation* prescribes water quality standards for potable water and the frequency of monitoring. Drinking water sampling is completed per BC Ministry of Environment, Health Canada, BC Ministry of Health, Environment Canada standards for a suite of parameters including fecal coliform, *E. coli*, metals, hardness, pH, turbidity, etc. Analysis is completed by a third party laboratory and results are posted on camp bulletin boards once received. An example of the third party analytical report is provided in Appendix A.

2.3.2 *Potable Water Supply*

The source of Brucejack Mine site drinking water is a drilled well titled "D3" in the Pilsner Valley, northwest of the mine site. This 83 m deep well is partly confined, with the well head protected by an

enclosed shipping container with all necessary instrumentation. The well is currently authorized to produce 75 m^3 of water per day. From the pump intake, raw water is pumped approximately 1.7 km to the Lower Camp Potable Water Treatment Plant (PWTP).

2.3.3 Potable Water Treatment

As the water arrives from the D3 Well it undergoes a four-stage filtration process at the PWTP, sodium hypochlorite injection, and ultraviolet (UV) disinfection prior to distribution. The PWTP can treat flowrates up to 200 GPM.

Stage 1 - Rapid Sand Filtration

The first stage inside the PWTP is sand filtration via five parallel sand filters using Next-Sand media. Next-Sand is capable of filtration to a 5-micron level when run at optimal bed depth and service flow rates. The Next-Sand filters take the bulk of the sediment load from the well water. After filtration, water flows back outside to two 75 m^3 primary storage tanks (total operating volume of 114 m^3). Having the Next-Sand filters before the tanks keeps sediment loading to a minimum. All further treatment is located inside the PWTP.

Stage 2 – Sodium Hypochlorite Injection

Sodium hypochlorite injection provides secondary, residual disinfection to the system. Sodium hypochlorite injection occurs in line as water is pumped into the two storage tanks. This system allows for sufficient contact time to take place in the tanks prior to further filtration and UV disinfection. A chlorine analyzer installed on the plant recirculation line monitors the free chlorine in the system.

A diaphragm pump alongside the chlorine analyzer is programed to ensure the free chlorine present in the system is kept between 0.4-0.6 ppm. Additionally, operators check the accuracy of the automated chlorine analyzer once per day using a handheld meter.

The remaining treatment stages are located after the primary raw water storage tanks.

Stage 3 - 5-Micron Cartridge Filtration

5-micron cartridge filtration consist of three filters in parallel. This stage provides protection to subsequent treatment steps if the Next-Sand filters ever need to be bypassed, or if they are overwhelmed by a significant surge in turbidity levels. They also assure that the 5-micron level pre-treatment has been completed prior to the 1-micron filters, in case the Next-Sand filters have not been able to reach this level on their own.

Stage 4 – 1-Micron (Nominal) Cartridge Filtration

1-micron cartridge filtration consists of three filters in parallel. This stage provides protection to the next filtration stage by filtering out as much particulate as possible beforehand.

Stage 5 - 1-Micron Absolute Cyst Removal Cartridge Filters

1-micron absolute cyst removal cartridge filtration consists of four filters in parallel. This level of filtration provides microbiological protection against many surface water pathogens such as *Cryptosporidium* and *Giardia* and removes ultra-fine sediments to improve UV transmittance and water clarity.

Stage 6 - UV Disinfection

UV treatment provides the primary pathogen disinfection. Seven units in parallel provide the suitable flow rate with redundancy. Each unit is protected by an independent automatic emergency solenoid shut-off valve and all the units are monitored by a single COMM Center.

2.3.4 Potable Water Distribution

Treated water leaves the PWTP and splits into three piping networks; first, to the Lower Camp; second, to the Mill building; and third, to the Heavy Shop storage tanks (60 m^3). There are additional branches off the Lower Camp and Heavy Shop piping networks, both supplying water to the Upper Camp Water Treatment Plant (UCWTP).

Water fed to the Lower Camp undergoes no further treatment due to proximity to the water treatment system.

Water to the Mill goes through additional 5-micron filtration and UV disinfection located inside the mill building before final distribution.

From the Lower Camp and Heavy Shop branches, water is pumped to two 20 m^3 cisterns in the UCWTP. The UCWTP can provide flowrates up to 120 GPM, the water is treated by two 5-micron filters in parallel followed by four UV units in parallel. From the UCWTP, treated water is pumped to the 216-person Upper Camp and Bunks 7 and 8, as well as former Bunk 2 (now used for exploration related purposes). Water pumped to the 216-person Upper Camp does not undergo further treatment.

Water pumped to Bunk 2 is treated by two 80-micron spin-down filters in parallel, two 5-micron filters in parallel, and two UV units in parallel. The treated water is then pumped to Bunk 2, 7, and 8.

2.4 FOOD SERVICES

2.4.1 Permanent kitchen and dining facilities

The Brucejack Camp kitchen and dining facility is centrally located and internally connected within the core camp complex. This kitchen operates under an approved Food Safety and Food Sanitation Plan and a current Health Operating Permit (#10188). Kitchen staff are FOODSAFE certified and undergo annual FOODSAFE training, Kitchen supervisors hold advanced FOODSAFE certification, Pretium's food safety and sanitation procedures are carried out through well-established policies and schedules following HACCP methodology and regularly audited. Pretium's temperature monitoring

and logging procedures for food transport, storage, service, and cooling are established and well maintained, often going beyond FOODSAFE guidelines through the use of automated temperature logging devices that eliminate human error.

The kitchen area including receiving, storage, production and service measures approx. 72′ x 76′ the dining area measures approx. 120′ x 88′ and holds a seated capacity of 450. The area also includes

- hot food services line;
- Lunch bag-up or grab-and-go room
- Hand washing facilities just outside the dining room;
- Washrooms just outside the dining room;
- Cold buffet and salad bar;
- refrigerated cabinets for condiments;
- refrigerated beverage coolers;
- refrigerated coolers for sack lunches;
- coffee and tea stations;
- drinking water dispenser; and
- toaster and microwave.

Privies

Indoor lavatories are located outside the dining hall in the entrance area, adjacent to hand wash stations. A lavatory with hand wash for kitchen staff only is located in the rear of the kitchen facilities and adjacent to space designated for chemical storage, and well-separated from food storage and preparation areas.

Separation of Dining Room from Kitchen

The kitchen is separated from the dining room by wall, with three access points: double swing doors for “kitchen staff only”, a pass-through counter window into the dishwashing area and a hot buffet service area. The buffet itself will be is behind glass and an open space above the buffet will allows clients to pass plates to servers, and vice versa.

Pests

Pests are kept from kitchen area by the use of screens on all windows and rodent-proof sweepers on all outer doors. All food is kept in secure pest-proof storage containers. Garbage will be is removed frequently and disposed of in a dumpster with a pest-proof lid which will be is kept closed at all times. Regular sanitation of kitchen, dining room, waste receptacles and dumpster will prevent attracting pests. A pest control service contract is in place and pest control technicians visit site bi-monthly; audit reports are issued and any required corrective actions are monitored until closed out.

Food Equipment Maintenance

All food equipment is maintained per manufacturer's instructions and serviced regularly. Equipment is fitted with safety lockouts where necessary, and all staff are trained on safe use. Equipment is cleaned and sanitized regularly according to daily, weekly, monthly, and on-demand cleaning schedules, established as part of Pretium's Food Safety and Sanitation Plans.

Kitchenware and Utensil Storage

Kitchenware and Utensils are stored on plastic coated wire rack shelving, or in stainless steel inserts on such shelves, all inserts and shelving are cleaned and sanitized regularly as part of Pretium's Sanitation Plan. Other ware and utensils are hanging above work areas from purpose-built stainless steel racks, and such racks are cleaned and sanitized regularly as part of Pretium's Sanitation Plan. All stored utensils are cleaned and sanitized regularly as part of Pretium's Sanitation Plan.

Protecting Food from Contamination

Food is protected from contamination in several manners which include: use of sealed containers; proper storage procedures (e.g., meats to be stored in designated areas apart from other food items and cooked foods to be stored in designated areas apart from uncooked food); regular cleaning and sanitation of all food storage areas and food storage containers as part of Pretium's Food Sanitation Plan; by storing potential allergens in sealed clearly labelled food safe containers and kept in designated areas apart from other foods; by storing chemicals and other non-food items in designated areas well-separated from food storage and preparation areas; by washing all knives, tools and cutting boards and cleaning and sanitizing work areas between tasks; food handlers change aprons and uniforms after handling meat, allergens, or other potential contaminants.

Food Storage

Food is stored in appropriate covered food safe containers in temperature controlled and monitored walk-in or reach-in coolers and freezers. Operating temperatures will be monitored and logged twice daily to maintain safe operating temperatures as per Pretium's Food Safety Plan or stored in designated pantry areas for dry foods. Food for service is served in hot or cold buffet areas at appropriate food safe temperatures, and temperatures is logged regularly as part of Pretium's Food Safety Plan. All food storage areas and containers are regularly cleaned and sanitized as part of Pretium's Food Sanitation Plan.

Procedures for Cleaning and Sanitizing Utensils and Non-absorbent Surfaces

Utensils are cleaned and sanitized by automatic heat-sanitizing dishwasher, and the temperature is checked and logged regularly to ensure proper sanitation. Utensils which can't be washed in automatic dishwasher are washed by 3-sink method, which includes washing in clean warm soapy water, then rinsed in clean water and finally sanitized in clean water containing appropriate amount of food safe sanitizing solution per the manufacturer's instructions and then air-dried. Non-absorbent surfaces are cleaned and sanitized by the 5-step method, which includes the removal of gross debris, thoroughly washing with clean warm soapy water, rinsing the surface of soap with clean water, wiping dry with clean cloth and then spraying with food safe sanitizer and air drying per manufacturer's instructions.

Procedure for Washing Dishes, Cutlery and Cookware

Dishes are cleaned and sanitized by 5-step method which includes, scrapping dishes to remove gross debris, racking and spraying down dishes, putting dishes through automatic heat-sanitizing dishwasher (temperature is logged regularly to ensure proper sanitation), and then air-drying. Dishes which cannot be washed in automatic dishwasher are scrapped, spray-rinsed, then washed and sanitized using 3-sink method.

FOODSAFE Certification

It is the intention to maintain 100% of kitchen staff FOODSAFE certified. Any new kitchen staff without certification are trained and certified within 3 months of hire, and at no time will less than 75% of kitchen staff on any shift are FOODSAFE certified.

2.5 LIQUID AND SOLID SEWAGE DISPOSAL

Liquid waste or sewage is currently treated by a proprietary Membrane Bio-Reactor (MBR) package waste water treatment plant (WWTP) manufactured by Filterboxx™ Water and Environmental Corp. (Filterboxx). The package plants have the capacity to treat up to 225 m^3/day of raw water flow and is designed to meet the requirements of the BC Ministry of Environment (MOE). The process consists of:

- lift stations or gravity feed from various site buildings;
- influent pre-screen;
- influent tank;
- aeration tank and associated blower;
- membrane filtration system;
- treated effluent tank;
- UV disinfection units;
- sludge holding tank;
- sludge dewatering;
- process logic controllers (PLC) and Human Machine Interface (HMI); and
- various transfer pumps.

Treated water is discharged to the Waste Rock Tailings Storage Facility (WRTSF) via an insulated, heat traced, pipeline.

Sludge is primarily dewatered and transferred offsite for disposal at Meziadin landfill. As needed, liquid sludge is transferred offsite for disposal at an approval disposal lagoon in Meziadin Junction.

2.6 SOLID WASTE DISPOSAL

Solid waste is managed in accordance with the Brucejack Waste Management Plan and Refuse Incinerator Management Plan.

2.7 OTHER FACILITIES THAT SUPPORT POSITIVE HEALTH OUTCOMES

All of Pretium's residence camps include the following amenities that promote positive health and mental health:

- gymnasium with a yoga/aerobics area, cardio machines, and weights;
- recreation facility that includes pool tables, ping pong tables, social areas, TV lounges;
- quiet area for reading/study;
- at Brucejack, marked walking/hiking/snowshoeing trails;
- private single rooms;
- public phones so workers can call home at no cost;
- Wi-Fi internet access throughout the facility; and
- 24/7 access to the dining room.

3 ON-SITE PROGRAMS AND SERVICES

3.1 HEALTH SERVICES

Pretium's goal is to continually improve the on-site health service delivery model that provides not only high-quality occupational illness prevention and initial injury care but also addresses the general health and primary care needs of the site workforce whenever possible. Pretium's aims to be self-sufficient to a reasonable extent; but should a patient's condition warrant care beyond the scope of practice or expertise of the on-site team(with the remote support of the primary and emergency physician telehealth MSP services), Pretium's collaborates closely with NH and BCAS to ensure an efficient and effective transfer of care.

3.1.1 Health Services at Brucejack

Pretium health services are detailed below but have been recently re-structured in order to be as self-sufficient as possible, minimizing impacts on NH and providing high-quality care to the site's workforce. The approach to minimizing impact on NH resources is multi-faceted:

- Comprehensive pre-deployment occupational health assessment: this ensures that personnel working at Pretium have been assessed as fit to work in a rural environment and, for patients with chronic diseases, there has been liaison between the on-site medical team and the patients' regular physicians to ensure a plan is in place for disease monitoring/surveillance and a crisis plan in the event of a deterioration while on-site.
- Experienced on-site healthcare team: Pretium employs remote-certified RNs and ACPs with more than seven years' experience. These individuals have experience of working in rural areas and have robust clinical judgment.
- Access to increasing breadth of diagnostic facilities at site: see Diagnostics section for further details. However, the aim is to give the on-site team more confidence to risk-stratify presentations at site and to dictate urgency with which patient needs further medical attention, either at home after the rotation finishes or at an NH facility.
- Access to comprehensive medications at site: Pretium maintains a comprehensive inventory of medications to treat both emergency presentations and minor illnesses or injuries that would otherwise precipitate a visit to a local NH facility.
- Working-hours primary care physician support: the on-site healthcare team is able to contact experienced primary care physicians during working hours for advice on non-urgent presentations in which there may be diagnostic uncertainty or where decision-making is complex. While a proportion of these calls will, inevitably, result in the need for the worker to attend an NH facility, this service will significantly reduce the number of presentations to NH facilities that would otherwise occur.

- 24/7 emergency telehealth support: where patients are critically ill or injured, access to 24/7 experienced critical care or emergency physicians will improve the immediate on-site response. Clinical decisions made in the first few minutes and hours after injury can have a dramatic impact on overall outcome, and through this service, Pretium's on-site healthcare team will be supported in managing these complex cases whenever they occur. In the event of a critically injured or ill patient, the service will not prevent the need for transfer or evacuation but will be able to improve the patient's condition, where possible, prior to departure from site and will be able to direct the patient to the most suitable receiving facility (see later discussion on transfer). Furthermore, the physicians will be able to pre-alert the receiving facility of the incoming case so that they are able to prepare and anticipate the patient's arrival.
- Quality of MSPs: Pretium has agreements with MSPs that cover the spectrum of care from non-urgent to urgent, emergent and critical cases. The primary care and emergency telehealth services are led by senior and engaged medical personnel who have extensive experience in the planning and delivery of health care services in rural communities and are fully aware of the regional and local context of Pretium's operations and the need to minimize impact on local health facilities, as well as the specific health challenges related to Pretium's activities. Pretium's MSPs are involved in health services above and beyond clinical care of patients and are committed to supporting corporate leadership and collaborating closely with all relevant stakeholders, including NH.
- Robust clinical governance processes: under the direction of the Manager Medical Services, Pretium will, in conjunction with its MSPs, ensure that health services on site are tightly governed, with routine audits of clinic activity and utilization metrics to inform future staffing levels and health promotion activities, regular debriefs of cases where evacuation from site is required, including where possible, the involvement of the receiving facility and MSPs. Health service and mine rescue (ERT) personnel at Pretium will undertake regular training including the use of in-situ simulation in order to prepare for anticipated health events so that the response to a future real event can be optimized.

Pretium currently employs a full time clinic working steady days and on-call for night shift.

Brucejack Clinic Team	Rotation Pattern
RN-C / NP	2 Full time positions on regular 2 weeks on: 2 weeks off rotation
ACP	2 Full time positions on regular 2 weeks on: 2 weeks off rotation
RN	>12 OFA3/First responder trained, located across site in various departments
Knipple Clinic Team	**Rotation Pattern**
ACP	2 Full time positions on regular 2 weeks on: 2 weeks off rotation
Wildfire Clinic Team	**Rotation Pattern**
OFA3 / Security Supervisor	2 Full time positions on regular 2 weeks on: 2 weeks off rotation

Role allocation within the team:

- The ACP's would be the primary attendant to emergencies occurring outside of the Clinic, to provide the advanced medical evacuation escort as required by patient severity.
- The RN (Remote Certified) and NP would primarily manage the medical cases within the clinic and should retain an advanced scope of practice. The RN fills the role of co-medical leads for the site and act in a "physician extender" role.
- The RN would provide support the management of medical cases within the clinic.
- We anticipate continuing with this baseline coverage but will look to add additional staff as the workload warrants.

The Clinic staff are supported by a 3rd party 24/7 emergency telehealth physician provider, staffed by emergency and critical care physicians with extensive experience of remote practice. This service is activated as required during situations requiring emergency response, when considering the need to transfer a patient off-site or in cases of diagnostic uncertainty.

By directly linking the on-site team with an on-call physician group with experience of the local environment, the team can collaborate on treatment plans and together develop a more extensive initial patient care plan than would be possible otherwise. This care plan includes the provision of higher levels of assessment and treatment plans including both prescription and non-prescription medications.

The Clinic staff also have access, during working hours, to primary care support provided by Total Medical Remote Doctor Services for cases that do not meet the threshold of requiring emergency physician engagement. Although not the primary purpose of the Clinic, a significant amount of primary care activity occurs on-site due to the nature of self-presentations to Clinic and the enthusiasm of the staff to care for colleagues. There are efforts to utilize Northern Health printed resource materials around workplace wellness and risk factors that can lead to injury, illness, and chronic disease.

3.1.2 On site Resources

The on-site medical team has access to the existing site medical clinic(s) located within the camp buildings or adjacent. The medical clinic meets or exceeds all current WorkSafe regulations and include amenities seen in a well-equipped Northern Health Diagnostic and Treatment centre. This includes a trauma area, observation area and the ability to monitor a patient overnight should a medevac not be possible due to weather.

Fully outfitted ambulances are located onsite and provide immediate access to the clinics.

The medical facility's are equipped with diagnostic equipment that aims to assist the on-site medical staff to quickly triage, assess, and treat the patient in the most self-sufficient way possible, and to assist telehealth physicians to risk-stratify potential emergencies with a view to assessing whether a patient needs to be transferred to NH facilities, or if they can in fact be cared for on-site.

The Clinics stocks a range of medications to treat emergency presentations and minor illnesses or injuries that would usually precipitate a visit to a family doctor or emergency department. These medications include first line prescription antibiotics, gastro-intestinal, cardiac, respiratory, and dermatologic medications to be dispensed by clinic staff under remote physician orders.

The Clinics do not stock medications for chronic conditions such as hypertension or diabetes. A formal medication management system is planned with an accurate inventory on-site and an arrangement with a regional pharmacist where, in collaboration with the on-call physician, new prescriptions can also be provided to the workforce. Workers are expected to be up to date with routine immunizations prior to going to site. Immunizations such as tetanus, Twinrix and seasonal influenza will be provided on-site at the medical clinic.

A wide array of non-prescription medications are available on-site to manage the common non-occupational illnesses such as flus, coughs, colds, local skin infections, skin rashes and others.

3.1.3 On-site Medical Clinic Areas of Practice

The following conditions will be within the scope of treatment for the medical team with or without engagement of a 3rd Party emergency telehealth and primary care physician:

- Treatment and care of illnesses, occupational injuries and injuries which can be treated using OTC (over the counter) medications.
- Treatments outlined in Schedule 2 of the Emergency Medical Assistants Regulations under the Advanced Care Paramedic licence category.
- Treatments outlined in the NNPBC (Nurses and Nurse Practitioners of BC) Decision Support Tools.
- Management of acute trauma and cardiac condition requiring Advanced Cardiac Life Support interventions and advanced airway management (intubation).
- Initial and ongoing treatment with IV and oral antibiotics for dental, skin, respiratory, urinary, and ear nose or throat infections.
- Oral and/or IV hydration for dehydration secondary to environment, gastro-intestinal illness, or other cause.
- Treatment for conditions requiring initial pain management such as lower back, musculoskeletal, overuse injuries and dental pain.
- Simple foreign body removal/lancing of abscesses/wound management.
- Short-term observation of various conditions such as minor head injuries, abdominal pain, or asthma exacerbation.
- Treatment on-site, whenever possible, for a wide array of non-urgent medical issues including prescribing/dispensing medications (starter packs).

Although the goal of the Hybrid health and medical services team will be to have workers assessed and treated so they can remain at site, there will inevitably be situations where a patient will require

a referral to a Northern Health facility or other service. Further detail on the referral and trauma transfer process is outlined in the sections below but the overall goal is to provide the highest standard of healthcare possible to patients requiring medical assistance by ensuring effective communications with Northern Health facilities before, during and after the transfer process. This will, where possible, include pre-alerting receiving facilities and transferring with the patient a summary of their medical records held on-site.

The following areas necessarily fall outside the scope of the on-site healthcare team:

- Patients requiring urgent laboratory or radiologic work-up.
- Patients requiring assessment or treatment above the capabilities of the on-site team including those requiring prolonged observation or hospital admission.
- Embedded foreign body removal from the eye and complex laceration repair.
- Fracture management, beyond initial stabilisation and reduction

3.1.4 Non-urgent Care Demands

Pretium recognizes that in addition to responding and treating occupational injuries or illnesses, many employees have chronic medical issues that require on-site monitoring and continuing care by the medical team. The medical staff, in collaboration with the engagement of the 3rd party primary care service and the patient's regular primary care physician, will make best efforts to coordinate and provide care consistent with the patient's care plan. As needed, best effort will be made to contact the person's home healthcare provider to best coordinate care when there are changes in the patient's condition.

Furthermore, Newcrest implements robust occupational health programs including pre-deployment medical screening for all employees travelling to NRC. Pre-employment medical screening aims to prevent illness, injury or loss of life by ensuring that individuals are placed in suitable work according to their physical and mental capabilities. The pre-employment assessment provides a snapshot of the worker's health as they begin their role in a new position. This helps to inform subsequent medical surveillance required on-site and facilitates discussion between the employee's home healthcare provider, Newcrest and NRC's MSPs prior to travel to site regarding risk management and surveillance plans.

3.1.5 Mental Health and Substance Use

Pretium strives to provide a safe and healthy working and living environment but recognizes that both employees may require assistance in managing mental health and substance use issues that may arise.

The on-site medical staff is well versed in mental health promotion and in the specific mental health and substance use issues relevant to camp life. The goal will be to have the medical staff continue to maintain a high level of competency in this key area of health through ongoing medical education programs as well as working closely with programs promoted by Northern Health.

The Pretium is a "dry camp", and no alcohol or illicit drugs are allowed anywhere on the property, it is still important for the medical team to have a significant understanding of substance use issues. Camp will be equipped with multiple naloxone kits and on-site medical team will have training in overdose response.

Additional programs focused on substance use awareness will be incorporated as part of their continuing professional development programs. The following resources are reviewed and incorporated into the on-site awareness program:

- Overdose prevention | Northern Health
- Health and Safety during the Opioid Overdose Emergency: Northern Health's Recommendations for Industrial Camps, Northern Health
- Infographics - University of Victoria (uvic.ca)
- http://www.ccsa.ca/eng/Pages/default.aspx

Pretium will work collaboratively with Northern Health and Pretium's Employee Assistance Provider (EAP) to distribute awareness and educational materials to support the areas of both mental health and addictions.

To help reduce stigma, mental health and substance use awareness health awareness promotional materials will be posted at site in high traffic areas. Supervisors and Managers will receive training on the company's policies and procedures as they relate substance use, thereby promoting consistent and equitable treatment for all employees. Site drug and alcohol policy allows for financial support for rehabilitation programs, and upon medical clearance and successful completion of the program, a return to work. Pretium's current practice of recovering used sharps via collection areas in restrooms will continue.

Overall, Pretium supports Northern Health's recommendations to promote health and safety on industrial camps with respect to the opioid overdose emergency.

Recommendation in NH guidance pertaining to health and safety during opioid overdose emergency	Pretium implementation
Promote mental wellness at work and in camp	1. Annual mental health and psychological safety at work promotion campaigns 2. Promote use of recreation facilities on-site 3. Promote use of EAP
Foster an open, respectful and well-informed working environment	1. Provision of information on drug and alcohol use/addiction to workforce as part of annual mental wellbeing campaign 2. Promote use of EAP
Prepare for the possibility of an opioid overdose	1. Include recognition and immediate management of suspected opioid overdose in first aid and Mine Rescue (Emergency Response Team) training, including conducting scenario-based training (in-situ simulation) on this topic to assess adequacy of response on-site 2. Refresher training for clinic staff on opioid overdose – signs, symptoms, management 3. Drafting of Opioid Overdose clinical protocol in accordance with BC Emergency Health Services treatment protocols
Provide confidential access to harm reduction supplies	1. Provision of education on substance use
Support employees with addictions to get help	1. Facilitate access to mental health and addiction programs, via EAP
Manage the risk of impairment in safety-sensitive positions	1. Continued use of drug and alcohol testing and enforcement of policies forbidding drug and alcohol use on site 2. Increase awareness among shift supervisors of behaviours that may suggest impairment 3. Provide training for clinic staff in how to approach workers who have been referred to the clinic by their supervisors' suspecting they may be impaired. The approach needs to balance the rights and wellbeing of the worker with the safety-sensitive nature of many roles at Pretium and the risks to others' safety

Pretium has engaged and secured an EAP to provide support for employees and their family members. On-site contractors will be strongly encouraged to have their own EAP programs for their employees. On-site contractors and their employees will have access to on-site facilities: telephone and internet to contact their service providers and best efforts made to provide a private location for this service. In a Crisis Management situation Pretium will make best efforts to ensure all camp residents will have access to the necessary counselling resources.

The EAP provides Counselling Services which are available by e-mail, telephone, or video. Appointments can be scheduled using any of the aforementioned. The model of counselling is short-term in focus with clearly defined goals and outcomes. It is designed to help employees understand their concerns and develop a plan of action to address them. All new employees are provided EAP information upon hiring. Posters and pamphlets promoting the EAP, with contact information, will be displayed in high traffic areas of camp.

EAP counselling is available and can include the following caregiving, life planning, career planning, and health management services:

- life balance services;
- new parent support;
- childcare and parenting (including online childcare resource locator);
- elder and family care (including online eldercare resource locator);
- financial consultation;
- legal advisory;
- relationship solutions;
- career smart services;
- career counselling;
- pre-retirement planning;
- shift worker support;
- health smart coaching;
- nutritional counselling; and
- smoking cessation program.

Each of these services has been developed to allow employees and family members to take a proactive approach to manage everyday challenges and life transitions, and to receive the information and support that suits each unique situation. All these services are delivered by phone or online and often include expert support and coaching, and/or personalized resource material. The EAP can be reached +1 800 663 1142 anytime day or night, 365 days of the year. In an emergency, immediate support is available.

Whenever this program is used, it is in complete confidentiality.

3.1.6 Sexual Health

Pretium is very aware that the camp environment and lifestyle can lead to poor sexual health choices. To address this important issue, Pretium ensures that the on-site medical team has the necessary training and qualifications to raise awareness on sexual health issues, that education and safe sex counselling may be required as well as coordination of testing and treatment in some cases.

Pretium's EAP provider will provide "safe sex" counselling when needed, and provide on-site awareness programs including posters, brochures, and pamphlets to reduce the risk of STDs and unplanned pregnancies. Additionally, we will ensure that the on-site medical team as well as camp workers are aware of the following resources:

- Health Link BC:
  - https://www.healthlinkbc.ca/health-topics/stdis
  - https://www.healthlinkbc.ca/healthlinkbc-files/preventing-sti
  - https://www.healthlinkbc.ca/services-and-resources/healthlinkbc-files/series#STD
- BCCDC:
  - https://smartsexresource.com/about-stis/got-symptoms

Should a patient have a potential STD or sexual health issue, the on-site medical team will look to initiate a treatment plan, collaborate with the person's home healthcare provider to develop and implement a patient specific follow-up treatment plan.

On-site interventions will include coordination of STD screening and treatment, birth control options, "safe sex" counselling, referral, and other supports for sexual health. Free sexual harm reduction supplies will be made available in discreet locations at camp. When specific laboratory testing and results reporting is required, a pre-established protocol has been developed in collaboration with Northern Health.

3.1.7 Diagnostics

As mentioned in a previous section, the goal is to equip the medical clinic, when possible, with diagnostic capabilities like those found in a diagnostic and treatment centre. Current equipment includes an observation machine (blood pressure, pulse, oxygen saturations, end-tidal carbon dioxide) ECG monitors with 12 lead capability, peak-flow meters, glucometers, urinalysis, pregnancy tests and target tests such as screening for respiratory viruses. In future, additional diagnostics may be procured in order to inform decision-making by clinical teams both on-site and when engaged for remote advice. Such diagnostic tests can significantly amplify the impact that the emergency and/or primary care physicians can have by providing biochemical data to support advanced clinical decision-making when used in conjunction with evidence-based clinical protocols in a well-governed system.

Pretium also maintains a program of pre-employment medicals, audiograms, and D&A testing for potential employees, and will require contractors to complete the same for their potential employees. Individuals who pose too great a risk to themselves or others related to their health will be prevented

from working at Pretium. The on-site medical staff will have the ability to test for drugs or alcohol where it is warranted.

It should be noted that an on-site x-ray facility is not usually eligible for accreditation from the College of Physicians and Surgeons Diagnostic Accreditation Program so there is no x-ray capability at site.

Any patients requiring x-rays or laboratory tests beyond the on-site medical clinic capability will be evaluated to determine the most efficient timing and location for the testing with the goal of minimizing the utilization and impact on Northern Health facilities. Where it is safe to do so e.g. chronic disease surveillance, individuals will be encouraged to have tests with their home provider during their next scheduled break. However, in the event of the on-site team, in conjunction with the MSPs, suspecting any acute pathology, the health of the individual will be prioritized, and efforts made to facilitate the investigation required with as minimal delay as possible.

3.1.8 Bridging with Providers in Home Communities and Northern Services

Pretium recognizes the fact that Northern Health is not funded by the Ministry to fully support temporary resident populations such as those in industrial camps. For this reason, Pretium will make best efforts to ensure patients requiring care for non-urgent illnesses or injury are able return to their home communities for treatment once it is determined that their condition is stable, and they are fit to travel to their home community.

Examples are patients requiring follow-up of injuries requiring a plastic or orthopaedic surgeon assessment or conditions requiring internal medicine or medical specialist assessment. Pretium will track and initially follow all patients who are referred to any Northern Health facilities and ensure they are aware of the option to be transported home should they choose this option.

Whenever follow-up care is required off-site or a change in an established treatment plan is deemed necessary for a camp patient there will be an expectation that the Pretium on-site healthcare team will directly contact the patient's home health care provider. This includes family and specialist physicians, dentists, physiotherapist, or other licensed health care providers. In some cases, this contact may include health authority services.

3.1.9 A Focus on Discretion, Privacy, and Confidentiality

Pretium recognizes workers' concern regarding discretion, privacy, and confidentiality can hinder whether they choose to use an on-site medical clinic. We continually strive to have all necessary measures in place to ensure patients can access care without any concern for repercussions related to their employment and continually seek to promote a high level of trust between employees and the on-site medical clinic staff.

Pretium and the various site contractors can only access first aid records as permitted by WorkSafe BC for occupational related illness or injury. Pretium understands the company is not legally permitted to access any patient's medical record unless they have the express written consent of the patient. Pretium recognizes that any Electronic Medical Records are strictly confidential and will be securely stored requiring electronic passwords and supported by an IT policy requiring staff to lock their computers when not at their computers. Any paper records will be kept in a secure storage area.

The discretion, privacy, and confidentially process outlined above will be posted in the medical clinic as well as communicated on a regular basis to camp workers. This information will also be placed in the worker orientation package.

3.1.10 On-site Management of Company Policy Requirements

Pretium will make best efforts to implement company policies, when possible, which can be implemented by the on-site medical team and not require the resources of Northern Health, especially their emergency departments. Pretium will require the same approach for all contractors on-site. Thus, sick notes, insurance forms or other forms (such as return to work) which require completion on behalf of employees, contractors, or WorkSafe shall be completed using on-site resources whenever possible.

Pretium recognizes that some occupational illnesses and injuries (e.g., those requiring x-rays for example) will be beyond the capabilities of the site medical staff and require referral to Northern Health facilities. To assist in these referrals, a Functional Abilities Form (FAF) will be created for all major work categories. Best efforts will be made to ensure any worker that is sent off-site for further medical assessment will have a FAF included in their referral paperwork to assist the attending physician or medical professional in their assessment of the patient and their ability to return to work, return with modified duties or be deemed not fit for work. Pretium will make best efforts to ensure the follow-up process will minimize the burden on local resources.

Modified duty programs are a requirement of WorkSafe BC as they have been proven to show that the quicker the person returns to work, the quicker the person will recuperate and become a productive employee again. Pretium will reassign the worker to modified work tasks until they are fully functional and healthy to return to work. Pretium will rely on the on-site medical staff and, with the support of off-site MSP's and additional third-party support, will determine when a worker may safety return to work, and to what degree of graduated return-to-work program they can undertake.

As noted previously Pretium has a zero-tolerance policy to drugs and alcohol in the workplace and is a "dry camp". To meet this objective, Pretium also has a comprehensive Drug & Alcohol Policy. It should be noted that any drug and alcohol substance use problems that are brought forward by employees will be supported by the company with guidance from Pretium's EAP provider and community resources.

3.1.11 Disease and Infection Prevention and Outbreak Protocols

The remote setting of Pretium poses unique challenges, and the camp has the potential to be a high-risk area for the transmission of communicable diseases and infections, as the inhabitants are often near each other in a confined living and working environment.

Pretium is committed to the proper management of communicable disease, infection, and outbreak occurrences and this will be achieved through prevention, rapid response and the collaboration of personnel and resources. A detailed Communicable Disease Control Plan has been developed for the following the Northern Health's Best Management Guide for Industrial Camp outline.

The Manager Medical Services is Communicable Disease Control Lead (CDCL), with nominated medical staff filling the onsite role.

The following section provides a high-level overview of the plan which is outlined in greater detail in Pandemic Response.

Prevention

The ideal approach to the prevention and containment of an infectious outbreak is to implement a series of controls as referenced in the BC Provincial Infection Control Network resources:

https://www.picnet.ca/ wpcontent/uploads/PHAC_Routine_Practices_and_Additional_ Precautions_2013.pdf.

Engineering Controls

The camp design incorporates best practice engineering controls which include single rooms, private toilets and sinks, designated areas for hand washing and hand hygiene dispensers. Appropriate ventilation will be implemented across the camp including natural ventilation when possible. A, a protocol to isolate an infectious patient to a private room is in place to limit their exposure to the rest of the worker population.

Administrative Controls

The administrative controls will be introduced to provide an infrastructure of policies, procedures and patient care practices intended to prevent exposure to and/or transmission of infectious disease within the camp. The on-site medical team will be well versed in the identification, diagnosis, and treatment of common camp illnesses such as URTIs, influenza, noroviruses and also the need to maintain vigilance for all reportable illnesses listed on the BC Centre for Disease Control website.

Appropriate occupational health and safety policies including work restrictions, sharps safety, prevention of exposure to bloodborne pathogens and immunization programs will be communicated to the workers through the introduction at safety meetings and awareness campaigns. Ongoing awareness campaigns for the need for hand hygiene and cough etiquette will be in place with special focus during the typical months for season influenza activity.

Routine environmental cleaning policies have been created for the housekeeping staff as well as the safe use and disposal of sharps, incorporation of safe practices for handling blood, body fluids and secretions as well as excretions by both housekeeping and medical staff.

In order to reduce the risk of food handling related to norovirus infection and consequent outbreaks, there will be an ongoing focus on the need to maintain food hygiene standards. Policies are in place to include attention to hand hygiene, prevention of gross contamination during food preparation, provision of adequate handwashing facilities for food handlers and ensuring that food handlers do not work while they have symptoms of gastroenteritis.

Personal Protective Equipment

PPE is available for the protection of on-site medical staff, housekeeping or other team members involved in an outbreak to minimize the risk of contact with an infectious disease. These barriers include gloves, gowns, masks, facial protection, eye protection (including face shields, or masks with visor attachments) and N-95 respirators as required. Simple face masks will be made available to patients with a cough and symptoms of a respiratory infection to help reduce their chances of disease spread.

Outbreak Management

Pretium, through the Manager Medical Services Western Canada, will ensure the onsite medical provider is well versed in all aspects of outbreak management including the requirement to notify Pretium HSE immediately and the Northern Health Medical Officer, within 24 hours of an outbreak or occurrence of any illness above the incident level that is normally expected at an industrial camp. The on-site medical team will maintain vigilant for all reportable illnesses listed on the *Health Act Communicable Disease Regulation* 7/2015, O.C. 14/2015) under the *Public Health Act*.

Pretium will work directly with medical, housekeeping and food preparation providers to prevent an outbreak of infectious disease from happening. If however, an outbreak does occur an outbreak protocol will be in place to provide a systematic approach developed in accordance with the recommendations of the "Provincial Infection Control Network of British Columbia." Pretium will make best efforts to ensure workers and contractors are remunerated financially if they are required to isolate to a private room and not able to work.

A protocol has been developed based on the toolkit created by Fraser Health (http://www.fraserhealth.ca/media/Respiratory-Outbreak-Protocol-and-Toolkit-for-Residential-Care-Facilities.pdf) as well as resources available from the Provincial Infection Control Network. There is a process in place to mobilize an Outbreak Prevention and Management Team as necessary, which will link directly with external partners such as Northern Health for their input, expertise, and guidance. Necessary protocols will be developed outline the following key areas to manage influenza, respiratory, and gastro-intestinal outbreaks:

1. Develop "alert stages" to ensure outbreaks are identified as early as possible.
1. Initiate action steps promptly when there are 2 or more people with new or worsening cough or other symptoms consistent with an infectious disease.
2. Notify the Northern Health Medical Officer on call within 24 hours of a suspected outbreak.
3. Initiate Daily Surveillance.
4. Implement the appropriate Outbreak Control Measures.
5. Distribute educational/awareness materials.
6. A process for patient placement, accommodation, and flow during an outbreak developed by the medical team. This will include developing a "holding area" if necessary.

3.2 HEALTH PROMOTION, DISEASE PREVENTION, AND ON-SITE WELLNESS PROGRAMS

Pretium supports a population-based approach to health promotion, disease prevention, and on-site wellness. We recognise that promoting a healthy lifestyle will not only reduce the potential for injury or illness for workers in camp, but it also is proven to reduce fatigue and enhance camp morale. Addressing risk factors that can lead to injury, illness, and chronic disease is a shared aim of Pretium.

Northern Health has developed some excellent web based and printed resource materials in the area of Workplace Wellness and Pretium will make best efforts to assist in making these resources available to the camp workers at no cost to NH. Pretium continues ongoing collaboration with Northern Health to support and implement future programs at the Brucejack site as they are developed.

The overall goal of Pretium's on-site Wellness Program is to address a spectrum of topics in the area of wellness and be consistent with the position papers developed by Northern Heath to address the areas of Health Communities and Preventing Injury. These topics include:

- Sedentary Behaviour and Physical Inactivity;
- Healthy Eating;
- Tobacco Reduction;
- Prevention of Problematic Substance Use; and
- Health, Weight and Obesity.

Specific Disease prevention and on-site wellness initiatives planned for the Brucejack site include:

- collaborating and supporting current Northern Health Wellness initiatives such as: making copies of *The MANual – A Men's Health Survival Guide* available in camp; posters to encourage the use of the website https://men.northernhealth.ca/ or other Northern Health resources as they become available;
- assessing the feasibility of implementing the BC Cancer Wellness Fits program or and the Working on Wellness (WOW) programs in the camp: www.bchealthyliving.ca/wat-we-do/working-on-wellness;
- embedding wellness programs into camp policies;
- incorporating wellness as a standing item on the joint health & safety committee;
- introducing a "health tip" of the week at any regular health and safety meetings;
- providing a healthy selection of food choices in the dining area;
- offering a recreation facility that includes pool tables, ping pong tables, social areas, TV lounge; and
- offering a recreational gym that has cardio, weights and a yoga room to all employees. Employees also have access to group fitness classes.

- having a recreation committee to encourage social activity and comradery.

Company Policies

Pretium recognizes that company policies can play a large role in determining the health of the camp. As mentioned previously, Pretium has a zero tolerance policy to drugs and alcohol in the workplace and the Brucejack Mine is a "dry camp". Pretium has a comprehensive Drug & Alcohol Policy (D&A), which will include pre-employment D&A screening and on-site "reasonable cause" testing if warranted. Pretium has a WorkSafe BC compliant policy on smoking and protecting workers from second hand smoke.

Pretium has developed a Respectful Workplace Policy to support the creation of a positive workplace environment and a respectful workplace. Pretium demonstrates commitment to this approach through the following:

- making a strong publicized commitment to the maintenance of a positive work environment;
- providing workplace skills training in conflict resolution;
- providing ongoing education, skills training, and monitoring of the Respectful Workplace Policy;
- having a culture that aims to prevent workplace conflict and effectively resolve conflicts that do arise;
- having a policy which describes unacceptable behaviour and defines workplace harassment;
- providing sufficient resources and training to those responsible for implementing the policy;
- implementing personnel policies that acknowledge and value the diverse personal and professional lives of members such as: parental leave, alternate work schedules and compassionate leave.

Collective Messaging

As referenced multiple times throughout this HSMP, Pretium is committed to ongoing collaboration with Northern Health to support and align efforts in all areas of medical care including health promotion and prevention. Pretium will make best efforts to utilize shared resourcing materials and messages as appropriate.

3.3 COLLABORATION, COMMUNICATION AND PROBLEM SOLVING

Pretium recognizes that clear and effective communication forms the basis for developing an effective partnership with Northern Health and is essential for the management of patient flow and trauma care, responding to emergencies and problem solving. To this end Pretium will establish a clear process for coordination of medical and health program delivery with Northern Health.

3.3.1 Identification of Communication Pathways

In collaboration with Pretium's medical service provider, Pretium will establish clear lines of communication with key Northern Health stakeholders including the Stewart Health Center, Mills Memorial Hospital, the local Health Services Administrator, BC Ambulance Service, local physicians, Northern Health Resource office, Medical Health Officers and all other identified stakeholders. The following communication plan is proposed:

1. Establish a single point of contact, Manager Medical Services Western Canada for any healthcare issues related to the Brucejack Mine and provide their name and contact information to the various Northern Health key contacts.
2. Convene an initial face to face meeting between representatives of Pretium, healthcare service provider and Northern Health to review in detail this Health Services Monitoring Plan. Key to the meeting will be the input of the NH Health Services Administrator to ensure the current plan meets with Northern Health expectations and review further ways in which we can mitigate the impact on the local health resources.
3. With the input from the HSA establish a long-term Brucejack Working Group/Committee to continue to review the HSMP on an on-going basis and provide a forum to address any issues that arise from the mine. An established meeting schedule will be established.
4. If practical, arrange an on-site tour for key members of Northern Health including any physicians able to attend. The goal of the visit will be to provide an orientation and background to the operations and seek any additional input from the NH team.
5. Connect regularly with Northern Health's Office of Health and Resource Development to ensure that the Brucejack Camp is linking with the necessary Northern Health Stakeholders and are up to date on best practice recommendations for industrial camps.

3.3.2 Patient Flow Information, Trauma Care, and Emergency Response

Pretium will work collaboratively with Stewart Health Centre and Mills Memorial Hospital and Northern Health to establish escalation protocols and ensure there is a venue for sharing information.

In the cases where the patient requires a higher level of care each patient will be triaged by the medical team including the physician on call as necessary to ensure proper procedures are followed so Northern Health resources are accessed in the most efficient manner.

1. For patient's acutely ill or injured and requiring immediate transport, a Brucejack Protocol will be established with the Stewart Health Centre and Mills Memorial to address the optimal medevac procedure from the camp (e.g., helicopter), utilizing BCAS as necessary and a protocol to ensure adequate notification of the healthcare staff.
2. For patients who are ill or injured patient but stable – e.g., foot/ankle/hand injuries requiring x-ray or medical complaints such abdominal pain, low risk chest pain, chronic disease exacerbation – a Brucejack Stable Patient Transfer Protocol will be established with the Health

Centre to ensure the patient is transported when it is appropriate so they can be seen during normal working hours.

3.3.3 Northern Health's Role in the Pretium ERP

Stewart Health Centre is identified as the closest medical facility to the Brucejack Camp. Stewart Health Centre and/or Mills Memorial Hospital in Terrace are identified as the receiving sites for any mass casualty incident with the expectation that they will be notified immediately should an event or potential event occur. We recognize this notice is essential in order to activate the Health Centre's own disaster plan.

It is understood that the Medical Health Officer's mandate is to protect public health under the *Public Health Act*, and Part 5 of the *Public Health Act* provides the ability to act in emergency situations to reduce an immediate and significant public health risk.

3.3.4 Hiring Considerations

Pretium is very mindful of Northern Health's significant efforts to recruit and retain health care professionals in the North. We recognize that while there is generally a focus to hire locally, we will not recruit local health care providers such as nurses or paramedics unless it is in the best interests of both Pretium and Northern Health.

We are very interested in working collaboratively with BC Ambulance and the Stewart Health Centre on how we can attract more health care professionals to the region and build capacity for more local hires.

3.3.5 Quality Improvement

Pretium will work with its medical service provider to develop a Quality Improvement Framework to continually seek ways to improve the health care delivery for the camp worker, minimize the impact on local resources and respond to unforeseen issues and changing conditions.

The following is Pretium's proposed Quality Improvement Framework:

1. Pretium will commit to meet regularly with the medical service team to review the effectiveness of the health services and update the plan as necessary.
2. Regular review of the HSMP with Northern Health to ensure Pretium's commitments are being met and adaptive to changes to the NH medical service delivery capacities.
3. Regular meetings with NH to maintain an open line of communication.
4. Regular reporting of NH utilization stats and measures taken to mitigate when areas of high impact are noted.
5. An ongoing review of each patient transferred to ensure it was appropriate and minimized local impact. An immediate review should NH identify a patient transfer concern.

3.3.6 Health Service Utilization Information and Reporting

Pretium will track, on an ongoing basis, specific utilization information on the number of times on-shift contract staff or employees utilize the services of Northern Health. These indicators will be reviewed as a component of the regular meetings. Specific data collected will include:

- date and time of visit;
- nature of the visit;
- type of visit: emergency/outpatient;
- duration of the service; and
- requirement for specialist referral.

Medical Clinic

APPENDIX B. MEDICAL CLINIC

Appendix C

OPTM Roles and Responsibilities

APPENDIX C. OPTM ROLES AND RESPONSIBILITIES

ROLES AND RESPONSIBILITIES
Outbreak Prevention and Management Team (OPMT) Organizational leadership is essential in Brucejack to ensure effective outbreak prevention and control. This team is responsible for ensuring that procedures are in place for preventing outbreaks, and for directing and overseeing the management of all aspects relating to an outbreak. The OPMT team will have decision making authority for the regulation and direction regarding an outbreak within the Brucejack Project at these times. A team leader will be appointed to coordinate the meetings during an outbreak and link directly. Participation of OPMT members will include asymptomatic representatives from each major department appointed in an effort to ensure comprehensive collaboration, observation and communication during outbreak management.
Team Leader • Coordinate the meetings of the OPMT during an outbreak and ensure the team is working collaboratively • Provides timelines for reporting and implementing of control measures
Administration and Communications • Establishes communication and notification within the OPMT team and outside resources
Infection Control • Provides primary direction in outbreak pre-planning and implementation during an event (quarantine, discontinuing of group activities, etc.) to the OPMT
Occupational Health • Collaborates with Infection Control to ensure prevention, early recognition, and implementation of control strategies are in place
Environmental • Provides support to determine the source and means of spread of the agent where food or waterborne contamination may be involved
Support Services (Housekeeping/Laundry) • Assists in outbreak management by ensuring additional resources such as personnel, supplies, enhanced cleaning, etc., are available and best practices are in place

ROLES AND RESPONSIBILITIES
Foods Service • Implement additional precautions for safe food handling and common touch areas and items to prevent further spread (PPE, single server for food items, etc.)
Front Line Health Care Provider • Early recognition of outbreak, diligent use of treatment control strategies, symptom tacking and direct treatment of symptomatic patients
Northern Health Representative/External Partners • Provide input, expertise and guidance to the internal team to manage the outbreak

Appendix D

Appointee Action Chart

APPENDIX D. APPOINTEE ACTION CHART

Title	Name and Date Appointed	Role	Specific Action to be Taken	Time To Be Implemented/ Completed
Team Leader		Coordinate the meeting(s) of the OPMT during an outbreak and ensures the team is working in collaboration. Provides timelines for reporting and implementing of control measures		
Administration & Communications		Establishes communication and notification within the OPMT team and outside resources		
Infection Control		Provides primary direction in outbreak pre-planning and implementation during an event (quarantine, discontinuing of group activities, etc.) to the OPMT		
Occupational Health		Collaborates with Infection Control to ensure prevention, early recognition, and implementation of control strategies are in place		
Environmental		Provides support to determine the source and means of spread of the agent where food or waterborne contamination may be involved		
Support Services (Housekeeping/ Laundry)		Assists in outbreak management by ensuring additional resources such as personnel, supplies, enhanced cleaning, etc., are available and best practices are in place		
Foods Service		Implement additional precautions for safe food handling and common touch areas and items to prevent further spread (PPE, single server for food items)		
Front Line Health Care Provider (HCP)		Early recognition of outbreak, diligent use of treatment control strategies, symptom tacking and direct treatment of symptomatic patients

GLOSSARY AND ABBREVIATIONS

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

BC	British Columbia
BC ILMB	British Columbia Integrated Land Management Bureau
BC MFLNRO	British Columbia Ministry of Forests, Lands and Natural Resource Operations
BC MOFR	British Columbia Ministry of Forests and Range
CIS LRMP	Cassiar Iskut-Stikine Land and Resource Management Plan
FRPA	*Forest and Range Practices Act* (2002a)
IAPP	Invasive Alien Plant Program
IPMP	Integrated Pest Management Plan
ISCBC	Invasive Species Council of British Columbia
m	Metre(s)
NWIPC	Northwest Invasive Plant Council
Pretium	Pretium Resources Inc.
Project	Brucejack Mine Project
SARA	*Species at Risk Act* (2002b)

1 PURPOSE

The purpose of the Invasive Plant Management Plan is to maintain ecosystem functions by avoiding the introduction and spread of invasive plants resulting from activities during the Construction, Operations, Closure, and Post-closure phases of the proposed Brucejack Mine Project (the Project). This plan provides strategies and mitigation measures for the ongoing management of invasive plants at the Project site and is based on the guiding principles outlined by:

- Northwest Invasive Plant Council (NWIPC; 2012a);
- Invasive Species Council of British Columbia (ISCBC; 2013);
- *Pest Management Plan for Invasive Alien Plants on Provincial Crown Lands in Central and Northern British Columbia* (BC MOFR 2010b); and
- *The Invasive Alien Plant Program Reference Guide* (BC MOFR 2010a).

2 PERFORMANCE OBJECTIVES

The performance objective of the Invasive Plant Management Plan is to protect natural ecosystem composition, structure, function and resilience by preventing invasive plant establishment. The Invasive Plant Management Plan is designed to provide environmentally responsible, realistic, and operationally feasible guidance for ecosystem, soils, and vegetation management related to invasive plants.

3 SCOPE

The Invasive Plant Management Plan includes guidance on the inventory, prevention, management, and monitoring of invasive plants during the Construction, Operation, Closure, and Post-closure phases of the Project.

4 RELEVANT LEGISLATION, REGULATIONS, AND EAC CONDITIONS

4.1 RELEVANT LEGISLATION AND REGULATIONS

The following legislation, guidelines, management plans, and governing agencies are applicable or relevant to the management of invasive plant species:

- *Forest and Range Practices Act* (2002a). This act specifies that activities should not encourage the establishment or spread of invasive plants.
- *Weed Control Act* (1996). Administered by the British Columbia (BC) Ministry of Agriculture, this act imposes a duty on all land occupiers to control designated noxious plants, so they are not introduced or spread to unaffected areas.
- *Seeds Act* (1985). This act regulates the grading of seed sold, imported, and exported in Canada; requires that seed in Canada is free of prohibited noxious weeds; and ensures standards of purity are met.
- *Species at Risk Act* (SARA; 2002b). This act specifies that invasive plant species that threaten rare wildlife species' habitat must be controlled.
- BC *Integrated Pest Management Act* (Environment Canada 2003). This act regulates the use of herbicides to control weeds (invasive plants).
- *Cassiar Iskut-Stikine Land and Resource Management Plan* (CIS LRMP; BC ILMB 2000). The CIS LRMP identifies measures to be undertaken in the short- and long-term to control existing alien plants and to monitor and prevent the introduction of other alien species.
- *Pest Management Plan for Invasive Alien Plants on Provincial Crown Lands in Central and Northern British Columbia* (BC MOFR 2010b). This plan, prepared in association with the BC Ministries of Environment, Agriculture and Lands, and Transportation and Infrastructure, provides:

  > *…the ability to meet obligations for invasive plant management as outlined in the* Weed Control Act *(1996) and the* Forest and Range Practices Act *(2002a) and facilitates the Government's partnerships in invasive plant management as outlined in the invasive plant management strategies developed by the NWIPC and the Northeast Invasive Plant Committee. It is developed in accordance with the* Integrated Pest Management Act *(Environment Canada 2003) and accompanying regulations* (BC MOFR 2010b).

- *The Invasive Alien Plant Program Reference Guide* (BC MOFR 2010a). A resource manual for all agencies and partners involved in invasive plant management in BC.

- ISCBC. This registered charity has a primary goal of educating the public and professionals about invasive species and their risk to ecosystems and economies. Relevant outreach materials include a variety of brochures, pamphlets, and booklets, including the T.I.P.S. series.
- NWIPC. This group comprises agencies, organizations, and individuals, and identifies plant species of regional significance or concern. Planning and strategy documents available through the council include the *NWIPC 2014 Plan and Profile* (NWIPC 2013), and the *Invasive Plant Strategy for British Columbia* (Invasive Plant Council of British Columbia).

4.2 RELEVANT EAC CONDITIONS

Pretium was granted an Environmental Assessment Certificate (#M15-01) on March 26, 2015 that included a series of conditions. This management plan fulfills Condition #2, in relation to a Component Plan for invasive plant management, presented within Schedule B of the Certificate and copied below.

> *Condition 2*
>
> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*
> - *Effects mitigation measures;*
> - *Monitoring programs;*
> - *Monitoring schedules; and*
> - *Reporting requirements.*
>
> *The Holder must consult with the Nisga'a Lisims Government (NLG), Tahltan and Tsetsaut / Skii km Lax Ha Nation (TSKLH) on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.*
>
> *The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."*

5 ENVIRONMENTAL PROTECTION AND MANAGEMENT

5.1 MITIGATION MEASURES AND BEST MANAGEMENT PRACTICES

5.1.1 General Measures

An ecology-based approach to vegetation and soil management will be used to effectively prevent the introduction and spread of invasive plants related to the Project. Ecosystems are complex interactions of abiotic and biotic components that result in unique species composition, structure, and functions. Reducing effects to these ecological processes and ecosystem integrity will reduce the likelihood of invasive plant establishment and spread. The following measures will reduce impacts to ecosystem integrity.

- Minimizing clearing dimensions during Construction phase activities (including pullouts and upgrades to the Brucejack Access Road) as invasive species thrive in recently disturbed areas.
- Minimizing soil degradation, i.e., erosion, by adhering to the Reclamation Plan and the Surface Erosion Prevention and Sediment Control Management Plan. Specifically, soil will be salvaged during appropriate weather conditions, transported to stockpiles within appropriate time frames of salvage, and managed for surface erosion prevention.
- Vehicle inspections for target invasive plants at designated Project checkpoints such as the entry to the Brucejack Access Road. Major Project vehicles (bulldozers, mine trucks, excavators, etc.) transported from other areas will be visually inspected; target species will be removed (if present) and disposed of properly. Where required by the inspection, vehicles will be properly washed at an appropriate location where the removal of dirt or plants can be effectively achieved without harm to natural ecosystems.
- Seed mixes will be sourced from reputable dealers, complete with a Certificate of Analysis for each species included in the mix.
- Detection and eradication of invasive plants will be managed, through an effective early detection system that includes an inventory, control, and monitoring program (detailed in the following sections).
- Follow-up monitoring of controlled sites will occur to evaluate efficacy of treatment and requirements for follow-up treatment.

The Principal, Environment is responsible for implementing the Invasive Plants Management Plan (IPMP) and will look to resources available through the ISCBC and the NWIPC for training, orientation, or support materials. Invasive species references currently available for use include:

- *Best Practices for Managing Invasive Plants Along Roadsides: A Pocket Guide for British Columbia's Maintenance Contractors* (ISCBC 2013);

- ISCBC website (T.I.P.S. brochures): identification of key plant species, with pictures and brief habitat and management information (ISCBC 2013);
- *Forest and Range Practices Act* (FRPA; 2002a) and *Invasive Plants Identification Field Guide* (Province of BC 2008): developed to help identify the FRPA-listed invasive plants throughout BC; also provides basic habitat and impact information;
- *Field Guide to Noxious and Other Selected Weeds of British Columbia* (Cranston, Ralph, and Wikeem 2002); and
- *A Guide to Weeds in British Columbia* (BC Ministry of Agriculture 2002).

As appropriate, additional training in existing provincial legislation, available data management tools, and reporting programs related to invasive plant management will be provided to the Project's Principal, Environment/Environmental Superintendent/Environmental Coordinator.

5.1.2 Specific Measures

The primary focus of the Invasive Plants Management Plan is to avoid the introduction of invasive plants. Pretium will work with the Northwest Invasive Plant Council (and/or the Invasive Plant Council, depending on availability) to determine the level of screening required in order to avoid the introduction of invasive plants. Pretium will also work with the NWIPC to identify high-priority species and site-specific best treatment options for invasive plant occurrences, in the event that they occur. The following section outlines prevention and treatment options for management of introduced invasive plants.

5.1.2.1 Prevention

Preventing the introduction of invasive plant species is typically the most efficient and cost effective approach to invasive plant management (Clark 2003; Polster 2005). Averting the movement of propagules into unaffected areas and creating or maintaining environments that do not favour the establishment of invasive plants are basic, effective approaches to minimize potential introduction. Specific preventative measures will include:

- Minimizing ground disturbance, where possible;
- Maintaining a healthy vegetation cover in disturbed/high traffic areas;
- Purchasing reclamation seed mixes from reputable dealers, complete with Certificates of Analysis for all species that have gone into the mix.
- Equipment from off site will be required to be washed prior to transport to site. Equipment from off-site will be screened at security to ensure it has been washed prior to arrival on site and if not will be washed at a designated wash station or transported offsite to be washed.
- Vehicle wash stations will be established according to the best management practices for vehicle wash stations.
- Waste material from wash stations will be disposed of according to regional best management practices for the disposal of invasive plants.

5.1.2.2 Pre-Construction Survey

A roadside survey for invasive species will be conducted along the Brucejack Access Road prior to the start of Construction. The survey will focus initially on areas that are planned for upgrading. The pre-Construction survey will ensure that existing invasive species in these locations are not reported as Project-caused and will enable spot treatments to minimize potential for further spread. Pre-construction surveys will occur early in the growing season (late June to early July).

Inventory surveys for the NWIPC priority species will be conducted every two years for the life of the Project. The surveys will target roadsides (particularly at entry points to the site), recently disturbed areas, lay-down areas, and forest edges (extending up to 100 metres [m] into the forest, if invasive species are identified adjacent to forest stands). The surveys will be conducted early in the growing season (July) to provide an opportunity to undertake control measures within the same season and prior to seed dispersal.

5.1.2.3 Treatment and Control

If invasive plants are identified on site, the NWIPC or an appropriate authority will be consulted to determine if control or monitoring is the optimal approach. If control is recommended or required, appropriate treatment options and timing will be identified. The appropriate treatment for invasive plants depends on the species involved, site conditions, and the size of infestation. Invasive plant species vary in their aggressiveness and ability to dominate a site. Some are inherently easier to eradicate than others. Larger infestations are also more difficult to control than smaller ones. The NWIPC ranks species and site conditions and provides a guide for determining if, when, and how to control different invasive plants in northwest BC (NWIPC 2012b).

Potential treatment options include mechanical, biological, and chemical methods. Mechanical control adopts physical means of removal, such as pulling by hand. Biological control uses living organisms, such as insects, to control invasive plants. Chemical control uses herbicides to reduce and eradicate invasive plants.

5.1.2.3.1 Chemical Control

If herbicide use is recommended, the *Handbook for Pesticide Applicators and Dispensers* (BC MOE 2005) provides guidance on application methods and includes measures to protect waterbodies and riparian areas. To the extent feasible, approved herbicides will be applied using spot-control methods rather than broad spraying techniques to minimize adverse effects to the surrounding environment.

Approved herbicides will be used on sites where the elimination or containment of invasive plant species can be best achieved through chemical control (BC MOFR 2007). Herbicide application will be performed in compliance with BC's *Integrated Pest Management Act* (Environment Canada 2003). Applications will be documented using the BC Ministry of Forests, Lands and Natural Resource Operations (BC MFLNRO) *Invasive Plant Chemical and Mechanical Treatment Record* (BC MOFR 2010a). Herbicides should not be used under the following conditions:

- site is within a Pesticide Free Zone (e.g., near water sources, see *Handbook for Pesticide Applicators and Dispensers* [BC MOE 2005]);
- site conditions exclude the use of herbicide treatment (e.g., coarse textured soils); and
- benefit of herbicide application is negligible.

5.1.2.3.2 Mechanical Control

Where herbicides are not permitted or practical, mechanical control methods, such as seeding, hand pulling and cutting, mowing, and burning will be used. Mechanical treatments will be documented using the *Invasive Plant Chemical and Mechanical Treatment Record* (BC MOFR 2010a).

5.1.2.3.3 Biological Control

Biological control uses living organisms to control pest populations. Effective bio-control reduces the competitive ability of invasive plants and allows native species to colonize affected areas (Harris 2002). Biological control agents are suitable for use in Pesticide Free Zones or for extensive infestations where mechanical or chemical control would not be effective (BC MOFR 2007). Sites considered for biological control will be assessed according to the *Invasive Alien Plant Program Reference Guide* (BC MOFR 2010a). Biological control treatments will be documented using the Biological Control Agent Release and Monitoring Form and the Photoplot Record Form (BC MOFR 2010a). In many cases biological control is most effective when combined with other control methods in an IPMP.

Further details regarding control methods, including legislation and site-specific use of herbicides (from storage and transport to application and disposal), is available within the *Pest Management Plan for Invasive Alien Plants on Provincial Crown Lands in Central and Northern British Columbia* (BC MOFR 2010b).

6 ENVIRONMENTAL MONITORING

The aim of the Monitoring Program is to evaluate and document if the IPMP is successfully preventing the introduction and spread of invasive plants resulting from Construction, Operation, Closure, and Post-closure activities.

6.1 PERFORMANCE MONITORING

Survey monitoring will follow the methodology outlined in the Invasive Alien Plant Program (IAPP): Reference Guide, Part I (BC MFLNRO 2014). The IAPP forms, will be used for inventory, monitoring and treatment records so that the data are collected as required by the provincial IAPP database. A trained observer will conduct surveys and monitoring. If invasive plants are observed, information will be collected to help determine appropriate response actions (i.e., ecosystem type, species present, soil texture, species density and distribution, proximity to water, structure, elevation, slope, and any other characteristics that may contribute to the way in which the site is managed). Biennial surveys will be conducted to determine the effectiveness of the treatment and control measures. The results will determine if follow up monitoring in the same year is required to ensure that the stated objectives are being achieved and to determine if future monitoring is required. This information will be collected using a monitoring form designed specifically for the Project.

6.2 WORK PLANNING AND SCHEDULE

The Principal, Environment (or designated qualified staff) will communicate the performance objectives and actions to Project personnel who have the potential to directly or indirectly influence vegetation, soils, or ecosystems on site during the Construction, Operation, Closure, and Post-closure activities, particularly those involved in ground disturbance works. Communication of this information and sign-off by individuals will be recorded, and tracked as a key performance indicator.

Monitoring will occur biennially (between June and September). The timing of the surveys will be determined by the Principal, Environment (or designated qualified personnel) based on plant phenology (e.g., timing of biological activities such as flowering, propagation, and seed dispersion). If herbicide treatment is required, it will be applied before the flowering stage (early spring) when plants are most susceptible (BC MOE 2005). A minimum of two weeks between treatments will be observed (BC MOFR 2010b). Treatments applied after flowering (autumn) will involve the removal and disposal of seed heads to an appropriate waste disposal location.

7 REPORTING AND RECORDING

7.1 REPORTING

Biennial reporting of the environmental monitoring inspection reports will include a description of the following:

- Records of inventory, treatment, monitoring, and reclamation activities. A photographic record of locations surveyed for invasive species, as well as a copy of all data forms filled in for that year, will be included in the report.
- Quality assurance and quality control methods employed to ensure data accuracy and assessments of the effectiveness of the inventory, treatment, and monitoring for invasive species control and actions taken to improve the program if relevant.
- Identification of any emerging negative environmental trends likely attributable to the Project.

Invasive species occurrences will be entered into the "Report-a-Weed" Program, a provincial online mapping and reporting tool associated with the IAPP Application, within the same year as the survey. Once the data (report) are entered, they are automatically compared to known locations of the reported species in the IAPP Application, and are then sent directly to a provincial Invasive Plant Specialist for the region.

7.2 RECORD KEEPING / TRACKING

7.2.1 Monitoring Results

Pretium will keep records and results of surveys and monitoring conducted. Data will be entered in a format and program that will allow for comparison between years. Monitoring data will be stored for the life of mine.

7.2.2 Continuous Improvement, Follow-up, and Adaptive Management

Results from the surveys and monitoring programs will be reviewed to determine if any trends are evident and if target criteria are being met. The need for any corrective actions to avoid the introduction and spread of invasive plant species will be determined on a case-by-case basis. Indications of the need for corrective action or additional control measures may include:

- monitoring data showing an increasing negative trend (e.g., increase in the presence, abundance, distribution or type of invasive plants).

The monitoring data will also be used to provide feedback to modify any management and monitoring procedures, as required. Measures described in the IPMP apply to all components for the life of the Project, unless otherwise indicated. Components of the IPMP may need to be revised over the life of the Project, based on regulatory changes and/or technological advances. Any modifications made to the overall Plan will be communicated to regulatory authorities where applicable.

SOP	Standard Operating Procedure
WRTSF	Waste Rock and Tailings Storage Facility
WTP	Water Treatment Plant
T-C	Total Carbon
T-S	Total Sulphur

1 PURPOSE

The purpose of this Metal Leaching and Acid Rock Drainage (ML/ARD) Management Plan is to provide guidance and procedures for Pretium Resources Inc. (Pretium), a member of the Newcrest Group of companies, on how to avoid, minimize and mitigate potential ML/ARD at the Brucejack Mine. This includes:

1. Proper management, including excavation, handling, and disposal, of all bedrock that may be disturbed as a consequence of the development of the Brucejack Mine;
2. Management of rock surfaces that are newly exposed during the course of mine development; and
3. Management of water that comes into contact with disturbed and exposed potentially acid-generating (PAG) bedrock.

The primary objective of the plan is to avoid ML/ARD to the greatest possible extent and mitigate potential effects where bedrock disturbance is unavoidable. This document will be updated as appropriate during mine life, as additional relevant information becomes available.

Planned and potential bedrock disturbance and exposure has been assessed for all mine components. The main potential sources of ML/ARD associated with the Brucejack Mine include:

- Excavated rock and newly exposed rock surfaces resulting from mine development;
- Surface runoff that comes into contact with the newly exposed rock surfaces and excavated rock, both at the Mine Site Area and elsewhere;
- Rock that is excavated and newly exposed during mine Operations, including underground mine waste rock, and underground rock surface exposures;
- Cemented paste backfill; and
- Sludge from the Water Treatment Plant (WTP).

During Operations, the Brucejack Mine will generate approximately 6.5 Mt of waste rock from the underground mine; 17.5 Mt of tailings; and approximately 150 kt of sludge. In addition, some minor disturbance and/or exposure of rock may be required for Brucejack Access Road improvements and maintenance.

This ML/ARD Management Plan describes ML/ARD prevention and mitigation strategies for the Brucejack Mine, as well as contingency plans that will be implemented if and as needed. It also describes planned monitoring, reporting, and record keeping procedures.

2 PERFORMANCE OBJECTIVES

The general performance objectives with respect to ML/ARD are to:

1. Avoid and minimize bedrock disturbance;
2. Minimize the volume of disturbed PAG bedrock and rock surfaces that are exposed to oxidation, as well as the duration of sub-aerial storage of PAG materials;
3. Minimize the volume, and manage surface water that comes into contact with disturbed and exposed bedrock with potential for ML/ARD; and
4. Confirm and document geochemical characteristics and quantities of disturbed and exposed rock.

Specific measures to achieve these general objectives are described in more detail below.

The performance objectives are and will continue to be achieved through two principal strategies. The first strategy is and has been to address the general performance objectives noted above through design mitigation. The second is and has been to manage the construction and development of the mine in a systematic way, as part of an overall environmental management system (EMS). Both design mitigation and components of the overall EMS related to ML/ARD are described in section 5 below.

The mine has been designed such that no subaerial waste rock or tailings disposal facilities are required on surface. This is a major advantage and simplifies the ML/ARD Management Plan for the mine. More specifically, key waste management commitments are that:

- No waste rock has or will be disposed subaerially. All waste rock from the mine site has and will continue to be deposited in either the Waste Rock and Tailings Storage Facility (WRTSF) or in the deeper levels of the underground mine that will remain flooded post-closure. Both of these deposition methods allow a substantial water cover that is expected to be stable over the very long term.
- Most surface water that contacts exposed PAG rock surfaces on the Mine Site, and all water that is removed from underground workings, is and will continue to be treated to reduce suspended solids and metals to specified concentrations prior to discharge to the WRTSF (either immediately or ultimately).
- All tailings generated as a result of ore processing will be disposed either in the WRTSF, or as cemented paste backfill in underground workings, most of which will also be deposited below the final water level.

There is no segregation of PAG and non-potentially acid generating (NPAG) waste rock. Only a small proportion of the total volume of rock that has or will be disturbed or exposed at the Mine Site and within the underground mine is expected to be NPAG (between 10 and 15% based on the results of geochemical assessment undertaken to date). Pretium has committed to managing the mine such that no waste rock will be disposed subaerially, including both PAG and NPAG rock. Consequently, segregation is not required. This further simplifies the mine plan and ML/ARD Management Plan for the mine.

3 SCOPE

This ML/ARD Management Plan applies to any and all areas where any bedrock disturbance may occur as a result of development and operation of the Brucejack Mine, including the Mine Site Area (area within the Mining Lease and, in terms of bedrock excavation, confined to the headwaters of Brucejack Creek), as well as the facilities situated in the Nass watershed, including planned improvements to the lower Brucejack Access Road.

The ML/ARD Management Plan applies throughout Operations and Closure. The plan also extends into the Post-closure phase of the mine for as long as monitoring related to ML/ARD management is warranted.

The volumes of bedrock disturbance and surface areas of newly exposed rock that fall within the scope of this plan are summarized in Table 3-1 below.

Table 3-1. Summary of Volumes of Bedrock Disturbance and Areas of Bedrock Exposure Associated with Waste Rock Excavation at the Brucejack Mine

Facility	Volume of Rock to be Excavated (Mm^3)	Surface Area of Newly Exposed Rock (ha)
Mine Site	0.53	17
Underground Mine	2.32	463
Brucejack Access Road	To Be Determined*	To Be Determined*

** Excavation planning, including to minimize ML/ARD potential, to be completed as part of engineering design.*

The quarry site on the south side of the WRTSF is comprised of rock that is NPAG. This was a critical requirement when potential quarry sites were identified and evaluated.

Confirmation of geochemical characteristics and volume of rock disturbed and exposed is an important component of this ML/ARD Management Plan.

4 RELEVANT LEGISLATION AND REGULATIONS

This ML/ARD Management Plan for the Brucejack Mine has been developed in accordance with applicable legislation, regulations and guidelines. Development of a formal ML/ARD Management Plan for mining projects is required by Section 10.1.16 of the *Health, Safety and Reclamation Code for Mines in British Columbia* (BC EMLI 2022). The Code requires that ML/ARD Plans be prepared with reference to the *Guidelines for Metal Leaching and Acid Rock Drainage at Mine Sites in British Columbia* (Price and Errington 1998). The Guidelines require that prediction, and, where necessary, prevention and mitigation be undertaken for both solid mine waste and contact water.

Undertaking work that results in generation of ML/ARD is not strictly prohibited in British Columbia, although appropriate management to prevent, minimize and mitigate such activity is a requirement of the BC *Mines Act* (1996) and the above-noted Code. At the Federal level, release of ML/ARD products into fish-bearing waters may constitute deposition of a deleterious substance, an offence as defined in section 36 (3) of the Federal *Fisheries Act* (1985). Discharge of mine effluent is regulated by the Metal and Diamond Mining Effluent Regulations (MDMER; SOR/2002-222), issued pursuant to sections 34(2), 36(5) and 38(9) of the *Fisheries Act* (1985).

In addition, discharge of waste from a mine (a prescribed industry or activity) without proper authorization is an offence pursuant to section 120 (3) of the BC *Environmental Management Act* (2003). The BC Ministry of Environment and Climate Change Strategy administers this Act, and has published *Guidance on Applications for Permits under the Environmental Management Act* (BC MOE 2010). Field sampling must be undertaken in accordance with the *British Columbia Field Sampling Manual For Continuous Monitoring and the Collection of Air, Air-Emission, Water, Wastewater, Soil, Sediment and Biological Samples* (BC MWLAP 2003), and laboratory analyses must be completed in accordance with the *British Columbia Laboratory Manual* (2013 Approval holder Edition; BC MOE 2013). The BC *Spill Reporting Regulation (*BC Reg. 263/90), issued pursuant to the *Environmental Management Act* (2003), establishes reporting requirements for spills of substances, both as defined in the *Schedule – Reportable Levels for Certain Substances* included in the Regulation.

A number of other guidelines and reports have been published that document best management practices (BMPs) in ML/ARD prediction, prevention and mitigation. These include papers published by the Mine Environment Neutral Drainage (MEND) Program, the Canadian partner in the International Network for Acid Prevention (INAP), and the Global Acid Rock Drainage (GARD) Guide (INAP 2009).

5 ENVIRONMENTAL PROTECTION AND MANAGEMENT

Prevention, mitigation and management of ML/ARD are important components of environmental protection and management for the Brucejack Mine. The overarching objective is to avoid and minimize oxidation of sulphide minerals at the mine to the greatest possible extent.

The majority of the rock at the Mine Site contains relatively high concentrations of sulphide minerals, and variable proportions of carbonate minerals (which neutralize ML/ARD), with the result that the majority of the bedrock at Brucejack Mine is characterized as PAG, as noted in section 2 above.

This section describes how potential ML/ARD has and will be prevented, mitigated and managed through the life of the mine. Prevention, mitigation and BMPs for each component of the mine that may require disturbance or exposure of bedrock is set out below.

5.1 NPAG Quarry Development

The km 72 NPAG Quarry site has been operational since autumn 2015 and was selected specifically because it is reasonably accessible, proximal to the Mine Site, and because the rock in this location was and has continued to be characterized as NPAG. Bedrock at the km 72 NPAG Quarry site has low sulphide content, high neutralization potential, and overall has high net neutralization potential ratio (NPR) values. However, even rock that is not likely to produce ARD may still pose some metal leaching (ML) risk if metals are present that may be mobilized in circumneutral pH conditions.

Section 6 outlines confirmatory sampling to verify that rock sourced from the quarry is, in fact, NPAG, and that neutral metal leaching is not likely to occur. It also describes conditions that will trigger contingency actions and the nature of the contingency.

5.2 Mine Site Excavation

The plant, including the mill for processing ore, WTP, mine camp and all associated facilities, has been constructed in the same area where the exploration camp was located. The underlying bedrock has variable sulphide content and neutralization potential and has been characterized and confirmed as PAG. There is generally some neutralization potential available in the bedrock in this area, and time to ARD onset is expected to range from a decade or more to much longer time periods.

A concerted effort was made to minimize the footprint of the Mine Site; the total surface development footprint of the Mine Site is only approximately 38 ha.

Given the prevalence of PAG rock within the Mine Site area, it was recognized during planning and design that minimizing bedrock disturbance is a key mitigation strategy. The Mine Site has a number of advantages, including proximity to the mineralized zones targeted for mining (minimizing disturbance and distance between the underground mine and Mine Site), the fact that the site is already disturbed (minimizing incursion into adjacent areas that are not already disturbed), and proximity to the lake, where both waste rock and tailings are and will be deposited (minimizing disturbance and distance between the Mine Site and waste deposition areas).

Pads within the Mine Site have been levelled to provide a safe and efficient area for mining operations. PAG waste rock excavated from the Mine Site area was deposited in the WRTSF without delay. If future excavation is required, then the rate of deposition will be similar to the rate of excavation (drilling and blasting), such that only a small, temporary 'surge' pile of waste rock will be stored sub-aerially, as the material is moved onto (subaqueous) deposition slopes of the south shore of the WRTSF. Material will normally be exposed on surface for days or weeks, although residence time could be extended if necessary to address safety concerns associated with operating heavy machinery on newly placed fill (these considerations are discussed in the Operation, Maintenance and Surveillance Manual: Brucejack Mine Subaqueous Waste Rock and Tailings Deposition), and/or if necessary to minimize impacts to water quality at the outlet of the WRTSF (monitoring site BJ 3.10).

5.3 UNDERGROUND MINE

A total of approximately 5.3 Mt (1.9M m^3) of waste rock will be excavated underground during mine life. Of this, between 35 and 100% will be deposited in the WRTSF, with the remainder (up to 65%) to be backfilled in underground workings. It is expected that waste rock will be generated at a relatively steady rate of roughly 1000 t (374 m^3) per day through life of mine (and up to 3800 tonnes of ore will be mined per day, on average).

Rock that will be disturbed in the underground mine has been classified into six units, all of which are considered to be PAG. The median NPR values for the units range from 0.31 for the 'Fragmental' unit to 1.8 for the 'Office P1' unit. The results of ABA tests are summarized by lithological unit in Table 5.3-1 below. All units have some neutralization potential; time to onset of ML/ARD is generally expected to be delayed for at least a decade or more from the time of exposure, even for the units with the highest ML/ARD potential and is generally expected to be much longer.

Table 5.3-1. Summary of Underground Mine Waste Rock – Median ABA Results by Lithological Unit

Lithological Unit	TIC (%)	Total S (%)	AP (kg $CaCO_3$/t)	$CaCO_3$ NP (kg $CaCO_3$/t)	Carbonate NPR
Conglomerate	0.52	3.2	89	43	0.42
Fragmental	0.42	3.9	113	35	0.31
Office P1	1.1	1.9	52	92	1.8
Office P2	0.99	3.9	111	83	0.70
Silicified Cap	0.40	1.8	50	33	0.49
VSF	0.71	3.0	84	59	0.66

A summary of the total mass of rock to be disturbed, along with the maximum portion to be backfilled is provided in Table 5.3-2 below. The surface area and relative proportion of the six units that will be exposed underground is summarized in Table 5.3-3. Pretium will continue to map and record the underground lithologies as development proceeds. The geologic block model developed for the Brucejack Mine will be updated annually using information from both drilling and underground mapping.

Table 5.3-2. Summary of Underground Mine Waste Rock - Mass by Lithology

Lithological Unit	Total UG waste disturbed over LOM* (t)	Total UG waste disturbed over LOM (relative %)	Maximum Backfilled UG waste (t)	Maximum Backfilled UG waste (relative %)
Conglomerate	383,428	7.3	164,431	4.8
Fragmental	1,186,126	22.6	695,721	20.4
Office P1	933,257	17.6	739,507	21.6
Office P2	29,154	0.5	29,154	0.9
Silicified Cap	79,506	1.5	33,262	1.0
VSF	2,689,519	50.5	1,754,484	51.4
TOTAL	5,300,991	100.0	3,416,559	100.0

*Between 35 and 100% of the total UG waste rock disturbed will be placed in the WRTSF.

Table 5.3-3. Summary of Underground Mine Waste Rock – Surface Area by Lithology

Lithological Unit	Pre-Construction (m^2)	Construction (m^2)	Operations (m^2)	Total (m^2)	Total (relative %)
VSF	75,188	69,609	823,933	968,730	48
Fragmental	31,790	98,559	399,616	529,965	26
Conglomerate	-	64,403	126,597	191,000	9
Silicified Cap	-	4,715	26,168	30,883	1.5
Office P1	2,291	6,883	287,583	296,757	15
Office P2	216	-	8,811	9,027	0.45
Total	109,485	244,169	1,672,708	2,026,362	

All waste rock that is excavated underground has and will continue to either be deposited in the WRTSF or backfilled into underground workings below the final water level to achieve subaqueous disposal, in accordance with this ML/ARD Management Plan. Pretium recognizes that there is uncertainty with respect to the final water table in the underground workings. Water table predictions will be refined using data from groundwater monitoring wells, dewatering pump records and through further refinement of the predictive groundwater model as mining advances. Upper workings will not be backfilled with waste rock until the end of mine life and only to an elevation to maintain a minimum 10m water cover above waste rock. As a contingency measure, waste rock originally designated to remain underground late in mine life will be deposited into the lake instead, if necessary. Plans for waste rock deposition underground and in the WRTSF, estimated final water table, and associated water quality impacts will be updated on a regular basis, and reported to the B.C. Ministry of Energy, Mines and Petroleum Resources, every five years as part of required mine and reclamation plan updates.

5.4 TAILINGS AND SLUDGE

It is expected that a total of 17.4 Mt of thickened tailings will be generated through life of mine. Of this, up to approximately 11.9 Mt, or 68% will be deposited in the WRTSF with the remainder to be deposited underground in cemented paste backfill. It is expected that tailings will be generated at a

steady rate of approximately 3800 tonnes per day, on average. Sludge generated from the WTP, amounting to approximately 7 kt, will be co-deposited with tailings in the WRTSF.

Tailings will be deposited either as thickened tailings discharged to the WRTSF or in cemented paste backfill in underground voids. An overview of the anticipated physical and chemical characteristics of materials is provided below.

5.4.1 Thickened Tailings Deposition in the WRTSF

The discharge of tailings to the bottom of the WRTSF is expected to provide an effective means to stabilize these materials both physically and chemically. Tailings contain a minor quantity of oxidized minerals (e.g., ferric iron oxide or hydroxide) that are not expected to undergo dissolution when placed in a circumneutral pH and anoxic environment.

The pH of normal lake bottom water and porewater near the sediment-water interface is expected to remain circumneutral. Because of the alkaline nature of tailings, porewater of tailings deposited on and near the lake floor is expected to be circumneutral to alkaline. Under such pH conditions, metal oxides or hydroxides will generally be stable. Metal remobilization from tailings on the bottom of the WRTSF due to pH change is therefore considered unlikely.

On the lake floor, the dissolved oxygen content is generally low, but oxic conditions are expected to be sustained, except in porewater below the tailings-water interface where suboxic conditions may develop. The depths at which suboxic conditions occur, however, will depend on the sulphide content of tailings and the balance of organic matter and dissolved oxygen supplies from the water column to tailings and porewater. Given the high deposition rate of the sulphide-depleted tailings material and the limited organic matter supply from the water column, suboxic conditions are only expected to develop in porewater some distance below the tailings-water interface. In the suboxic zones, reductive dissolution of the oxidized minerals in tailings is expected to occur, and consequently, metals associated with the oxidized minerals will be remobilized to porewater. However, given the low abundances of the oxidized minerals identified in the ore and tailings materials (i.e., ≤ 0.2%), such metal remobilization would be minor.

Furthermore, the main pathway for the remobilized metals in porewater to enter the water column is through molecular diffusion, which is expected to be a slow process given the low metal concentration gradients in porewater. In addition, oxidation of dissolved iron and manganese by oxygen in porewater above the suboxic zone and trace metal co-precipitation will further reduce metal fluxes from tailings porewater to the water column. Given the low fluxes at the tailings-water interface, the deep water depth (≈40m at the top of the ultimate tailings deposition mass) and relatively short residence time of water in the lake (estimated to be approximately 18 months), diffusive fluxes from the submerged tailings are not expected to adversely affect water quality at monitoring site BJ 3.10. In the long term, following the cessation of tailings discharge, the progressive accumulation of natural sediments will serve to physically and chemically isolate the tailings materials from the water column and further reduce potential diffusive fluxes.

5.4.2 Tailings in Cemented Paste Backfill

The placement of tailings in the underground in cemented paste backfill, plus flooding upon mine closure, is expected to provide an effective means to reduce ML/ARD formation. Because the tailings

are expected to be NPAG and NP will be afforded by the paste cement, no ARD is expected to be generated from the backfilled tailings and paste materials. It is possible, however, that some metals may leach from cemented paste backfill at neutral or alkaline pH (neutral metal leaching) in the short-term. In particular, geochemical test work indicates that hexavalent chromium may leach from cement in paste when it is hydrated and for some time thereafter. A Chromium Management Plan has been developed for the mine and includes a monitoring program for underground mine water, the WRTSF and paste backfill cement. A trigger threshold level is defined for D-Cr in WTP influent and at BJ 3.10 such that control measures can be implemented as necessary. Pretium's preferred Cr mitigation strategy, should it be required, is the addition of ferrous sulphate to the paste backfill within the paste plant prior to placement underground; however, addition of ferrous sulphate to sump water is an alternate mitigation option that could be implemented.

5.4.3 Sludge

Sludge from the WTP is co-deposited with tailings in the WRTSF. Sludge is mixed with the tailings in the Tailings Disposal Surge Tank prior to subaqueous deposition in the WRTSF via the tailings pipeline. As described for tailings (Section 5.4.1), deposition of sludge with tailings at the bottom of the WRTSF is expected to provide an effective means to stabilize these materials both physically and chemically.

Static and kinetic test programs were developed to assess the potential impact of sludge deposition on BJ 3.10 water quality. Sequential extraction results on WTP sludge shows that metals are not easily soluble or mobilized under reducing conditions. Kinetic tests comprised of saturated columns with appropriate tailings and sludge mixtures were used to derive conservative flux estimates for parameters of interest. The results show insignificant changes to predicted BJ 3.10 water quality. The full set of results are reported in "Brucejack Gold Mine: Assessment of Long-term Sludge Stability for In-Lake and Underground Deposition" (Lorax, 2016).

5.5 BRUCEJACK ACCESS ROAD

The existing Brucejack Access Road, which provides access to the Mine Site from Highway 37, will require some upgrades and improvements, as well as ongoing maintenance. Engineering design for road improvements will avoid disturbance of PAG rock to the maximum extent possible while remaining within safe parameters for road usage. This ML/ARD Management Plan will be followed to develop plans for environmental protection as appropriate.

6 ML/ARD VERIFICATION AND MONITORING

Environmental monitoring required in the context of this ML/ARD Management Plan is focused on verifying the initial geochemical characterization of bedrock that will be disturbed and exposed, and the quality of contact water, as well as confirming the results of the geochemical assessment, and to verify that the ML/ARD Management Plan is proving to be effective. Sampling and analysis of Mine Site Area contact water from various sources is and will continue to be used to verify source terms used in the water quality model for the Brucejack Mine, and associated water quality predictions. This information will also be used to evaluate the potential onset of ML/ARD and the magnitude of any environmental effects.

6.1 NPAG QUARRY

6.1.1 Confirmatory Sampling

Confirming that rock to be excavated from the NPAG Quarry is NPAG was and remains essential given that the rock has and will continue to be widely distributed throughout the mine site for use in construction of building foundations, roads and other infrastructure. At least one composite sample comprising a minimum of 1 kg of rock that is representative of every 1,000 m^3 of rock to be excavated from the NPAG Quarry was obtained during the early stages of quarry development to confirm that rock obtained from the quarry is, in fact, NPAG.

The initial ML/ARD Management Plan allowed for sampling intensity to be reduced if initial sampling indicated that (i) the rock to be excavated from the quarry is consistently NPAG, and (ii) the lithology is consistent to the perimeter of the quarry, with lateral distance between samples of not more than 100m. In this case, the remaining 'infill' sampling intensity could be reduced to not less than one composite sample per 10,000 m^3 of rock, at the discretion, and under the direction of, a qualified professional. This reduction in sampling intensity was done when the above criteria were met.

In addition, material from the NPAG Quarry will continue to be evaluated through sampling and analysis of on-site field bins constructed of representative rock from the NPAG Quarry site. These have been constructed to assess the geochemical behaviour of this rock in the conditions that actually occur at the site, including climatic conditions such as precipitation and freeze-thaw cycles. Field bins are discussed in more detail in Section 6.9 below.

6.1.2 NPAG Quarry Runoff

Based on sampling and analysis completed to date, bedrock at the NPAG Quarry site has high neutralization potential, low sulphide content and high NPR values. Materials that are not likely to produce ARD conditions may still pose some risk, as some metals are mobile in neutral pH conditions. Therefore, runoff or seepage from the NPAG Quarry site will be sampled at least twice during every summer season when surface runoff is present (given that surface water will occur as ice and snow from mid-autumn until late spring or early summer) to identify any neutral metal leaching that may occur. NPAG Quarry runoff quality will be monitored throughout mine life.

Water quality sampling and analysis are focused on sulphate and dissolved metal concentrations. Sulphate is a good indicator of the onset of ML/ARD, and dissolved metal concentrations provide a reliable indication of neutral metal leaching, should it occur. Total suspended solids (TSS) and associated total metals in runoff from the NPAG Quarry, in contrast, may exceed FWAL Guidelines from time to time, due to natural variation associated with spring snowmelt and during major precipitation events in spring, summer and early autumn. These events are considered to be normal for the WRTSF catchment and will not trigger additional monitoring procedures.

6.1.3 Triggers and Contingency

Any rock samples for which analysis indicates that the NPR is less than 2 (indicating that the rock may be PAG) will trigger contingency measures. In this case, NPAG Quarry operations will be suspended within 50 m of the location of the sample of concern while a geologic and geochemical assessment of rock exposed at the NPAG Quarry in the general vicinity of the PAG rock is undertaken.

The purpose of the assessment will be to re-evaluate the geochemical nature of the rock to be quarried. If the PAG sample is considered to be an anomaly, a minimum of three additional composite samples will be obtained from the same area and analyzed. If analyses of all three (or more) samples indicate that the surrounding rock is NPAG, quarry operations will be resumed. If additional samples are deemed to be PAG, the suspension will remain in force, while additional geologic and geochemical characterization is undertaken and/or alternate sources of NPAG rock are identified. Excavation in other parts of the NPAG Quarry may continue while the analyses and assessments described above are carried out.

Should sulphate in NPAG Quarry runoff exceed 350 mg/L, and dissolved metal concentrations exceed the applicable BC Guidelines for the protection of aquatic life, the Environmental Principle will seek the advice of qualified professionals to assess whether or not mitigation of neutral metal leaching is necessary, and if so, what measures should be implemented.

6.2 MINE SITE

6.2.1 Confirmatory Sampling

Confirmatory sampling was undertaken for surface bedrock excavations at the Mine Site, and will be done for any future surface excavations, to provide a basis for further evaluation of the PAG potential of disturbed rock within the Mine Site. This was and will continue to be done to (i) confirm that subaerial storage for up to two years will not result in the onset of ML/ARD that could impact water quality at BJ 3.10, and (ii) to document the volume, characteristics and disposal location of this rock, as the information will be used to confirm predicted water quality at BJ 3.10 through life of mine and Post-closure.

A composite sample was and will continue to be obtained for every 25,000 m^3 of rock excavated from the Mine Site, at minimum. This sampling regime generally conforms to the guideline of one sample per 75 kt of waste, as recommended in the *Prediction Manual for Drainage Chemistry from Sulphidic Geologic Materials* (Price 2009).

6.2.2 Mine Site Surface Runoff

Surface runoff from most of the Mine Site is and will continue to be collected in the Contact Water Pond (CWP) via the contact water management system and directed to the WTP for treatment. Contact Water Pond water is and will continue to be monitored for pH and turbidity, and sampled quarterly for laboratory analysis of pH, acidity, alkalinity, TSS, nutrients, major anions and cations, and dissolved and total trace metals.

Due to the degree of recirculation of water to the CWP, two additional sampling locations were identified in 2019 for the specific purpose of identifying the onset of ML/ARD. These locations capture the majority of surface runoff into the CWP and samples will be collected a minimum of twice per year.

6.2.3 Triggers and Contingency

Rock excavated from the Mine Site is PAG as was predicted and has (and will continue to be if there is additional future surface excavation) been disposed in the WRTSF without delay, in accordance with this ML/ARD Management Plan and the Operation, Maintenance and Surveillance Manual: Brucejack Mine Subaqueous Waste Rock and Tailings Deposition. The subaerial exposure of PAG waste rock from the Mine Site will be limited to no more than two years.

In the event that sulphate or key metal species concentrations in surface runoff exceed upper case concentration levels defined by the water quality model, additional confirmatory samples will be obtained for immediate analysis.

If additional sampling confirms high concentration levels that exceed previous predictions, the data set will be evaluated and additional Mine Site testing may be required to more fully assess whether degradation of water quality can be attributed to a particular Mine Site source. The surface runoff water quality data will be used to (i) confirm that the WTP can treat the increased metal load to an acceptable level and (ii) update the Post-closure phase source term and predicted Post-closure water quality at BJ 3.10.

6.3 UNDERGROUND MINE

6.3.1 Confirmatory Sampling

The majority of the rock to be excavated in the underground mine is expected to be PAG, as noted above. Confirmatory sampling is required to verify water quality model predictions. Water quality that develops in the underground workings post-closure is an important consideration, as the majority of this water will ultimately flow as groundwater and discharge into the upper reaches of Brucejack Creek.

A minimum of one composite sample has and will continue to be obtained for every 25,000 m^3 of waste rock, as per the guideline of one sample per 75 kt in the *Prediction Manual for Drainage Chemistry from Sulphidic Geologic Materials* (Price 2009), recognizing that 25,000 m^3 of rock will have a mass of just under 75kt, given an estimated specific gravity for waste rock of about 2.8 (as compared to water).

Samples are obtained at this rate from underground workings, as they are developed. Samples must be comprised of at least 1 kg of recently exposed wall rock that is representative of a specific lithology.

The samples are sent to an accredited laboratory for analysis. All samples are analyzed for rinse pH, acid base accounting (ABA), solid phase element analysis and shake flask extraction (SFE).

6.3.2 Contact Water in Underground Workings (Operations Phase)

Contact water has and will continue to be pumped from underground mine workings and directed to the WTP for treatment, as noted above. In-situ pH and turbidity measurements will continue to be carried out on underground sumps and seeps on a quarterly basis. Bulk underground discharge will also be sampled quarterly for laboratory analysis of pH, acidity, alkalinity, TSS, nutrients, major anions and cations, and dissolved and total trace metals. The sampling will be used to verify the source terms used in the water quality model/predictions, and the rate of onset of ML/ARD.

Wall washing stations have been established for each major lithology in the underground mine. Additional stations will be installed as more lithologies are exposed and will be sampled on an annual basis for laboratory analysis of pH, acidity, alkalinity, major anions and cations, total ammonia and dissolved trace metals. Data from these stations will be used to estimate soluble load associated with flushing of the mine walls at closure when the mine is flooded.

6.3.3 Triggers and Contingency

With respect to PAG waste rock, no segregation is intended. All waste rock generated in the underground mine will ultimately be disposed underwater, whether in the WRTSF or backfilled into underground workings that are flooded. All waste rock backfilled underground (up to 65% of the total generated, as noted above) will be flooded following mine closure. Consequently, there are no triggers or contingency associated with underground mine rock sampling. The information is required primarily to verify water quality predictions and as an input to the mine closure and reclamation plan.

The geological block model developed for the underground mine is updated annually using information from drilling, underground mapping and the above-noted rock sampling. If revisions to the block model indicate significant increases to the exposures of lithological units with higher AP, or significant changes to the geochemical characteristics of any unit(s), then the water quality model will be updated.

With respect to contact water in underground workings, in the event that sulphate or key metal species exceed upper case model predictions of underground water quality, additional confirmatory samples will be obtained for immediate analysis.

If an exceedance occurs, the data set will be evaluated and additional testing may be warranted to more fully assess whether neutral metal leaching may be occurring, whether early onset of ML/ARD has occurred in some exposed rock units or if degradation of water quality can be attributed to some other source.

All monitoring results will be included in the Annual Reclamation Report, as per *Mines Act* permit M-243 part D 3. (f), and updated water quality predictions will be included in the Mine Plan and Reclamation Plan due every five years (the first by July 31, 2020), as per condition D 4. (e).

6.3.4 Flooded Underground Workings (Closure and Post-Closure Phases)

Upon mine closure, underground workings below the groundwater table will be flooded. The WTP will remain onsite through the Closure phase to treat underground mine water as necessary. In order to mitigate the potential impact of metal release from oxidation products that may have accumulated in the underground workings, water will be treated as the mine floods, following an adaptive management plan.

A Closure Water Quality Investigation Plan will be developed and appended to this ML/ARD Management Plan. This Plan will include an appropriate monitoring program, water quality triggers and management actions to ensure that groundwater that discharges from underground workings post-closure is protective of the receiving environment.

6.4 WTP INFLUENT AND EFFLUENT

Water treatment plant influent and effluent are monitored. Analytical results are used to verify water quality predictions for contact water from the underground mine.

6.4.1 Confirmatory Monitoring

Both influent and effluent flow volume are monitored on a continuous basis, along with pH and turbidity. In addition, both influent and effluent samples must be obtained and analyzed in the field for turbidity, pH, conductivity and temperature and at an external laboratory for a full suite of parameters, a minimum of twice per month.

6.4.2 Triggers and Contingency

The monitoring described above for the Mine Site, underground mine and WTP influent will provide the means to evaluate short- and long-term changes in influent composition. Short-term changes to influent quality will be evaluated based on WTP water quality measurements. Long-term changes to WTP influent quality will be evaluated on an annual basis to verify source term predictions, and to confirm that the capacity of the WTP is adequate to treat the volume and quality of water directed to the WTP from the Mine Site and underground workings.

If external laboratory analyses indicate that onset of ML/ARD is resulting in dissolved concentrations of key metals exceeding modelled predictions, then model predictions will be revised and WTP treatment capacity evaluated.

6.5 TAILINGS

6.5.1 Confirmatory Sampling

Confirmatory sampling is required to verify the geochemical characteristics of thickened tailings to be discharged to the WRTSF and cemented paste backfill. Both of these waste materials are expected to be NPAG, as noted in section 5.4 above.

Two types of tailings are collected for analysis; (i) thickened tailings from the Thickener underflow, and (ii) cemented tailings from the paste plant. Sampling frequency will gradually be reduced if these materials exhibit expected geochemical characteristics.

The sampling schedule for the tailings solids is:

- Weekly for the first quarter (the equivalent of approximately one sample per 10,000 tonnes of tailings);
- Monthly for as long as necessary to verify geochemical characteristics; and
- Quarterly thereafter.

After collection, all tailings slurry samples are left to settle before the solid phase and supernatant are collected for analysis. Samples of the solid tailings phases will be submitted to an accredited laboratory for the full suite of ABA, solid phase element determination by aqua regia digestion and SFE to confirm that the tailings are NPAG. Thickened tailings have been submitted for saturated column tests to evaluate potential short and long-term chemical loading, and potential impact on water quality in at BJ 3.10.

Solid phase samples from the paste plant will also be submitted for ABA, solid phase element determination and SFE tests as well as for kinetic testwork. Saturated column tests have been initiated to evaluate the long term geochemical behaviour of paste.

6.5.2 Mill Process Water Sampling

Tailings slurry for supernatant analysis will follow the sampling schedule defined above for tailings solids. Tailings supernatant samples will be analyzed at an accredited laboratory for pH, TSS or turbidity, acidity, alkalinity, nutrients, major anions and cations, and dissolved and total trace metals, so as to monitor changes in the aqueous portion of the tailings discharge, and to verify the source term used for tailings loads.

Water samples will be collected at the inlet and outlet to the Semi-Autogenous Grinding (SAG) Mill on a quarterly basis such that soluble tailings loads can be assessed and compared to modelled loads. Loads will be determined based on the input and output concentrations, the feedwater flow rate and the ore throughput. In this way, the loads associated with ground ore (i.e., pre-processed tailings) can be deconvolved from loads recirculated in the Mill.

Samples of SAG Mill influent and effluent will follow the sampling schedule defined above for tailings supernatant and solids. SAG Mill samples will be analyzed at an accredited laboratory for pH, TSS or turbidity, nutrients, major anions and cations, and dissolved and total trace metals. The SAG Mill samples provide additional characterization of loads from the ore.

6.5.3 Triggers and Contingency

If ABA results indicate that tailings are PAG, they will be directed to the WRTSF, not to paste backfill, and the reason for the production of PAG tailings will be investigated and process modifications undertaken as soon as possible to ensure tailings generated are NPAG.

The SFE and subaqueous column tests for thickened tailings, and saturated column tests for paste, will provide an indication of potential metal leaching from thickened tailings. The tests will be focused on the long-term geochemical behaviour of the material in various environments and will be used to verify source terms and water quality models. These predictions are an important consideration in the latter stages of the Operations phase and in the Post-Closure phase.

If the thickened tailings supernatant quality changes significantly such that concentrations of key parameters are higher than expected (as compared to values assumed for water quality model), an evaluation of the potential cause(s) in the feed and mill process will be undertaken. Data will be evaluated and corrective actions will be taken in the process plant if the source of the issue is identified as upset conditions.

If the supernatant quality change cannot be addressed in the process plant, source terms and water quality predictions will be updated if appropriate. Likewise, if the loads derived from the SAG Mill sampling program are significantly different than anticipated, then the water quality model inputs for tailings loads will be revised. If the changes result in a prediction of significant degradation of predicted water quality at BJ 3.10 compared to predictions, the update will be provided in the Annual Reclamation Report, and the Updated Mine and Reclamation Plan, due every five years.

6.6 SLUDGE

6.6.1 Confirmatory Sampling

Confirmatory sampling is required to verify the geochemical characteristics of WTP sludge to be co-deposited with tailings in the WRTSF. The sludge sampling program for WTP is described in Appendix 13. The sampling schedule for the WTP sludge is:

- Quarterly sampling for ABA and solid phase elemental abundances;
- Annual sampling for sequential extraction testing; and
- After activating the sulfide precipitation process of the WTP, should it be required, a sludge sample will be collected within three months for ABA, solid phase elemental abundance, sequential extraction and kinetic testing.

Samples of sludge will be submitted to an accredited laboratory for testwork and results will be assessed to evaluate the potential impact of sludge deposition on water quality at BJ 3.10.

6.6.2 Triggers and Contingency

The confirmatory data collected for sludge, including the ABA, solid phase elemental abundance and sequential extractions, will be compared to results used for preliminary sludge assessment. If the geochemical characteristics of sludge change significantly such that concentrations of key parameters are higher than expected (as compared to values assumed for water quality model), an evaluation of the potential cause(s) will be undertaken. Geochemical source terms and water quality predictions will be updated as appropriate. If revised water quality predictions indicate significant degradation of water quality at BJ 3.10, then sludge management options will be re-evaluated at that time. Updated water quality predictions will be provided in the Updated Mine and Reclamation Plan, due every five years.

6.7 Brucejack Access Road

The Brucejack Access Road will need maintenance throughout mine life; this will periodically require sourcing of quarried rock for road surfacing and related work. Pretium will minimize the disturbance of PAG rock. New quarries will be developed in NPAG rock only (based on geochemical assessment) to the extent that they are needed to provide road base or material for other aspects of road construction and maintenance.

6.8 Kinetic Tests

Materials from the NPAG Quarry, Mine Site and underground mine are being evaluated through sampling and analysis of on-site field bins constructed of representative rock from the respective locations. These have been constructed to assess the geochemical behaviour of this rock in the conditions that actually occur at the site, including climatic conditions such as precipitation and freeze-thaw cycles. The results of the field and laboratory kinetic tests are presented on an annual basis in the Annual Reclamation Report.

6.9 Communication and Operational Protocols

The Environmental Principle is responsible for the implementation of the ML/ARD Verification and Monitoring program. The Environmental Principle or designate is responsible for coordinating sampling and will arrange for sampling support by the mine geochemist, or by qualified geologists through requests to the Chief Mine Engineer or delegate. The Environmental Principle or designate is responsible for reviewing data and implementing contingency measures if required. The Qualified Professional responsible for the ML/ARD Management Plan will review the plan annually, at a minimum, and provide technical direction to the site geochemist and Environmental Principle as needed. Standard Operating Procedures for each part of the ML/ARD verification and monitoring program are included as Appendices 1 through 14 in the order that they appear in this section.

7 TEMPORARY OR EARLY MINE CLOSURE

Temporary mine suspension, or early mine closure, will require specific mitigation and management, including to address ML/ARD. Considerations related to the underground mine and deposition of waste materials in the WRTSF are most relevant.

7.1 UNDERGROUND MINE

In the event that mine development is temporarily suspended beyond ten years, or the mine is closed prematurely, Pretium will construct a portal plug and allow the mine to flood.

7.2 DEPOSITION OF WASTE MATERIALS IN THE WRTSF

Waste rock and tailings will be deposited in the WRTSF on an ongoing basis, adhering to the 2 year allowable subaerial exposure time limit. Tailings will be disposed in the WRTSF as they are generated via pipeline or underground as paste. If mine development is temporarily suspended, or the mine is closed prematurely, Pretium will dispose all residual waste rock, tailings, and WTP sludge in the WRTSF without delay.

8 RECORDING AND REPORTING

8.1 RECORD KEEPING / TRACKING

8.1.1 Monitoring Results

Field results are and will continue to be recorded when taken and external lab test results are transferred electronically into a database. The Environmental Principle is responsible to ensure the maintenance of the original records and database. Parameters of concern are also tracked graphically and reviewed periodically to identify trends. Routine monitoring includes, at minimum, the following, unless otherwise approved based on additional analytical results and assessment:

- NPAG Quarry rock 1 sample/10,000m^3;
- Mine Site rock 1 sample / 25,000m^3;
- Underground rock, collect one composite sample for every 25,000 m^3 of waste rock;
- Tailings solids and supernatant, quarterly lab analyses;
- SAG Mill sampling, quarterly lab analyses;
- WTP sludge, quarterly lab analyses;
- Water Quality field parameters, monthly and quarterly lab samples;
- Surface flows;
- Seeps quarterly; and
- Underground flows.

Investigation and corrective action will be undertaken if monitoring data indicate that actual geochemical characteristics are significantly less conservative than predicted or expected, based on initial geochemical assessment, or if specified trigger levels are exceeded, or other effects on the receiving environment are observed. The observed condition will be logged as an incident report for tracking purposes.

8.1.2 Continuous Improvement, Follow up, and Adaptive Management

Triggers and other performance indicators, corrective actions and mine plans will be reviewed to identify potential operational improvements. Management strategies will be assessed and updated using evidence-based approaches.

The Environmental Principle ensures that relevant information is included in the Annual Reclamation Report and will ensure that it is included in the updated Mine and Reclamation Plan to be submitted to the Chief Inspector of Mines every five years starting on July 31, 2020. These reports summarize monitoring data, the outcomes of continuous improvement measures and identify new measures that are to be implemented.

Environmental performance indicators that will be monitored include:

- Solid phase parameters from surface and underground blasted rock;
- Water quality parameters of concern compared to discharge limits, guidelines and SBEBs; and
- Long term trends for all parameters of interest.

8.2 REPORTING

8.2.1 Internal Reporting

Internal reporting will be undertaken by the Environmental Principle or designate as appropriate to advise Pretium's Senior Management of ML/ARD monitoring activities and results, and to highlight where improvements are needed.

8.2.2 External Reporting

ML/ARD-related information are reviewed and incorporated into external reports, as needed. These include:

1. The Annual Reclamation Report required under *Mines Act* Permit M-243 for Construction and Operations; and
2. The updated Mine and Reclamation Plan for the mine, which must be submitted every five years to the Chief Inspector of Mines.

List of Appendices

Appendix 1

Standard Operating Procedure:
General Water Sampling

PRETIVM		BJ-ENV-SOP-028 General Water Sampling	
Owner: Colleen Atherton	Approver: Torence Sandhals	Revision Number:	Creation Date: 12/05/2018 Revision Date:

Objective

To provide general sample handling instructions for the collection of representative, reproducible water samples using syringe with disc filter or a pump with inline filters.

Scope

This SOP applies to all water samples collected in support of the ML-ARD Management Plan.

Health, Safety & Reclamation Code of BC

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

Definitions

- Aliquot: Portion of sample
- DI water: De-ionized water
- DO: Dissolved Oxygen
- Field parameters: DO, pH, and conductivity
- HDPE: High Density Polyethylene
- ML/ ARD: Metal Leaching/ Acid Rock Drainage
- TSS: Total Suspended Solids

Preparation

Hazards

- Working with hazardous chemicals

Tools

- pH/conductivity meter
- See sample specific SOP

Requirements

- Trained and qualified to conduct water-quality sampling

Job Step

1. **General considerations**
   - Schedule field work to meet laboratory hold times. Samples can only be collected Sunday to Wednesday for shipment Monday to Thursday.
   - All sample bottles must be certified clean by the laboratory. Certified clean bottles do not require rinsing.
   - All reusable equipment must be cleaned and rinsed three times prior to use. Blanks should be obtained to verify equipment cleaning procedures are effective.

2. Field preparation

- Calibrate pH/conductivity meter according to manufacturer's instructions. This step is conducted only at the beginning of the day.
- Collect frozen ice-packs from freezer and place in cooler.
- Collect and prepare field supplies in cooler. The number and type of sample bottles, filters and preservative required will depend on the specific sampling SOP being followed.
- Use either pre-printed labels provided by the laboratory or, using black marker, label the bottles with the Date, Sample ID and parameters of analysis provided in the sampling specific SOP and return the labeled bottles to the cooler.
- Always take at least one extra set of sample bottles in case a sample needs to be re-collected due to accidental contamination.

3. General sampling instructions

- Put on vinyl gloves.
- Gloves must be replaced between samples and if suspected of having made contact with a dirty surface.
- Measure field parameters using a separate aliquot of sample that will not be used in any other analysis. If in situ field parameters are being measured, measure field parameters after sample collection or downstream from/beside the sampling location.
- Fill unfiltered sample bottles, followed by filtered sample bottles.
- When filling bottles, remove the lid without touching the inner surface of either lid or bottle.
- Do not allow any equipment to make contact with the inner surface of either lid or bottle.
- Fill the sample bottle to capacity, leaving space for preservative if required, without making contact between the bottle and the sampling equipment.
- Add preservative, if required, and tightly replace the lid. Be careful not to spill the preservative as it may be a concentrated acid; may cause damage to skin, eyes and clothing; and will erase the label.
- Invert the bottle twice to mix.
- Place the bottle in the cooler with the ice packs.

4. Sample filtration using a syringe and filter cassette

Syringe filtering is conducted under two scenarios:

- when limited sample volumes are available, and/or
- when TSS is low.

If sample volumes are low and TSS is high, a sample aliquot can be collected in an extra 500 mL plastic bottle which may be taken back to the lab, allowed to settle and decanted for filtration.

- Remove a 50 mL syringe from its wrapper.
- A new syringe must be used for every sample.
- Remove a disc filter from its package
  - If disc filters are in bulk format, ensure remaining filters are not contaminated by gloves.
  - This can be accomplished by shaking the bag, so a single filter moves toward the opening.
  - Grasp the filter by the outside edge rather than the outlet.
- Fill the syringe with sample.
- Screw the disc filter onto the end of the syringe.
- Push a small volume of sample through the disc filter before collecting your sample. This will flush potential contaminants from the filter.
- Place the sample bottle below the filter (as shown in Figure 1), being careful not to touch the tip of the disc filter to anything.
- Depress the plunger to force the sample through the filter.

- Remove the disc filter, refill the syringe, and replace the disc filter as required to fill all the bottles requiring filtered sample.
- Multiple filters may be required if the sample contains high TSS.
- If a filter is punctured or defective, the sample will be contaminated. Discard the sample, bottle and filter. Collect another sample using a new bottle and filter.

5. Sample filtration using a peristaltic pump and in-line high capacity filter

Inline filters absorb a large volume of water before discharging filtered water. Inline filters are only used when sufficient sample volume is available.

- To prevent hand injuries, use only waterra cutters to cut tubing for the geopump.
- Cut two sections of HDPE peristaltic tubing: one section for between the sample source and pump and a second section for between the pump and sample bottle.
- Cut one 8" piece of silicone tubing.
- Thread the ends of the HDPE tubing into the ends of the silicone tubing.
- Thread the silicone tubing through the housing of the peristaltic pump (Figure 2).
- Ensure the flow direction switch is in the correct position.
- Turn the pumping speed down.
- Switch on the pump and gradually increase the flow until the desired flow rate is achieved.
- After collection of the unfiltered sample aliquots, place a 2" piece of silicone tubing on the sampling end of the HDPE tubing.
- Open a waterra inline filter and thread the barbed end of the filter into the 2" piece of silicone tubing (as shown in Figure 2). The filter housing has an arrow indicating flow direction.
- Be careful not to overpressure the waterra filter. If too much back pressure builds up in the tubing, the tubing will separate from the filter and risks contaminating the sample.
- Multiple filters may be required if the sample contains high TSS.
- If a filter is punctured or defective, the sample will be contaminated. Discard the sample, bottle and filter. Collect another sample using a new bottle and filter.

6. Complete COC

- Complete COC as indicated on the sampling specific SOP.

7. Shipping Samples

- Ship samples to the analytical laboratory (currently ALS Global in Burnaby, BC).
- Use adequate ice packs to ensure that the samples arrive at the laboratory <10°C.

Standard Operating Procedure:
Confirmatory Sampling of NPAG Quarry Rock

PRETIVM			BJ-ENV-SOP-033 NPAG Quarry Rock
Owner: Colleen Atherton	Approver: Torence Sandhals, Jason Gabora	Revision Number:	Creation Date: Jul 24, 2015 Revision Date: Aug 13, 2018

Objective

To provide guidance for confirmatory ML/ARD sampling during the development of the NPAG quarry.

Scope

All activities related to sampling of NPAG Quarry rocks through life of mine. This includes sample collection protocols, quality assurance and quality control (QA/QC) requirements, shipping and handling details, analytical procedures, parameters to be measured, communications with the analytical laboratories, the COC (chain of custody) and documenting the results.

Health, Safety & Reclamation Code of BC

- 1.11.1 Training.
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment.

Definitions

- ABA: Acid Base Accounting.
- AP: Acid Potential.
- COC: Chain of Custody.
- NP: Neutralization Potential.
- NPAG: Non-Potentially Acid Generating.
- PPE: Personal Protective Equipment.
- QA/QC: Quality Assurance/ Quality Control.
- TIC: Total Inorganic Carbon.

Preparation

Hazards

- Slips and falls.
- Working near heavy machinery.
- Rotating equipment.
- Scaling and rock fall hazards.
- Noise.

Tools

- PPE.
- Hearing protection.
- Half mask respirator with P100 cartridges.
- Hand shovel.
- Field notebook, pen and markers.
- Sample bags, sample tags and zip ties.
- Hand lens.
- GPS.
- Camera.

Requirements

- Trained and qualified to identify lithological units.
- Fit tested and trained to use a half mask respirator and cartridges.
- Knowledge of the drill program and plans.
- Knowledge of this SOP.

Job Step

Samples will be collected from NPAG Quarry rock at a frequency of one samples per 10,000 m3.

1. Field Preparation

- The sampler must be clean shaven in case a respirator must be worn.
- Contact the Industrial Hygiene Advisor to obtain personal air monitoring equipment. Industrial Hygiene sampling will be conducted once project starts to determine if a respirator must be worn.
- One sample must be collected for every 10,000 m3 excavated. This SOP assumes that drilling will precede excavation and confirmatory samples can be collected from drill cuttings. To achieve one sample per 10,000 m3, create a 2D grid (plan view) of the quarry with a drill hole centered in each 30 x 30 m block.
- Ensure an appropriate number of sample bags and sample tags are available to collect two samples from each hole.

2. Mobilize to Quarry

- Check out of camp with Dispatch on Channel 2 – Repeater 1.
- Obtain permission from Surface Operations Supervisor (Channel 9 – LAD 2) before accessing site. Determine if any other quarry staff require notification of sampling activities.

3. Sampling

- If elevated levels of dust are present, don the half mask respirator with the particulate filters.
- Before sampling, communicate sampling plan with drill operator – communicate intended collar spacing and sampling intensity for each hole, including when QA/QC samples will be collected.
- At each drill hole, note surface lithology and GPS coordinates in your field book.
- Obtain a composite sample from each hole for every 10 m depth interval. Each sample should have a minimum mass of 1 kg.
- An additional sample should be collected if a lithologic change is observed in the drill cuttings. Note the depth of the change(s) and from which depth(s) the sample(s) are collected.
- Photograph and describe each lithology in your field book.
- Place a sample ID tag in each sample bag and record the tag number in your notebook. An example of field notes is provided in Figure 1.
- Obtain QA/QC samples as described in Section 4 below.
- Check in hourly with Dispatch if working alone.

4. QA/QC

- A field duplicate and laboratory duplicate must be collected for the first sample of every year and for one in every 20 samples thereafter.
- Collect a 3-4 kg sample, from which the field duplicate and laboratory duplicate will be sub-sampled.
- It is best to sub-sample from a large sample rather than collect duplicates sequential from the same hole and depth interval.
- The field duplicate is obtained by taking a 1 kg sub-sample from the larger sample and placing it in a separate sample bag with a unique sample tag number.
- The remaining 2-3 kg sample must be flagged by adding DUP to the sample tag number, in your notebook and on the COC (e.g., B0020####-DUP). This sample will be split at the laboratory following pulverization.

5. **Demobilize from Quarry**
   - Inform Surface Operations Supervisor that you are demobing from Quarry.
   - Check in to camp with Dispatch on Channel 2 – Repeater 1.
6. **Shipping and Analytical Parameters**
   - All samples are to be shipped to an accredited laboratory (currently SGS Laboratories in Burnaby, BC) for total sulphur (T-S) and total carbon (T-C) analysis.
   - Laboratory duplicate QA/QC samples are to be submitted for the full suite of ABA analyses and solid phase element determination by aqua regia digestion. The full list of parameters to be measured for the laboratory duplicates are listed in Table 1.
   - A completed COC form is to be shipped with the samples and an electronic version sent via e-mail to the accredited laboratory and any other appropriate parties. An example COC is provided in Appendix I.
7. **Data Tracking and Analysis**
   - Data will be compiled and evaluated by a Senior Geologist or Qualified Professional.
   - If exceedances of trigger limits as defined in the ML/ARD Management Plan occur, then the Mine Manager and the Environmental Manager must be informed and actions outlined in the ML/ARD Management Plan must be taken.

Standard Operating Procedure:
NPAG Quarry Runoff Sampling

PRETIVM		BJ-ENV-SOP-032 NPAG Quarry Run Off Sampling	
Owner: Colleen Atherton	Approver: Torence Sandhals, Jason Gabora	Revision Number:	Creation Date: 08/31/2015 Revision Date: 07/23/2018

Objective

To describe the steps required for collection of water samples from NPAG Quarry run-off as per the ML/ARD MP.

Scope

All activities related to the collection of water samples from the NPAG Quarry at the Brucejack Gold Mine.

Health, Safety & Reclamation Code of BC

- 1.11.1 Training.
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment.
- 2.13 WHMIS.

Definitions

- BCMDG: British Columbia Mine Design Guidelines.
- COC: Chain of Custody.
- DI water: De-Ionized water.
- ML/ARD MP: Metal Leaching/ Acid Rock Drainage Management Plan.
- PPE: Personal Protective Equipment incl. hard hat, safety glasses, high visibility vest and steel toe boots.
- QA/QC: Quality Assurance and Quality Control.
- TOC: Total Organic Carbon.
- TSS: Total Suspended Solids.

Preparation

Hazards

- Slips and falls.
- Working near hazardous chemicals.
- Exposure to elements.
- Rock fall/overhead hazards.

Tools

- GPS.
- PH/conductivity meter.
- Syringe and disc filters.
- Vinyl gloves.
- DI water.
- Water-proof markers.
- Sample labels.
- Data sheets.
- Camera.
- Cooler containing sample bottles and preservatives as per Table 1.

Requirements

- Trained and qualified to conduct water-quality sampling.
- Knowledge of this SOP.

Job Step

Water samples will be collected from NPAG Quarry run-off twice per year during the unfrozen period.

1. **Scheduling**
   - NPAG Quarry runoff samples will be collected at least two times per year.
   - The first sample will ideally be collected in spring after freshet.
   - The second sample will ideally be collected in fall before freeze-up.
   - Each sampling event will include a minimum of three samples: one quarry run-off test sample, one field duplicate and one field blank.
   - If more than one run-off stream or pool is observed, then an additional set of bottles from Table 1 must be added to the supplies.
2. **Field Preparation**
   - Contact Mountain Safety (ext.102) several days before sampling to determine if the NPAG Quarry is safe to access or if a guide is required.
   - Calibrate pH/conductivity meter.
   - Collect and label field supplies and place in a cooler with ice packs.
   - Label sample bottles with the date, sample ID and parameters of analysis as provided in Table 1.
   - Samples are labeled "NPAG QUARRY". Add A, B, etc. as required if multiple seeps or pools are identified.
   - Prepare one duplicate sample and one field blank sample.
   - Add a bottle set for one extra sample to the cooler.
3. **Mobilize to NPAG Quarry**
   - Call Logistics on radio channel "Repeater 1" to check out of camp.
   - Call Logistics a second time when you arrive at the NPAG Quarry.
4. **Collection Methods**
   - Run-off/Seep: fill a bottle by holding the bottle below the seep or drip without allowing the mouth of the bottle to come in contact with the rock face. If there is a large volume, the sample should be taken near the surface at mid-flow.
   - Ponded/pooled: fill a bottle by holding the mouth just beneath the surface of the water with your hand well below the neck and placed downstream of the bottle opening. Do not disturb sediment or organic matter.
   - Low flow: a composite sample can be obtained by mixing equal volumes of discrete grab samples which may be collected at one point at regular time intervals or collected from multiple seep points on a rock exposure with consistent lithology.
5. **Leachate Sample Collection**
   - Review BJ-ENV-SOP-028 for general sample collection and handling procedures.
   - Fill the bottles in the order identified in Table 1.
   - Filter and preserve the sample as indicated in Table 1 using the syringe and disc filter.
   - Using a separate aliquot, measure pH, conductivity and temperature.
   - Record sampling observations using the template in Appendix I.
   - Take photographs of the sample location and record the GPS location.

6. **QA/QC Samples**
   - Collect one field duplicate by filling a second set of bottles with run-off water using the filtering and preservation procedure described in Table 1 and Steps 4 and 5. This sample is identified by -98, e.g., NPAG QUARRY-A-98.
   - Collect one field blank by filling an additional set of bottles with DI water at a run-off location using the filtering and preservation procedure described in Table 1 and Steps 3 and 4. This sample is identified by -99, e.g., NPAG QUARRY-A-99.
7. **Demobilize from NPAG Quarry**
   - Call Logistics when you return to your vehicle.
   - Call Logistics when you return to camp.
8. **Complete COC**
   - Complete COC as per Appendix II.
9. **Shipping Samples**
   - Ship samples to the analytical laboratory (currently ALS Global in Burnaby, BC).
   - Use adequate ice packs to ensure that the samples arrive at the laboratory <10°C.
10. **Data Tracking and Analysis**
   - Data will be compiled and evaluated by the Environmental Manager or designate.
   - If exceedances of threshold limits as defined in the ML/ARD Management Plan occur, then the Mine Manager must be informed and actions outlined in the ML/ARD Management Plan must be taken.

Table 1

Bottle Type and Volume	Field Preservation	Field Filter	Refrigerate (4°C)	Indicate on Bottle	Parameter(s)*
500 mL plastic	None	No	Yes	Generals	pH, conductivity, TSS, turbidity, alkalinity, acidity and anions
125 mL amber	1 mL 1:3 H2SO4	No	Yes	Nutrients	TOC, phosphorus, T-N and ammonia
60 mL plastic	0.8 mL 1:4 HNO3 (18%)	No	Yes	Total Metals	Total metals (BCMDG)
60 mL plastic	0.8 mL 1:4 HNO3 (18%)	Yes	Yes	Dissolved Metals	Dissolved Metals (BCMDG)

Standard Operating Procedure:
Confirmatory Sampling of Mine Site Waste Rock

PRETIVM		BJ-ENV-SOP-036 Confirmatory Sampling of Mine Site Waste Rock	
Owner: Colleen Atherton	Approver: Torence Sandhals	Revision Number: 1	Creation Date: Aug 31, 2015 Revision Date: Oct 22, 2018

Objective

To provide guidance for Metal Leaching/ Acid Rock Drainage (ML/ARD) sampling of Mine Site waste rock including waste rock excavated from the Mill site, the Contact Water Pond (CWP), roads within the mine site boundary, diversion ditches, the laydown areas and the truck shop area and any other areas identified during mine operations.

Scope

All activities related to sampling of Mine Site waste rocks through life of mine. This includes sample collection protocols, shipping and handling details, analytical procedures, quality assurance and quality control (QA/QC) requirements, parameters to be measured, communications with the analytical laboratories, the COC (chain of custody) and documenting the results.

Health, Safety & Reclamation Code of BC

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment

Definitions

- ABA: Acid Base Accounting
- AP: Acid Potential
- COC: Chain of Custody
- NPAG: Non-Potentially Acid Generating
- NP: Neutralization Potential
- PAG: Potentially Acid Generating
- PPE: Personal Protective Equipment
- QA/QC: Quality Assurance/ Quality Control
- SFE: Shake Flask Extraction
- TIC: Total Inorganic Carbon

Preparation

Hazards

- Slips and falls
- Working near heavy machinery
- Rotating equipment
- Scaling and rock fall hazards
- Noise

Tools

- PPE
- Hearing protection
- Hand shovel
- Field notebook, pen and markers
- Sample bags, sample tags and zip ties
- Hand lens

- GPS
- Camera

Requirements

- Trained and qualified to identify lithological units
- Knowledge of the drill program and plans

Job Step

One sample must be collected for every 25,000 m3 of each lithologic model unit excavated from the Mine Site Surface.

1. **Field Preparation**
   - Coordinate with Surface Operations Supervisor to ensure that samples can be collected from the muck pile hear the blast face.
   - Ensure appropriate number of sample bags and sample tags are available to collect composite samples from all lithologies present.
2. **Sampling**
   - Mobilize to site
   - Obtain a lithology-specific composite sample from the blasted muck pile amounting to at least 1 kg.
   - Note the location of the sample, and photograph and describe the sample in your field book.
   - Place a sample ID tag in each sample bag and note the tag number in your field book.
   - Obtain QA/QC samples as described in Section 3 below.
3. **Description of QA/QC Samples**
   - A field duplicate and laboratory duplicate must be collected for the first sample of every year and for one in every 10 samples thereafter.
   - Collect a 3-4 kg sample, from which the field duplicate and laboratory duplicate will be sub-sampled.
   - It is best to sub-sample from a large sample rather than collect duplicates sequentially.
   - The field duplicate is obtained by taking a 1 kg sub-sample from the larger sample and placing it in a separate sample bag with a unique sample tag number.
   - The remaining 2-3 kg sample must be flagged by adding DUP to the sample tag number, in your notebook and on the COC (e.g., B0020####-DUP). This sample will be split at the laboratory following pulverization.
4. **Shipping and Analytical Parameters**
   - All samples are to be shipped to an accredited laboratory (currently SGS Laboratories in Burnaby, BC) for total sulfur (T-S) and total carbon (T-C) analysis.
   - Laboratory duplicate QA/QC samples are to be submitted for the full suite of ABA analyses, solid phase element determination by aqua regia digestion and SFE tests. The full list of parameters to be measured for the laboratory duplicates are listed in Table 1.
   - A completed COC form is to be shipped with the samples and an electronic version sent via e-mail to the accredited laboratory and any other appropriate parties. An example COC is provided in Appendix I.
5. **Documents and Records**
   - Record the sample IDs, an estimate of the total Mine Site waste rock excavated to date since the beginning of Construction phase, sample location and a description of the lithology including the geological block model unit code in your field notes (in a similar manner as the table below). Where appropriate, photograph the exposed lithology and/or sample(s).
   - Complete the COC, including the date and time of collection, name of sampler, sample IDs and analyses to be conducted.

6. **Data Tracking and Analysis**
   - Data will be evaluated by the Geochemist or designate. If exceedances of trigger limits as defined in the ML/ARD Management Plan occur, then the Mine Manager and the Environmental Manager must be informed, and actions outlined in the ML/ARD Management Plan must be taken.

Appendix 5

Standard Operating Procedure:
Surface Contact Water Sampling

PRETIVM		BJ-ENV-SOP-070 Surface Contact Water Sampling	
Owner: Environment	**Approver**: Robin McCall	**Revision Number**:	**Creation Date**: 09/13/2019 **Revision Date**: 2020/10/06

Objective

To describe the steps required for collection of water samples from the Contact Water Management System (CWMS) to support ML/ARD monitoring.

Scope

All activities related to the collection of water samples from the CWMS at the Brucejack Gold Mine.

Health, Safety & Reclamation Code of BC

- 1.11.1 Training.
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment.
- 2.13 WHMIS.

Definitions

- BCMDG: British Columbia Mine Design Guidelines.
- COC: Chain of Custody.
- CWMS: Contact Water Management System
- DI water: De-Ionized water.
- ML/ARD MP: Metal Leaching/ Acid Rock Drainage Management Plan.
- PPE: Personal Protective Equipment incl. hard hat, safety glasses, high visibility vest and steel toe boots.
- QA/QC: Quality Assurance and Quality Control.
- TOC: Total Organic Carbon.
- TSS: Total Suspended Solids.

Roles and Responsibilities

The Mine Manager or Designate is responsible for:

- Ensure this procedure is implemented and followed.

The Health and Safety Manager or Designate is responsible for:

- Ensure this procedure complies with H&S regulation.

The Area Manager or Designate is responsible for:

- Ensure this procedure is followed and sampling is completed on time.

The Worker is responsible for:

- Ensure this procedure is followed for all surface contact water sampling.

Preparation

Hazards

- Slips and falls.
- Working near hazardous chemicals.
- Exposure to elements.

Tools

- PH/conductivity meter.
- Long-handled sample dipper.
- Syringe and disc filters.
- Vinyl gloves.
- DI water.
- Water-proof markers.
- Sample labels.
- Data sheets.
- Camera.
- Cooler containing sample bottles and preservatives as per Table 1.

Requirements

- Trained and qualified to conduct water-quality sampling.
- Knowledge of this SOP.

Job Step

Water samples will be collected from CWMS run-off twice per year during the unfrozen period.

1. Scheduling

- CWMS samples will be collected at least two times per year.
- The first sample will ideally be collected in spring after freshet.
- The second sample will ideally be collected in fall before freeze-up.
- Each sampling event will include a minimum of two samples: one East Weir sample and one East Camp sample
- The first sampling event of the year will also include a field duplicate and a field blank sample.

2. Field Preparation

- Review BJ-ENV-SOP-028 for general sample collection and handling procedures.
- Calibrate pH/conductivity meter.
- Collect and label field supplies and place in a cooler with ice packs.
- Label sample bottles with the date, sample ID and parameters of analysis as provided in Table 1.
- Prepare one duplicate sample and one field blank sample for the first sampling event of the year.
- Add a bottle set for one extra sample to the cooler.

3. Collection Methods

- Figure 1 and 2 indicate sample locations.
- East Camp sample: fill a bottle by holding the bottle below the culvert without allowing the mouth of the bottle to come in contact with the culvert
- East Weir sample: use a long-handled sampler to retrieve water pooled behind the weir. Fill all bottles from the sampler.
- At the two locations measure and calculate the flow depending on flow conditions:
    - In low flow conditions measure flow from the culvert by timing how long it takes to fill a container of known volume (e.g. 1 L graduated cylinder). Repeat this procedure five (5) times and calculate the average flow rate in L/s.
    - In medium-to-high flow conditions measure flow using the FH-950 flow meter as described in **Appendix I**.
- Filter and preserve the sample as indicated in Table 1 using the syringe and disc filter.
- Unfiltered samples may be decanted directly into the sample bottle.

- Using a separate aliquot, measure pH, conductivity and temperature.
- Record sampling observations.
- Take photographs of the sample location.

4. QA/QC Samples

- Collect one field duplicate by filling a second set of bottles with contact water using the filtering and preservation procedure described in Table 1 and Step 3. This sample is identified by -98, e.g., East Weir-98.
- Collect one field blank by filling an additional set of bottles with DI water at a contact water location using the filtering and preservation procedure described in Table 1 and Steps 3. This sample is identified by -99, e.g., East Weir-99.

5. Complete COC

- Complete COC as per Appendix II.

6. Shipping Samples

- Ship samples to the analytical laboratory (currently ALS Global in Burnaby, BC).
- Use adequate ice packs to ensure that the samples arrive at the laboratory <10°C.

7. Data Tracking and Analysis

- Data will be compiled and evaluated by the Environmental Manager or designate.

Table 1

Bottle Type and Volume	Field Preservation	Field Filter	Refrigerate (4°C)	Indicate on Bottle	Parameter(s)*
500 mL plastic	None	No	Yes	Generals	pH, conductivity, TSS, turbidity, alkalinity, acidity and anions
125 mL amber	1 mL 1:3 H2SO4	No	Yes	Nutrients	TOC, phosphorus, T-N and ammonia
60 mL plastic	0.8 mL 1:4 HNO3 (18%)	No	Yes	Total Metals	Total metals (BCMDG)
