Figure 1: East Camp sample UTM – 427145/6258590

Figure 2: East Camp sample UTM – 426660/6258725

Appendix II – Flow Measurement Using the FH-950 Meter

- Before heading out to the field conduct a meter “zero” calibration
- Measure the culvert diameter and the distance from the culvert crown (i.e. top) to the water surface
- In the FH-050 Select : **Profiler → Conduit → Circular**
- Enter the measured culvert diameter and distance from crown to water surface
- Select: **Method 2D→ Measure velocity**
- Place sensor at prompted depth and select **Capture**
- Once measurement starts, move sensor in a circular pattern (**Figure 3**) until the measurement is complete.
- Write down the calculated flow (m3/s)

- **Figure 3. Sensor circular pattern for flow measurement in a culvert. Start at point 1, finish at point 2.**

Standard Operating Procedure:
Confirmatory Sampling of Underground Mine Waste Rock

PRETIVM		BJ-ENV-SOP-037 Confirmatory Sampling of Underground Mine Waste Rock	
Owner: Colleen Atherton	Approver: Torence Sandhals	Revision Number: 1	Creation Date: Aug 31, 2015 Revision Date: Oct 22, 2018

Objective

To provide guidance for Metal Leaching/ Acid Rock Drainage (ML/ARD) sampling of underground mine waste rock.

Scope

All activities related to sampling of underground waste rock through life of mine. This includes sample collection protocols, shipping and handling details, analytical procedures, quality assurance and quality control (QA/QC) requirements, parameters to be measured, communications with the analytical laboratories, the COC (chain of custody) and documenting the results.

Health, Safety & Reclamation Code of BC

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment

Definitions

- ABA: Acid Base Accounting
- AP: Acid Potential
- COC: Chain of Custody
- NP: Neutralization Potential
- PAG: Potentially Acid Generating
- PPE: Personal Protective Equipment
- QA/QC: Quality Assurance/ Quality Control
- SFE: Shake Flask Extraction
- TIC: Total Inorganic Carbon

Preparation

Hazards

- Slips and falls
- Working near heavy machinery
- Scaling and rock fall hazards
- Noise
- Poor air quality

Tools

- PPE
- Hearing protection
- Rock hammer
- Field notebook, pen and markers
- Sample bags, sample tags and zip ties
- Hand lens
- Camera

Requirements

- Trained and qualified to identify lithological units
- Knowledge of blasting and excavation procedures
- Knowledge of the underground mine development plans and the geologic block model
- Underground orientation and driver training

Job Step

One sample must be collected for every 25,000 m3 of each lithologic model unit excavated from the underground mine.

1. Field Preparation

- Update underground ARD master sampling table to determine excavated volumes of each lithology.
- Identify model units that require additional sampling.
- Identify recently exposed areas for each model unit requiring additional sampling.
- Ensure appropriate number of sample bags and sample tags are available to collect composite samples from all lithologies requiring additional samples.

2. Sampling

- Mobilize to sampling site.
- Verify that the sampling site is in the expected lithology.
- Obtain a lithology-specific composite sample from rock collected from recently exposed rib amounting to at least 1 kg.
- Note the location of the sample, and photograph and describe the sample in your field book.
- Place a sample ID tag in each sample bag and note the tag number in your field book.
- Obtain QA/QC samples as described in Section 3 below.

3. Description of QA/QC Samples

- A field duplicate and laboratory duplicate must be collected for the first sample of every year and for one in every 20 samples thereafter.
- Collect a 3-4 kg sample, from which the field duplicate and laboratory duplicate will be sub-sampled.
- It is best to sub-sample from a large sample rather than collect duplicates sequentially from the same area of rib.
- The field duplicate is obtained by taking a 1 kg sub-sample from the larger sample and placing it in a separate sample bag with a unique sample tag number.
- The remaining 2-3 kg sample must be flagged by adding DUP to the sample tag number, in your notebook and on the COC (e.g., B0020####-DUP). This sample will be split at the laboratory following pulverization.

4. Shipping and Analytical Parameters

- All samples are to be shipped to an accredited laboratory (currently SGS Laboratories in Burnaby, BC) for rinse pH, the full suite of ABA analyses, solid phase element determination by aqua regia digestion and Shake Flask Extraction (SFE). The full list of parameters to be measured for the laboratory duplicates are listed in Table 1.
- Laboratory duplicate QA/QC samples are to be submitted for the same parameters as the primary samples.
- A completed COC form is to be shipped with the samples and an electronic version sent via e-mail to the accredited laboratory and any other appropriate parties. An example COC is provided in Appendix I.

5. **Documents and Records**
   - Update the underground ARD master sampling file on a quarterly basis, at minimum, and send to the Environmental Manager or Designate for review.
6. **Data tracking and analysis**
   - Data will be compiled and evaluated by a Geochemist or Qualified Professional.
   - If exceedances of threshold limits or triggers as defined in the ML/ARD Management Plan occur, then the Environmental Manager and the Mine Manager must be informed, and actions outlined in the ML/ARD Management Plan must be taken.

Figure 1 – Field Notes

Sample ID	Date Collected	Lithology	Heading Name	Composite Collected From	Description

Standard Operating Procedure:
Sump Sample Collection

PRETIVM		PVG-ENV-SOP-023 Sump Sampling Underground	
Department: Environment	**Manager/Designate**: Robin McCall	**Revision Number**: 3	**Creation Date**: 2018/06/27 **Revision Date**: 2020/10/06

Objective

To describe the steps required for collection of quarterly water samples from the underground sumps as per the ML/ARD MP.

Scope

This SOP applied to all personnel completing activities related to the collection of samples from underground sumps.

Health, Safety & Reclamation Code for Mines in British Columbia

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

Definitions

- Back: ceiling of the underground mine.
- BCMDG: British Columbia Mine Design Guidelines.
- COC: Chain of Custody.
- DI water: De-Ionized water.
- DO: Dissolved Oxygen.
- DOC: Dissolved Organic Carbon.
- HDPE: High Density Polyethylene.
- Loose: Rock on the ribs and back of the underground mine that may fall unexpectedly.
- ML/ARD MP: Metal Leaching/ Acid Rock Drainage Management Plan.
- Muck: blasted rock.
- PPE: Personal Protective Equipment incl. hearing protection, boots with meta-tarsal protection, coveralls, W-65 self-rescuer and miners belt.
- QA/QC: Quality Assurance and Quality Control.
- Rib: Vertical wall of the underground mine.
- Slimes: fine-grained sediment generated during mining activities.
- TOC: Total Organic Carbon.
- TSS: Total Suspended Solids.
- VOK: Valley of Kings.
- WZ: West Zone.

Roles and Responsibilities

The Mine Manager or Designate is responsible for:

- Ensure this procedure is implemented and followed.

The Health and Safety Manager or Designate is responsible for:

- Ensure this procedure complies with H&S regulation.

The Area Manager or Designate is responsible for:

- Ensure this procedure is followed and sampling is completed on time.

The Worker is responsible for:

- Ensure this procedure is followed for all sump monitoring and sampling.

Preparation

Hazards

- Noise.
- Air quality.
- Unstable ground.
- Loose.
- Unstable slimes.
- Heavy equipment interactions.
- Working near hazardous chemicals.
- Slips, trips, and falls.

Tools

- YSI ProPlus/DSS multi-meter (if available) or Oakton probe.
- Geopump and charged battery.
- Vinyl gloves.
- HDPE Peristaltic tubing.
- Masterflex silicon tubing.
- Waterra cutters.
- Waterra inline filters. (0.45 µm)
- DI water.
- Water-proof markers.
- Sample labels.
- Data sheets.
- Camera.
- Cooler containing sample bottles and preservatives as per Table 1.
- Blue flashing hard hat light.

Requirements

- Trained and qualified to conduct water-quality sampling – review and sign off on this SOP.
- FLHA completed at the job site.
- Underground driver training or chaperone.
- Underground orientation.
- Full underground PPE.

Job Step

1. Arrange Transportation

- Contact the Mine Captain and arrange access to a truck (only if you are trained and signed off to drive underground) or a chaperone.

2. Attend Underground Morning Meeting

- Inform Procon Superintendent that you will be conducting sump sampling and ask that an announcement be made to the miners to be aware of personnel working around the sumps.
- Obtain a copy of the production and development lineups or travel with someone knowledgeable about underground mining.

3. Field Preparation

- Calibrate pH/conductivity meter.
- Collect and label field supplies and place in a cooler with ice packs.
  - Label sample bottles with the date, sample ID and parameters of analysis as provided in Table 1.
  - Samples are labeled by elevation, e.g. “SUMP-1230” for the sump on the 1230 level.
  - Samples are collected at the sumps on 1110, 1170, 1230, 1290, 1380W, and 1410W if water is available.
  - Additional sumps may be added as mine development progresses.
- Prepare one duplicate sample and a field blank sample for every quarterly sample set.
- Add a bottle set for one extra sample to the cooler.

4. Mob to Sump

- Plan order of sample collection to minimize exposure to haul traffic e.g., if a scoop will be working on 1230 in the morning, but not in the afternoon, wait until the afternoon to sample SUMP-1230.

  Note: the mining plan may change over the course of the day so check with Superintendent or Shift Boss.
- **Alert haul traffic to your presence as you arrive at each sump.**
- **Use a hand-held radio to monitor haul truck traffic and be aware that a haul truck may pull into a level unexpectedly.**
- **If sump must be collected on a level with active hauling, use a spotter.**
- **If sampling cannot be conducted safely, do not sample.**
- **Do not walk on slimes as they may liquify.**

5. Collect Sump Sample

- Review BJ-ENV-SOP-028 for general sample collection and handling procedures.
- Set up the peristaltic pump, being careful to keep the tubing and the pump clean**.**
  - Place the pump case on a flat, stable surface near the sump and place the pump and battery on top of the case.
  - Cut an 8” piece of silicon tubing.
  - Cut one 18” piece of HDPE tubing, and a second piece long enough to reach from the pump location to the sump.
  - Attach the HDPE tubing to the silicon tubing and feed the silicon tubing into the pump housing.
  - Ensure the flow is in the correct direction by toggling the flow direction switch.
  - **When selecting a location, be aware that water levels in the sump can change rapidly when pumps cycle on or off.**
- Put on vinyl gloves. Replace gloves if they become contaminated and between each sample.
- The sample should be collected from the ponded sump water, but may be collected from the inflow into the sump if access restricted by presence of slimes.
- When filling bottles, keep end of tubing near surface of sump to minimize entrainment of slimes.
- Fill and preserve (as specified in Table 1) bottles for general parameters, total metals and nutrients.
- Attach waterra inline filter and fill and preserve (as specified in Table 1) bottles for dissolved metals and DOC and total dissolved P.
- Collect measurements of temperature, conductivity and pH using the Oakton probe
- Fill in data sheet (see Appendix I).
- Take a photo of the sump.

6. QA/QC Samples

- Collect one field duplicate by filling a second set of bottles with sump water at a given location, using the filtering and preservation procedures described in Table 1 and Step 5. This sample is identified by -98, e.g., SUMP-1230-98.
- Collect one field blank by filling an additional set of bottles with DI water using the filtering and preservation procedures described in Table 1 and Step 4. This sample is identified by -99, e.g., SUMP-1230-99.
- Collect QA/QC samples on a level with low traffic and/or adequate refuge.

7. Complete COC

- Complete COC as per example in Appendix II.

8. Ship Samples

- Ship samples to the analytical Laboratory (currently ALS Global in Burnaby, BC).
- Use adequate ice packs to ensure that the samples arrive at the laboratory <10°C.

Table 1: Sample Volume and Preservation Requirements

Bottle Volume and Type	Field Preservation	Field Filter	Refrigerate (4 °C)	Indicate on Bottle	Parameter(s) to be indicated on COC
500 mL plastic	None	No	Yes	Generals	pH, conductivity, TSS, turbidity, alkalinity, acidity, and anions
60 mL plastic	0.8 mL 1:4 HNO_3 (18%)	No	Yes	Total Metals	Total metals incl. Hg (BCMDG)
60 mL plastic	0.8 mL 1:4 HNO_3 (18%)	Yes	Yes	Dissolved Metals	Dissolved metals incl. Hg (BCMDG)
125 mL amber	1 mL 1:3 H_2SO_4	No	Yes	Nutrients	Phosphate, TOC, T-N, and ammonia
125 mL amber	1 mL 1:3 H_2SO_4	Yes	Yes	DOC and T-Diss-P	DOC and total dissolved P

Standard Operating Procedure:
Seep Inspection and Sample Collection

PRETIVM		PVG-ENV-SOP-022 Seep Monitoring	
Department: Environment	**Manager/Designate**: Robin McCall	**Revision Number**: 2	**Creation Date**: 2018-06-27 **Revision Date**: 2020/10/06

Objective

To describe the steps required for collection of quarterly water samples from the underground seeps as per the ML/ARD MP.

Scope

All activities related to the monitoring of underground seeps.

Health, Safety & Reclamation Code for Mines in British Columbia

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

Definitions

- Back: ceiling of the underground mine
- BCMDG: British Columbia Mine Design Guidelines
- DI water: De-Ionized water
- DO: Dissolved Oxygen
- DOC: Dissolved Organic Carbon
- COC: Chain of Custody
- Cross cut: drive off main level developed to access stopes.
- Loose: Rock on the ribs and back of the underground mine that may fall unexpectedly
- ML/ARD: Metal Leaching/ Acid Rock Drainage
- Muck: blasted rock
- PPE: Personal Protective Equipment incl. hearing protection, boots with meta-tarsal protection, coveralls, W-65 self-rescuer and miners belt
- QA/QC: Quality Assurance and Quality Control
- Rib: Vertical wall of the underground mine
- Shifter: underground supervisor
- Slimes: fine-grained sediment generated during mining activities
- TOC: Total Organic Carbon
- TSS: Total Suspended Solids
- VOK: Valley of Kings
- WZ: West Zone

Roles and Responsibilities

The Mine Manager or Designate is responsible for:

- Ensure this procedure is implemented and followed.

The Health and Safety Manager or Designate is responsible for:

- Ensure this procedure complies with H&S regulation.

The Area Manager or Designate is responsible for:

- Ensure this procedure is followed and sampling is completed on time.

The Worker is responsible for:

- Ensure this procedure is followed for all seep monitoring and sampling.

Preparation

Hazards

- Noise
- Air quality
- Unstable ground
- Loose
- Unstable slimes
- Heavy equipment interactions
- Working near hazardous chemicals
- Slips, trips, and falls

Tools

- pH probe
- 4 L plastic beaker
- Vinyl gloves
- 0.45 µm syringes filters and syringes
- Sample bottles as per Table 1
- Aluminum seep tags
- Hammer
- Flagging tape
- Seep maps
- DI water
- Water-proof markers
- Sample labels
- Data sheets
- Camera
- Cooler containing sample bottles and preservatives as per Table 1
- Blue flashing hard hat light
- Hand-held radio with underground channels

Requirements

- Trained and qualified to conduct water-quality sampling
- Underground orientation (visitor or full)

Job Step

1. Preparation

- Contact the Mine Captain and arrange access to truck (only if you are certified to drive underground) or transportation.
- Obtain the most recent seep location figures from the Geochemist.
- Review locations of known acidic seeps (Table 2).
- Prepare the seep sampling and reconnaissance plan.

2. Attend Underground Morning Meeting

- Obtain a copy of the production and development lineups or travel with someone knowledgeable about underground mining.
- Schedule the order of seep monitoring to minimize exposure to haul traffic e.g., if a scoop will be working on 1200 level in the morning, but not in the afternoon, schedule 1200 level monitoring for the afternoon.

  Note: the mining plan may change over the course of the day.
- **Do not travel by foot on levels where remote mucking is occurring without first contacting the remote scoop operator (identified by blue flashing light at level access).**

3. Seep Monitoring

- Review BJ-ENV-SOP-028 for general sample collection and handling procedures.
- Consult map of previous seep locations (Appendix I contains maps of seep locations as of October 2019, current seep maps can be found here: J:\Environmental\03 Monitoring Programs\ML-ARD\Underground\Seeps).
- **Be aware of ventilation conditions. Unused cross cuts with no vent tubing are not ventilated. Cross cuts with vent tubing choked off are not ventilated. Do not travel more than 10 m beyond the end of vent tubing in a cross cut.**
- **Main level drives with ventilation raises at the end are ventilated, even if no vent tubing is present.**
- **Monitor known seeps on all portions of accessible level (cross cuts may be inaccessible due to the presence of muck, lack of ventilation or a barricade).**
- **DO NOT cross barricades without authorization from the Shifter.**
- **Authorization to cross a barricade must be obtained each time**.
- When a seep is encountered, evaluate the seep to determine if it is possible to monitor.
  - If the presence of loose makes the area hazardous to monitor, scale the loose if possible, or alert the Shifter to the presence of hazardous conditions.
  - Seeps that flow across vent tubing should not be monitored.
  - Seeps with very low flow rate cannot be monitored.
  - Seeps within 10 m of an open stope will not be monitored.
- Place the 4 L plastic beaker underneath the seep and rinse three times with approximately 15 mL of seep water each time.
- Return the 4 L plastic beaker to the seep and collect enough seep water to rinse the end of the Hanna probe and conduct temperature, pH and conductivity measurements.
- If the pH is <6 and the conductivity is >200 µS/cm, discard the aliquot used for measuring field parameters, and collect 1 L of seep water for a complete sample for laboratory analysis (see Table 1).
- Label each sample with the seep number, e.g., SEEP-001, date and parameters of analysis as provided in Table 1.
- Filter and preserve the sample as indicated in Table 1.
- Fill in the data sheet (see Appendix II). For new seeps, record the seep location and sketch it on the map.
- Take photos of the seep.

4. QA/QC Samples

- Collect one field duplicate for every 10 samples by filling a second set of bottles with seep water at a given locations using the filtering and preservation procedure described in Table 1 and Step 3. This sample is identified by -98, e.g., SEEP-001-98.
- Collect one field blank for every 10 samples by filling an additional set of bottles with DI water at a monitoring station using the filtering and preservation procedure described in Table 1 and Step 3. This sample is identified by -99, e.g., SEEP-001-99.

- Collect QA/QC samples on a level with low traffic and/or adequate refuge.

5. Complete COC

- Complete COC as per example in Appendix III.

6. Ship Samples

- Ship samples to the analytical Laboratory (currently ALS Global in Burnaby, BC).
- Use adequate ice packs to ensure the samples arrive at the laboratory <10°C.

Table 1: Sample Volume and Preservation Requirements

Bottle Volume and Type	Field Preservation	Field Filter	Refrigerate (4 °C)	Indicate on Bottle	Parameter(s) to be indicated on COC
500 mL plastic	None	No	Yes	Generals	pH, conductivity, TSS, turbidity, alkalinity, acidity, and anions
60 mL plastic	0.8 mL 1:4 HNO_3 (18%)	No	Yes	Total Metals	Total metals incl. Hg (BCMDG)
60 mL plastic	0.8 mL 1:4 HNO_3 (18%)	Yes	Yes	Dissolved Metals	Dissolved metals incl. Hg (BCMDG)
125 mL amber	1 mL 1:3 H_2SO_4	No	Yes	Nutrients	Phosphate, TOC, T-N, and ammonia
125 mL amber	1 mL 1:3 H_2SO_4	Yes	Yes	DOC and T-Diss-P	DOC and total dissolved P

Table 2: Known Acidic Seep Locations

Seep No.	Level	Location	Description
Seep-007	1380-22	Borehole on back, located 7 m into XC	Decrease from original pH of 7.9 and increase in Fe oxide precipitation since first observation in 2016.
Seep-044	1350-25	Borehole on back, located 12 m into XC	Borehole was grouted between initial observation in 2018 and subsequent monitoring in 2019. pH of seep increased from 4.6 to 8.0 following grout application. BH drilled in 2011, maximum distance to breakthrough on 1410 is 80 m.
Seep-053	VOK Portal	Multiple boreholes on face	Located in cutout on west side of VOK portal near doors. Extensive Fe oxide precipitation generated from multiple flowing boreholes
Seep-054	1320-12	Fracture on rib, located ~140 m into XC	Two well developed areas of Fe oxide precipitation, sample collected from the smaller area with no interference from bolt.
Seep-055	1320-W	Borehole on back, located ~25 m from level access	Minimal Fe oxide precipitation. Slow flow observed during initial sample collection (~100 mL/min).
Seep-056	1410-E	Borehole on back, located at intersection with XC12	Moderate Fe oxide precipitation, moderate flow observed during initial sample collection.

Standard Operating Procedure:
Mine Wall Washing Water Quality Sampling

PRETIVM		PVG-ENV-SOP-038 Mine Wall Washing Water Quality Sampling	
Department: Environment	**Manager/Designate**: Robin McCall	**Revision Number**: 3	**Creation Date**: 2017/09/29 **Revision Date**: 2020/10/06

Objective

To provide guidance for collection of water quality samples and solid phase surface products from underground walls as well as bulk samples of muck from underground floors.

Scope

All activities related to the collection of sediment samples and water quality samples associated with mine wall washing stations. This includes sample collection protocols, collection of field measurements, quality assurance and quality control (QA/QC) requirements, shipping and handling details, completion and verification of chain of custody (COC) form and analytical parameters, communications with the analytical laboratories and documentation of field measurements and notes.

Health, Safety & Reclamation Code for Mines in British Columbia

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

Definitions

- BCMDG: British Columbia Mine Design Guideline (i.e. cost-effective low-level detection limits)
- DI water: De-ionized water
- DO: Dissolved Oxygen
- ML/ARD: Metal Leaching/ Acid Rock Drainage
- QA/QC: Quality Assurance and Quality Control
- QP: Qualified Professional
- PPE: Personal Protective Equipment
- TSS: Total Suspended Solids
- VOK: Valley of the Kings

Roles and Responsibilities

The Mine Manager or Designate is responsible for:

- Ensure this procedure is implemented and followed.

The Health and Safety Manager or Designate is responsible for:

- Ensure this procedure complies with H&S regulation.

The Area Manager or Designate is responsible for:

- Ensure this procedure is followed and compliance sampling is completed on time.

The Worker is responsible for:

- Ensure this procedure is followed for all mine wall station sampling.

Preparation

Hazards

- Slips and falls

- Working in areas where explosives are being utilized
- Noise
- Heavy equipment interactions
- Loose
- Poor air quality
- Working near hazardous chemicals

Tools

- PPE
- Powderless vinyl gloves
- Camera
- Hand lens
- Field book/ pencil
- Sample bags (small whirlpak and large poly)
- Sample tags
- Zip ties
- Measuring tape
- Rock hammer/ scraping tool
- Collection paper
- Grubbing tool
- Water sample bottles and preservative as per Table 1 (one set per site)
- 1000 mL plastic beaker
- Squeeze bottle with graduated volume
- pH/conductivity meter
- waterproof markers
- disposable syringes (one per site plus spares)
- disposable 0.45 µm disc filters (10 per site)
- 1 L of DI water (per site)
- Cooler with ice packs
- Water quality sample labels
- COC form

Requirements

- Trained and qualified to conduct sediment and water quality sampling
- Knowledge of wall washing monitoring program
- Underground driver training or chaperone
- Underground orientation (visitor or full)

Job Step

Monitoring of each wall washing station will occur annually.

1. Inspection and maintenance

- Wall washing station locations are shown in Appendix I.
- An example of a wall washing station is provided as Figure 1.
- Wall washing experiments will be conducted on an annual basis. It is recommended that each station be inspected occasionally between sampling events, and at a minimum two weeks before the scheduled sampling so that any necessary repairs can be completed well before the sampling event.

- Inspect the station for loose edging and broken seals against the rock.
- Repair any problems immediately to avoid losing wall wash water through broken seals.
- Record a note if any condensation is observed and if any water may have condensed and trickled out of the station between sampling events.
- Report any issues or concerns with the station set-up to the QP. Report all repairs and possible loss of sample to the QP.

2. Field preparation

- Review BJ-ENV-SOP-028 if necessary.
- In the lab, calibrate pH/ conductivity meter according to instructions included with the probe.
- Ensure graduated volumes are still visible on the squeeze bottle and collection container.
- Prepare water sample bottles by using the provided labels to label the bottles with Date, Sample ID (see Table 2) and parameters of analysis (see Table 1)
- Collect ice packs and water sample supplies and place in the cooler.
- Collect field supplies for solids sample collection.

3. Collection of floor sediments

- Put on gloves.
- Using the grubber, dig a small pit in the sediments accumulated on the floor below the wall washing station. Dig until bedrock is encountered and measure the depth of the muck.
- Record information about the muck in your field book such as depth to bedrock, visible differences, sample tag ID, any large cobbles removed from sample and photo number.
- Collect a 5 kg composite sample of the entire profile depth and place in a sample bag with a sample tag.

4. Collection of surface products

- Put on new vinyl gloves.
- Inspect the wall surface outside of the isolated rock surface for any surface alteration phases.
- Using a clean scraping tool, scrape the wall rock to remove surface products. A minimum of 10 g is required. Collect scrapings on a piece of paper held below the location being scraped. This sample will be limited therefore it is imperative that there is no loss of sample. Gently funnel the collected products into a small whirlpak bag.
- Add a sample ID tag to the bag and identify the sample location on the sample ID. Indicate the Sample ID, station and time of collection in your field book.
- Record any observations about the sample or section of wall from which the sample was removed (e.g., colour and size of surface phase, obvious concentrated sulphides on wall in proximity to sample, etc.).
- Photograph any visible oxidation products.
- Surface products may not be visible or may not be present in the early stages of mine development and wall exposure. If after five years of exposure no products are visible, the QP should be informed and a sample collection attempted.

5. Wall washing procedure and sample collection

- Two people are required for this task.
- Put on new vinyl gloves before collecting sample.
- Carefully remove the plastic sheet and place it somewhere clean and dry.
- Record any condensation that has accumulated or trickled out of the station.
- Using DI water and the squeeze bottle, rinse away any solid products that have accumulated on the lower trough.
- After cleaning the trough, prepare to rinse the wall surface with 500 mL of DI water. Place the 1000 mL beaker at the downstream end of the lower trough to catch rinse water. It is important to catch all rinse water in the collection container.

- With the squeeze bottle, carefully spray 500 mL over the entire isolated rock surface to rinse the area thoroughly.
    - Begin at the top and methodically move across the area in a uniform manner.
    - Ensure that the entire area is wetted with water.
    - Gently squeeze the water onto the surface to avoid water spray outside of the target area.
- Fill the collection container by holding the bottle below, or within, the drip without allowing the mouth of the container to come in contact with the plastic edging or the rib.
- Record the volume of water sprayed on the rock and the amount of water recovered in the collection container. Note any areas where water escaped the target area through fractures or damaged edging.
- Record the volume of particulate that settles on the bottom of the collection container.
- If insufficient rinsate is recovered to fill all sample bottles, fill the bottle for dissolved metals, and put a minimum of 100 mL in each of the other two bottles. Inform the QP if there is not enough rinsate to meet this requirement. The volume of DI water applied to the area may need to be revised.
- Put on a new pair of gloves.
    - Fill the water sample bottles in the order identified in Table 1.
    - Filter and preserve the sample as indicated in Table 1.
- If there is sufficient sample remaining in the collection container, measure the pH, temperature and conductivity with the pH/ conductivity probe.
- Take a photo of the wall washing station.
- Record any pertinent notes in your field book.
- Collect the QA/QC sample described in Section 6.
- Reattach the plastic sheet to the perimeter edging with the metal or plastic clasps, ensuring the plastic sheet does not touch the rock surface. The plastic cover prevents spray and groundwater infiltration from reaching the isolated rock surface and contaminating or rinsing the surface.

6. Description of QA/QC sample

- Prepare a field blank using DI water.
- Fill a set of three bottles with DI water during sampling of one of the wall washing stations. This sample should be collected by pouring DI water into the syringe and filtering and preserving the bottles in the same manner as described for the rinsate.
- Label these bottles as MW-#-99, where the # refers to the station location where the sample was collected, e.g., MW-VSF-1-99.

7. Shipping and analytical parameters

- All water quality samples are to be shipped via courier to an accredited laboratory (currently ALS Laboratories in Burnaby) immediately after collection for analysis of the parameters listed in Table 1. The address for the lab is provided in Appendix II.
- All floor sediment samples and surface product samples are to be shipped to an accredited laboratory (currently SGS Laboratories in Burnaby) immediately after collection. The address for the lab is provided in Appendix III.
- All floor sediment samples are to be analyzed for the parameters listed in Table 3, below.
- All surface product samples are to be analyzed using Rietveld Refined X-ray Diffraction.
- A completed COC form is to be shipped with all samples and an electronic version send via email to the accredited laboratory and any other appropriate parties (such as QP) communicating that the samples are in transit.

8. Data tracking and analysis

- Data will be compiled and evaluated by the Environmental Manager or Designate

Figure 1: Example of Wall Washing Station Covered by Plastic Sheeting

Table 1: Summary of Bottles, Preservation and Analytical Parameters for Water Quality Samples

Bottle and Volume	Field Preservation	Field Filter	Refrigerate (4°C)	Indicated on Bottle	Parameters
60 mL plastic	HNO_3	Yes	Yes	Dissolved Metals	Dissolved Metals (BCMDG)
125 mL amber glass	H_2SO_4	No	Yes	Nutrients	Total ammonia and total nitrogen
250 mL plastic	None	No	Yes	General Chemistry	pH, conductivity, alkalinity (bicarbonate, carbonate, hydroxide), acidity, anions (Cl, F, SO4, NO2-N and NO3-N)

Table 2: Wall Washing Station IDs and Geologic Waste Rock Units

Underground Model Unit	No. to be Established	Location Description	Station ID
Fragmental (V12)	3	VOK Access Ramp Bypass 1	MW-V12-1A
		VOK Access Ramp Bypass 1	MW-V12-1B (destroyed)

Standard Operating Procedure:
Mine Wall Station Installation

PRETIVM		BJ-ENV-SOP-039 Mine Wall Station Installation	
Owner: Colleen Atherton	Approver: Torence Sandhals	Revision Number: 1	Creation Date: Sept 29, 2017 Revision Date: Oct 20, 2018

Objective

To outline the procedure for installing mine wall washing stations.

Scope

Activities related to the installation of mine wall washing stations. For wall washing and sample collection for oxidation minerals and floor sediments, see BJ-ENV-SOP-038

Health, Safety & Reclamation Code of BC

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment

Definitions

- ML/ARD: Metal Leaching/ Acid Rock Drainage
- QP: Qualified Professional
- PPE: Personal Protective Equipment

Preparation

Hazards

- Slips and falls
- Working in areas where explosives are being utilized
- Noise
- Heavy equipment interactions
- Loose
- Poor air quality
- Hand injury

Tools

- PPE
- Powderless vinyl gloves
- Camera
- Hand lens
- Cutting device
- Field book/ pencil
- Measuring tape
- Rock hammer
- Rock drill and drill bits
- 4.5 m of 90°-bent, flexible vinyl stair nosing
- 3 tubes of pure silicon bathroom sealant (must be pure silicon) with applicator gun
- 1.2m by 1.2m piece of clear high-density polyethylene plastic sheeting (preferably 6 mm thickness to prevent tearing)
- 8 black metal alligator clasps often used for holding unbound reports
- Heavy duty scissors or tin snips

- Compass with clinometer
- Brushes
- Shop towels

Requirements

- Knowledge of wall washing monitoring program
- Underground driver training or chaperone
- Underground orientation (visitor or full)

Job Step

Note: The installation of a wall washing station occurs only once to establish the monitoring site. Currently, five stations have been constructed and an additional two stations are proposed for six different locations based on current exposures underground. As the mine develops, additional stations may need to be developed.

1. UNDERGROUND SURVEY

- In advance of developing the wall washing stations, review geologic mapping to identify prospective locations in low traffic areas for each model unit listed in Table 1.
- After identifying prospective locations, visit each area to determine if the location contains an appropriate 1m by 1m site for station installation.
- The following conditions should be considered when selecting a site:
  - Relatively flat surface of rock, preferably with no surface fractures;
  - In a section of the mine that:
    - has been exposed for at least three years,
    - is no longer being actively mined,
    - will not receive heavy traffic (i.e., not on an active haul route), and
    - will not receive paste backfill (at least until near end of operations); and
    - Away from obvious groundwater seeps or drainage routes;
  - Away from areas of shotcrete usage;
  - Away from infrastructure related oxidation/weathering (e.g., orange staining around bolts); however,
  - If available, select areas of visible oxidation/weathering.
- Underline the target area (1 x 1 m) at each site with spray paint and record the location description (i.e., zone, level, reference site) in your field book. Spray paint the station name on the rock above or below the station.
- Photograph the target exposure with the station name.

2. FIELD PREPARATION

- Collect field supplies for installation of wall washing station (see list above). Ensure proper amount of supplies based on number of stations to be established (Table 1).

3. INSTALLATION PROCEDURE

- Select a 1 x 1 m section of rock based on the conditions listed above for the Underground Survey. Figure 1 below is provided for reference.
- Brush slimes off the rib in the area the edging will be installed. Do not brush slimes off the area that will be rinsed with DI water following installation.
- With gloved hands, mark the intended perimeter of the station on the surface with a permanent marker. Due to imperfections in the rock surface, the actual area isolated may be less than one square meter.
- Holding the vinyl nosing against the rock surface, drill through the nosing and into the rock surface.

- Cut the plastic edging to the length required for each limb.
- Secure each limb to the rock surface using masonry screws or expanding rock bolts.

Note: the lowest (bottom) limb must slope downwards from horizontal so that all water caught on it will drain in one direction for collection (Figure 1).

- Seal each limb to the rock surface using pure silicon sealant.
    - Ensure silicon sealant fills all open spaces between the edging and the rock surface so that no water can pass underneath.
    - Ensure each limb overlaps so that no large gaps exist at any junction; seal any smaller gaps with silicon.
    - Ensure the upper limb(s) overhang lower limbs to divert wall runoff around the sides of the station so that the water will not flow over the isolated area.
- Measure the length and angle of each limb and record these details in your field book. Record any other notes about the station such as visible oxidation, location of fractures, sketch of the station, etc.
- Photograph the completed wash station.
- Proceed to wall cleaning. For the first sample collection use 1 L of DI water, but otherwise follow the procedure for sample collection outlined in BJ-ENV-SOP-038
- Otherwise,
    - Cut a clear plastic sheet to extend 2 cm over each limb.
    - attach the plastic sheet to the perimeter edging with the metal or plastic clasps, ensuring the plastic sheet does not touch the rock surface. The plastic cover prevents spray and groundwater infiltration from reaching the isolated rock surface and contaminating or rinsing the surface.

Figure 1: Example of Wall Washing Station (from Morin and Hutt, 2001)

Table 1: Wall Washing Station IDs and Geologic Waste Rock Units

Underground Model Unit	No. to be Established	Location Description	Station ID	Status*

Standard Operating Procedure:
WTP Influent/Effluent Water Quality Sampling

PRETIVM		PVG-ENV-SOP-035 Water Treatment Plant Sampling	
Department: Environment	**Manager/Designate**: Robin McCall	**Revision Number**: 2	**Creation Date**: 2018/11/15 **Revision Date**: 2020/10/06

Objective

To provide guidance for Pretivm personnel for collection of samples from the Water Treatment Plant (WTP) in conformance with Effluent Permit (PE-107835) requirements.

Scope

Activities related to collection of samples from the WTP influent, contact water influent, process water influent clarifier, freshwater and effluent

Health, Safety & Reclamation Code for Mines in British Columbia

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

Definitions

- BCMDG: British Columbia Mine Design Guideline (i.e., cost-effective low-level detection limits)
- DI water: De-ionized water
- DO: Dissolved Oxygen
- DOC: Dissolved Organic Carbon
- EPH: Extractable Petroleum Hydrocarbons
- Field parameters: pH, specific conductivity, temperature, DO
- PE-107835: Environmental Management Act Effluent Permit
- TOC: Total Organic Carbon
- TDS: Total Dissolved Solids
- TSS: Total Suspended Solids
- VH: Volatile Hydrocarbons
- VOC: Volatile Organic Compounds
- WTP: Water Treatment Plant

Roles and Responsibilities

The Mine Manager or Designate is responsible for:

- Ensure this procedure is implemented and followed.

The Health and Safety Manager or Designate is responsible for:

- Ensure this procedure complies with H&S regulation.

The Area Manager or Designate is responsible for:

- Ensure this procedure is followed and compliance sampling is completed on time.

The Worker is responsible for:

- Ensure this procedure is followed for all WTP sampling.

Preparation

Hazards

- Noise
- Heavy equipment interactions

- Working near hazardous chemicals
- Slips, trips, and falls

Tools

- YSI ProPlus/DSS multi-meter
- Sample bottles and preservatives as per Table 1
- Disposable syringes
- Disposable 0.45 µm disc filters
- Vinyl gloves
- Water quality field data sheets
- Camera
- ~ 500 mL grab sampler (stored at WTP)

Requirements

- Trained and qualified to conduct water-quality sampling
- Mill orientation or guide

Job Step

Samples from the mine influent, contact water influent, process water influent, effluent and fire water will be collected twice per month.

1. **Field preparation**
   - Notify the WTP Operator 48 hours before collecting samples and request composite samplers be cleaned.
   - Calibrate multi-meter at lab.
   - Review BJ-ENV-SOP-028 Generic Water Sample Collection if necessary.
2. **Label sample bottles as per requirements and schedule in Appendix I.**
   Sample IDs are:
   - WTP-OUT-E302957
   - WTP-IN-Mine Water-E303052
   - WTP-IN-Process Water
   - WTP-IN-CWP-E303053
   - WTP-IN-CLARIFIER
   - Fire Water
3. **Enter Mill**
   - Report to control room and fill in sign in sheet located on clipboard outside of control room door. Contact WTP operator on shift and inform them that you are taking samples and request assistance if needed.
4. **At sample station, put on vinyl gloves**
   - Change gloves before every sample and when they become dirty or contaminated.
5. **Grab sample locations**
   - The clarifier overflow sample is taken as a grab sample using a long-handled sampler. This sample is taken from the top floor of the WTP from the walkway overlooking the underground clarifier. Rinse the grab sampler with DI water and wipe clean with a shop cloth. Rinse the grab sampler three times with clarifier overflow prior to sample collection.
   - The fire water sample is collected from the fresh/fire water pumps located beside the fresh/fire water tank in the southwest corner of the mill. There are three pumps and not all will be running simultaneously. Check the back of the motor casing to check the fan is running and select an active pump for sampling. Flush the valves for 30 seconds prior to sampling.

- Fill the general chemistry bottle.
- Agitating the general chemistry bottle after every aliquot is removed, use the general chemistry bottle to fill the nutrients bottle, followed by the total metals bottle.
- Filter an aliquot of sample from the general chemistry bottle into the dissolved metals bottle.
- Discard the sample remaining in the general chemistry bottle.
- Refill the general chemistry bottle with a fresh aliquot from the clarifier overflow.
- Preserve all bottles as indicated in Table 1.

6. Composite sample locations

- On top of the metal precipitation reactor (MPR) are the autosamplers for the process water and UG mine water influent. The CWP influent autosampler is located on the ground level along the eastern wall of the WTP. The final treated effluent autosampler is located on top of the final treated effluent tank. Access for these tanks are from the bottom floor of the mill.
- Composite samplers are maintained by the WTP Operator as per BJ-PRO-SOP-607.
- Samples are collected from the composite samplers maintained by the WTP.
- Water from the autosampler will be transferred to a 20 L bucket by the WTP Operator. This bucket will be left on the autosampler platform covered by a loose lid.
- Agitate the 20 L bucket prior to transferring an aliquot into each sample bottle.
- Collect sample using a new disposable syringe.
- Filter and preserve sample if required as per Table 1.

7. Collect QA/QC samples

- Collect one duplicate sample by collecting an additional bottle set for one of the sample locations. This sample will be identified by -98, e.g., WTP-OUT-98.
- Collect one field blank by filling an additional bottle set for one of the sample locations with DI water. Preserve the field blank as per the requirements in Table 1. This sample will be identified by -99, e.g., WTP-OUT-99.

8. Record field parameter measurements

- Using an aliquot of sample that will not be sent to the lab for analysis, measure the pH, specific conductivity, DO, turbidity, and temperature using the YSI ProDSS.
- In the case that the YSI ProDSS is unavailable, use the YSI ProPlus (or equivalent) to measure pH, conductivity, DO, and temperature. Collect an aliquot of sample that will not be sent to the lab for analysis. Upon return to the lab, measure the turbidity of the sample using a Lamotte 2020we turbidity meter.

9. Record site specific observations on the water quality form, such as:

- Station ID (i.e., WTP-OUT): consistent with each task being completed at the site (i.e., bottle labels, digital files, etc.).
- Samplers: the initials of all samplers present.
- Site conditions (e.g., plant shut down due to maintenance, composite sampler needs cleaning).
- Photo ref: the number of photos taken, if any, and photo file number on camera.
- Notes on any unusual occurrences, such as deviations from standard procedure, water colour or odour, algal growth, foreign substances (e.g., oil or surface film), etc.

10. Complete COC

- Complete COC as per example in Appendix I.

11. Ship samples

- Ship samples to the analytical Laboratory (currently ALS Global in Burnaby, BC).
- Use adequate ice packs to ensure that the samples arrive at the laboratory <10°C.

12. Data tracking and analysis

- Data will be compiled and evaluated by the Environmental Manager or designate.

- If exceedances of threshold limits as defined in the ML/ARD Management Plan occur, then the Mine Manager must be informed and actions outlined in the ML/ARD Management Plan must be taken.

Table 1: Summary of Bottles, Preservation, and Analytical Parameters for Samples

Bottle Volume and Type	Field Preservation	Field Filter	Refrigerate (4°C)	Indicate on Bottle	Parameter(s) to be indicated on COC	Locations	Frequency
500 mL plastic	None	No	Yes	General Chemistry	pH, conductivity, hardness, alkalinity, anions, Ortho P, TSS, TDS, and turbidity	All	2x per month
60 mL plastic	HNO_3	No	Yes	Total Metals	Total Metals (BCMDG)	All (except Fresh Water)	2x per month
60 mL plastic	HNO_3	Yes	Yes	Dissolved Metals	Dissolved Metals (BCMDG)	All (except Fresh Water)	2x per month
60 mL plastic	NaOH	Yes	Yes	D-Cr(VI)	Dissolved Cr(VI)	WTP-IN-Mine Water	When D-Cr >10 ug/L
40 mL glass	HCl	No	Yes	Total Hg	Total Hg	WTP-OUT	sQuarterly
40 mL glass	HCl	Yes	Yes	Dissolved Hg	Dissolved Hg	WTP-OUT	sQuarterly
125 mL amber	H_2SO_4	No	Yes	Nutrients	TOC, Total P, T-N and ammonia	All	2x per month
2x 100 mL amber	Sodium bisulphate	No	Yes	EPH	EPH	All (except Clarifier and Fresh Water)	2x per month

Standard Operating Procedure:
Tailings Supernatant and Solids Sampling

PRETIVM		PVG-ENV-SOP-007 Tailings Grab Sample Collection	
Department: Environment	**Manager/Designate**: Robin McCall	**Revision Number**: 3	**Creation Date**: 2017/11/15 **Revision Date**: 2020/10/06

Objective

To provide guidance for Environmental personnel regarding the collection of tailings slurry samples and the processing of tailings supernatant and solids.

Scope

All activities related to the collection and processing of tailings slurry solids and supernatant.

Health, Safety & Reclamation Code for Mines in British Columbia

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

Definitions

- Thickened tailings – Collected from the Tailings Thickener Underflow as it discharges into the Paste Stock Tank (PST) or the Tailings Disposal Surge Tank (TDST)
- ABA – Acid base accounting
- BCMDG – British Columbia Mine Design Guideline
- COD – Chemical Oxygen Demand
- DI water – De-ionized water
- DOC – Dissolved Organic Carbon
- HDPE – High-density polyethylene
- ML/ARD – Metal leaching and acid rock drainage
- QA/QC – Quality assurance and quality control
- PPE – Personal Protective Equipment, including hardhat, steel toed boots, hearing protection and safety glasses.
- PC – Potentiometric titration
- SFE – Shake flask extraction
- TDS – Total Dissolved Solids
- TOC – Total Organic Carbon
- TSS – Total Suspended Solids

Roles and Responsibilities

The Mine Manager or Designate is responsible for:

- Ensure this procedure is implemented and followed.

The Health and Safety Manager or Designate is responsible for:

- Ensure this procedure complies with H&S regulation.

The Area Manager or Designate is responsible for:

- Ensure this procedure is followed and sampling is completed on time.

The Worker is responsible for:

- Ensure this procedure is followed for all tailings sampling.

Preparation

Hazards

- Noise Level < 100 dB: normal hearing protection required
- Overreaching/heavy lifting
- Slips and falls
- Working near machinery
- Working near hazardous chemicals

Tools

- PPE
- For Steps 1-4 below:
  - 2-4 empty and clean 5 gallon HDPE buckets
  - 2 empty and clean 2 L wide-mouth HDPE bottles
  - Sharpie
  - SGS sample labels
  - Field data record sheets
- For Step 6 below:
  - Powderless nitrile gloves
  - Field data record sheets (same copy as for Steps 1-4)
  - Camera
  - pH/conductivity meter
  - Small (narrow) clean plastic cup (for field measurements)
  - Cooler for supernatant samples containing:
    - 3 disposable 60 mL Syringes and 30 disposable 0.45 µm disc filters
    - 3 empty 500 mL polyethylene bottles (general chemistry)
    - 6 empty 125 mL acid washed polyethylene bottles (metals)
    - 6 empty 125 mL amber glass bottles (nutrients/TOC/COD and DOC/T-dissolved-P)
    - 6 vials of preservative for total and dissolved metals (nitric acid for acid washed polyethylene bottles)
    - 6 vials of preservative for nutrients (1 mL 1:1 sulfuric acid for amber glass bottles)
    - DI water for rinsing and field blank collection
    - minimum of two large ice packs
  - ALS sample labels
- ALS COC form
- SGS COC form

Requirements

- Trained and qualified to conduct sediment and water-quality sampling
- Knowledge of tailings slurry solids and supernatant sampling program
- Mill Orientation or escort from Mill personnel

Job Step

1. Prepare sample containers.

- Label two 5 gallon buckets and one 2L HDPE bottle with “Thickened Tailings”.
  - Label 5 gallon buckets “1 of 2” and “2 of 2”.
- Label one 2L HDPE bottle with “Cemented Tailings”.

- During the first sampling event of the year, label a second set of containers as per the instructions above and as describe in Step 8 for the Thickened Tailings sample as a duplicate.

2. Thickened Tailings Sample

This sample will be collected from the inflow to the Tailings Disposal Surge Tank during discharge to lake or from the Paste Stock Tank during paste production.

This sample requires two 5 gallon buckets and one 2L HDPE bottle.

- Remove the lid of the 5 gallon buckets.
- Using the Marcy Cup sampler, fill both of the 5 gallon buckets by filling the Marcy Cup from the discharge of the thickened tailings underflow into the TDST or the Paste Stock Tank.
- Replace the lid of the 5 gallon buckets.
- Remove the lid of the 2L HDPE bottle.
- Using the same technique as above, fill the 2L HDPE bottle.
- Replace the lid of the 2L HDPE bottle.
- Record the time of collection and any issues (e.g., mill shut down).
- If mill shut down occurs, stop sampling and wait one hour before resuming sampling. However, in the event of an unanticipated mill shutdown the tailings thickener tank will contain slurry, in which case continue to take the sample from the inflow to TDST as long as the paste plant had not been running prior to the mill shutdown. Note any shutdowns on the data sheet.
- If paste shutdown occurs, wait until paste resumes before resuming sampling.

3. Collect sample of Cemented Tailings

This sample will be collected from the ports of the paste mixer overflow with assistance from the Paste Operator.

This sample requires one 2L HDPE bottle.

- Remove the lid of the 2L HDPE bottle.
- Fill the 2L HDPE bottle with paste.
- Replace the lid of the 2L HDPE bottle.

4. Tailings Settling

- Transfer sample containers to the tailings settling area by the TSDT.
- Remove lids of 5 gallon buckets, then set lids back on top of buckets.
- Do not move buckets for 48 hours.

5. Supernatant Field Preparation

- Calibrate pH/conductivity meter according to manufacturer's instructions.
- Collect frozen ice-packs from freezer.
- Collect and prepare field supplies for supernatant in cooler (see list above).
- Using the provided labels and black marker, label the bottles with the date, sample ID, and parameters of analysis as provided in Table 1 and return the labeled bottles to the cooler.

6. Supernatant Sample Processing

- Put on gloves. Replace gloves between samples and if suspected of having made contact with a dirty surface.
- Open the 5 gallon bucket to expose the thickened tailings supernatant.
- Decant supernatant from both buckets into a clean container using a clean syringe.
- Fill a pre-labelled 500 mL polyethylene bottle to capacity using a new 60 mL syringe.
- Fill a pre-labelled 60 mL acid washed polyethylene bottle to capacity for total metals using the same syringe, leaving only enough room for the preservative. Add the preservative (nitric acid), screw the lid on, and invert the bottle to mix.

- Fill a pre-labelled 120 mL amber glass bottle to capacity for nutrients, TOC and COD using the same syringe, leaving only enough room for the preservative. Add the preservative (sulfuric acid), screw the lid on, and invert bottle to mix.
- Using the same syringe and a disc filter, fill a pre-labelled 60 mL acid washed polyethylene bottle to capacity for dissolved metals as shown in Figure 2. Add the preservative (nitric acid), screw the lid on, and invert the bottle.
- Fill a pre-labelled 120 mL amber glass bottle for DOC and total-dissolved P using the same syringe and a new disc filter.
- Siphon supernatant using the same syringe and dispense in the small plastic cup. Use this sample for pH and conductivity measurements. Record the measurements on the field data sheets (Figure 1). Discard the sample.
- Collect the QA/QC samples for supernatant described in Step 8 during the first collection event of the year.
- Make notes regarding the sample and sample collection on the field data sheet (Figure 1).

7. Solids Sample Processing

- Solids are collected in 2 L HDPE containers.
- Do not pour off the supernatant as this may result in loss of fines.
- Place a completed SGS sample tag in each container.
- Use electrical tape or parafilm to secure the lids closed prior to shipment. If using parafilm, stretch a piece of parafilm across the opening of the container without breaking the parafilm. Screw the lid on tight.
- Communicate any issues with sample collection and shipping to the Environmental Manager and QP.

8. Description of QA/QC Samples

Supernatant QA/QC Samples:

- One field duplicate sample and one field blank sample are to be collected during the first supernatant sampling event of the year.
- A field duplicate is a second sample (a second set of five bottles) collected during sampling of the supernatant and is intended to monitor the variability in sub-sampling. This type of sample is obtained by filling a second set of bottles, from a separate aliquot of slurry, and filtering and preserving the samples in the same manner as described in Step 6 and in Table 1. A new 50 mL syringe and new disc filters must be used for the field duplicate. Label these bottles as Supernatant-##-98.
- A field blank is prepared using DI water, and is intended to monitor any contamination that may occur during sample collection, handling and transportation. This type of sample is obtained by filling a set of five bottles with DI water during sampling of the supernatant and filtering and preserving the metals and nutrient bottles in the same manner as described for the test samples in Step 6 and Table 1. A new 50 mL syringe and new disc filters must be used. Label these bottles as Supernatant-##-99.

Solids QA/QC Samples:

- A field duplicate is obtained by collecting a second sample of the tailings solids in the same manner as described in Step 2 or 3 during the first sampling event of the year. This type of sample is intended to assess heterogeneity of the tailings solids. The field duplicate is collected in a separate 2L bottle with a unique sample ID. Label this sample as Tailings-##-98. Specify which type of tailings the duplicate is.

Precautions During Sampling

- Under extenuating circumstances, when there is not sufficient supernatant to fill a complete set of bottles, use the following criteria.

- Ensure sufficient water to measure field parameters, in particular pH. The hold time for pH is 15 minutes; therefore, laboratory analysis of pH is always past the hold time.
- Fill each bottle according to the minimum volumes listed in the last column of Table 2 below. The bottles do not need to be filled completely under these circumstances.

Note that the minimum volumes provided do not allow for repeat analysis and should only be exercised if absolutely necessary. Record the details of the low supernatant volume in the field notes and collect additional slurry in subsequent sampling events.

Shipping and Analytical Parameters

Supernatant Samples:

- All samples are to be shipped via courier to an accredited laboratory (currently ALS Laboratories in Burnaby) immediately after collection for analysis of the parameters listed in the last column of Table 1. The address for the lab is provided on the Supernatant Sample COC in Appendix I.
- A completed COC form is to be shipped with the samples and an electronic version sent via e-mail to the accredited laboratory and any other appropriate parties (such as consulting QP) communicating that the samples are in transit. Email addresses are provided on the COC.
- Replace ice packs in cooler with frozen ice packs before shipping.

Solid Samples:

- All samples are to be shipped to an accredited laboratory (currently SGS Laboratories in Burnaby) for analysis. The address for the lab is provided on the COC in Appendix II. All tailings solids are to be analyzed for rinse pH, SFE, the full suite ABA analyses and solid phase element determination by aqua regia digestion. The full list of parameters to be measured are listed in Table 3 and on the COC.
- A completed COC form is to be shipped with the samples and an electronic version sent via e-mail to the accredited laboratory and any other appropriate parties (such as consulting QP) communicating that the samples are in transit. Email addresses are provided on the COC.

Data Tracking and Analysis

- Data will be compiled and evaluated by the Environmental Manager or designate. If exceedances of threshold limits or triggers as defined in the ML/ARD Management Plan occur, then the Mine Manager must be informed and actions outlined in the ML/ARD Management Plan must be taken.

Documents and Records

- Complete the COC, including the date and time of collection, name of sampler, sample IDs and analyses to be conducted.
- In the data sheet provided, record the date and time the tailings slurry is collected as well as the date and time the supernatant samples are collected. Complete the tailings sampling data sheet and record the field parameters.

Table 1 - Summary of Bottles, Preservation, and Analytical Parameters for Tailings Supernatant Samples

Bottle and Volume	Field Filter	Field Preservation	Refrigerate (4oC)	Indicate on Bottle	Parameter(s)*
500 mL plastic	No	none	Yes	General Chemistry	General Chemistry: pH, conductivity TSS, TDS, turbidity, alkalinity, acidity, anions (Br, Cl, F, SO_4, NO_2 and NO_3)
60 mL plastic	No	HNO_3	Yes	Total Metals	Total Metals (BCMDG)
120 mL amber glass	No	H_2SO_4	Yes	Nutrients, COD	Nutrients (phosphorus, nitrogen and ammonia), TOC and COD
60 mL plastic	Yes	HNO_3	Yes	Dissolved Metals	Dissolved Metals (BCMDG)
120 mL amber glass	Yes	H_2SO_4	Yes	DOC and T-dissolved-P	DOC and T-dissolved-P

Notes: * Parameters listed in bold must be indicated on the chain of custody for the analytical laboratory

BCMDG: Al, Sb, As, Ba, Be, Bi, B, Cd, Ca, Cr, Co, Cu, Fe, Pb, Li, Mg, Mn, Mo, Ni, P, K, Se, Si, Ag, Na, Sr, Th, Sn, Ti, U, V, Zn, Zr, Hg

Table 2 - Minimum bottle volumes required to complete analyses

Bottle Type	Parameters	MINIMUM Volumes	MINIMUM Bottle Volumes

Standard Operating Procedure:
SAG Mill Sampling

PRETIVM		BJ-ENV-SOP-041 SAG Mill Sampling	
Owner: Colleen Atherton	Approver: Torence Sandhals, Jason Gabora	Revision Number:	Creation Date: Oct 22, 2018 Revision Date:

Objective

To measure the nitrogen load per tonne of ore to validate or revise the water quality model assumptions.

Scope

All activities related to sampling of SAG mill influent and effluent. This includes sample collection protocols, shipping and handling details, analytical procedures, quality assurance and quality control (QA/QC) requirements, parameters to be measured, communications with the analytical laboratories, the COC (chain of custody) and documenting the results.

Health, Safety & Reclamation Code of BC

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

Definitions

- BCMDG: British Columbia Mine Design Guidelines
- COC: Chain of Custody
- COD: Chemical Oxygen Demand
- PPE: Personal Protective Equipment
- SAG: Semi-Autogenous Grinding
- TOC: Total Organic Carbon
- TSS: Total Suspended Solids

Preparation

Hazards

- Slips and falls
- Working near machinery
- Working near hazardous chemicals
- Noise
- Air Quality

Tools

- PPE
- Sample bottles and preservatives as per Table 1

Requirements

- Mill orientation or escort from Mill personnel
- Knowledge of SAG mill sampling program
- Trained and qualified to conduct water-quality sampling

Job Step

Collect SAG mill samples monthly in conjunction with Tailings and Supernatant samples (BJ-ENV-SOP 007).

1. **Field preparation**
    - 24 hours prior to sample collection, contact the Mill Operations Supervisor via email to request that SAG Mill Discharge and Process Water samples be collected.
    - Review BJ-ENV-SOP-028 Generic Water Sample Collection if required.
    - Label sample bottles and place in a cooler with ice packs.
        - SAG Mill Discharge:
            - 1 - 4L jug, unfiltered and unpreserved
        - Process Water:
            - 1 - 4L jug, unfiltered and unpreserved
            - 1 - 125 mL plastic, unfiltered and preserved with HNO3
    - Calibrate multi-meter.
2. **Enter Mill**
    - Contact control room operator to inform them that you have entered the mill building. Report to control room and fill in sign in sheet located on clipboard outside of control room door. Contact Grinding Operator on shift and inform them that you are taking samples and request assistance.
3. **Sample collection**
    - The Grinding Operator will collect a 20 L sample from each of the SAG mill discharge and the Process Water.
        - SAG Mill Discharge is collected by using a cutter to collect approximately 20 – 1 L aliquots into a 5 gallon bucket.
        - Process Water is collected by filling a 5 gallon bucket from a valve on the influent into the SAG Mill.
        - The sample will be collected in the morning on the day following notification to the Mill Operations Supervisor.
        - The Grinding Operator will wash and reuse the buckets for the subsequent sample.
    - Allow the sample to settle for 4-5 hours prior to subsampling.
    - Put on vinyl gloves prior to sampling.
    - Without agitating the sample, decant an aliquot from the 5 gallon bucket into the corresponding 4 L jug and 125 mL plastic bottle (Process Water only). Preserve the sample as indicated in Table 1.
4. **Data and records**
    - Complete Table 2 and send to the Geochemist and the Qualified Professional.
5. **Complete COC**
    - Complete COC as per example in Appendix 1
6. **Ship samples**
    - Ship samples to the analytical Laboratory (currently ALS Global in Burnaby, BC).
    - Use adequate ice packs to ensure that the samples arrive at the laboratory <10°C.
7. **Data tracking and analysis**
    - Data will be compiled and evaluated by the Environmental Manager or designate.

Table 1 – Summary of Analytical Parameters

Bottle Volume and Type	Field Preservation	Field Filter	Refrigerate (4°C)	Indicate on Bottle	Parameter(s) to be indicated on COC	Locations	Frequency
4 L plastic	None	No	Yes	General Chemistry	pH, conductivity, TSS, turbidity, total NH3-N, Br, Cl, F, NO3-N, NO2-N, T-N, T-P SO4, TOC, COD and dissolved metals excl. Hg	Both	monthly
60 mL plastic	HNO3	No	Yes	Total Metals	Total Metals excl. Hg (BCMDG)	Process Water	monthly

Appendix 14

Standard Operating Procedure:
Water Treatment Plant Sludge Sampling

PRETIVM		BJ-ENV-SOP-034 Water Treatment Plant Sludge Sampling	
Owner: Colleen Atherton	Approver: Torence Sandhals, Jason Gabora	Revision Number: 3	Creation Date: Aug 31, 2015 Revision Date: Oct. 23, 2018

Objective

To obtain samples of water treatment plant (WTP) sludge for static testing in accordance with the Metal Leaching – Acid Rock Drainage Management Plan.

Scope

This SOP applies to all employees who are sampling from the water treatment plant at the Brucejack Gold Mine.

Health, Safety & Reclamation Code of BC

- 1.11.1 - Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 - Personal Protective Equipment
- 2.13 - WHMIS

Definitions

- ABA: Acid Base Accounting.
- COC: Chain of Custody.
- HDPE: High Density Polyethylene.
- PPE: Personal Protective Equipment incl. hearing protection.
- TDST: Tailings Disposal Surge Tank.
- WTP: Water Treatment Plant.

Preparation

Hazards

- Noise.
- Working near hazardous chemicals.
- Working near machinery.
- Slips, trips and falls.
- Heavy lifting.

Tools

- PPE.
- Five empty and clean 20 L buckets (see note).
- Vinyl gloves.
- Notebook.
- Camera.
- SGS sample tags.

Note: in the first quarter of every year, fifteen 20 L buckets are required for duplicate samples.

Requirements

- Trained and qualified to conduct WTP sludge sampling.
- Mill orientation or guide.
- Knowledge of this SOP.

Job Step

WTP sludge samples will be collected once per quarter.

1. **Contact WTP Operator 24 hours before sample collection**
   - Request that wasted sludge be retained in the Sludge Centrifuge Feed Tank.
2. **Prepare sampling equipment**
   - Label the buckets "1 of 5", "2 of 5", etc.
   - In the first quarter of every year, prepare duplicate sampling equipment. In the first quarter a total of 15 buckets will be used. In all other quarters, five buckets will be used.
3. **Enter Mill**
   - Contact control room operator to inform them that you have entered the mill building. Report to control room and fill in sign in sheet located on clipboard outside of control room door. Contact WTP operator on shift and inform them that you are taking samples and request assistance if needed.
4. **Collect sludge from Sludge Centrifuge Feed Tank**
   - Fill all 20 L pails with WTP sludge.
   - Place lids on pails and transport to tailings supernatant prep area beside TDST.
   - Remove lids from pails and place lids on top to allow for minimal disturbance of sludge following settling.
   - Allow sludge to settle for 24 hours.
5. **Decant supernatant**
   - Pour off as much supernatant as possible without losing any fines.
   - Using a geopump, decant the remaining supernatant from the sludge. Be careful not to remove any sludge but remove as much of the supernatant as possible.
   - For details regarding geopump set up and operation, please see BJ-ENV-SOP-028.
   - **Ensure proper lifting techniques are being used, and two people when needed.**
6. **Consolidate sludge into one 20 L bucket**
7. **In the first quarter of every year, collect a field duplicate sample and a laboratory duplicate sample**
   - The laboratory duplicate will be composed of ten 20 L buckets. Label the HDPE buckets "1 of 10", "2 of 10", etc.
   - The field duplicate will be composed of five 20 L buckets. Label the HDPE bucket "1 of 5", "2 of 5", etc.
   - Decant all 15 buckets using the same techniques of decanting and consolidation in Step 5.
   - The sludge from the pails marked "laboratory duplicate" must not be mixed with sludge from the pails marked "field duplicate".
8. **Complete the SGS tags and place a tag in each consolidated bucket**
   - If collecting a duplicate sample, assign unique SGS numbers to the laboratory duplicate and the field duplicate.
   - Add DUP to the sample ID of the laboratory duplicate, e.g, B00######-DUP.
9. **Record field notes**
   - Date and time.
   - Name of samplers.
   - Sample IDs.
   - Observations.

10. Exit Mill

- Sign out at the control room and inform the control room operator that you have left the mill building.

11. Ship the samples to the laboratory

- Complete the COC as per the example provided in Appendix I.
- In addition to the typical shipping documents, complete an offsite removal form as per the example provided in Appendix II
- The current laboratory is SGS Laboratories in Burnaby, BC.

12. Data Tracking and Analysis

- Data will be compiled and evaluated by the Environmental Manager or designate.

Standard Operating Procedure:
Field Bin Sampling

PRETIVM		BJ-ENV-SOP-040 Field Bin Sampling	
Owner: Colleen Atherton	Approver: Torence Sandhals, Jason Gabora	Revision Number: 1	Creation Date: August 31, 2015 Revision Date: July 23, 2018

Objective

To provide guidance for maintenance and sampling of on-site field bins.

Scope

Field bins are used to mimic the natural weathering processes that act on mine waste material stored in surface impoundments and dumps in order to predict loadings from geologic materials. The sampling protocols described in this SOP are intended to ensure that field bin leachate samples and field data are collected in a consistent manner throughout the field bin monitoring program and that reliable, representative and scientifically credible water quality data is obtained.

All activities related to care and maintenance of the field kinetic tests and collection of leachate samples.

Health, Safety & Reclamation Code of BC

- 1.11.1 Training
- 1.8.2, 1.8.3, 1.8.4, 1.8.5 Personal Protective Equipment
- 2.13 WHMIS

Definitions

- BDMDG: British Columbia Mine Design Guideline (i.e., cost-effective low-level detection limits)
- DI water: De-ionized water
- COC: Chain of Custody

Preparation

Hazards

- Slips and falls
- Exposure to hazardous chemicals
- Pinch points
- Tight road ways & ATV/Truck use

Tools

- YSI meter
- 1 L Sample bottles
- Vinyl gloves
- Water quality field data sheets
- 1000 mL plastic beaker
- DI water
- Water-proof marker
- Sample labels
- Camera
- COC
- Radio

Requirements

- Trained and qualified to conduct water quality sampling
- If using ATV, ATV training and sign off

Care and Maintenance

1. **Commissioning**
   - Commissioning is to occur immediately after VOK becomes accessible following freshet and after risk of freezing has past, typically in June.
   - Attach tubing to the field bins and the sample collection jugs (Figure 1).
2. **Maintenance**
   - At the beginning of each sampling event, inspect tubing and connectors for cracks or damage.
   - A lack of water in one or more sample collection jugs may indicate a crack or damage to the tubing or connectors, clogging in the tubing or poor connections.
   - Water collected in the tote is an indication of a crack in the tubing or a poor connection.
   - Send photographs of damaged parts to Lorax and the Geochemist.
   - Dirty totes and/or collection jugs can be rinsed with DI water.
3. **Decommissioning**
   - Decommission field bins in late September or early October before freezing occurs.
   - Following collection of the final leachate sample, disconnect and remove water from tubing.
   - Collect the final leachate sample and return the empty jug to the tote.
   - Place tubing in a clean plastic bag, label the bag with the field bin number and place bag inside the tote.

Figure 1 – Configuration of sample collection jugs

Sampling

Samples are collected from the field bins whenever sufficient precipitation has been received for sample collection, typically monthly from June to October.

1. **Field Preparation**
   - Calibrate YSI meter
   - Collect and label field supplies and place in a cooler with ice packs.
     - For each field bin, label a 1 L polyethylene bottle with the date and field bin number.
   - Prepare one duplicate sample and one field blank sample for every sampling event.
2. **Leachate Collection**
   - Review BJ-ENV-SOP-028 for general sample collection and handling procedures.
   - Put on vinyl gloves. Replace gloves if they become contaminated and between each sample.
   - Remove lid of the leachate collection tote to reveal the sample collection jug (Figure 1).
   - Disconnect the tubing attached to the jug(s) in order remove the collection jug from the tote. This is accomplished by unscrewing the collar and pulling outward on the tubing (Figure 1).
   - Ensure you are wearing gloves. Once the tubing is disconnected, slowly pull the jug out of the buried tote, taking care not to pull the tubing out of the bottom of the bin.
   - Obtain a pre-labelled 1 L polyethylene bottle. Fill the bottle with leachate from the collection container by pouring the contents directly from the collection jug. If there is sufficient volume, fill the 1 L bottle to capacity. Screw the lid on and place the bottle in the cooler with the ice packs.
   - Fill the 2000 mL plastic beaker with water from the sample collection jug.

- Measure pH and conductivity of the leachate using the pH/conductivity meter.
- Fill in the Data Sheet (Appendix I)
  - Record time, temperature, pH and conductivity.
  - Using the beaker, record the total volume of leachate in the collection jug including the 1 L plastic bottle collected for laboratory analysis and the volume used to measure pH/conductivity.
  - Include any notes regarding the sample or sample collection.
- After measuring the volume, discard water from the sample collection jug.
- After emptying the sampling jug, reinstall it in the tote.
- Carefully place the jug back in the tote in the same position it was found originally, taking care not to pull the tubing out of the bottom of the field bin.
- Take the tubing and push it back into the elbow joint in the top of the sampling jug. It is important to make sure that the tubing is pushed all the way into the elbow joint to ensure a tight fit. Once the tubing is installed, pull the collar out to secure the tubing in the joint.
- Repeat the steps in Step 2 for each of the field bins.
- Collect the QA/QC samples described in Step 3.

3. QA/QC Samples

- Collect one field duplicate for every sampling event by filling a second 1 L polyethylene bottle with water from a collection jug that has sufficient volume. This sample is identified by -98, e.g., FB-01-98.
- Collect one field blank for every sampling event by opening a pre-filled 1 L polyethylene bottle containing DI water (provided by the analytical laboratory) during the collection of one of the leachate samples thereby exposing the contents to the same conditions as the leachate sample. This sample is identified by -99, e.g., FB-01-99.

4. Complete COC

- Complete COC as per example in Appendix II.
- All samples should be analyzed for the following parameters:
  - Anions-all, conductivity
  - pH, acidity, ortho – P
  - Alkalinity – PCT
  - TOC
  - Ammonia
  - Total Nitrogen
  - Dissolved Metals (BCMDG) + Hg
  - Hardness

5. Shipping and Analytical Parameters

- Ship samples to the analytical Laboratory (currently ALS Global in Burnaby, BC).
- Use adequate ice packs to ensure the samples arrive at the laboratory <10°C.

6. Data Tracking and Analysis

- Data will be compiled and evaluated by the Environmental Manager or designate.

COMMUNICATIONS AND CONTACT LISTS

Communications at Brucejack is available by VHF radio, satellite phones, and satellite Internet. Tables 1 to 3 provide internal and external contacts as well as other useful communications related references. Planning Managers will direct the maintenance team to maintain and monitor the communications system.

Table 1. Medical Emergency Contacts

Service	Party	Contact Number
Ambulance	BC Road and Air Ambulance	1-800-461-9911
	Back-up BC Ambulance	1-800-561-8011
	Terrace	1-250-638-1102

BRUCEJACK SITE EMERGENCY PHONE CONTACTS

The main Brucejack Phone Number is **778-724-4186**.

The primary means of communications on site is VHF Radio. There are three repeater channels allowing for long distance VHF communications and a number of shorter ranges "Talk Around" channels that require line of site with the receiving party (Table 4).

Table 4. Brucejack Radio Frequencies

Channel	Name	RX Frequency	TX Frequency	Tone
Ch 1	New Road **(NEW)**	166.080	166.080

1 MINE EMERGENCY RESPONSE PLAN (MERP)

1.1 MERP OBJECTIVES

The goal of this Mine Emergency Response Plan (MERP) is to provide Pretium Resources Inc. (Pretium) employees, contractors and their employees with guidance to prepare and respond to an emergency situation in an organized and effective manner (formal structure). An organized response will contain and control the situation, and will mitigate consequences to people, property and the environment. The MERP outlines the response procedures and preventive measures that will achieve effective and timely management of an emergency.

This MERP is proposed to cover all the Brucejack Mine facilities and work areas, which include the access road, satellite camps (i.e., Knipple, Bowser and Wildfire camps), construction activities and in mine site production operations for the surface and underground areas.

The MERP, dependent on the nature of the emergency, can be activated when a project-related emergency and/or incident occurs anywhere on the mine.

This plan also outlines the responsibilities and duties of an Emergency Response Team (ERT) as required by Pretium in the event of an emergency at the mine.

The MERP is intended to meet the following objectives:

- Provide a pre-determined course of action during a mine site emergency situation;
- Provide a listing of the duties and responsibilities of personnel;
- Assist personnel in determining appropriate responses to emergency situations;
- Provide guidance to prevent and minimize personal injury during a mine-site emergency situation;
- Provide guidelines for initial first aid treatment of injured personnel;
- Provide guidance for initial emergency response to minimize damage to property, equipment and the environment;
- Enable communication and co-operation between corporate personnel, site personnel, mutual aid organizations, agency officials, and the community at large;
- Provide guidelines for ensuring the safety of site personnel, visitors, and community members;
- Provide guidance to reduce the magnitude of environmental impacts;
- Assist response personnel to determine and perform remedial actions quickly;
- Comply with legal requirements in response related matters in case of emergencies;
- Reduce recovery time and cost;
- Inspire confidence in response personnel;

- Ensure procedures comply with OHS and environmental requirements; and
- Safely restore operations to normal.

Anyone discovering a potential emergency should know the immediate steps to take and will follow the "decision flow chart" included in this plan (See Section 2.1). The MERP will provide guidance when the initial attempts to control a situation are not successful.

1.2 MERP POLICY DIRECTIVE

A Mine Emergency Response Plan is required by Part 3.7.1 of the *Health, Safety and Reclamation Code for Mines in BC*, 2017 (MEMPR 2017), and must be in general accordance with the *Mine Emergency Response Plan Guidelines for the Mining Industry*, 2017, version 1.4.

Pretium management is dedicated to providing a safe workplace for its employees and contractors. The goals of this MERP are, in order of priority, to protect the health and safety of workers and the public, protect the environment, avoid adverse social and economic effects, preserve heritage, as well as protect and minimize damage to company properties.

This MERP was developed to assist in protecting personnel and company facilities in the event of an emergency. An emergency is the unforeseen combination of circumstances, unusual occurrences or resulting state which may result in endangerment to lives or areas of the mine. This emergency may call for the immediate action from management and/or trained mine rescue, fire and first aid personnel.

Possible situations with the potential to create an emergency under some circumstances might include:

- avalanches;
- wildlife and human interaction;
- fire (electrical/mechanical);
- spills of fuel or hazardous substances;
- contact water pond and tailings line discharge;
- underground mine emergencies: ground failures, main fan ventilation failure, etc.;
- unexpected/unplanned explosions;
- aircraft/ground vehicle accidents;
- non-life- and life-threatening injury or fatality;
- flooding/snowstorm/blizzards/ice storms; and
- natural disaster.

In order to protect site personnel, Pretium will use specific evacuation procedures to remove all personnel from the source of danger and to account for all personnel on shift.

During the operation and closure phases of the Brucejack Mine, senior management will assign various responsibilities to specific personnel, and will provide overall supervision and monitoring.

Pretium will ensure that the MERP is current and maintained at all times. The Mine Manager will ensure that there is a budget is in place to address the requirements of the MERP, including related training. As per the annual budgets, funding is provided for emergency response team training, high level scenarios, incident management team tabletop and mock scenarios. Additional funds are also provided for emergency and auxiliary equipment used during the scenarios. The Mine Rescue Team will be compensated if a call out occurs after their working hours. Copies of the MERP will be posted in common locations for workers to review. Each worker will be required to become familiar with the details of the MERP, and the location of all emergency services at the time of the initial mine site familiarization training.

Pretium is strongly committed to having in place an efficient MERP resulting in an organized and effective response at containing and controlling the situation, as well as mitigating consequences to people, property and the environment. In meeting this commitment Pretium will:

- Provide training to all employees, contractors and their employees for their roles in all emergency plans;
- Ensure that ALL site personnel are familiar with and are able to call a CODE 1 for any type of emergency, BJ-OHS-SOP-002 - Code One Call Out & Response;
- Ensure all supervisors are responsible that their employees are aware of, and trained in, the proper emergency response procedures and that procedures and contact information are posted in all work areas. Supervisors are also responsible for ensuring that all employees follow safe work procedures and follow regulations to prevent emergencies from occurring, and that they are provided with the proper tools to do so, including PPE;
- Ensure all personnel (including Pretium employees, contractors and their employees) will participate in emergency response drills on a regular basis;
- Appoint a qualified person as a trainer for mine rescue members as per Part 3.7.9 or the HSRC;
- Procure the necessary mine rescue and emergency response equipment, and ensure adequate training in the use of this equipment is provided by the qualified person(s);
- Develop the required Emergency Response Teams as per Part 3.7.2 of the HSRC;
- Appoint a Mine Emergency Response Plan Coordinator and Planning Committee;
- Set up and continually improve the long-term goals of the plan;
- Establish a budget for the emergency response program, including hiring and training qualified personnel, to ensure the successful implementation of the MERP; and
- Support all other activities necessary to develop and implement an effective Emergency Response Plan.

All Pretium employees, contractors and their employees will need to be aware of the normal hazards associated with their work area. A sudden change from the norm may result in an unusual and dangerous situation. Being prepared for an emergency will mean quicker action and ensure proper manner of action in cases of individual injury, help for individuals or of a mine problem area.

All Pretium employees, contractors and their employees will be shown at the time of initial mine site familiarization:

- the emergency response and first-aid procedures and where are they posted;
- the procedure to summon the emergency response team in the event of any emergency by using the CODE 1 emergency procedures;
- the procedure to summon first aid;
- the procedure to follow in the event of a fire;
- the ability to access information for emergency facilities such as air ambulance, police, and hospital; and
- the location of their assembly area in case of an emergency; they will be given names of emergency personnel, their qualifications, and their contact information. This information will be posted at each individual working area and updated as necessary.

All Pretium employees, contractors and their employees will also receive the Brucejack Project Occupational Health and Safety Plan (OHSP) at the initial mine site orientation. After a general presentation of the company's Health and Safety Program, each worker will be required to complete a written sign-off and acknowledgement of understanding this material.

Emergency response drills will be undertaken for the following reasons:

- to validate the adequacy of the organizational infrastructure to effectively deal with emergencies;
- to test the initial communications sequences;
- to verify contact numbers are correct;
- to familiarize personnel with their duties and responsibilities;
- to evaluate the preparedness of each party involved in the Emergency Response Program;
- to identify and correct deficiencies in the Emergency Response Program;
- to verify the availability of support services;
- to exercise tactical site-specific responses; and
- to examine the interaction between the individuals, support groups, organizations, and agencies named in the Emergency Response Program, and to address identifiable shortfalls in the established lines of authority.

1.3 MERP LINKAGES TO OTHER ENVIRONMENTAL MANAGEMENT PLANS

Pretium is committed to providing safe and healthy working conditions, and protecting the health, safety and the environment as vital elements of the mine. This commitment is essential to achieving a successful long-term operation. Throughout the various mine phases, Pretium plans to conduct activities to minimize impacts on the environment.

The commitment to this objective will be achieved with the preparation and integration of Environmental Management Plans (EMPs) into mine operations. Each plan will provide methods, procedures, and actions to be utilized by Pretium personnel and/or its contractors to ensure that their activities comply with appropriate environmental legislation, mine commitments, and applicable environmental standards. This MERP is one of several plans that form part of the Brucejack Mine Environmental Management System (EMS).

Other Mine EMPs related to this MERP include:

- Occupational Health and Safety Manual (OHSM);
- Chemicals and Materials Storage and Handling Management Plan (CMSHMP);
- Fuel Management Plan (FMP);
- Spill Response Plan (SRP)
- Hydrocarbon Contaminated Soil Management Plan (HCSMP);
- Construction Environmental Management Plan (CEMP); and
- Waste Management Plan (IDWMP).

1.4 MERP Coordinator and Planning Committee

On the Brucejack Mine, the Mine Manager will appoint the Health and Safety Manager, or a designate, to act as the Mine Emergency Response Plan Coordinator (ERCC) for the site. The ERCC will have the full support of Pretium to successfully implement the MERP. Currently the ERCC is the Emergency Response Team Coordinator.

The Mine Manager will select members for a Mine Emergency Response Planning Committee (ERPC), and will integrate the ERPC, ERCC and the Joint Occupational Health and Safety Committee (JOHSC).

The ERPC will perform the following duties:

- Examine possible eventualities for each area of the mine, together with the possible measures of prevention and protection and resulting actions. The outcome of this pre-planning exercise will be reviewed periodically as conditions change over time. Initially, all areas and processes of the mine will be inspected to determine the risks associated with the work environment, including confined spaces, mine fires, explosions, rock-bursts, falls of ground, runs of muck, inrushes of water and avalanches.
- Review mitigation measures designed to prevent emergency events from occurring and reduce the adverse effects of such events. The review will assess the effectiveness of the mitigation and consider alternatives where necessary.
- Confirm the appropriateness of training and procedures, safe working practices, housekeeping programs, and first aid training to prevent a minor emergency escalating to a crisis or a disaster.
- Review the MERP annually to verify its effectiveness. As the Brucejack Mine develops, a re-assessment of emergencies and incidents will be undertaken. Findings from this periodic assessment will be used to update and revise procedures associated with the MERP.

Updates will be made based on corrective actions noted during tabletop and mock high-level exercises. Pretium Resources/Brucejack Mine has set the standard to run a minimum of three tabletop scenarios and one mock scenario per calendar year. The scenarios need involve the Brucejack Site Emergency Response Team and Incident Management Team, as well as the corporate office in Vancouver.

1.5 ERPC DUTIES AND RESPONSIBILITIES IN REGARD TO THE MERP

Regarding the MERP, specific members of the ERPC have various duties and responsibilities, as detailed below.

1.5.1 Mine Manager

The Mine Manager shall:

- ensure that personnel, equipment and resources are adequate to effectively deploy the MERP;
- ensure that a MERP has been developed and communicated to site staff and contractors;
- participate in the emergency response evaluation meeting after each emergency response; and
- interface and communicate with corporate senior management.

1.5.2 Health and Safety Manager

The Health and Safety Manger is a member of the ERPC, which develops, maintains and implements the MERP that is comprehensive and is regularly updated to meet the changing needs of mine activities.

The Health and Safety Manager shall:

- ensure that mine orientation and safety meetings include training for ERP roles and responsibilities;
- participate in post-incident evaluation meeting to review emergency response, MERP effectiveness and opportunities for improvement;
- work with the Mine Manager to identify and implement improvements to the MERP;
- coordinate annual fire drill and “man-down” drills to test and evaluate emergency preparedness; and
- update and post the MERP, telephone lists and plot plans (i.e., muster areas; location of emergency/medical equipment).

1.5.3 Operations Supervisors

The Operations Supervisors shall effectively communicate MERP roles and responsibilities to new employees.

1.5.4 Joint Occupational Health and Safety Committee (JOHSC)

The JOHSC committee is made up of worker and employer representatives consulting in a cooperative atmosphere to identify and resolve health and safety issues/concerns in support of the MERP.

The JOHSC shall:

- participate in the identification of dangers to safety and health in places of employment, and recommend means of controlling the hazards;
- obtain information from the employer and from additional sources regarding the identification of existing or potential dangers to safety and health;
- receive, consider, and where necessary, investigate complaints respecting safety and health of workers at this workplace, and where necessary, make recommendations to the employer;
- participate in workplace inspections; and
- participate in incident investigations.

1.6 PROJECT HAZARD IDENTIFICATION, PREVENTION AND PROTECTION

The Brucejack Mine has developed a Risk Assessment document that will continue to be used through mine operation and closure. The purpose of this document is to provide direction to personnel related to hazard identification and risk assessment. This is a multi-page Excel spreadsheet used to identify the steps, associated hazards, controls in place, and additional controls needed after the assessment has been completed. The additional controls are assigned to a specific worker and have a completion date. These processes will continue to be used to identify and evaluate both existing and potential hazards throughout the mine site. They will also assist in defining methods to control and/or eliminate the hazards identified.

As part of the Hazards Identification program, all Pretium employees, contractors and their employees shall assess their worksite and complete a Job Hazard Analysis form (available in supervisor's office). This assessment process must be completed prior to the start of all jobs, particularly new jobs to identify existing or potential hazards to workers and then to eliminate and/or control these hazards through the use of appropriate engineering or administrative controls, proper training or the use of personal protective equipment.

All company staff and contractors are required to take a proactive approach to managing and reporting hazards. When they observe a hazard, they shall take steps to manage that hazard directly (provided they are knowledgeable / trained to safely do so) – eliminate the hazard or get assistance from appropriate persons to do so whenever reasonably possible. Where hazards cannot be eliminated immediately, take necessary steps to warn others of the hazard. Report hazardous or potentially hazardous conditions and acts to a supervisor or your site contact if a contractor.

1.7 EMERGENCY RESPONSE PROGRAM (ERP) OUTLINE

As part of the MERP, the Brucejack Mine has proposed the Emergency Response Program (ERP) for the mine site, described in Section 2. The ERP details emergency response levels, emergency management team, planning and training, emergency response team structure, etc.

1.8 RELEVANT ENVIRONMENTAL ASSESSMENT CERTIFICATE CONDITIONS

On March 26, 2015, Pretium was granted an Environmental Assessment Certificate (#M15-01) which included a series of conditions. This MERP fulfills Condition #2, in relation to a Component Plan for mine emergency response planning, presented within Schedule B of the Certificate and copied below.

Condition 2

> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*
> - *Effects mitigation measures;*
> - *Monitoring programs;*
> - *Monitoring schedules; and*
> - *Reporting requirements.*
>
> *The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5. The Aboriginal Consultation Plan outlines the notification process if there is an emergency at the Brucejack Mine.*
>
> *The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."*

1.9 FIRST RESPONDER CONSULTATION

The MERP will be provided to all mutual aid parties, British Columbia Ambulance Service, Stewart RCMP and Stuart Hospital. A map with helicopter landing zones will also be provided to Yellowhead Helicopters, BCA, Canadian Helicopters and Lakelse Helicopters.

2 EMERGENCY RESPONSE PROGRAM (ERP)

The Brucejack Mine has developed an Emergency Response Program (ERP) for the mine site. Details regarding certain aspects covered in the following sub-sections include:

- Emergency Response Levels: contains the emergency criteria, emergency level characteristics, reporting sequence and implementation summary;
- Emergency Response Management Team (ERMT): identifies who is on the Emergency Response Management Team(s) and identifies responsibilities and duties; and
- Planning and Training: documents pre-planning activities such as the development of the organization's emergency plans, education and training.

2.1 EMERGENCY CRISIS PROCESS

The Emergency Crisis Process assesses the consequence and severity level of an emergency (Figure 2.1-1). The Severity Table is provided in Appendix B.

Figure 2.1-1. Emergency Crisis Process

2.2 EMERGENCY RESPONSE LEVELS

2.2.1 Introduction

The following emergency response level concept was originally conceived by Galore Creek Mining Corporation as part of their Emergency Response Plan v. 2.1 (GCMC ERP v. 2.1). This concept will be adopted in this MERP because it provides sound directions, procedures, and courses of action to follow in the event of a mine site emergency.

An emergency can be defined as any incident, or event that causes or creates the potential for a serious injury, loss of life, significant loss or damage to property, or environmental damage. Although emergencies by definition are unexpected events, the relative risk of some occurrences can be identified and preparations (policy and procedures) put in place for timely and effective response. Remember, this identification is the first step in ensuring adequate response.

Pretium incident reporting policy requires all levels of emergencies to be reported to the Health and Safety Manager (or designate). The urgency shall depend on the severity of the situation.

Emergency response criteria, definitions of Level 1, 2 and 3 emergencies and emergency level decision flow chart are discussed in the following sections of this MERP. It is anticipated that Pretium employees, contractors and their employees will be able to utilize this system, to aid in making appropriate decisions regarding the emergency response.

2.2.2 Emergency Response Criteria

The Risk Ranking Matrix presented in Figure 2.2-1 will be used by the Emergency Response Coordinator (ERC; or designate) to determine the level of emergency and deployment of emergency response personnel as follows:

- Activities with Low risk or acceptable risk level are denoted in **Green** in the Matrix
- If the Ranking Matrix indicates a low potential (**Blue**), the ERC (or designate) will initiate a Level 1 Alert.
- If the Ranking Matrix indicates medium potential (Yellow), the ERC (or designate) will initiate a Level 2 Alert and review the situation.
- If the Ranking Matrix indicates high potential (**Red**), the ERC (or designate) will initiate a full Level 3 Alert.

2.2.3 Emergency Level Characteristics

The Emergency Decision Flow Chart provides a summary of emergency level characteristics and processes for the Brucejack Mine (Figure 2.2-2). The flow chart will be utilized to assist management and employees in ensuring that a proper approach is taken in case of an emergency incident.

STEP 1 DETERMINE LIKELIHOOD

Likelihood (L)			
A	Almost Certain	Happens often	More than one event per month
B	Likely	Could easily happen	More than one event per year
C	Possible	Could happen and has occurred here or elsewhere	One (1) event per 1 to 10 years
D	Unlikely	Hasn't happened yet, but could	One (1) event per 10 to 100 years (within a single mine life)
E	Rare	Conceivable but only in extreme circumstances	Less than one (1) event per 100 years (life of Pretivm Resources Inc.)

STEP 2 DETERMINE CONSEQUENCES

Consequence/Severity (C)						
Rank	Consequence	People	Damage/Loss	Environment	Business	Reputation
1	Catastrophic	Fatality	Extreme Financial Loss (>US$1,000,000)	Irreparable Damage, very serious long term impairment of the eco-system	>48 Hours Production Delay	Major Damage to Reputation receiving national or international negative media OR production to cease as a result of statutory concerns
2	Major	Permanent and total disability	Major Financial Loss (US$500K – 1,000K)	Major Impact, serious medium term environmental impact effecting the whole eco-system	24 to 48 Hours Production Delay	Major Damage to reputation receiving province-wide negative media OR non-compliance with statutory requirements resulting in a major fine
3	Moderate	Loss Time Injury	Moderate Financial Loss (US$100K – 500K)	Minor Impact, moderate short term effects affecting part, but not affecting whole eco-system	12 to 24 Hours Production Delay	Moderate Damage to reputation localized to regional media OR non-compliance with statutory requirements resulting in minor fine
4	Minor	Disabling Injury	Minor Financial Loss (US$ 10K – 100K)	Minor Impact on biological or physical environment	6 to 12 Hours Production Delay	Minor Impact to reputation localized to communities OR technical divergence that may attract attention from statutory authorities
5	Low	First Aid/Medical Aid with no time lost or change of duties	Low Financial Loss (US$ <10K)	Limited Damage to minimal area of low significance or previously disturbed areas	<6 Hours Production Delay	No Impact on stakeholder or reputation

STEP 3 CALCULATE RISK

		Consequence / Severity (C)				
Likelihood (L)		1 Catastrophic	2 Major	3 Moderate	4 Minor	5 Low
A	Almost Certain	1 (Ex)	2 (Ex)	4 (Ex)	7 (H)	11 (H)
B	Likely	3 (Ex)	5 (Ex)	8 (H)	12 (H)	16 (M)
C	Possible	6 (H)	9 (H)	13 (H)	17 (M)	20 (M)
D	Unlikely	10 (H)	14 (M)	18 (M)	21 (L)	23 (L)
E	Rare	15 (M)	19 (M)	22 (L)	24 (L)	25 (L)

Consequence Severity Table												
SEVERITY LEVEL	Severity Rating	Financial		Operations						Compliance	Strategic	
		Liquid Cash	Project Budget Variance	Mine Shutdowns	Project Delays	Security	Health	Safety	Environment	Legal/Regulatory	Community Perception/Stakeholder Relations	Strategy
5	Catastrophic	>$40M	>20%	>15% impact on production volume	> 6 months	Security breach resulting in material theft and loss of significant assets	Multiple fatalities or serious disabling illness to multiple people.	Multiple Fatalities; or Permanent impairment to multiple people.	Extensive impact (>20 years) to land, biodiversity, ecosystem services, water resources or air	Fines and prosecutions relating to criminal breaches including jail terms and being the subject of a royal commission	Prolonged (>2months) international multi-NGO and media condemnation Extensive long-term social impacts and serious infringements of cultural heritage	Loss of significant business capability
4	Major	$30 -$ 40M	15 - 20%	7.5 – 15% impact on production volume	3 - 6 months		Single fatality or irreversible health effects or disabling illness.	Single fatality or Permanent impairment to > 30% of the body	Major impact (5-20 years) to land, biodiversity, ecosystem services, water resources or air	Major civil litigation including class actions	Major adverse international multi-NGO and media condemnation Major long-term social impacts and infringement of cultural heritage	Significant reduction in business capability
3	Serious	$20M - $30M	10 - 15%	2.5 – 7.5% impact on production volume	1 - 3 months	Security breach resulting in serious theft and/or loss of significant assets	Severe, reversible health effects of concern that would typically result in a lost time illness.	Permanent impairment, < 30% of the body to 1 or more Days lost due to injury/illness	Serious impact (1-5 years) to land, biodiversity, ecosystem services, water resources or air	Breach of regulations and lack of exploration title	Serious public or national media outcry, damaging NGO campaign Moderate medium-term social impacts	Temporary loss of service or business capability
2	Moderate	$10M - $20M	5 - 10%	0.5 – 2.5% impact on production volume	2 - 4 weeks	Security breach resulting in moderate theft and/or loss of low value assets	Reversible health effects of concern that would typically result in medical treatment.	Objective but reversible impairment Medical treatment for injury/illness	Moderate impact (<1 year) to land, biodiversity, ecosystem services, water resources or air	Minor legal issues, non-compliances and breaches of regulation	Non-material reputation damage Attention from regional media and local public attention and complaints Minor social impacts	Temporary delay in reaching objectives
1	Low / Minor	<$10M	<5%	< 0.5% impact on production volume	< 2 weeks	Security breach resulting in small theft	Reversible health effects of little concern, requiring first aid treatment at most.	Low-level short-term subjective symptoms or inconvenience. No medical treatment required	Minor disturbances and/or Low-level impact to land, biodiversity, ecosystem services, water resources or air	Low-level legal issues	Public concern restricted to local complaints Low-level interest from local media and/or regulator Low-level social impacts	No material impact on the achievement of business objectives

RISK MATRIX

LIKELIHOOD	Score	1	2	3	4	5
	Rating	Rare	Not Likely	Possible	Highly Likely	Expected
Chance of the potential consequence occurring considering the controls in place	Frequency	Greater than 100 year event	Every 10 to 100 years	Every 1 to 10 Years	Every 2 to 3 years	Almost Yearly

Risk Level	Actions Required
Critical	STOP - Manager approval required. Controls to reduce risk must be identified and implemented before performing work.
High	STOP - Superintendent approval required. Controls to reduce risk must be identified and implemented before performing work.
Moderate	STOP - Review and follow Work Instruction or complete Group JHA with team members and Team Leader.
Low	Worker conducts personal JHA prior to performing task and continually assesses risks.

Figure 2.2-1. Risk Ranking Matrix

Emergency levels are classified into three categories, based on different criteria described below. Generally, Level 1 emergencies can be controlled entirely by personnel within the immediate vicinity of the incident/accident. Notification will be made immediately with documentation to the safety department within 24 hours of the incident. As for Level 2 and 3 emergencies, they may force temporary suspension or shut down of operations indefinitely. These incidents must be reported immediately to the Mine Manager.

Level 1 – Potential Emergency (Containment Level)

- Can be controlled entirely by mine site personnel and operations;
- Located within the immediate vicinity of the incident/accident site;
- No danger outside of the mine site;
- Immediate control of the hazard/sources is possible;
- No threat to the public;
- Minimal environmental impact; and
- Little or no media interest.

Level 2 – Emergency (Notification Level)

- A section of the operation is temporarily shut down;
- Can be controlled by the personnel and equipment that are readily available at the mine;
- Potential exists for the emergency to extend beyond the mine site;
- Outside agencies (MEMPR, police, fire, etc.) must be alerted and kept informed of the situation;
- Imminent control of the emergency is probable;
- Some threats to the public exist;
- Moderate environmental impact; and
- Local/regional media interest is probable.

Level 3 – Major Emergency (Mobilization Level)

- Forces the indefinite shut down of operations;
- External emergency support services are required;
- Safe operating control has been lost;
- Actual or potential severe injuries or fatalities;
- Public safety jeopardized;
- Significant and ongoing environmental impact;
- Significant media interest;
- Immediate multi-agency involvement; and

- Assistance from outside parties required.

2.2.4 Emergency Level Decision Flow Chart

This flowchart, provided in Figure 2.2-2 is a simplified decision guide to assist management and particularly employees in taking appropriate actions in case of an emergency.

2.2.5 Emergency Response Plan Implementation Summary

Table 2.2-1 provides additional information for Pretium employees, contractors and their employees to ensure decisions are commensurate with the level of emergency.

Figure 2.2-2. Emergency Decision Flow Chart (after GCMC Emergency Response Plan v. 2.1)

Table 2.2-1. Emergency Response Summary

Level	Criteria	Examples	Pretium Actions	Government Agency Actions
Level 1: ERT members to the initial response	• No danger outside of company property. • Immediate control of hazard/ source. • No immediate danger to public exists. • Minimal environmental impact. • Little or no media interest. • Situation handled entirely by company personnel.	• Potential for a small spill or small release of product confined to company property • Company/Contractor. Personnel minor injury or property damage. • Complaint telephone call received. • Trespassers on company property. • Spot fire/minor explosion	• Operational response made. • Reported as required internally. • Comply with appropriate government reporting after the fact. • Additional company personnel may be placed on standby status • Pretium initial response is undertaken as per the site specific ERP.	• No actions required. • Monitors response if advised.
Level 2 Mobilize IMT	• No immediate danger outside of company property, potential exists for emergency to extend beyond company property. • Outside services and Provincial Government agencies must be alerted • Imminent control of hazard is probable. • Some threat to workers or the public. • Moderate environmental impacts. • Local/regional media interest.	• Confirmed release with imminent control of the hazard probable. • Injuries/accidents involving workers. • Mischievous acts by trespassers threatening worker or public safety. • Fire/explosion that has a direct impact on worker/public safety.	• Pretium fully activates its ERP - internal resources mobilized - External resources mobilized. • Pretium mobilized and the emergency operations centre (EOC) may be on standby. • Lead agency notified (Smithers). • Public safety actions begin which could involve sheltering or evacuation. • External communications to media prepared and executed.	• Pretium has the capability to manage and control the incident using its own resources and expertise with limited assistance from local agencies and government authorities (MEMPR and WorkSafe BC, if necessary). • Lead agency notifies other agencies that may be affected. • Lead agency puts government EOC on standby. • Agencies with direct involvement may establish direct contact with Pretium. • Government agencies activate their
Level 3 Mutual aid mobilized to assist.	• Worker and/or public safety jeopardized. • Uncontrolled hazard. • Significant and ongoing environmental impacts. • Immediate multi-agency municipal and provincial government involvement. • Assistance from outside parties is required.	• Major accident impacting on workers or the public • Explosion with extensive damage to facilities • Mischievous acts which result in major damage • Major fire in a populated area and/or major wild fire	• Pretium emergency response is at maximum. • Pretium notifies lead agency • Pretium dispatches representative to Government EOC. • Pretium mobilizes corporate emergency response capabilities including Public Affairs, Legal, Executive, etc.	• Hospitals in Terrace and Stewart notified of potential trauma patients. • Government agencies with direct involvement dispatch staff to Pretium Operations. • Full activation of the Government Emergency Response Support Program to support Pretium.

2.3 EMERGENCY RESPONSE MANAGEMENT TEAM (ERMT)

Overall command to activate the Emergency Response Program shall be the responsibility of Pretium senior management at the incident site and/or the ERMT. Pretium personnel and contractor employees have the responsibility to implement the Brucejack Mine ERP.

Depending on the emergency level and the type of emergency, the Brucejack Mine - ERMT described below shall be formed to respond to an emergency.

In the event of an emergency at the mine, the chain of command structure provided in the Incident Command Emergency Management Organizational Chart will be enacted (Figure 2.3-1). The lead person for the chain of command will be the Emergency Response Coordinator (ERC), or alternatively the Mine Manager. This organization chart will expand or contract depending on the type and severity of the incident/emergency.

2.3.1 Emergency Operations Center (EOC)

The EOC will be established at the On-site Conference and Training Room following notification of an emergency. The site ERC (or designate) and facilitators of the site Mine Rescue Emergency Response Team (ERT) shall converge at this office. Requirements may include activities such as the allocation of on-site resources (personnel and equipment), setting up a communications center and external reporting of the incident/accident to government agencies, etc.

Should conditions dictate evacuation due to imminent danger; the EOC will be located at another defined location that is farthest from the imminent danger zone.

Figure 2.3-1. ICS Emergency Management Organizational Chart

Once established, EOC personnel will manage the emergency and undertake the following functions:

- Ensure that the Brucejack Mine ERP has been properly implemented;
- Monitor the health and safety of workers at the site;
- Monitor Security; and
- Provide appropriate technical information related to the incident.

2.3.2 Emergency Response Responsibilities and Duties

The following personnel involvement or requirements will depend solely on the Level emergency response (i.e. Level 1, 2, or 3).

All major emergencies require senior management personnel to form an ERMT. This team will direct emergency operations and assign tasks to individuals or groups. Responsibilities for each group are described in the following subsections. Note the list is not exhaustive and additional responsibilities may be identified commensurate with the type of incident.

2.3.2.1 Mine Rescue Emergency Response Team

The on-site surface and/or underground ERTs will consist of personnel trained as required of Part 3.7.7 of the *Health, Safety and Reclamation Code for Mines in BC*, 2017. They will be notified and requested as necessary.

2.3.2.2 First Responders – Level 1, 2, or 3 Emergency

- Take action to ensure their own safety;
- Alert other personnel in the immediate vicinity of the incident/accident;
- Determine the magnitude of hazards present, contact the Health and Safety Department and provide particulars of the emergency and request appropriate help;
- Perform duties as directed by the on-site supervisor (or designate). These initial duties may be as follows:
  - Providing assistance to injured personnel;
  - Assisting with procedures to control or minimize the effects of the emergency;
  - Determine if Personal Protective Equipment (PPE), safety equipment and supplies are adequate; and
  - Initiate an Event Log for the emergency.

No worker will approach a hazardous condition alone or without the proper PPE. First Responders will wait for the arrival of additional personnel and equipment.

2.3.2.3 Medic/Advanced First Aider – Level 1, 2, or 3 Emergency

When an injury requiring medical attention is reported, the Health and Safety Department will call the Medic/Advanced First Aider who will assess the degree of response required. All events shall be recorded in the Treatment Logbook. The Medic/Advanced First Aider shall:

- Take action to ensure your own safety;
- Alert other personnel in the immediate vicinity of the incident;
- Upon notification, the on-site supervisor (or designate) will meet with the Medic/Advanced First Aiders at the incident/accident scene (unless in radio contact). On-site supervisor (or designate) ensures that the Medic/Advanced First Aiders have the required supplies and that the area is secured and does not present any further danger to personnel; and
- The Medic/Advanced First Aiders will stabilize casualties and prepare for transportation. If transported, an Advanced First Aider will be required to attend.

2.3.2.4 Emergency Response Coordinator (ERC)

Upon hearing of and/or arrival at the scene of an emergency, the on-site Emergency Response Coordinator (or designate) will assume full command for the emergency response actions. Sometimes the ERC will work in conjunction with the on-site Mine Manager who will act as the representative of the company. In the event of an emergency the ERC will be responsible for:

- Determining the Level response of the emergency;
- Coordinating all emergency procedures through various levels of company personnel and delegate authority where appropriate;
- Making available the resources necessary to set up the ECO to deal effectively with the emergency including rehabilitation;
- Informing the Health and Safety Office of the emergency and have them remain on standby at the phones;
- Designating a person for traffic control who shall not allow any person to leave or enter the property via the glacier road or aircraft. The exception will be the following personnel who will be directed to the appropriate site locations:
    - Mine Rescue Emergency Response Personnel;
    - Emergency Response Team (ERT);
    - Mines Inspectors – BC Ministry of Energy, Mine, and Petroleum Resources; and
    - Other approved essential personnel.
- Conducting, in conjunction with the Health and Safety Office, all aspects of the investigations both at and away from the emergency scene, and report to the on-site Mine Manager; and
- Maintaining a log of occurrences.

Note the person designated for traffic control shall record the names and affiliations of any persons entering or leaving the property (after permission is given) and direct incoming workers to the mine dry to await instructions from the EMT.

2.3.2.5 Mine Manager

If the Emergency Response Coordinator is not immediately available, then upon hearing of and/or arrival at the scene of an emergency, the Mine Manager will assume full command for the emergency response actions until the ERC arrives at the EOC.

Otherwise in the event of an emergency the Mine Manager will be responsible for:

- Requesting assistance from agencies and others as required;
- Contacting local Mine's inspector as per the Mines Act requirements;
- Contacting R.C.M.P., Coroner, and senior management, as required;
- Activating the Mutual Aid Agreement; and
- Reviewing and making recommendations on emergency reports submitted by the ERC.

All public and press inquiries shall be directed to the Vancouver office.

2.3.2.6 Operations Superintendent

The Operations Superintendent (or designate) will ensure that Pretium employees, contractors and their employees are aware of their responsibilities under the plan. When notified of an occurrence, the Operations Superintendent will delegate authority to those on the scene, and relay pertinent information to those as required.

The Operations Superintendent will coordinate the efforts of response groups focusing on the following:

- **Evacuating the Mine:**
  - accounting for all employees and their locations;
  - evaluate the situation and estimate the number of personnel to handle the situation;
  - have mine rescue teams prepare and go on standby; and
  - in conjunction with the Mine Manager, arrange to have appropriate tasks assigned to all outside agencies and personnel on site as required.

- **If men are underground the Operations Superintendent will:**
  - devise a plan for rescue operations;
  - if fire, will devise a plan for control and extinguishment;
  - instruct / brief response group; and
  - send rescue teams underground.

- **As information from underground comes in, decide if additional rescue teams are required, change in rescue/procedures are required.**

- **If all men are accounted for and evacuated:**
  - locate the fire;
  - control and extinguishment of the fire;
  - ventilate the mine;
  - check the rest of the mine and assess damage;
  - determine causes and make reports; and
  - rehabilitation of damaged area.

- **In conjunction with the Mine Manager and ERC, will arrange to have appropriate tasks assigned to all outside agencies and on-site personnel as required.**

2.3.2.7 Mine Foreman or Shift Boss

The Mine Foreman or Shift Boss at the scene will assume command of the emergency until control is passed onto the Operations Superintendent. The Mine Foreman or Shift Boss will then work under the direction of the Operations Superintendent to implement rescue and rehab procedures. The Mine Foreman will take on the same responsibilities as the ones listed for the Operations Superintendent until the Superintendent arrives on the scene.

2.3.2.8 Security/Safety Manager

The Security/Safety Manager (or designate) will report directly to the Operations Superintendent and will be responsible for:

- Supervising all first aid, security and mine rescue operations;
- Ensuring all first aid, firefighting and mine rescue equipment is available to the accident scene;
- Coordinating call out of outside emergency agencies (Air Medivac, Ambulance) or other as required; and
- Coordinating investigation team, findings and reporting of emergency.

2.3.2.9 Maintenance Superintendent

Upon being notified of an emergency, the Maintenance Superintendent (or designate) will report to the EOC.

The Maintenance Superintendent will assist in mechanical/electrical matters relating to:

- mechanical/electrical problems and personnel;
- supply of compressed air;
- supply of tools and equipment that may be needed for the rescue operation;
- technical matters relating to power distribution and communication systems; and
- will ensure adequate water supply to the mine and servicing of pumping equipment underground.

2.3.2.10 Engineering Department

The Engineering Department will report to the Operations Superintendent and will provide up to date 1:250 and/or 1:3,000 scale plans showing:

- refuge stations;
- exit routes;
- fire-fighting equipment locations;
- an up to date ventilation plan showing directions and volumes of air flowing, fans and vent tubing extensions; and
- all vent doors being closed or open.

Upon the location of a fire, the Engineering Department designate along with the Operations Superintendent will assist in identifying locations of workers and equipment underground.

2.4 PLANNING AND TRAINING

2.4.1 Pre-incident Planning

2.4.1.1 Safety Precautions and Personnel Training

In preparation for implementation of this ERP, the Mine Manager shall verify the following measures are taken:

- Conduct safety meetings and orientation sessions with ERT Members to review the contents of the ERP;
- Ensure personnel on the mine site are familiar with their roles, duties, and safety responsibilities;
- Conduct ERP exercises four times per year to familiarize personnel with the correct emergency reporting and response procedures. On completion of each exercise, evaluate how efficiently the exercise was conducted, and address any areas of concern;
- ERT members respond in all mock scenarios as a training exercise. This is in addition to weekly planned training which is organized by the ERCC to cover all aspects of emergency response. Which includes specific focus on actual incidents in the mining industry;
- The Incident Management Team (IMT) planning manager and the rest of the IMT participate in all tabletop and mock scenarios where the focus is on incident management and business continuity planning;
- Ensure personnel are familiar with equipment they may be required to use; and
- Verify adequate safety equipment is available to meet the requirements in an emergency.

2.4.1.2 Mine Rescue Emergency Response Program Exercises

An emergency response exercise is a mechanism used to review the level of emergency preparedness within an organizational infrastructure and to evaluate the ability of the infrastructure to respond to potential emergencies that could arise (Table 2.4-1).

Table 2.4-1. Incident Management Team Training

Team	Induction (role specific)	Desktop Exercise	Mock Exercise (frequency/participants)
IMT	Within 2 months of joining (at a maximum)	Quarterly (four times a year)	Every 1-2 years

Prior to becoming an Incident Management Team Member, an individual must complete practical training with the ERT Coordinator. This will be achieved in one of two ways:

- One-on-One training: The new member and the ERT Coordinator will go through the IMT Room, IMT status boards, breakout room, communication systems, and general workflow of an IMT incident.
- Desktop Scenario: The new member will participate in an IMT desktop scenario, either as a primary, alternate, or observer. Every 1 to 2 years this will include all external offices to participate.

Once the member is trained, they become an Incident Management Team Member.

Objectives

Emergency Response Exercises are to be conducted for the following reasons:

- to validate the adequacy of the organizational infrastructure to effectively deal with emergencies;
- to test the initial communications sequences;
- to verify contact numbers are correct when required;
- to familiarize personnel with their duties and responsibilities;
- to evaluate the preparedness of each party involved in the ERP;
- to identify and correct deficiencies in the ERP;
- to verify the availability of support services;
- to exercise tactical site-specific responses; and
- to examine the interaction between the individuals, support groups, organizations, and agencies named in the ERP, and to address identifiable shortfalls in the established lines of authority.

Once scenarios are completed a debrief will be conducted to determine where changes need to be made. A record will be kept and followed up on until all items have been completed.

Scope

Emergency response exercises are held to review and evaluate existing ERPs. Normally a programmed scenario is developed to present a set of hypothetical emergency conditions, relevant to activities that fall under the scope of an existing ERP.

Emergency response exercise scenarios can be targeted to evaluate the initial response to potential emergency situations that may develop at both the site-specific level or at the senior management level.

Hypothetical criteria can be targeted to measure immediate tactical response or the extent of initial administrative support, depending upon how the scenario is devised.

Emergency response exercises may involve active communications from personnel within the organization, from government agencies, contract support services, and other parties involved in the ERP. Only those communication responses as described in the scenario will be activated.

A performance review meeting should be held immediately following the exercise. At the conclusion of the exercise a report will be generated to describe the outcomes for further analysis and to initiate remedial action and follow up.

2.4.2 Post-incident Review

2.4.2.1 Critical Incident Stress Debrief (CISD)

A critical incident stress debrief is a short (30 to 45 minute) non-judgmental session with all personnel involved in responding to a workplace incident. An incident is any workplace event like an accident, injury, or fatality that causes emotional or psychological trauma.

The critical incident Stress Debrief should occur no longer than 6 hours after the incident and should be carried out by professionals. The group will consist of personnel involved in the incident. Topics will vary but should include: what happened, what was learned, what was done well, as well as actions needing further improvement. The CISD should be a constructive experience for all those involved.

2.5 POSSIBLE FUTURE INCLUSIONS TO THE MERP

Further to the Emergency Response Process there are additional components, which are only outlined and/or not included in this initial MERP document. These additional MERP components should be developed by the Brucejack Mine operations management. They may include:

- **Detailed Emergency Response Team Structure:** Outlining the infrastructure of personnel that will be established to respond to an emergency and to provide further details on their assigned responsibilities.
- **Detailed Alerts and Warnings:** Documentation on how the organization will be alerted to an event or incident, and how the emergency communications sequence will be implemented for the Emergency Response Program.
- **Assessment and Notification:** Documentation of communications protocols within the organization and with outside agencies, including relationships with the media, before and after the event. Provisions for assessing and documenting the nature and severity of the

incident will also need to be developed. The MERP includes a family liaison, external affairs and human resource manager which is responsible for contacting and updating next of kin, managing press and social media.

- **Comprehensive Emergency Response Details:** Description of procedures needed to test the efficiency of the Emergency Response Program. This would document how members of the emergency management group would respond to emergencies within the context of the organization's EOC. Full comprehensive procedures combined with charts with tactical maps will need to be developed for both the alert and activation phases of the EOC.

3 EMERGENCY EVACUATIONS

3.1 OVERVIEW OF EVACUATION PROCEDURES

Structural fires may present the highest potential hazard at the Brucejack Mine. This is because of the flammable nature of the materials used in the construction of most buildings (camp, offices and administration complex).

The following functions listed below are essential in maintaining the integrity of the fire suppression systems and also providing adequate and effective response in the case of a fire.

Evacuation procedures will need to be further developed for the administration, processing and maintenance facilities. However, if there is an alarm or initiation of an evacuation order (administration facility, processing plant, etc.) or stench warning (underground), ensure you follow these procedures immediately:

- Evacuate the facilities, area of work or underground;
- Warn others of the emergency if you encounter them during your evacuation;
- Notify appropriate emergency services and your supervisor;
- All personnel will assemble in the designated (muster) areas and will remain there until ordered to move by the supervisor or the emergency services;
- If you did not evacuate to the designated area immediately you could be classified as missing, therefore immediately report to the supervisor in charge to get checked off the list;
- Some personnel may elect to use emergency equipment to control and/or extinguish flames, spills, etc. but at no time is any worker to remain in the facilities or underground if further exposure shall increase the risk hazard to the worker;
- No worker shall re-enter the workplace and/or return into the buildings after an evacuation until authorized by the Mine Manager and the emergency services; and
- Appoint a person to direct emergency vehicle(s) or personnel to the emergency site.

In the event of an emergency response, the responsibility for directing the response will be the ERC. The Supervisor(s) and Mine Rescue Emergency Response Team will assemble with the ERC at the EOC, who will then direct rescue and firefighting operations.

The response group will assess any reporting on anyone missing and/or details concerning the fire. The response group will then locate and rescue anyone not accounted for, and deal with the emergency response.

3.2 MEDICAL EMERGENCIES

In the event of an incident requiring first aid and/or evacuation, the Medic/Advance First Aider will attend immediately to the scene of the accident to provide first aid and to assess the requirement

for evacuation of the injured. The Medic/Advance First Aider, upon deciding to evacuate these person(s), will inform the ERC and Mine Manager who will then decide upon an appropriate course of evacuation for the injured.

Monthly fire suppression systems inspections will be essential to ensure their integrity. Scheduled maintenance and repairs will be undertaken in order to maintain the integrity of fire suppression systems.

Particular attention to housekeeping and observing the BC Fire Code will ensure that fire protection remains effective at all times. Combustibles shall not be stored inside buildings unless they are part of a work process. Flammable materials such as paints and aerosols shall be stored in approved and appropriate storage cabinets.

Fire drills and evacuation drills will be conducted periodically by management, and all persons shall co-operate during these drills.

3.3 General Mine Emergency Response Procedures – Surface Operations

Surface Operations include all surface activities such as the mill and maintenance operations, administration, camp, vehicle use, access roads, glacier travel routes, quarries, snow dump, etc.

In the event of a surface operations emergency, announce a Code One as per the Code One SOP.

3.3.1.1 Emergency Notification Plan, BJ-OHS-SOP-002 - Code One Call Out & Response

The person(s) discovering the emergency shall do the following.

If you have a radio, announce the "**Code 1**" three times on radio **Channel 2, Repeater 1** and stay on this channel until you receive confirmation that your notification was received by Dispatch. Make sure you pass on all details of the emergency, including:

- your name;
- nature of the emergency;
- location of the emergency;
- requirements for handling the emergency (i.e., first aid, rescue team, ambulance, firefighting);
- number of injured personnel; and
- description of the injuries.

When notification is received by Dispatch, they will instruct **"Radio silence – Code 1"** three times on **Channel 2, Repeater 1** as this channel is monitored at all times. All nonessential radio traffic and work activity will cease until further notice.

The onsite clinic personnel will be monitoring the repeater channels at all times.

If only a surface emergency, the Medic/Advanced First Aider assumes command and coordinates with Medical Aid and Air Operations. If it is a Code 1 then the ERCC assumes command and follows the ERP protocols.

3.3.2 Administration Facilities Emergency Evacuation

The procedure for evacuation from the facilities is clear. If some personnel elect to use emergency equipment to control and/or extinguish flames, spills, etc. they may do so until further exposure increases the risk hazard to that worker. If a risk hazard increase than all personnel will need to evacuate from the facilities immediately.

3.3.3 Camp Muster Areas

All emergencies will be coordinated through the senior on-site supervisor or designated person. All radio traffic will be cleared in the event of an emergency. All Camp mustering stations are clearly marked on-site.

3.3.4 Employee Responsibilities during All Emergencies

In an emergency, employees shall:

- ensure their own personal safety;
- assist others, alert others;
- check work area for others;
- close doors and windows;
- report to the muster station during an emergency or drill;
- bring appropriate PPE and clothing for the weather;
- report to their supervisor at the muster station; and
- remain in the muster area until directed by their supervisor.

3.3.5 Supervisor Responsibilities during All Emergency

All supervisors shall:

- Report to the muster station during an emergency or drill;
- Account for all employees under their direction;
- Provide a report to the ERC, if applicable regarding status of head count;
- Report all unaccounted employees including the last known whereabouts of the employee(s); and
- Instruct employees to remain at the muster station until the emergency is over.

3.4 MOBILE EQUIPMENT/VEHICLE ACCIDENTS

There is a potential for vehicle accidents involving multiple casualties on the Mine Access road.

In the event of these accidents it is highly likely to encounter multiple casualties because of the high volume of traffic on the road and the type of vehicles used (buses and multi-passenger vehicles).

In the event of an accident of this type the following procedures must be followed:

- Assess the accident scene for hazards, such as:
  - fire;
  - spills – hazardous cargo (chemicals or fuels);
  - equipment stability; and
  - electrical hazards from downed wires, etc.
- If you have a radio, announce the "**Code 1**" three times on radio **Channel 2, Repeater 1** and stay on this channel until you receive confirmation that your notification was received by Dispatch. Make sure you pass on all details of the Emergency:
  - your name;
  - nature of the emergency;
  - location of the emergency;
  - requirements for handling the emergency (i.e., first aid, rescue team, ambulance, firefighting);
  - number of injured personnel; and
  - description of the injuries.
- If it is not safe to approach the accident scene, stay clear, until appropriately trained mine rescue emergency response team arrives.

Figure 3.4-1 summarizes these procedures in flow chart format.

Figure 3.4-1. Mobile Equipment Accident Response Flow Chart

3.5 GENERAL MINE EMERGENCY RESPONSE PROCEDURES – UNDERGROUND OPERATIONS

The following ERP outlines the basic procedures to follow should any emergency occur in the underground operations at the Brucejack Mine. This section deals specifically with the underground; however, several of the other components of this plan are as relevant for the entire operation including fire and emergency procedures.

Some of the information in this section was sourced from the SOP "Underground Emergency Response Plan – Brucejack". Review the SOP for additional details.

Underground emergencies are those events that could cause an immediate threat to life. Types of underground emergencies could include the following but not limited to:

- injury to, or people requiring rescue;
- loss of life;
- unexpected/unplanned explosion;
- fire/heat/smoke;
- falls of ground;
- equipment electrical - failure/damage;
- loss of main ventilation; and
- any other situation that may jeopardize the safety of workers and/or the mine.

It is very important that all personnel be prepared. In order to accomplish this the following should be undertaken:

- Every employee should be trained and familiar with the MERP;
- Each employee must be familiar with the stench gas warning system, how it works and must understand what to do upon smelling it;
- All management personnel must be familiar with their roles in an emergency;
- Mine rescue personnel should be properly trained. Locations in where they can be reached shall be posted and their personnel in/out tags should be marked so they can be located easily;
- Refuge stations must be located where needed, maintained in good condition, well equipped, and with instructions for procedures to be followed posted in each station;
- Fire extinguishing equipment must be located where needed, must be ready for use and inspected regularly;
- The communication system underground must be kept in good condition;
- Ventilation doors if installed must be well located, kept in good repair and clearly marked "OPEN" or "CLOSED";

- Mine plans showing exit routes, refuge station locations must be posted; and
- All underground employees will receive basic training in the use of fire extinguishers and water hoses as well as survival mine rescue and first aid.

3.5.1 General Underground Emergency Response Procedure

3.5.1.1 Emergency Notification Plan, BJ-OHS-SOP-002 - Code One Call Out & Response

The person or persons discovering the emergency shall do the following:

- If you have a radio, or are at an underground phone (Femco), announce "**Code 1**" three times on your radio – UG All Dispatch **Channel 1** and stay on this channel until you receive confirmation that your notification was received by Dispatch. Note*: Underground Emergency – Code 1 will deploy UGIC if stench has been released.* Make sure you pass on all details of the Emergency:
  - your name;
  - nature of the emergency;
  - location of the emergency;
  - requirements for handling the emergency (i.e., first aid, rescue team, ambulance, firefighting);
  - number of injured personnel; and
  - description of the injuries.
- Remain on the radio or phone and wait for further directions.
- If you do not have a radio, go to the nearest Femco phone and announce the Code 1. Ensure supervisor has heard and will pass on to Dispatch.
- Warn all personnel in the area by releasing the stench gas in the ventilation system. Releasing the stench gas in compressed airlines requires approval from the Mine Manager.
- According to your skills and training, do what you can do to correct the situation with whatever you may have at hand to do so. Remember; do not jeopardize your own personal safety.
- When calling out ensure you give as complete information as possible to ensure correct and appropriate response.
- If there is any sign of fire or smoke put on your W65 self-rescuer, retreat to a refuge station or fresh air escape way and advise others in the area.
- If surface visibility is compromised due to whiteout snow conditions, the mine manager or designate shall organize for a guideline to be strung between the portal and truck shop.

3.5.2 Underground Fire Emergency Procedures

3.5.2.1 Discovery of Smoke Underground

If you encounter smoke anywhere in the underground mine workings:

- Assess the type of smoke you have encountered. Is this blasting smoke, diesel smoke or possible smoke from a fire? You will have to use your sense of smell and judgment to distinguish between the different types of smoke.
- If you suspect the smoke is from a fire, go to the nearest phone and call site dispatcher/ supervisor or the surface shops/offices and pass on all details of the emergency and have them call a **"Code 1"** three times on the UG Emergency **Channel 4**.
- Make sure you pass on all details of the emergency and ask for the stench gas to be injected:
  - provide your name and location of the emergency;
  - the precise location, nature of the fire and what is burning;
  - the size of the fire; and
  - your planned destination after the call.
- Put on your self-rescuer and proceed to the portal. If egress through the portal is not possible, proceed to the nearest refuge station or place of safety and await further instructions.
- Advise other workers that you encounter of the emergency.
- If your passage to the nearest refuge station or place of safety is blocked proceed to the nearest dead-end drift that has air and water available and seal yourself in using any available materials. Use your jacket, oiler jacket or shirt to make a tent over your head and the air header and crack open the airline and wait for help.
- **Do not panic and enter smoke** – trained rescue personnel will get you out.
- Occasionally beat on a pipe in a series of three (3) taps to indicate your location.
- If you reach the portal, proceed immediately to the tag board and tag yourself out. Then report immediately to your supervisor and notify him that you are out of the mine.
- Do not leave the truck shop area until authorized to do so by your supervisor.

3.5.2.2 Discovering Fire or Emergency

Persons discovering the fire or emergency shall:

- Immediately try to extinguish the fire with whatever means are available. Fire extinguishers are located at all refuge stations, shops, electrical sub-stations, storage areas, fuse and powder magazines and on all pieces of mobile equipment.
- If you cannot put the fire out quickly, try to warn everyone that you can and or get to a phone or radio and call your supervisor or the surface shops/offices and pass on all details of the emergency and have them call a **"Code 1"** three times on UG Emergency Channel 4. Make sure you pass on all details of the emergency and ask for the stench gas to be injected:

- your name and location of the emergency;
- the precise location, nature of the fire and what is burning;
- the size of the fire; and
- your planned destination after the call.

When the alarm is turned on, a stench gas warning will be introduced into the airline and ventilation system in the mine and all persons underground should proceed as follows:

- Put on your self-rescuer and proceed to the portal. If egress through the portal is not possible, proceed to the nearest refuge station or place of safety and await further instructions.
- Advise other workers that you encounter of the emergency.
- Upon reaching the portal, proceed immediately to the tab board and tag yourself out. Then report immediately to your supervisor and notify him that you are out of the mine. Remain at the pre-arranged safe designated place.
- Do not leave the truck shop area until authorized to do so by your supervisor.

3.5.2.3 Fire on Piece of Underground Equipment

If there is a fire on a piece of equipment in the underground mine workings:

- Stop the piece of equipment and shut down the engine.
- Turn off the master switch.
- Extinguish the fire using the handheld fire extinguisher from the piece of equipment first. If you are unsuccessful activate the fire suppression system from one of the two activation points located on most pieces of underground equipment.
- Do not expose yourself to smoke or gases.
- Even if you succeed in extinguishing the fire do not delay in announcing an emergency. Go to the nearest phone and call your supervisor or the surface shops/offices and pass on all details of the emergency and have them call "**Code 1**" three times on the **UG Emergency Channel 4.** Make sure you pass on all details of the emergency and ask for the stench gas to be injected:
  - your name and location of the emergency;
  - the precise location, nature of the fire and what is burning;
  - the size of the fire; and
  - your planned destination after the call.

When the alarm is turned on, a stench gas warning will be introduced into the airline and ventilation system in the mine and all persons underground should proceed as follows:

- Put on your self-rescuer and proceed to the portal. If egress through the portal is not possible, proceed to the nearest refuge station or place of safety and await further instructions.
- Advise other workers that you encounter of the emergency.

- Upon reaching the portal, proceed immediately to the tab board and tag yourself out. Then report immediately to your supervisor and notify him that you are out of the mine. Remain at the pre-arranged safe designated place.
- Do not leave the truck shop area until authorized to do so by your supervisor.

3.5.3 Emergency Activation System (Stench Gas)

3.5.3.1 Stench Gas Activation

Stench gas is normally injected for emergencies requiring mine evacuation or refuge such as fires. In the event of a stench gas deployment, all persons shall:

- Evacuate to a safe area where communication can be maintained unless immediately requested to assist.
- Evacuate to a designated assembly area for a head count or further instruction.
- Not leave the assembly areas or go back into the area until authorized.
- Not make any off-site phone calls with details of the emergency.
- If underground proceed to the portal. If egress is not possible, proceed to the refuge station and contact surface via the mine phones.

In order to release the stench gas underground follow BJ-OHS-SOP-004 Stench Gas Release.

3.5.3.2 Person Encountering Stench Gas

If you smell stench gas (ethyl mercaptan/rotten egg smell) anywhere in the mine:

- Stop working immediately and make sure others in the area are aware of the emergency.
- Shut down and secure any equipment you have been using. Make sure it is not parked blocking the roadway or access to emergency or electrical equipment.
- If egress to the portal is not possible (do not go past a refuge station), proceed to the refuge station.
- Travel quickly but calmly and do not run. Take any available tools with you. If there is any indication of the smell of smoke put on your W65 self-rescuer or Ocenco 6.5 EBA.
- Always stay on the fresh air side; never travel in air containing smoke.
- Do not change the ventilation system.
- Warn anyone you meet along the way of the emergency.
- Upon reaching the portal, proceed immediately to the tag board and tag yourself out. Then report immediately to your supervisor and notify him that you are out of the mine.
- Do not leave the tag board area until authorized to do so by your supervisor.

3.5.4 Loss of Ventilation

If ventilation is lost in the mine:

- In the event of an auxiliary fan failure:
  - leave the area;
  - shutdown all diesel-powered equipment;
  - notify your shift boss of the problem;
  - the shift boss will call an electrician to evaluate the problem;
  - once evaluated and fixed the ventilation will be turned on to flush out the affected area for 20 minutes prior to resuming work in the area; and
  - work will not resume in the heading until adequate ventilation can be established.
- In the event of a main fan failure:
  - shut down all diesel-powered equipment and notify shift boss;
  - small diesel-powered tractors or utility vehicles may be used to egress;
  - all personnel should proceed to the refuge station;
  - roll call will be completed from the tag board to ensure all personnel are accounted for;
  - work will not resume in the mine until adequate ventilation has been established; and
  - a gas tests as well as flow and velocity checks in all work areas will be completed prior to work resuming.
- If smoke or fire is encountered at any point refer to Section 3.5.2 of this MERP.

3.5.5 Refuge Station

3.5.5.1 Action Steps for Refuge Station Procedures

Step I – General Actions

1. A responsible person will take charge immediately (Does not have to be a supervisor).
2. Determine if there is compressed air coming in or not (airline).
3. Follow Step II or Step III, depending on compressed air.
4. Call in (phone/radio) and report all persons in refuge station. Double-check all names and those present. Make certain all present have been reported in.

Step II – When Compressed Air Is Available

1. Go in through the first door and close it behind you.
2. Purge contaminated air in the air lock with provided compressed air cylinders.
3. Open second door to enter chamber and close behind you.
4. Ensure compressed air is on.
5. Keep a check on pressure inside refuge station (must be positive). This can be determined by holding a string or piece of paper, etc. in exhaust pipe opening.
6. Conserve oxygen by keeping quiet and still.
7. Mix the air by having one-person walk around every fifteen (15) minutes or so.

8. Keep off the floor. The exhaled air containing CO_2 is heavier than normal air and settles to the floor.
9. Conserve cap lamps. One on per group is adequate.
10. Remain in station until you receive official instructions.
11. “NO SMOKING “at any time during Emergency Stench Warning.
12. Remain calm, follow Emergency refuge conduct procedures.
13. Ensure continuous gas monitoring to ensure air quality is sufficient.

Step III – If Compressed Air Is Not Available

***Note**: When compressed air (airline) is not available extra care must be exercised.*

1. Go in through the first door and close it behind you.
2. Purge contaminated air in the air lock with provided compressed air cylinders.
3. Open second door to enter chamber and close behind you.
4. Ensure the compressed air valve is closed.
5. Turn on oxygen and refuge chamber continuous gas monitor. This will continually measure the air quality in the chamber.
6. Ensure names of those in refuge station are phoned/radioed in and update information as necessary.
7. Frequently check sealed openings for possible leaks and maintain positive air pressure.
8. Conserve oxygen by keeping quiet and still.
9. Mix the air by having one-person walk around every fifteen (15) minutes or so.
10. Keep off the floor. The exhaled air containing CO_2 is heavier than normal air and settles to the floor.
11. Conserve cap lamp batteries – use only one cap lamp at a time.
12. Remain in the refuge station until you receive official instructions that it is safe to leave.
13. **NO SMOKING** at any time in the refuge station during the emergency.
14. Remain calm, you will eventually be rescued.

3.5.5.2 Duties of Person in Charge of Station

Duties of person in charge of station (a responsible person or as designated by Supervisor):

- Phone/radio mine office. If phone/radio is out of order, stay at your location until rescued.
- Report number and names of personnel in refuge station, injuries if any, location of fire if known, smoke conditions, ventilation, locations of other persons if known.
- Maintain discipline in the refuge station.
- Keep use of phone/radio to a minimum.

- Remain in refuge station until instructed otherwise.

3.5.5.3 Persons Entering Refuge Station

Duties of person entering a refuse station (a responsible person or as designated by Supervisor):

- Report your name and working place to person in charge.
- Follow any instructions by the person in charge.
- Sit down and remain calm and quiet.
- Do not smoke in the refuge station.
- Turn off your cap lamp to conserve the life of your battery. One lamp on per group is sufficient to illuminate the station.
- Save any food or liquid in case your rescue may be delayed.
- If you are alone in the refuge station, follow instructions given above or as posted in the refuge station.

REMEMBER: You are in no danger if you remain where you are. You will be advised via telephone/ radio by someone in authority or by the Mine Rescue Emergency Response Team when it is safe for you to leave and by what route you should travel to reach surface.

3.5.5.4 Refuge Station Locations

All refuge station locations must be constructed and equipped in accordance with Part 6.13.3 of the HSRC, 2017.

3.5.5.5 Refuge Station Required Emergency Supplies

The following items are to be stocked in each refuge station. No person may use or consume any of these supplies unless it is an emergency.

- first aid supplies and blankets;
- oxygen therapy unit;
- radio communications;
- phone (Femco or other);
- CO_2 scrubber;
- oxygen bottles;
- food rations;
- drinking water;
- portable toilet;
- sealant; and

- compressed air.

If inventory is taken from the refuge station, the safety department must be notified immediately so it may be restocked.

3.5.6 Employee Tally Procedures

In the event of an emergency a systematic check must be conducted to account for all persons underground at the time of the emergency. To achieve this, the following procedures must be followed.

1. Once an emergency has been established, the Shift Boss or designate will begin a roll call of all employees known to have gone underground. This firstly can be assessed by checking the tag board located in the main dry/shifters area. All employees going underground are required to place their personal ID tag on the board. All others such as visitors or contractors would be tagged accordingly. A back up check would be to do a mine lamp count and compare to tag count.
2. Should anyone be unaccounted for, the Shift Boss or designate would then determine their job description (miner, electrician, mechanic, etc.) and the last location where the person was working.
3. Once the Incident Command Group has been assembled a search and rescue plan shall be initiated.

4 GENERAL PROCEDURES TO FOLLOW FOR ACCIDENTS AND FIRST AID TREATMENTS

4.1 FIRST AID AND MEDICAL SERVICES

As per requirement of Part 3.6.1 of the *Health, Safety and Reclamation Code for Mines in BC*, 2017, Pretium Resources/ Brucejack Mine is providing and maintaining first aid supplies and services as required by WorkSafeBC. As part of the emergency response plan, Pretium Resources/ Brucejack Mine has mutual aid partnerships with Silvertip Mine and New Gold and will mutually provide resources and compensation as required.

The fully equipped first aid facility is located in a designated facility on the property. The facility and equipment are clearly identified and reserved for the treatment of injured personnel. The Medic/OFA 3 can be reached by radio at all times, On Channel 2, Repeater 1 in case of emergency, or if underground call on Channel 1.

All personnel working on site, including laborers and equipment operators are required to:

- have general knowledge of how to summon first aid help, and general knowledge of securing the scene and helping (as per the level they are trained at); and
- be authorized to call for transportation for injured workers and must be trained in the procedures.

The mine site should have a percentage of employees who have Level 1 and Transport first aid tickets while working on the mine site.

Any work site that requires specialized equipment for the rescue or transport of injured personnel is clearly identified. The equipment is properly stored to prevent damage or deterioration. Clear access to this equipment will be always maintained, and a regular inspection program has been established to check for deficiencies.

To complement the first aid services, Pretium has enacted the general procedures described in Section 4.2. All employees, contractors and their employees should follow these procedures in case of first aid treatments, accidents, and dangerous occurrences.

An Emergency Response Coordinator (or designate) will be in command during Code 1 emergencies.

To ensure that appropriate information is gathered during a site emergency or during a first aid response, checklists will need to be developed. An example form is provided in Section 9.

4.2 FIRST AID, MEDICAL AID AND TREATMENT PROCEDURES

4.2.1 First Aid Treatment Procedure

Any worker who sustains an injury or illness that is, or may be, work related shall report for treatment as soon as possible. The following three (3) situations below highlight, depending on the type of injury, what type of actions are required:

- If you suffer a minor injury that requires First Aid, the first three (3) action items are required.
- If you suffer a significant injury and are unable to continue work, and/or will not return to work the next day or for a period of time, all five (5) action items are required.
- If you suffer a significant injury and will not return to work the next day or for a period of time, all five (5) action items are required.

Action items to follow depending on the type of injury situation:

1. Report injury to First Aid Attendant.
2. Ensure you receive proper treatment.
3. Document in treatment record book.
4. Notify supervisor, who will initiate an investigation.
5. Complete required paperwork and forms.

If you encounter these typical first aid scenarios, be prepared and know how to treat them:

- bleeding from cuts and abrasions;
- slips and falls – injuries such strains, sprains and broken bones (fractures) or concussions;
- burns; and
- allergic reactions.

4.2.2 Procedures for Handling Medical Emergencies

The following assessment will be necessary during any medical emergency. Whether it is minor or life threatening, use the following simplified **Priority Action Approach:**

1. **Scene Assessment:** Mechanism of Injury? Hazards? Environment?

   First: Keep yourself safe

   Second: Observe for bleeding/deformities/eyes

   Third: Observe the skin/level of consciousness – moving/verbal

   Fourth: Spinal Precautions

   Fifth: **Airways** – With C-spine: Open/Clear – manually stabilize head

   Breathing – Rate and Quality

   Circulation – Radial/Carotid, skin – color, temperature and condition

   Sixth: Rapid Body Search (RBS) – Rapid/Through Life Threatening

Seventh: Warmth – Blankets/Reassurance/Support Injuries

2. **Transport Decision:** Load and Go (Hospital and/or Call for an ambulance)/Stay and Play (Administer First Aid).
3. **Communicate to Emergency Services:** Stewart or Terrace Hospital or call for help from other persons on-site.
4. **Secondary Assessment:** Vital, History, Head to Toe Evaluation.
5. **Definitive Treatment:** Ice, Dressings, Splitting, Wound Cleaning, etc.

Once relieved by the Medic/Advanced First Aider, continue to assist if required and pass on any information gathered during assessment of patient.

If the injury requires offsite medical aid, it will be the sole responsibility of the Medic/Advance First Aider on duty to do all Medical Aid Referrals, by making the decision to transport, the choice of methods and the decision to accompany the patient, if necessary. The direct supervisor is then solely responsible to arrange for the required transportation for the injured worker. If the transport is by helicopter than the Medic/Advanced First Aider will call the Site Dispatcher who will contact VIH Helicopters on radio Channel 2 or at the VIH Hanger in Stewart at 1-250-636-2498. Advise them if a litter stretcher is required. **THE LITTER STRETCHER IS REQUIRED FOR ALL SPINEBOARD SCENARIOS**.

If ambulance transportation is required from the Stewart Airport to the Stewart Health Centre or there is more than one injured person, contact BC Ambulance Services at 1-800-461-9911.

It is the responsibility of the Medic/Advance First Aider to complete the proper forms and submit them to WCB; as well to distribute a copy to the Mine Manager and if necessary, provide a copy for Pretium Resources Inc. head office. A record of every injury or illness that requires first aid treatment is kept in the Accident Record Book. Each record must be signed and dated by the person providing treatment. The First Aid statistics shall be reviewed monthly at a safety meeting to determine trends and recommend corrective action.

4.2.3 Procedures to Follow in Case of a Serious Accident or Fatality

The following basic procedures should be followed in the event of a serious (life-threatening) accident requiring first aid treatment or a fatality. It is imperative that you ensure there is no further danger to yourself and to the patient before starting treatment.

If you have a radio, call “Code 1” three times on UG Emergency Channel 4 and stay on this channel until you receive confirmation that your notification was received by Supervisor/Site Dispatcher/ Security/Safety Manager. If you are near a phone call extension 100 to dispatch and call a Code 1. ***Note:*** *Code 1 Emergency will deploy ERMT. Make sure you pass on all details of the Emergency*.

- Then follow the appropriate Emergency Evacuation Procedures that have been established for your area of operations;
- Ask Supervisor/Site Dispatcher/Security/Safety Manager to notify the Medic/Advanced First Aider (by radio) and indicate there is a medical emergency – **STAY CALM**;

- All work at the area of the accident, must cease, all equipment is to be shut off and made secure, except for those required to assist in the emergency; and
- ENSURE THAT THE ACCIDENT SCENE IS SAFE TO APPROACH – If not, report what you see.

If the scene is safe and you are able to approach the injured person, report and complete the Procedures for Handling Medical Emergencies as noted in Section 4.2.2.

REMEMBER: Call for help, stop or control bleeding, restore breathing, and avoid panic. Do no more than is necessary until help arrives.

Even if not in danger, **DO NOT MOVE** the injured patient but provide the best available first aid treatment that does not exceed your level of training. Provide comfort and warmth to the patient.

Ensure that, except for the purpose of saving a life or relieving human suffering, the scene of the accident or occurrence is not disturbed without appropriate approvals as required by Part 1.7.1 (2) of the HSRC, 2017.

If the injury is an obvious **fatality**, immediately contact the Mine Manager, who in turn will contact the appropriate authorities (RCMP and Chief Inspector of Mines). Every serious accident must be reported immediately to the Mine Manager, by the first aid attendant on duty after requesting an ambulance or helicopter. The Mine Manager will then contact MEMLCI, who will advise whether the Ministry will investigate the accident.

4.2.4 Procedures to Follow when Calling for a Provincial Ambulance

When instructed by the Medic/Advance First Aider or the Direct Supervisor, follow these steps:

1. Call AMBULANCE: Phone 1-800-561-8011 or 911;
2. When asked “For what place?” answer “Pretium – Brucejack Mine”;
3. As the mine does not have a municipal address, the dispatcher may not be familiar with the locations. If that is the case, pass along the following information that fits the 911 dispatch system:
   - First Name: Brucejack Camp
   - Last Name: Pretium Exploration Inc.
   - Street Number: Northern BC
   - Street Name: Near KM 215, Highway 37, Down 73 km Haul Road
   - City: Between Meziadin Junction and Bell 2
   - Other Information: LAT 56°27’57.64’N LON 130°11’11.32”W
     Elevation 1,440 m asl, 73 KM Haul Road Access off Hwy 37
4. State that “We have life threatening injuries and request vehicle or helicopter evacuation”;
5. There will be several questions the dispatcher will ask including:
   - “Your exact location?”
   - The Brucejack Camp co-ordinates are?”

     Latitude: 56 degrees 28 minutes 01 seconds

Longitude: 130 degrees 11 minutes 01 seconds

Map Coordinates: NAD 83 UTM: 9V East: 427080 North: 6258695

- What is the phone number you are calling from?
- What happened exactly?
- What are the injuries?
- Are you with the injured person now?
- How many people are hurt?
- How old is the patient?
- Is the patient conscious or unconscious?
- Is the patient on a spine board?
- Is the patient breathing?
- What is the weather at site?
- Is there an accessible area to safely land a helicopter?
- Is the patient accessible?
- How many daylight hours are left?

Triage is done based on the information you are able to provide. A road or air ambulance will be dispatched to the required location. If the ambulance crew from Stewart is required, they will come in a helicopter from Stewart. Flying conditions will be reviewed and Medevac will proceed at the discretion of the pilot in command.

The **one-way** flight lengths to Stewart:

- Direct: 60 km (approximately 20 minutes)
- Via the Granduc Valley and Knipple Glacier: 76 km (approximately 30 minutes).

Flight lengths to the Terrace airport:

- Direct: 245 km (approximately 80 minutes).

If you are calling for an air ambulance, then you must prepare a helicopter landing pad/area. This area must be clearly marked and cleared of debris that could become airborne when the helicopter approaches and damage the rotors in the machine. A guard must be posted in this area and all traffic in the vicinity stopped. The helicopter will be looking for this area and can be guided into the landing area.

4.2.5 Reporting of Illness or Injury

Every Pretium employee, contractor and contractor employee at the Brucejack Mine must report any work-related injury or illness to their immediate supervisor, immediately. It is the responsibility of the supervisor and/or Medic/Advanced First Aider to ensure that the ill or injured worker receives appropriate first aid or medical treatment immediately.

Failure to report any work-related injury or illness is grounds for discipline, up to and including dismissal.

Any non-work-related injury or illness that will result in a worker being absent from work, for any reason, must be reported to their immediate supervisor as soon as possible after the worker learns of his or her inability to work. All personnel (management, direct employees and contractor employees) with non-work-related injury or illness shall provide the immediate supervisor with any information they have as to the expected duration of the injury recovery or illness to allow for efficient manpower planning.

Prior to returning to work (from a work caused illness or injury or nonwork-related illness or injury) the person shall contact the immediate supervisor to confirm their return-to-work date.

5 SURFACE FIRE EMERGENCIES

Fires could be one of the most common incidents on the job. Therefore, it is important to have some general fire protection rules that must be adhered to by all Pretium employees and contractors.

5.1 GENERAL FIRE PROTECTION RULES

General protection rules include, but are not limited to the following:

- There will be no smoking on the job, other than those areas designated as “smoking areas.”
- Evacuation routes are to be posted at various locations throughout the mine site. Every person shall be familiar with the emergency escape routes and the evacuation procedures from their workplaces to the assigned assembly area.
- No person shall tamper with fire protection equipment or issue a false alarm.
- Discharged fire extinguishers and non-serviceable fire protection equipment shall be reported immediately to the supervisor on duty. Discharged and expired fire extinguishers shall be returned immediately to the Warehouse for a replacement, and the replacement shall be installed in its proper location.
- Any fire, and use of fire protection equipment regardless of severity, shall immediately be reported to management.
- Except for during an emergency, no work shall be performed on any fire protection system, including fire alarms and fire water supply, without the prior approval of the Mine Manager. In the case of emergency work being performed on fire protection system, the Mine Manager shall be immediately notified.
- Fire hazard areas shall be identified by warning signs, and no person shall smoke or use open flames in designated fire hazard areas.
- All persons shall be familiar with the location, and the use of the fire extinguishers, and know how to summon assistance.
- Fire extinguishers and fire suppression systems shall be inspected annually by an authorized person, and a written record of the inspection will be reported to management.
- Open flames, welding, and cutting and similar activities in certain locations shall not be permitted without following protocol as noted in the maintenance (welding) section.
- Flammable liquids shall be labeled, stored in a separate area, and transported and disposed of in an approved manner.
- When using gasoline-powered engines, do not refuel hot or running engines. After refueling, clean up all spills before starting.
- Never use gasoline or other flammable materials as a cleaner.
- When using propane for heating or other purposes in an enclosed area ensure that the gas supply is turned off at the cylinder, or the torch is removed from the area when the flame is extinguished.

5.2 PROCEDURES TO FOLLOW IN CASE OF A FIRE

If you encounter smoke and/or a fire, follow the rules listed below. A fire/explosion emergency response flowchart is provided in Figure 5.1-1.

- Attempt to extinguish the fire only if you can do so safely.
- If you encounter smoke, shout “FIRE” and sound an alarm or have someone do it and/or call on the mobile radio the situation.
- Evacuate the area and **call a Code 1 on Channel 2**, **repeater 1**.
- Immediately notify the supervisor on duty and/or Mine Manager.

If you are in a building and hear an alarm, the following procedures shall be followed:

- Leave the building immediately by the nearest fire exit, alerting people on the way.
- Close the doors behind you when exiting the building – REMAIN CALM.
- When exiting the building shout “FIRE” and knock on doors as you go out, but do not wait for an answer as the person may be off shift or working elsewhere.
- When you have reached the outside, move away from the building.
- Go to the designated assembly area.
- Wait for further instructions from either the supervisor on duty or the Mine Manager. If you are part of the emergency response team, at your discretion, attempt to control the fire with available fire equipment.
- DO NOT GO BACK INTO THE BUILDING FOR ANY REASON.

Record information about the fire; someone must keep notes on the situation, such as:

- Where was the fire?
- When was it discovered and by whom?
- Whom did you contact and when?
- What actions were taken to contain the fire?
- What is the extent of damage?
- Your name and telephone (contact) information.

5.3 PROCEDURES FOR USE OF FIRE EXTINGUISHERS

Attempt to extinguish a fire with an extinguisher only if the following conditions exist:

- There is a clear exit and the fire is small;
- The person using the fire extinguisher is familiar with its use; and
- The extinguisher is in working order.

When using a portable fire extinguisher:

- never place the fire between yourself and the exit;
- never turn your back on the fire;
- always keep your back to the exit; and
- remember PASS: Pull – Aim – Squeeze – Sweep.

A person shall not attempt to extinguish a fire if:

- the fire is quickly spreading beyond its point of origin; and
- the fire could block the exit, or the person is unsure how to use a fire extinguisher.

Figure 5.1-1. Fire/Explosion Emergency Response Flow Chart

6 AVALANCHE EMERGENCIES

6.1 INTRODUCTION

The Brucejack Mine operates in a high snowfall area with steep terrain subject to snow avalanches. At this time, some infrastructure facilities are located outside of known avalanche-prone areas, however personnel do work in avalanche-prone areas. During periods of (high) snow, advice on current (avalanche) risks must be obtained from an avalanche technician. As well all personnel must be equipped with appropriate safety gear and trained to use avalanche beacons.

At the mine, the Mine Rescue Emergency Response Team(s) will be trained in avalanche rescue techniques in case an avalanche affects facilities and personnel. Avalanche rescue will not be attempted unless the site is considered to be safe from further danger by Pretium's Mountain Safety personnel.

Pretium currently has an avalanche safety plan (ASP, Brucejack Mine Avalanche Safety Plan, updated March 2021) developed by Pretium's Mountain Safety Department. Some of the information in this section was obtained from the ASP, which will remain current for avalanche safety during mine operation and closure.

The ASP contains pertinent information on the following:

- Organization Structure and Personnel – Roles and Responsibility of Pretium and the Avalanche Contractor;
- Avalanche Training;
- Equipment and Infrastructure;
- Operational Procedures; and
- Search and Rescue, etc.

Pretium management, as part of the on-site training, will ensure that all employees, contractors and their employees have reviewed the ASP. Further, the ASP will be accessible on-site and available for future review.

6.2 GENERAL AVALANCHE SAFE OPERATIONAL PROCEDURES

All Pretium employees, contractors and their employees will be required to adhere to the General Avalanche Safe Operational Procedures. These procedures ensure work is conducted safely within avalanche areas and are effective at all hazard levels. General procedures include:

- attending scheduled avalanche safety training sessions;
- familiarizing themselves with avalanche hazard zones;
- familiarizing themselves with the location and use of rescue equipment;
- knowing how to properly use avalanche PPE, including the rescue transceiver;

- reading the Avalanche Hazard form every day, and adjusting work and PPE accordingly;
- following check-in, check-out procedures as per the Underground Incident Command Procedure;
- ensure that personal avalanche PPE is maintained and ready for use;
- reporting avalanche accidents or near misses immediately to Mountain Safety technicians, the Mine Manager, Health and Safety Manager and Operator Supervisor; and
- contacting Mountain Safety Technicians (MSTs) to update them of unusual weather or snow conditions.

6.3 AVALANCHE ACCIDENT/INCIDENT REPORTING AND REVIEW

All avalanche accidents, incidents or near misses will be immediately reported to MSTs, the Health and Safety Manager and the Mine Manager and Operator Supervisor. MSTs will complete the avalanche incident investigation reports and depending on the severity of the incident will be reported to the appropriate authorities as necessary (MEMPR, JHSC, WorkSafeBC, the CAA (Infoex) and Insurance agents if applicable). Standard WorkSafeBC protocols will be followed for accident investigation.

6.4 SEARCH AND RESCUE

In the event of an avalanche involvement, rescue must be initiated immediately. TIME IS OF THE ESSENCE. If people are buried in a vehicle, they may have several hours of available oxygen if they are not injured. If buried on foot, then they may only have 10 to 15 minutes, or less.

Rescuer safety is of paramount importance in an avalanche rescue. Under no circumstance should a rescue party enter an avalanche area unless it is certain that the area is safe. If in doubt, consult with MSTs.

There are three (3) separate documents that make up the overall Avalanche Emergency Response Plan for an avalanche accident/incident:

1. **Avalanche Rescue Card** – for those involved in or witnessing an avalanche.
2. **Site Rescue Leader (Commander)** (cheat sheet) – for the site rescue leader.
3. **Emergency/Incident Response Plan** – for base/office personnel.

6.4.1 Avalanche Rescue Card

Immediate Action for Vehicle or Worksite

IF YOU ARE BURIED IN A VEHICLE, DO THE FOLLOWING:

1. Shut off the engine and lights.
2. DO NOT smoke.
3. CALL a “Code 1” three times on the radio.
4. Make sure your avalanche beacon is on.

5. Turn on your four-way flashers.
6. Honk briefly 2 to 3 times/minute.
7. If you are completely buried, try pushing a probe out of the snow.
8. Stay calm and wait to be rescued.
9. DO NOT GET OUT OF VEHICLE, ANOTHER AVALANCHE COULD COME DOWN.
10. WAIT FOR INSTRUCTIONS FROM THE MOUNTAIN SAFETY TECHNICIANS.

If you witness an avalanche accident, follow these steps:

1. Note the last seen point and number of people caught in avalanche.
2. Ensure personal and/or group safety.
3. CALL “Code 1” three times on the radio and initiate the Incident Response Plan.
4. Reference the Site Rescue Leader (Commander) (Cheat Sheet).
5. WAIT FOR INSTRUCTIONS FROM MOUNTAIN SAFETY.

6.4.2 Site Rescue Leader (Commander) (Cheat Sheet)

Guidelines contained in the Site Rescue Leader Cheat Sheet are shown in Figure 6.4-1.

6.4.3 Avalanche Emergency Response Plan

The Avalanche Emergency Response Plan has been developed for a Level 1, 2 or 3 incidents at the Brucejack Mine. The plan is based on the Incident Command System (ICS) structure. It is envisioned that on-site resources will complete the rescue in the first Operational Period (1 to 2 hours) dependent on size and location of incident.

In the event of a Code 1 avalanche being called, Emergency Response Teams (including Mountain Safety) will mobilize to the scene, the Fire Hall or be put on standby.

The Incident Management Team (IMT) will convene in the Incident Management Room (IMR) which is the boardroom in the Main Camp.

The IMT will define the Objectives, the Response Level and Strategies to be adopted as well as assigning resources to the rescue.

In the event of a large avalanche or an incident involving occupied buildings being damaged or destroyed, a Second Operational period would likely be required and the initial ICS structure expanded.

Figure 6.4-1. Site Rescue Leader Cheat Sheet

7 ON-SITE MINE RESCUE

7.1 MINE RESCUE EMERGENCY RESPONSE TRAINING

Pretium's underground contractor (Procon) has a fully developed underground MERP, that includes a fully trained mine rescue team equipped with all required emergency equipment, according to Part 3.7.1 of the HSRC, 2017. Pretium will continue to utilize the underground MERP and will develop and implement as well a surface MERP for the Brucejack Mine.

As per requirements of Parts 3.7.1 to 3.7.13 of the HSRC, 2017, the Brucejack Mine will have in place the appropriate mine rescue response capabilities. To this end several Pretium employees and contractors will be certified mine rescue personnel. They will meet the requirements of the Code and will have appropriate training.

The Mine Rescue Emergency Response Team will have qualified trainers, who will conduct classroom and field training/practice for not less than eight (8) hours in each three-month period of mine operations.

A training record/logbook is maintained on site. The surface/underground training programs will include both theory and practical training, in such things as:

- Mine Rescue Operations;
- Mine Gases – Recognition, Effects and Treatment;
- Oxygen Therapy;
- Gas-Detection Instruments;
- Fire Emergencies and Safe Firefighting Practices;
- Respiratory Protection Equipment Training;
- Mine Ventilation and Fire Suppression Underground;
- Emergency in Underground Mining Operations;
- Electrical Safety;
- Rescue Rigging;
- Rescue Operations, and
- Special Hazards of Winter Conditions.

7.2 UNDERGROUND MINE RESCUE EQUIPMENT INVENTORY

The Brucejack Mine will maintain the underground mine rescue equipment inventory shown in Table 7.2-1.

Table 7.2-1. Underground Mine Rescue Inventory

Description	Quantity	Part #
Dräger BG4's breathing apparatus	23	PSS BG4 PLUS
Ambulance – Miller Toyota	1	
BG4 oxygen bottles - spare (full)	34	B30230
BG4 filter mats (50)	3	4058167
BG4 ice molds	5	4056449
BG4 Tramix kit	1	R33777
BG4 dryer	1	R28305
Masterline Oxygen Booster Pump	1	
18 kg keg of Drägersorb	20	6737985
Filling stand for reusable canister	2	R33752
Dräger Tester RZ 7000	1	AG02690
Drager Quaestor 5000	1	
Airkem A-33 disinfectant	2	DIN 02035707
Klar-pilot anti fog	33	D40699
BC Level 3 first aid kit, soft case	1	EMFBC309
Basket stretcher	2	EMF34000
Spine board	2	EMF34100
Clam shell	1	
Set of spider straps	2	FOW770C
Adjustable hard collar	2	ABU000-281-000
Multipurpose splint	6	GEEM100
Gray utility blanket	14	SAFC125
50 ft canvas fire hose	4	ANG014909-1IF
200 ft Bag of 12 mm rescue rope	1	MSASRP504866SL200
100 ft Bag of 11 mm rescue rope	1	MSASRO544000100
30 m roll of 25 mm webbing	1	7901-RD
50 mm minding pulleys	4	610014
13 mm pulleys	4	610013
Scarab descender	2	NFPA128701

Carabiners	25	NGSN263G
Mine rescue whistle	1	73-0646-0
8.5 x 11 clip board	2	97123
Scales	4	987-18-4

7.3 SURFACE MINE RESCUE EQUIPMENT INVENTORY

The Brucejack Mine maintains two sets of surface/crevasse rope rescue equipment. The first set is located in the Brucejack Mine Rescue Room (Table 7.3-1). The other set is located in the km 59 staging area shipping container (Table 7.3-2).

Table 7.3-1. Brucejack Surface/Crevasse Rescue Equipment Inventory-Brucejack Mine Rescue Room

Description	Quantity
70 L dry bag	1
60 m x 11 mm rope	1
Climbing harness (BD, large)	1
PSS 7000 SCBA	14
Petzl Bermuda Triangle evacuation sling	1
Camp helmet	1
Crampons	1
Petzl tikka headlamps	2
Picket	1
G3 steel probe (350 cm)	1
Edge protector	1
Ice screws	4
BD ascenders	2

Yates sewn sling (yellow)	1
Bulk 1# tape sling material	2
7 mm prussic slings	3
8 mm prussic slings (long)	5
8 mm prussic slings (short/knotted or sewn)	4

7.4 ACTIVATING THE MINE RESCUE MUTUAL AID PARTNERS

Pretium Brucejack Mine has a written agreement with mutual aid partners for on-site assistance, as needed. These partners are: New Gold based in Kamloops, BC, and Silvertip Mine located in northeast BC.

The decision to activate the mine rescue mutual aid partners shall be made in conjunction with the General Manager, the Mine Manager (or designate) and the Emergency Response Coordinator (ERC).

7.4.1 Standby Status

Once an emergency which has the potential need for mutual aid response is identified, Pretium's Mine Manager (or designate) or ERC will notify the mutual aid partner(s) to be prepared to respond.

Pretium's staff will begin evaluating transportation options and notifying Granmac Services and VIH Helicopters to standby and be ready to mobilize personnel, vehicles, and equipment.

Contact information for all mutual aid partners is included in the Emergency Contact List. The Mine Manager will notify the MEMLCI of this decision.

7.4.2 Activation Status

Once it is clear that additional assistance is required, the Mutual Aid Partners will be activated. At this time, Pretium staff will begin making transportation requirements. All mutual aid partners requested to help will start transporting personnel and equipment to site as directed by Pretium's staff.

The Mine Manager will notify the MEMLCI of this decision.

8 EARTHQUAKE RESPONSE

8.1 INTRODUCTION

The Brucejack Mine is located on the Pacific Rim and earthquakes of varying magnitudes are a possibility. An earthquake at site could affect:

- personnel safety;
- building structural integrity;
- fixed equipment integrity;
- waste dump stability;
- underground geotechnical conditions;
- avalanche slopes; and
- rock slope stability.

The following response protocols will be initiated in the event of a significant earthquake. For the purposes of this document a significant earthquake is an event during which buildings can be felt to sway or that will cause some noticeable damage.

8.2 INCIDENT MANAGEMENT

Depending on the severity of damage, the Mine Manager will decide if implementation of the Incident Command System is required.

8.3 PRIORITIES FOR RESPONSE

During or following an earthquake, the following actions will take priority:

- **Save Lives**: The preservation of life will be the top priority of managers and first responders and take precedence over any and all other considerations.
- **Diminish Suffering**: All possible efforts will be made to diminish suffering by providing basic human needs, including medical care, heated shelter, food, and water.
- **Protect Property:** All possible efforts will be made to protect Pretium and contractor property from further damage.
- **Protect the environment:** All possible efforts will be made to protect the environment from further damage. Protection of waterways will take priority.
- **Restore Basic Services: P**ower, heat, sanitation, and medical services will be restored as quickly as possible to enable the camp to function.

- **Restore Production:** Once the above items have been accomplished efforts to restore production will begin. Some production restoration items may be completed in parallel with the prior activities.

8.4 ROLES AND RESPONSIBILITIES

8.4.1 Brucejack Mine Site

In the event of an earthquake, the Mine Manager will be responsible for coordinating emergency medical response, environmental response, and facilities inspections. The various department heads will report to the Mine Manager.

8.4.2 Mine Manager

The Mine Manager will assign roles to the Incident Command system if necessary.

Once site conditions are assessed and response efforts are underway, the Mine Manager shall notify the senior management in the Vancouver and Smithers offices of the incident and any support required.

If damage or injuries fall under any immediately reportable category as defined by HSRC Section 1.7.1 and 1.7.3, the Mine Manager shall immediately report the incident to a BC MEMPR Inspector of Mines.

As soon as particle after the incident, the Mine Manager shall assign a qualified person to complete an incident report.

8.4.3 Access Road Manager

The Access Road Manager is responsible for coordinate response and doing inspections along the access road from km 0 to the base of the glacier. He is also responsible for coordinating response and inspections at Wildfire, Bowser, and Knipple Transfer Station camps.

8.4.3.1 Camp Inspections

Each Camp Manager shall be responsible for inspecting their camp's facilities in the event of a significant earthquake. All camp personnel shall report to their camp's muster location for roll call. Any personnel unaccounted for at the muster stations should be contracted on the radio. Searches will be completed for any personnel not accounted for during roll call.

The Camp Managers shall inspect or appoint a competent person to inspect the following items:

- **Propane tanks**: Propane supply valves should be shut off if it is safe to do so. They should not be turned on again until an inspection of the propane distribution system is completed.
- **Propane pipes**: The propane distribution pipes should be inspected for damage. If any rotten-egg smell from ethyl mercaptan in the propane is noted, the area should be evacuated and the propane supply isolated. Repairs to the propane piping shall be repaired and pressure tested by a qualified person prior to use.

- **Structural damage**: All buildings shall be inspected for damage to the structure or foundations. Damage should be documented so that repair planning can be implemented. The Mine Manager shall decide if damage is severe enough to require restrictions on building use.
- **Fuel stations**: All fuel storage areas shall be checked for damage. The inspection shall include the tanks, piping, and containment systems. If damage is noted to one or more tanks, efforts shall be made to immediately stop any leaks by plugging or transferring of fuel to another tank if possible. All spills shall be reported to the Environmental Manager. All spills over regulatory thresholds will be immediately reported to the Emergency Management BC.
- **Drinking Water Systems**: The drinking water system shall be inspected. Short term silting of the potable water system may be expected. If silting is sustained, bottled water should be used until confirmatory water analysis can be completed.

8.4.3.2 Road Conditions

The Access Road Manager shall inspect or appoint a qualified individual to do an inspection of the entire road. Areas of concern are:

- loose rock falling on the road;
- avalanches triggered by the earthquake;
- cracks in the road surface, particularly near the Bowser River and an elevated road surfaces; and
- cracks in any fill slopes above and below the road surface.

Any damage shall be reported to the Access Road Manager so that repairs can be planned. The Access Road Manager will determine if any road closures or restrictions are required.

8.4.3.3 Bridge Inspections

There are fifteen bridge along the access road between Hwy 37 and the Knipple Glacier. In the event of an earthquake, each of the bridges listed in Table 8.4-1 shall be inspected. The Access Road Manager shall inspect or appoint a competent person to perform a visual inspection of the bridge deck and footings prior to authorizing traffic over the bridges. If inspections show damage to the bridges, a qualified bridge engineer will be contacted to complete a formal inspection and make recommendations for repairs and any necessary load restrictions.

8.4.3.4 Airstrip Inspections

The Access Road Manager shall inspect or assign a competent person to inspect the airstrip. The runway and apron surfaces shall be inspected for any damage that would make it unsafe to land airplanes. The airstrip navigation lights and instrumentation shall also be checked for functionality.

If any airplanes are inbound at the time of an earthquake, the airstrip staff will attempt to divert the plane until an inspection of the runway surface can be completed.

Table 8.4-1. Access Road Bridges

Bridge	Road Kilometre	Notes
1	0.5	Bell Irving River
2	2.2	Wildfire Creek
3	4.3	
4	8.9	
5	12.6	
6	23.8	
7	30.6	
8	38	Scott Creek
9	40.3	
10	40.9	
11	46.9	
12	48.7	
13	49.7	
14	53.7	Knipple Causeway
15	53.9	Knipple Causeway

8.4.4 Emergency Response Staff

All paramedics, nurses, and OFA 3's shall call inform dispatch of their location and ability to respond to medical emergencies. All emergency response staff shall remain on standby until notified by dispatch that they may return to normal duties.

8.4.5 Dispatch

8.4.5.1 Roll Call

In the event of an emergency, the dispatcher shall report to the muster area with a copy of the current camp roster. The dispatcher shall confirm the presence of each individual by performing a roll call. Personnel unaccounted for at the muster station shall be contacted by radio. The mine tag board shall be checked to confirm which employees are underground. In the event that individuals are still not accounted for, the Mine Manager will be notified so that he may assign a person to perform a search.

8.4.5.2 Confirm Communications Systems Operational

The following communications procedures will take place following an earthquake:

- **Radio:** The Brucejack Mine Site dispatcher will verify radio functionality over all frequencies. If service is disrupted on a repeated channel, the Mine Manager will authorize helicopter mobilization so that the repeater(s) in question can be inspected.

- **Phone**: The IT department will verify phone system functionality. If service is disrupted, the satellite dish should be inspected for damage and alignment.
- **Internet**: The IT department will verify internet functionality. If service is disrupted, the satellite dish should be inspected for damage and alignment.

8.4.5.3 Notify Pretium Senior Management

At the Mine Manager's instruction or in the event the Mine Manager is unable, the Dispatcher shall attempt to contact Pretium's Senior Management Team in Smithers and Vancouver. Those contacts are listed in Appendix A-3.

8.4.6 Surface Foremen

In the event of a significant earthquake, the first duties for surface supervisors are as follows:

1. Recall all personnel and equipment from the Brucejack Lake waste rock dump site.
2. Conduct a roll call to confirm the location and wellbeing of their direct reports.
3. Check in with the dispatcher and Mine Manger.
4. Perform inspections of the following facilities:

- propane storage and distribution facilities;
- fuel storage and containment facilities;
- generators;
- waste rock dump;
- maintenance shops; and
- other active work areas.

8.4.7 Mine Superintendent

The Mine Superintendent is responsible for confirming the safety of all underground employees and the status of all underground workings and infrastructure. The Mine Superintendent will also coordinate any rescue or repair work required. The Mine Superintendent will report his findings and any updates to the Mine Manager. The Mine Superintendent will advise if Mine Rescue Teams should be placed on standby or if they can be assigned to assist with surface rescue needs.

8.4.8 Underground Shift Boss

In the event of an earthquake, the first priority for the Shift Boss is to account for the safety and whereabouts of his crews. Following that, he should report that status to the Mine Superintendent and standby for further instructions.

If a mine evacuation is warranted due to fire or other underground emergency, the Shift Boss will assign a person to guard the mine entrance against further entry. The Shift Boss will report to the mine tag in board to make sure all underground personnel are accounted for. Attempts shall be

made to contact any missing personnel by radio or by calling the mine refuge stations. If persons are still missing, the mine rescue team shall be assembled and prepared for an underground search. Once the mine has been evacuated no personnel shall enter the mine until authorized by the Mine Manager.

Once mine entry is authorized by the Mine Manager, all underground work areas shall be inspected for physical damage and adequacy of ventilation. The Shift Boss shall check and document gas readings in all headings prior to the Mine Manager authorizing re-entry.

In addition to active headings, the following infrastructure areas will be inspected for damage:

- Main fan;
- Mine heater and propane lines;
- Portal structures;
- Infrastructure areas;
- Refuge stations;
- Maintenance facilities;
- Crusher chamber;
- Fan Installations;
- Fuel storage bays;
- Substations;
- Conveyor declines;
- Explosives storage bays; and
- Active stope areas.

8.4.9 Mine Rescue Team

In the event of a significant earthquake, all members of the mine rescue team shall check in with the Mine Superintendent and standby for instructions.

8.4.10 Mill Manager

The Mill Manager shall inspect or appoint a competent person to inspect the mill facilities for damage to the process plant, paste backfill plant, mine water treatment plant, and tailings infrastructure.

8.4.11 Avalanche Technicians

In the event of a significant earthquake, the Mountain Safety Technicians (MSTs) should immediately call in to dispatch and report their availability to assist as needed.

The MSTs shall report current avalanche conditions to the Mine Manager and await his instructions in case inspections along the road are required. Depending on snow conditions, the MSTs may issue short-term closures or restrictions for certain sections of the mine, specially for Lake Shore Drive.

9 EMERGENCY CHECKLISTS AND REPORTING FORMS

As part of the revisions to this MERP, it is expected that Brucejack Mine management will develop and document critical information such as EOC location, EOC staffing and layout, building descriptions, personnel assets, transportation assets, communications assets, emergency equipment and supply assets, and medical staff and supplies. The revisions will also include current contact numbers, forms, site plans, and a controlled product inventory.

To ensure that appropriate information is gathered during a site emergency or during a first aid response, checklists will be developed for the Brucejack Mine. An example of an Incident reporting form is provided in Figure 9.1-1, the Brucejack evacuation map is provided in Figure 9.1-2, Figures 9.1-3 and 9.1-4 show the locations of primary and secondary muster stations for the main and upper camps, Figure 9.1-5 shows the layout of underground workings, and Figure 9.1-6 shows the underground evacuation.

In addition, Duty Cards are provided in the following sections:

- Section 10: Duty Cards for the Incident Management Team
- Section 11: Duty Cards for the Underground Incident Command Team Figure 9.1-1. Example Incident Reporting Form

Figure 9.1-1. Example Incident Reporting Form

This form needs to be completed before the end of the shift and sent directly to safety@Pretium.com					
Date:		Time:		Equipment Involved (if any):	
Supervisor:		Location (be specific):		Department/Contractor:	
Incident Category					NM - Near Miss High Potential
Injury/Illness		Property Damage		Other	
	FA – First Aid		PD – Property Damage		Loss of process
			FR – Fire		**DO** – Dangerous Occurrence

Occupation:		Task experience:	
Shift:	Day ☐ Night ☐	Regular schedule ☐	Overtime ☐

Description of the event: (What happened? How? What was the current task?)
IMMEDIATE CORRECTIVE ACTIONS TAKEN:
(Actions taken immediately to prevent re-occurrence, to make the scene safe for others)

Nature of material damage (if applicable):			
A. Was the workplace and/or equipment in good order?		Yes ☐	No ☐
B. Was the working method adequate (procedure respected)?		Yes ☐	No ☐
C. Was the employee trained to perform the task?		Yes ☐	No ☐
D. Did the employee wear the correct PPE to perform the task?		Yes ☐	No ☐
If you answered 'no' to any of the points A – D, explain the reason:			
For severity levels, refer to below chart of the incident report form			
Real severity:	1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐	Potential severity:	1 ☐ 2 ☐ 3 ☐ 4 ☐ 5 ☐
Is an A required?	Yes ☐ No ☐	(the supervisor is responsible for initiating the Analysis process)	

In order to determine the level of intervention, the following gravity codes have been established:

Classification of accidents/incidents:

Impact Category	Actual & Potential Impact Rating				
	1 – Low	**2 – Minor**	**3 – Moderate**	**4 – Major**	**5 Catastrophic**
Health and Safety	First Aid assessment only	First Aid Treatment	Lost Time Injury Restricted Work Medical Treatment	Serious injury, significant lost time > than two rotations	Permanent disability or fatality
Cost	> $50,000 > 1 hr. production delay	$50,000 - $250,000 1 - 4 hr. production delay	$250,000 - $1 Million 4 - 18 hr. production delay	$1 Million -$5 Million 18 hr. - 4 d production delay	> $5 Million > 4 d production delay

Incidents OR Potential of category 3, 4 or 5 must be incident analysis. Repeat incidents of category 2 or 1 that could have a higher severity level must also be investigated. The following table shows the times of investigation, analysis and report production.

Deadlines for the investigation, analysis, preparation and transmission of the investigation report:

Actual & Potential Impact Rating			
	4 or 5	**3**	**1&2**
Investigation	Immediately	Immediately	
Analysis and report production	Immediate verbal summary report max. 12h or less	Max. 72h	Potential is >3 completed 72h
Temporary corrective measure	Immediately	Immediately	Immediately
Permanent corrective action/preventative measure must be realized in:	3 days	5 days	5 Days

10 DUTY CARDS FOR THE INCIDENT MANAGEMENT TEAM

10.1 IMT LEADER

DUTY CARD 1 — IMT LEADER Reports to: Brucejack Mine President & CEO
Objective: The IMT Leader has overall responsibility for the management of the Incident Management Team (IMT). The IMT Leader leads and supervises the activities of IMT staff, develops objectives, approves plans and ensures that the response is carried out in a safe and legally sound manner. The IMT Leader interacts with appropriate government officials, the media, the community, and company management. The IMT Leader can delegate authority to IMT members to act on their behalf but retains the final responsibility for IMT response actions and decisions.
RESPONSIBILITIES
PRE-INCIDENT
☐ Ensure the operational readiness of the IMT; ☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT.
IMMEDIATE ACTIONS
☐ Obtain a verbal briefing outlining the incident from the relevant manager and on-scene coordinator (if deployed); ☐ Start an individual log; ☐ Proceed to the IMR; ☐ Assess the level of the incident/issue using the Brucejack Mine Severity Table; ☐ Decide the level of IMT activation required to respond to the incident and activate the IMT if required via Dispatch ext 108; ☐ Authorize any additional resources or specialist advisors required; ☐ Obtain a current situation update on the incident; ☐ Confirm the IMT appointments required for the crisis; ☐ Conduct an initial team brief and detailed initial response priority to the IMT Managers; and, ☐ Ensure that relevant regulatory authorities are notified.
DURING INCIDENT
☐ Lead the IMT; ☐ Ensure the ERT are supported in their emergency response activities; ☐ Establish communications, exchange information and coordinate activities with other relevant response organisations (ERT, Emergency Services) and appropriate management personnel; ☐ Ensure that all necessary and required internal and external notifications have been made, ☐ Especially to government agencies and key stakeholders; ○ Doug Flynn Senior Inspector of mines (acting) - 1-250-847-7386 or 250-877-9747(cell) ○ Jacque Perron, President & CEO – 778-357-0809, 1-604-209-5456 cell ○ Patrick Godin, VP Operations & COO – 604-566-8784 ○ Sean Masse, General Manager – 250-202-2038 (140), 1 (604)754-9671 cell ☐ Manage the activities of the IMT and maintain overall control at the operational level. ☐ Ensure all IMT Group Managers are briefed and understand their individual and team responsibilities;

☐ Request additional specialist support if required; ☐ Regularly review the response by convening IMT update briefings at regular intervals; ☐ Oversee planning and set recovery and business resumption goals; ☐ Approve and authorise implementation of incident specific response and recovery plans; ☐ Monitor and control access to the IMR; ☐ Keep the President informed of the situation via regular situation reports; ☐ Remain aware of the communication strategy and be prepared to act as a media spokesperson; ☐ Authorise dissemination of press releases and statements to the public and media; ☐ Ensure active and on-going engagement with all relevant local stakeholders; ☐ Ensure all actions, decisions and events are accurately recorded and documented; ☐ Document all personal actions and decisions on an individual log; ☐ Decide when the crisis is over, inform IMT members; and, ☐ Communicate end of crisis response internally and externally.
POST-INCIDENT
☐ Oversee the conduct of an investigation; ☐ Review and approve the incident report; ☐ Allocate and supervise the implementation of the recovery plan; ☐ Chair the incident post-crisis review and ensure all lessons learned are recorded and implemented; ☐ Ensure all ERT and IMT members are debriefed and receive feedback; and, ☐ Debrief the IMT Deputy and IMT Group Managers and provide feedback;

10.2 DEPUTY IMT LEADER

DUTY CARD 2 — DEPUTY IMT LEADER Reports to: IMT Leader
Objective: The Deputy IMT Leader reports to the IMT Leader and is responsible for assisting the IMT Leader in managing the team's response to an incident. The Deputy IMT Leader assists in developing incident objectives, supervises the activities of the IMT Managers and manages set-up of the IMR. The Deputy IMT Leader conducts assessment meetings, oversees implementation of approved plans and ensures that safety of all responders is the highest priority. The Deputy IMT Leader assumes the responsibilities of the IMT Leader in their absence.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the IMR; ☐ Start an individual log; ☐ Confirm the arrival of all IMT members; ☐ Facilitate the initial team brief for the IMT Leader; ☐ Advise on the mobilisation of additional resources or specialist advisors required; ☐ Advise on the notification of the relevant Health Safety Environment Community (HSEC) related stakeholders; and, ☐ Draft relevant HSEC related reports for approval by the IMT Leader prior to releasing to external stakeholders.
DURING INCIDENT
☐ Understudy the IMT Leader; ☐ Ensure all IMT Control Group members are briefed and understand their individual responsibilities; ☐ Coordinate the activities of the IMT and manage work effort between groups as required; ☐ Facilitate regular IMT update briefings; ☐ Ensure regular situation reports are distributed to key stakeholders; ○ Doug Flynn Senior Inspector of mines (acting) - 1-250-847-7386 or 250-877-9747(cell) ○ Jacque Perron, President & CEO – 778-357-0809, 1-604-209-5456 cell ○ Patrick Godin, VP Operations & COO – 604-566-8784 ○ Sean Masse, General Manager – 250-202-2038 (140), 1 (604)754-9671 cell ☐ Assume the IMT Leader's role when he/she is unavailable; ☐ Supervise the activities of the IMT Group Managers, ensuring they act in a manner;

☐ Consistent with corporate policy and applicable government regulations and directives; ☐ Take the lead in the coordination, development and review of the response plan including: ☐ Coordinating of the plan and any sub-plans; ☐ Documenting response decisions; ☐ Consulting with specialist advisers and use of additional resources; ☐ Oversee the operation of the IMR, including status board updates and the flow of information; ☐ Keep the IMT Leader updated on the nature and status of the response operations; ☐ Check all correspondence drafted for release prior to approval by the IMT Leader; ☐ Remain aware of the communications strategy set by Brucejack Mine; ☐ Ensure regular liaison and reporting with Brucejack Mine employees; ☐ Ensure team rotations occur and back-up shifts are arranged for the ERT and IMT; ☐ Document all personal actions and decisions on an individual log; and, ☐ Ensure all ERT and IMT actions, decisions and events are recorded.
POST-INCIDENT
☐ Oversee post-crisis actions on behalf of the IMT Leader when required; ☐ Coordinate the incident post-crisis review; ☐ Debrief all Control Group members and provide them with feedback; and, ☐ Coordinate the development of the incident report.

10.3 IMT COORDINATOR

DUTY CARD 3 — IMT COORDINATOR Reports to: Deputy IMT Leader
Objective: The IMT Coordinator reports to the Deputy IMT Leader. This role is responsible for coordinating IMT preparation activities, overseeing the management of IMT information, and providing for the administrative requirements of the IMT.
RESPONSIBILITIES
PRE-INCIDENT
☐ Coordinate and attend all training activities organised for the IMT;
IMMEDIATE ACTIONS
☐ Proceed to the IMR; ☐ Start an individual log; ☐ Obtain a current situation update; ☐ Provide the IMT Leader with regular updates; ☐ Ensure the IMR is set-up as required; ☐ Ensure that the Log Keeper has commenced the IMT log; and, ☐ Attend the IMT initial briefing.
DURING INCIDENT
☐ Establish communications, exchange information and coordinate activities; ☐ Ensure the status boards are regularly updated by the Recorder; ☐ Assist the Log Keeper in maintaining a chronological log of events and make tape recordings as appropriate (pay special attention to times of significant activities and events); ☐ Ensure IMT members are present for briefs as required by the IMT Leader and Deputy; ☐ Ensure that any IMT member not able to attend a briefing session is updated with the relevant information; ☐ Manage the flow of hard copy information and retain copies for the permanent log; ☐ Provide administrative support to the IMT as required; ☐ Regularly collate the notes (logs) from other IMT groups into the IMT log; ☐ Collate all documentation for follow-up investigation, compensation, insurance and litigation purposes; ☐ Provide administrative, IT and catering support to the IMT; ☐ Monitor health, fatigue, morale and stress levels of the group and advise the Deputy as required; and, ☐ Document all personal actions and decisions on an individual log sheet.
POST-INCIDENT
☐ Participate in the post-crisis review; ☐ Contribute to the development of the incident report; ☐ Evaluate the effectiveness of the IMR during the response and implement any necessary changes to the room or associated procedures.

10.4 OPERATIONS MANAGER

DUTY CARD 4 — OPERATIONS MANAGER Reports to: IMT Leader
Objective: The Operations Manager reports to the IMT Leader and manages operations directly related to the IMT's field response. He/she activates, organises, assigns and directs all resources and activities in the field. He/she implements all operational plans to achieve the response objectives and protect people, the environment and property. He/she communicates frequently with the IMT Leader and Deputy IMT Leader to keep them updated on the progress of response operations.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT and the Operations Group.
IMMEDIATE ACTIONS
☐ Proceed to the IMR; ☐ Obtain all available information on the situation from the ERT, Dispatch, Underground Command Centre and/or Medical Clinic; ☐ Start an Individual log; ☐ Recommend to the IMT Leader the incident categorisation and the level of response required; ☐ Mobilise any additional resources or specialist advisors immediately required to assist with the crisis; ☐ Activate initial personnel required in the Operations Group; and, ☐ Attend the IMT initial briefing.
DURING INCIDENT
☐ Manage the activities of the Operations Group (including shift rosters); ☐ Ensure communications are maintained with the ERT; ☐ Ensure all Operations Group members are briefed and understand their individual and team responsibilities, and assess the need for additional specialist support; ☐ Attend IMT briefs and keep the IMT informed of progress on resolving the issue; ☐ Oversee and monitor the ERT response; ☐ Support the ERT; ☐ Ensure the Incident Dispatch and/or Medical Team are kept informed of the IMT response; ☐ Manage the development of the Response Plan; ☐ Manage the implementation of the Response Plan; ☐ Contribute to IMT situation reports; ☐ Allocate tasks to Operations Group members; ☐ Ensure that the Operations Group and the ERT are aware of and are following applicable Brucejack Mine policies and government agency directives; ☐ Document all personal actions, decisions and instructions on an individual log sheet; and ☐ Ensure all group actions, decisions, instructions and events are accurately recorded and documented in the IMT Log.
POST-INCIDENT

- Inform the ERT and Operations Group members when the crisis is over;
- Identify any group follow-on actions required and allocate responsibilities, resources and deadlines;
- Conduct Operations Group incident review and consolidate group feedback points;
- Attend the ERT debrief;
- Attend the post-crisis review;
- Debrief all Operations Group members and provide feedback; and,
- Contribute to the incident report.

10.5 RECORDER

DUTY CARD 5 — Recorder Reports to: Deputy IMT Leader
Objective: The Recorder reports to the Deputy IMT Leader and is responsible for updating the status boards, managing and equipping the Incident Management Room and providing for administrative requirements of the IMT.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; ☐ Ensure status boards, charts, maps and other tools/aids are readily available; ☐ Remain familiar with your responsibilities within the IMT; ☐ Confirm that there are sufficient quantities of consumables available for the IMT; and, ☐ Understand where the Incident Management Room equipment is stored and its use.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the Incident Management Room; ☐ Assist the IMT Coordinator in the set-up of the Incident Management Room; ☐ Start an Individual Log; and, ☐ Attend the IMT initial briefing.
DURING INCIDENT
☐ Record key incident information on the status boards; ☐ Manage the flow of hard copy information and retain copies for the permanent log; ☐ Assist the Log Keeper with the IMT Log as required; ☐ Alert other IMT members to major changes, issues and outstanding actions; ☐ Take digital photos of status boards before they are updated; ☐ Proactively monitor all communications and record pertinent points as they arise; and, ☐ Document all personal actions and decisions in an Individual Log.
POST-INCIDENT
☐ Assist with the collection and filing of all documentation from all groups; ☐ Ensure allocated post-crisis follow-up actions are completed; ☐ Participate in the IMT post-crisis review; ☐ Assist with refurbishing the IMR back to a ‘ready’ state; and, ☐ Assist the incident investigation as required.

10.6 LOG KEEPER

DUTY CARD 6 — Log Keeper Reports to: Deputy IMT Leader
Objective: The Log Keeper reports to the Deputy IMT Leader and is responsible for maintaining an accurate, up-to-date record of the decisions and actions of the IMT.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; ☐ Remain familiar with your responsibilities within the IMT; ☐ Understand where the Incident Management Room equipment is stored and its use; and, ☐ Assist the Recorder in maintaining the readiness of the Incident Management Room.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the Incident Management Room; ☐ Assist the IMT Coordinator in the set-up of the Incident Management Room; ☐ Start an individual log; ☐ Start the IMT log; and, ☐ Attend the IMT initial briefing.
DURING INCIDENT
☐ Assist the Recorder with updating the status boards; ☐ Request additional Log Keeper support as required; ☐ Maintain a chronological log of events and make tape recordings as appropriate (pay special attention to times of significant activities and events); ☐ Manage the flow of hard copy information and retain copies for the permanent log; ☐ Collect and retain a copy of all relevant IMT documents and incorporate into the incident log; ☐ Regularly collate the notes (logs) from other IMT groups into the IMT log; ☐ Remind the Deputy IMT Leader of outstanding issues or actions from the log; and, ☐ Proactively monitor all communications and record pertinent points as they arise.
POST-INCIDENT
☐ Assist with the collection and filing of all documentation from all groups; ☐ Ensure allocated post-crisis follow-up actions are completed; ☐ Participate in the IMT post-crisis review; ☐ Contribute to the development of the incident report; ☐ Assist with refurbishing the Incident Management Room back to a ‘ready’ state; and, ☐ Assist the incident investigation as required.

10.7 PLANNING MANAGER

DUTY CARD 7 — PLANNING MANAGER Reports to: IMT Leader
Objective: The Planning Manager reports to the Deputy IMT Leader and manages IMT related planning for the detailed recovery and resumption of normal operations. He/she oversees preparation of the Recovery Plan and assists in the development of other specialist plans, if required.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT and the Planning Group.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the IMR; ☐ Start an individual log; ☐ Attend the IMT initial briefing; ☐ Confirm the level of activation of the Planning Group in consultation with the IMT Leader; and, ☐ Mobilise any additional resources or specialist advisors required for the Planning Group.
DURING INCIDENT
☐ Manage the activities of the Planning Group; ☐ Ensure all Planning Group members are briefed and understand their individual and team Responsibilities; ☐ Ensure that the response plan and the recovery plan flow logically and are coordinated; ☐ Attend IMT briefs and keep the IMT informed of progress on the recovery plan; ☐ Manage the business continuity response including the implementation of workarounds; ☐ Lead the development of the business recovery plan and manage its implementation; ☐ Consult with specialist advisers (if required) for their input into the recovery plan (Maintenance, engineering, etc.); ☐ Contribute to the IMT Update Meetings; ☐ Document all personal actions and decisions on an individual log sheet; and, ☐ Ensure all group actions, decisions and events are accurately recorded and documented, and recorded in the IMT Log.
POST-INCIDENT
☐ Inform Planning Group members when the crisis is over; ☐ Identify any group follow-up actions required and allocate responsibilities and deadlines; ☐ Conduct Planning Group post-crisis review and record outcomes; ☐ Attend the incident post-crisis review; ☐ Debrief all Planning Group members and provide feedback; and, ☐ Contribute to the incident report.

10.8 SURFACE OPERATIONS SUPERVISOR

DUTY CARD 8 — SURFACE OPERATIONS SUPERVISOR Reports to: IMT Leader
Objective: The Surface operations supervisor reports to the IMT Leader and manages IMT related-support and service activities for the response. He/she is responsible for obtaining personnel, equipment, facilities and material needed to carry out response operations. He/she provides food, shelter, transportation, facilities, security, communications and other necessities for response personnel who are located both in the field and at the IMR. The Surface operations supervisor is to ensure that internal and external service needs are met.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT and the Logistics Group.
IMMEDIATE ACTIONS
☐ Respond to IMT activation ☐ Proceed to the IMR; ☐ Activate initial personnel required for Dispatch upon activation of the IMT ☐ Start an individual log ☐ Attend the IMT initial briefing ☐ Mobilize any additional resources or specialist advisors required for Dispatch; and, ☐ Conduct an initial group briefing.
DURING INCIDENT
☐ Manage the activities of Dispatch; ☐ Ensure Dispatch has been briefed and understand their individual and team responsibilities, and assess the need for additional specialist support; ☐ Identify the location and status of off-site equipment and personnel suitable to deal with the issue and coordinate their deployment as required; ☐ Liaise with the Operations Manager to provide transport and care/accommodation for employees and relatives if necessary. ☐ Ensure an overall inventory is maintained of all equipment, materials and supplies purchased, rented, borrowed or otherwise obtained; ☐ Inform the IMT Leader of logistical movements (include names and locations); ☐ Develop a resource plan in support of the response plan to: ○ Prioritize needs; ○ Identify alternative resources and supplies; ○ Coordinate delivery/deployment; ☐ Attend IMT briefings and keep the IMT informed on the actions of Dispatch; ☐ Contribute to the development of the response plan; ☐ Contribute to the development of the recovery plan;

☐ Contribute to the IMT situation reports; ☐ Document all personal actions and decisions on an individual log sheet; and, ☐ Ensure group actions, decisions and events are accurately documented, are recorded in the IMT Log.
POST-INCIDENT
☐ Inform Dispatch when the crisis is over; ☐ Identify any group follow-up actions required and allocate responsibilities and deadlines; ☐ Conduct Dispatch post-crisis review and record outcomes; ☐ Attend the incident post-crisis review; ☐ Debrief Dispatch and provide feedback; and, ☐ Contribute to the incident report.

10.9 HUMAN RESOURCES OFFICER

DUTY CARD 9 — HUMAN RESOURCES OFFICER Reports to: External IMT Coordinator
Objectives: The Human Resources Officer identifies and tracks all personnel involved in the incident. He/she coordinates and provides feedback to employees, ensures that consistent messages are conveyed to all concerned, and provides counselling services as required.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities within the IMT.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the IMR; ☐ Start an individual log; ☐ Participate in the initial group briefing.
DURING INCIDENT
☐ Work with Operations Group to establish the facts relating to casualties/numbers/severity of injuries/location etc.; ☐ Track casualties progress and inform the Family Liaison Officer; ☐ Ensure that Casualty Board is kept up to date; ☐ Verify any discrepancies relating to casualties; ☐ Provide advice to the IMT on ○ Employee relations; ○ Industrial relations; ○ Company HR Policy; ☐ Ensure that appropriate resources are available. Consider alerting all employers of personnel working at the site and/or within the asset/operation; ☐ Consider arrangements for handling / assisting employees, contractors, next-of-kin and public affected by the emergency; ☐ Ensure that appropriate systems are in place for managing Human Resource issues; ☐ Arrange grief counselling where needed for employees and families; ☐ Verify and maintain a record of location and status of persons involved in the incident; ☐ Verify details of fatalities, casualties, missing people and survivors; ☐ Arrange survivor reception and support for evacuees; ☐ Liaise with the Family Liaison Officer and External Affairs Officer to provide verified facts on the situation; ☐ Establish the Next-of-Kin room with the Family Liaison Officer; ☐ Work with External Affairs to draft internal messages and site notices; and, ☐ Document all personal actions and decisions on an individual log sheet.
POST-INCIDENT
☐ Complete any follow-up actions as directed; ☐ Contribute to the dispatch post-crisis review; and, ☐ Contribute to the incident report.

10.10 External Affairs Officer

DUTY CARD 10 — EXTERNAL AFFAIRS OFFICER Reports to: External IMT Coordinator
Objectives: The IMT External Affairs Officer reports to the External IMT Coordinator and manages IMT-related media and community issues for the response. He/she compiles and releases information on the incident and response efforts to the media and organises IMT press conferences and briefings. He/she works closely with the Family Liaison Officer to develop a community and stakeholder response strategy and arranges community outreach programs.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and,
IMMEDIATE ACTIONS
☐ Proceed to the IMR and set-up for operations; ☐ Start an individual log; ☐ Attend the IMT initial briefing; and, ☐ Advise the IMT Leader on potential community and media-related issues.
DURING INCIDENT
☐ In conjunction with the Investor Relations Spokesperson, determine the media strategy to be adopted for the incident and who will handle various aspects of the company's external affairs effort; ☐ Serve as the principal advisor to the IMT Leader regarding interactions with the media and advise him of any pressing media issues, concerns, or problems; ☐ Manage the Media Response Team (MRT); ☐ Establish a media briefing room onsite; ☐ Prepare and disseminate media holding statements, press releases and "fact sheets" for approval by the IMT Leader, as appropriate; ☐ Ensure proper and complete distribution of all approved press releases and fact sheets; ☐ Assist the IMT Leader in preparing for press conferences and interviews; ☐ Pass on all press releases as soon as possible to the IMT Leader; ☐ As appropriate, arrange and manage tours for the media, provided that they do not jeopardise personal safety or inhibit operations; ☐ Be available to respond to inquiries from the media; ☐ Monitor and maintain a record of media and internet coverage of the incident; and, ☐ Prior to demobilisation, ensure that all media, government relations and community issues and concerns have been resolved; Work with the Team Leader, Community Development to ☐ Identify community concerns and key issues; ☐ Identify community stakeholders and determine the best way to communicate with the community ☐ Develop a community management plan, if appropriate;

- Determine the optimum timing for and arrange and manage, community and "Town Hall" meetings;
- Determine whether additional community coordination personnel are needed, and if so, coordinate their activation and supervise their activities;
- Work closely and coordinate activities with the Family Liaison Officer;
- Assess the impact of the incident on the community, including:
- Duration;
- Health and safety issues;
- Impacts on housing and accommodations and the need for shelters;
- Disruptions to utilities and services such as electricity, water, heat, gas, transportation, sewage, etc.;
- Impacts on schools, hospitals, businesses and other institutions; and
- Other issues or causes for concern.
- Serve as the principal advisor to the IMT Leader regarding interactions with the community and advise him/her of concerning pressing issues or problems;
- Assist the IMT Leader or other IMT personnel in preparing for community meetings;
- Be the principal point of contact for the community;
- Attend IMT briefs and keep the IMT informed of community issues;
- Ensure the response plan and the recovery plan adequately considers community issues;
- Establish and maintain contact with relevant community groups;
- Assist the Services Coordinator with drafting internal messaging and site notices;
- Document all personal actions and decisions on an individual log sheet; and,
- Other duties as directed by the External IMT Coordinator.

POST-INCIDENT

- Complete any follow-up actions as directed;
- Contribute to the Dispatch post-crisis review;
- Attend the incident post-crisis review and ensure community issues are captured;
- Work with the Team Leader, Community Development to:
  - Ensure that all community-related concerns have been addressed and the best possible relations with the community are maintained;
  - Continue to monitor community attitudes concerning the incident and keep management advised of any which may have a substantial impact on the company or its operations;
  - Evaluate effectiveness of the community outreach program during the response and make appropriate modifications to IMT strategies and plans; and,
- Contribute to the incident report as required.

10.11 Family Liaison Officer

DUTY CARD 11 — FAMILY LIAISON OFFICER Reports to: External IMT Coordinator
Objectives: To provide support to the employee's family and friends during the incident. The Family Liaison Officer is to be the main point of contact for next-of-kin and friends and works closely with the Human Resources Officer and External Affairs Officer in gaining the latest information on the incident to be passed to the families.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT; and, ☐ Remain familiar with your responsibilities.
IMMEDIATE ACTIONS
☐ Respond to IMT activation; ☐ Proceed to the IMR; ☐ Start an individual log; ☐ Prepare for the initial briefing.
DURING INCIDENT
☐ If applicable, manage the Next-of-kin support Team ☐ Work with the IMT in communicating factual personnel information on the incident: ○ Pass on casualty/fatality list (including next-of-kin details); ○ Identify other stakeholders and ensure close liaison; ○ Provide liaison with Police and any incident investigation teams; ○ Determine the nature, tone and format of communication with employees and families; ○ Conduct post-incident debriefing as soon as possible; ○ Arrange transportation for families; ○ Plan accommodations; ○ Consider need for cash / clothing / communications with families etc.; and ☐ Establish call schedules as appropriate. ☐ Facilitate visits to hospitals by relatives, as requested by IMT; ☐ Provide support for families. Consider: ○ Transportation to hospital / point of arrival; ○ Childcare; ○ Accommodation; ○ Passport / Visa issues; ○ Financial Support; ○ Counselling support; ○ Reassurance, as appropriate. ☐ Document all personal actions and decisions on an individual log sheet; and, ☐ Other duties as directed by the External IMT Coordinator.
POST-INCIDENT
☐ Complete any follow-up actions as directed; ☐ Contribute to Dispatch post-crisis review; and ☐ Contribute to the incident report as required.

10.12 Dispatch and Aviation

DUTY CARD 12 — Dispatch/Aviation Reports to: IMT Leader
Objective: The Dispatch/Aviation reports to the IMT Leader and manages IMT related support and service activities for the response. He/she provides and coordinates radio communications and other necessities for ground/air transportation in the field and at the IMR. Dispatch/Aviation is to ensure that internal and external service needs are met.
RESPONSIBILITIES
PRE-INCIDENT
☐ Attend all training activities organised for the IMT ☐ Remain familiar with your responsibilities within the IMT.
IMMEDIATE ACTIONS
☐ Respond to IMT activation ☐ Activate initial personnel required for dispatch upon activation of the IMT ☐ Contact and assist in mobilizing additional resources or specialist advisors ☐ Start an individual log ☐ Attend the IMT initial briefing
DURING INCIDENT
☐ Identify the location and status of off-site equipment and personnel suitable to deal with the issue and coordinate their deployment as required; ☐ Liaise with the Operations Manager to provide transport and care/accommodation for employees and relatives if necessary. **Medivac will be arranged by Iridia Personnel with the assistance of Dispatch.** ☐ Inform the IMT Leader of logistical movements (include names and locations); ☐ Develop a resource plan in support of the response plan to: ○ Prioritise needs; ○ Identify alternative resources and supplies; ○ Coordinate delivery/deployment; ☐ Attend IMT briefings and keep the IMT informed on the actions of Dispatch/Aviation; ☐ Contribute to the development of the response plan; ☐ Contribute to the development of the recovery plan; ☐ Contribute to the IMT situation reports; ☐ Document all personal actions and decisions on an individual log sheet; and, ☐ Ensure group actions, decisions and events are accurately documented, and recorded in the IMT Log.
POST-INCIDENT
☐ Identify any group follow-on actions required and allocate responsibilities and deadlines; ☐ Attend the incident post-crisis review; ☐ Contribute to the incident report.

11 DUTY CARDS FOR THE UNDERGROUND INCIDENT COMMAND TEAM

11.1 INCIDENT COMMAND DUTY CARD

INCIDENT COMMANDER - **Checklist**		
☐	1)	In the event that there is an Underground CODE 1 **fire** emergency, it is critical that the Underground Emergency warning system is activated without delay, and that the accounting for personnel begins. These Three Actions must be taken FIRST before the Underground Incident Command Team musters: • Ensure the Main fan (WZ and VOK) Stench Gas has been released: • Only if required, have the electricians manually release the stench in the compressed airlines • Ensure Code One was called on all channels (Dispatch is responsible for this action); • Secure the UG tag-in board by placing a guard at the board. Non-fire emergencies require Code One call, and radio message to clear the ramp to the scene.
☐	2)	Ensure the Underground Incident Command Team positions are fulfilled: Operations Coordinator; Engineering Coordinator; Maintenance Coordinator; and Recorders. <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444

☐	3)	Obtain a verbal briefing outlining the incident from the relevant Underground Team Captain and/or ERT Advisor (ext 444 Fire Hall).
☐	4)	Conduct an initial team brief and detail initial response priorities to the Underground Incident Command Team.
☐	5)	Start an individual log, document all personal actions and decisions. Ensure the Recorder has posted the status boards and is recording relevant information.
☐	6)	If the fire is in a heading with charged explosives (Operations Coordinator will confirm) and communicate this with the ERT Coordinator. The ERT Coordinator will instruct the ERT not to fight the fire.
☐	7)	In consultation with ERT Coordinator decide on a response plan for the Mine Rescue Team and whether or not to activate the Incident Management Team. Ventilation cannot be changed until the mine manager has approved changes and all personnel are accounted for. As well, everyone must be made aware of the ventilation change.
☐	8)	Determine staging areas for the extra people and traffic that are in the area effected by the code one.
☐	9)	Follow up and monitor assigned responsibilities.
☐	10)	Consult with ERT Coordinator and Mechanical Supervisor to determine if a mechanical inspection of any mobile equipment involved is required prior to calling the Code One over.
☐	11)	In consultation with the ERT Coordinator, decide when the incident is over. The ERT Coordinator will make arrangements for the “Code One Over” message to be relayed and broadcast. Dispatch will receive confirmation from the Incident Commander prior to broadcasting “Code one over”
☐	12)	Ensure all relevant information is entered in Incident Commander Log sheet.
☐	13)	At the conclusion of the incident, sign the Incident Commander log sheets.
Post Incident - **Checklist**		
☐	1)	Ensure the ERT Coordinator replenishes the Duty Card Packets.
☐	2)	Debrief the Underground Incident Command Team and provide feedback.
☐	3)	Confirm recommended changes to the Underground Incident Command Manual and other relevant documents have been completed (ERT Coordinator is responsible).

11.2 ERT COORDINATOR DUTY CARD

ERT Coordinator - Checklist		
☐	1)	Coordinate with Incident Commander and Underground Incident Command Team to plan the Mine Rescue Teams actions while underground. <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	Brief Mine Rescue Team 1 on incident and plan of action. When Team 2 is travelling to Underground, Team 1 will get under air. Once Team 2 enters the Underground surface building, Team 1 can commence with their rescue operation.
☐	3)	Record all actions and orders given to Mine Rescue Team in your action log. Record the time Team 1 enters the underground in the ERT Coordinator Logbook (Approximately 1 bar for every 1-minute Underground with the BG4). Check in every 15mins and record all air supply levels of the team.
☐	4)	Maintain contact with Mine Rescue Team while underground and provide direction as required. Always follow the Mine Rescue Principals in order: Safety of the team; Safety of the trapped/injured; Protection of mine property; Rehabilitation of mine property.
☐	5)	Consult with Incident Commander and Mechanical Supervisor to determine if a mechanical inspection is required prior to calling the Code One over.
☐	6)	Check with Incident Command on areas underground where pre-loading of emulsion explosives are located. **NOTE: Under no circumstances will the Mine Rescue Team fight fires in a heading with charged explosives**
☐	7)	Contact Incident Command to relay 'The Code One is over' once the final Team is finished.
☐	8)	Replenish incident command cards
Post Incident- Checklist		
☐	1)	Debrief with ERT members at the Fire Hall.
☐	2)	Follow-up with Incident Commander and Engineering Coordinator on the Underground Incident Command Team debrief. Gather notes and action items.

11.3 ERT ADVISOR DUTY CARD

ERT Advisor - Checklist		
☐	1)	Gather cap lamps, tag-in cards, and W65's for incoming teams.
☐	2)	Report to Dispatch (108) or ADMIN CH 1 (ERT CHANNEL) when ERT arrives at the Fire Hall (both Team 1 and 2).
☐	3)	Brief Mine Rescue Team 1 on incident and plan of action. When Team 2 is travelling to Underground, Team 1 will get under air. Once Team 2 enters the Underground surface building, Team 1 can commence with their rescue operation.
☐	4)	Contact ERT Coordinator via Channel 1 (ERT Channel) <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
Post Incident- Checklist		
☐	1)	Debrief with ERT members at the Fire Hall.
☐	2)	Follow-up with Incident Commander and Engineering Coordinator on the Underground Incident Command Team debrief. Gather notes and action items.
☐	3)	Collect all information from rescue and make any necessary changes to procedure.

11.4 OPERATIONS COORDINATOR DUTY CARD

Operations Coordinator - Checklist		
☐	1)	Record all relevant information in the Operations Coordinator log sheet.

☐	2)	Oversee all immediate needs of the Incident Commander.
☐	3)	Assign the following responsibilities: Check-in Coordinator – Name: Mine Entrance Guards – Names: West Zone portal guard: VOK portal guard: Office Entrance Guard(security) – Name: Door guard: Transportation Coordinator (not required unless operation is extensive) Transportation Coordinator name:
☐	4)	Confirm with ERT Coordinator to ensure the Underground Mine Rescue Team has been notified and all necessary radio calls have been made.
☐	5)	If applicable, barricade or post guards at the incident area to prevent any unauthorized access and remove all non-essential personnel.
☐	6)	Brief and keep the Incident Commander informed. This communication must include any area that has the potential for explosives.
☐	7)	Monitor assigned responsibilities.
☐	8)	Sign the Operations Coordinator log sheet and return to Recorder when emergency is over.

Post Incident - Checklist		
☐	1)	Participate in the post crisis review
☐	2)	Evaluate the effectiveness of the Underground Incident Management Team during the response and implement any necessary changes to the room or associated procedures

11.5 Engineering Coordinator Duty Card

Engineering Coordinator - Checklist		
☐	1)	Set up personal workstation.

		Required Phone Numbers: Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	Enter all relevant information on the Engineering Coordinator log Sheet.
☐	3)	Assign a Ventilation Engineer and provide instructions and support throughout the incident.
☐	4)	Provide copy of current ventilation plans. Review plans showing mining areas, ventilation flows and controls, refuge stations, escape ways, explosives magazines, etc.
☐	5)	Provide technical assistance to the Incident Commander.
☐	6)	Ensure main surface fans are operating as required.
☐	7)	Follow up and monitor all assigned responsibilities.
☐	8)	Sign the Engineering Coordinator log sheet and return to the Recorder when emergency is over.
Post Incident - Checklist		
☐	1)	Assist with the collection and filing of all documentation from all groups. Pass the information onto the ERT Advisor.
☐	2)	Participate in the post-crisis debrief.
☐	3)	Ensure allocated post-crisis follow-up actions are completed.

11.6 MAINTENANCE COORDINATOR DUTY CARD

Maintenance Coordinator - Checklist		
☐	1)	Assign Mechanical Supervisor and Electrical Supervisor, if required: Name of Mechanical Supervisor:

		Name of Electrical Supervisor:
☐	2)	Confirm that Stench at the main fans has been released (by radio). Only if required, check to make sure the stench gas has been released in the compressed lines.
☐	3)	Report to Incident Commander that stench has been released.
☐	4)	Under the direction of the Incident Commander, identify and work to remedy any maintenance related issues.
☐	5)	Discuss with the ERT Coordinator the need to have a mechanic inspect equipment involved in the incident prior to calling the Code One over.
☐	6)	Record relevant information in the Maintenance Coordinator log sheet.
☐	7)	Sign the Maintenance Coordinator log sheet and return to Recorder when emergency is over.
Post Incident - Checklist		
☐	1)	Participate in the post crisis review
☐	2)	Evaluate the effectiveness of the Underground Incident Management Team during the response and implement any necessary changes to the room or associated procedures
☐	3)	Provide a list of what equipment is locked out and/or need repair.

11.7 RECORDER DUTY CARD #1

Recorder - Checklist		
☐	1)	Set up personal workstation and start recorder.
☐	2)	Record key incident information on the event log and/or the status boards (rolled up poster sheets located in the auxiliary room). This must include times.
☐	3)	Update the status boards and manage administrative functions.
☐	4)	Manage the flow of hard copy information and retain copies for the permanent log.
☐	5)	Assist the Incident Commander in record keeping.
☐	6)	Alert team members of major changes, issues and outstanding actions.
☐	7)	Take digital photos of status boards before they are updated.
☐	8)	Proactively monitor all communications and record pertinent points as they arise.
Post Incident - Checklist		
☐	1)	Assist with the collection and filing of all documentation from all groups.
☐	2)	Participate in the IMT post-crisis interview.
☐	3)	Assist with refurbishing the Incident Management Room back to a ready state.

11.8 RECORDER DUTY CARD #2

Recorder - Checklist		
☐	1)	Set up personal workstation.
☐	2)	Record key incident information on the event log. This must include times.
☐	3)	Assist Dispatch in all aspects.
☐	4)	Manage the flow of hard copy information and retain copies for the permanent log.
☐	5)	Record all pertinent information from radio and telephone communication
☐	6)	Alert team members of major changes, issues and outstanding actions.
☐	7)	Take digital photos of information received
☐	8)	Proactively monitor all communications and record pertinent points as they arise.
Post Incident - Checklist		
☐	1)	Assist with the collection and filing of all documentation from all groups.
☐	2)	Participate in the IMT post-crisis interview.
☐	3)	Assist with refurbishing the Incident Management Room back to a ready state.

11.9 DISPATCH DUTY CARD

Dispatch - Checklist		
☐	1)	If an underground emergency is called on any UG channel, immediately relay the message without delay to Senior Management as per site extensions. Ch2 days Event: _____ Location of Event: _____ Person Reporting Event: _____ Injuries: _____ <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	If it is a medical emergency, inform all personnel on all underground channels to clear all ramps to the incident scene.
☐	3)	Monitor channel “all dispatch” and record any information in the Dispatch logbook.
☐	4)	If calls are received from a refuge station to report people present tell the caller that someone will contact them shortly. If the caller has information regarding the emergency record on log sheet. Relay information to Operations Coordinator.
☐	5)	Relay relevant information received from the UG channels to the Operations Coordinator.
☐	6)	When requested, provide any information on the location of personnel or equipment to the Operations Coordinator.
☐	7)	Record relevant information on Dispatch log sheet.
Post Incident - Checklist		
☐	1)	Participate in the IMT post-crisis interview

11.10 Check-In Coordinator Duty Card

Check-In Coordinator - Checklist		
☐	1)	Start your Check in Coordinator log sheet. <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	Designate the West Zone shop area and VOK Portal entrance as the muster area.
☐	3)	Assign one of the people mustering to direct, supervise & monitor personnel in the muster area. Instruct them to ensure all personnel remain in the muster area. Name: _____ Assign one Tag Board Check-In Assistant to oversee/guard the tag board. Instruct them not to let anyone remove a tag from the board until all workers are accounted for and the Check-In Coordinator has given approval. Tag board check in assistant: _____
☐	4)	Install the TAG BOARD “NO ENTRY” BARRICADES around the tag board to prevent persons from entering the TAG BOARD area.
☐	5)	Assign two Refuge Station Check-In Assistants. Designate each person specific refuge stations. Distribute refuge station records accordingly.
☐	6)	Delegate two Check-In Assistants to sit in the Shifter’s office to start call ins. Refuge Station Check-In Assistants #1: Refuge Station Check-In Assistants #2: Ensure the Check-In Assistants have their appropriate Refuge Station Check-In sheets (#1 and #2). The refuge stations are split up between Assistants to increase efficiency.
☐	7)	Monitor and direct the activities of the Check-In Assistants and UG Office muster area.
☐	8)	Provide a list of personnel accounted and unaccounted for and any Refuge Stations that were not contacted to the Operations Coordinator
☐	9)	Inform Operations Coordinator when all personnel are accounted for.
☐	10)	Release persons in the UG Offices muster area once the Code One is over.

☐	11)	Ensure all relevant information is entered in Check-In Coordinator log sheet, sign, then give to the recorder.
Post Incident - Checklist		
☐	1)	Participate in the IMT post-crisis interview

11.11 Check-In Assistant Duty Card

Check in Assistant - Checklist		
☐	1)	Use the REFUGE STATION RECORD sheets to phone all assigned refuge stations and record the name, employer/company name, refuge location, and condition of all personnel. Repeat the names to the refuge station attendant for verification. Ensure to include the refuge station attendant name. If a refuge station cannot be contacted by phone inform the Check-In Coordinator who will provide a radio. Attempt to contact the refuge station on radio channel 1, 2, and 3. Use a separate sheet for each refuge station and circle the refuge station location at the top of the sheet. <u>Required Phone Numbers:</u> Main Camp Boardroom (UGIC) – 640 Boardroom (IMT) Mill Dry 3rd – 455 Tagboard – 675 1440 refuge - 405, 1335 refuge – 676, 1320 refuge - 413, 1230 refuge - 425, 1200 refuge-707, 1170 refuge - 457, 1110 refuge - 809, 1080 refuge - 810 Survey office (Check in – Alternate) – 484 Firehall – 444
☐	2)	After all refuge stations have been contacted once, take the REFUGE STATION RECORD to the tag board and read the names one at a time to the Tag Board Check in Assistants. The Tag Board Check in Assistant will flip the tags as you read them. The Refuge Station Check in Assistant will mark an X in the column on the REFUGE STATION RECORD beside the person's name to indicate their tag has been flipped. Once all names have been read from the Refuge Station Check in Assistants list, compile a list of people not accounted for and notify the Check-In Coordinator.
☐	3)	Return to designated office and contact all the refuge stations again for any new arrivals. Repeat process at tag board of confirming names and flipping tags.
☐	4)	Provide a list of personnel unaccounted-for to the Check-In Coordinator.
☐	5)	Follow all directions from the Check in Coordinator.

☐	6)	Record all relevant information in the Refuge Station Check in Assistants Log sheet
☐	7)	Sign the Refuge Station Check in Assistant's Log sheet and return all paperwork to Recorder when emergency is over.
Post Incident - Checklist		
☐	1)	Attend the incident post-crisis review

11.12 Entrance Guard Duty Card

Entrance Guards - Checklist		
☐	1)	There are two locations that need to be guarded: West Zone Portal; VOK Portal; The Operations Coordinator will brief the two individuals with all pertinent information.
☐	2)	Obtain communications radio (Channel 2 RPT 1) and proceed to your designated location.
☐	3)	Record all relevant information in the Entrance Guard log sheet.
☐	4)	Position yourself, or vehicle: West Zone Portal - In a location that allows visual surveillance of the portal without being exposed to mine exhaust flow. VOK Portal - In a location that allows visual surveillance of the portal without being exposed to mine exhaust flow.
☐	5)	Stop anyone: West Zone Portal – Who attempts to enter the mine via the West Zone Portal. Contact Operations Coordinator to advise. VOK Portal – Who attempts to enter the mine via the VOK Portal. Contact Operations Coordinator to advise.
☐	6)	Identify anyone who exits the mine via the West Zone or VOK Portal. Contact the Operations Coordinator (Channel 2) to request transportation or first aid treatment of personnel exiting the mine.
☐	7)	Follow all directions from the Operations Coordinator.
☐	8)	Duties are not relieved until the Operations Coordinator instructs you to leave your post.
☐	9)	Sign the entrance guard log sheet and return to Underground Incident Command Team when emergency is over.

DISCLAIMER

Use of this Spill Response Plan is restricted to Pretium Resources Inc. (Pretium) staff and contractors who have participated in Spill Prevention and Response Training.

This plan should be viewed as a guide. Each spill is different and must be assessed individually. A response must be formulated to include unique strategies for safe containment, cleanup, disposal, and site restoration using best practicable technologies and methods. The strategies should be based on all available information, including the circumstances of the spill and information contained in this plan.

GLOSSARY AND ABBREVIATIONS

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

BJAR	Brucejack Access Road
CSA (Group)	Canadian Standards Association – Canadian authority on safety and performance standards and certification
EMBC	Emergency Management BC – the organization to which spills are reported in BC and which alerts agencies and assigns a case number
EMS	Environmental Management System
IAAC	Impact Assessment Agency of Canada
IMC	Incident Management Centre
IMT	Incident Management Team
KTA	Knipple Transfer Area
MECCS	BC Ministry Environment & Climate Change Strategy
MEMPR	BC Ministry of Energy, Mines and Petroleum Resources
MEMLCI	BC Ministry of Energy, Mines and Low Carbon Innovation
MERP	Mine Emergency Response Plan
Mine	Brucejack Mine
NLG	Nisga'a Lisims Government
PEP	Provincial Emergency Program – the predecessor to EMBC
PPE	Personal Protective Equipment – e.g., gloves, goggles, hard hat, etc.
Pretium	Pretium Resources Inc.
Regulated Person	A person or employee of a person who, while operating an industry, trade or business had possession, charge or control of a prescribed substance in prescribed quantities.
Responsible Person	A person who has possession, charge or control of a substance or thing when a spill of the substance or thing occurs or is at imminent risk of occurring.
SCBA	Self-contained Breathing Apparatus
SDS	Safety Data Sheet
TSKLH	Tsetsaut/ Skii km Lax Ha Nation
ULC	Underwriters Laboratories of Canada – an independent product safety testing, certification, and inspection organization
Universal Sorbent	Sorbent material that recovers water-soluble substances as well as oil products, usually grey, yellow or blue in colour

1. INTRODUCTION

1.1 PURPOSE

The purpose of this Spill Response Plan for the Brucejack Mine (the Mine) is to safeguard as far as possible against accidental spills of harmful substances that may negatively affect the environment. This will be achieved primarily by implementing spill prevention systems to avoid accidental releases to the environment, followed by responding timely and efficiently to a spill, thereby mitigating any negative effects.

This plan provides guidance to site personnel on how to respond to an accidental spill emergency and is a component of the environmental management system (EMS) for the mine and ancillary infrastructure. The information contained in this plan not only fulfils the basic requirements of Mines Act permitting, but also expands further to satisfy specific details related to the operation of the mine. The plan is reviewed every year.

This plan has been prepared to facilitate the prevention and safe and efficient cleanup of spills of the substances that may be present at the various Brucejack Mine facilities, including the Mine Site Area, along the Brucejack Access Road (BJAR), Knipple Transfer Area (KTA), Bowser Aerodrome, Brucejack transmission line and Wildfire Camp (Table 1.1-1).

Table 1.1-1. Substances in Use at the Brucejack Mine

Fuels/Oils	Dangerous Goods	Non-regulated Products	Gases
Diesel Gasoline	Ethylene Glycol Explosives (ANFO,Emulsion)	Actisand Borax	Acetylene Argon
Jet A	Hydrochloric acid	TerraFlow (mine backfill cement)	Propane Oxygen
Hydraulic	Litharge (lead oxide)	Propylene glycol	
Lube	Vanfroth 250 (frother)	Hydrated Lime	
Waste Oils	Nitric acid	Ferric Sulphate	
	Potassium Amyl Xanthate	Anionic Polymer (AN905)	
	Solvents ChemTreat CT788 Sodium Nitrate Perchloric Acid Hydrofluoric Acid Sulphuric acid	Flocculant (AN910) ChemTreat ML4428 Lithium Chloride	
	Sodium Sulphide		

Note: this list will be reviewed when the plan is updated as required

1.2 PERFORMANCE OBJECTIVES

The principal objectives of this Spill Response Plan are to:

- Provide emergency response information to mine management, response crews, and government agencies in the event of a spill;
- Comply with federal, provincial, and regional regulations pertaining to the preparation of contingency plans and spill reporting requirements;
- Promote the safe and effective recovery of spilled materials;
- Minimize the environmental impacts of spills to water, or land and ice; and
- Facilitate the management of wastes according to legislation.

This plan provides practical steps to safely assess an incident and to implement a response. Follow-up and corrective actions are also addressed so that these steps can be safely and efficiently conducted.

1.3 PLAN STRUCTURE

Relevant legislation and regulations are provided in subsection 1.4. Subsection 1.5 provides information on the Company and Emergency Operations.

Section 2 describes Spill Alerting and reporting, and Section 3 describes the Action Plan. Information on contacts (internal and external) is provided in Section 4. Finally, Section 5 describes Spill Response Roles and Responsibilities.

Additional information is provided in a series of appendices listed below.

- Appendix A provides the physical and chemical properties as well as emergency response measures for all substances expected to be in use have been compiled as Product Response Guides.
- Appendix B describes a current inventory of spill response kits.
- Appendix C describes the response strategies applied to the spill situations related to the chemicals and substances typically used at the Mine.
- Appendix D includes checklists for fuel and chemical storage and transfer operations. Regular inspections will help prevent spills and demonstrate due diligence. This appendix also provides the location and information of existing storage tanks.
- Appendix E outlines the spill response training that will be taken by Pretium employees and contractors. Training will enable them to respond safely and effectively to oil and chemical spill incidents.
- Appendix F contains Pretium's Standard Operating Procedure for Hydrocarbon Fuel Spill Response (BJ-ENV-SOP-025) including the Spill Reporting Information form.

Certain actions and responses supporting the implementation of the objectives of this Spill Response Plan overlap with other component management plans of the mine. Examples these plans are: the Mine Emergency Response Plan, the Chemicals and Materials Storage and Handling Plan and the Waste Management Plan. Spill prevention is also discussed in an appendix of the Chemicals and Materials Storage and Handling Plan.

1.4 RELEVANT LEGISLATION, REGULATIONS, AND ENVIRONMENTAL ASSESSMENT CERTIFICATE (EAC) CONDITIONS

1.4.1 Relevant Legislation and Regulations

This Spill Response Plan is a specific requirement of the BC Ministry of Energy, Mines and Low Carbon Innovation under the BC *Mines Act* and is also a requirement of the BC Ministry of Environment and Climate Change Strategy under the BC *Environmental Management Act* and regulations noted below. Applicable legislation and regulations include the following:

- BC Fire Code 2018;
- *Fire Services Act*
- *Fisheries Act*
- *Motor Vehicle Act*
- *Transportation of Dangerous Goods Act and Regulations*
- ULC/CSA standards
- *BC Water Act*
- *BC Water Sustainability Act*
- *BC Environmental Management Act:*
  - Petroleum Storage and Distribution Facilities Storm water Regulation
  - Hazardous Waste Regulation
  - Spill Reporting Regulation
  - Spill Preparedness, Response and Recovery Regulation
  - Spill Contingency Regulation
- Workplace Hazardous Materials Information System (WHMIS, 2015)
- BC *Mines Act*
- Environmental Code of Practice for Aboveground and Underground Storage Tank Systems Containing Petroleum and Allied Petroleum Products (Canadian Council of Ministers of the Environment [CCME]), Document PN1326,2003
- BC Fuel Guidelines, 11th Edition January 2022
- BC Guidelines for Industry Emergency Response Plans updated July 2002

1.4.2 Relevant EAC Conditions

Pretium was granted an Environmental Assessment Certificate (EAC, #M15-01) on March 26, 2015 which includes a series of conditions. This Spill Response Plan contributes to fulfilling Condition 2 in relation to the component plans outlined in Appendix A of Schedule B of the EAC. Condition 2 of the EAC states that:

"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.

Component Plans, at minimum, must include the following information:

- *Purpose of Component Plan;*
- *Performance objectives;*
- *Effects mitigation measures;*
- *Monitoring programs;*
- *Monitoring schedules; and*
- *Reporting requirements.*

The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.

The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."

1.5 COMPANY INFORMATION AND EMERGENCY OPERATIONS

1.5.1 Site Information

The Mine major components are:

- the Mine Site Area, the Brucejack Access Road linking the mine to Highway 37;
- the Bowser Aerodrome;
- the Knipple Transfer Area (KTA) bulk emulsion staging area;
- Bowser and Wildfire camps; and,
- the Brucejack transmission connecting to the Long Lake Hydro substation (Figure 1.4-1).

This plan has been developed to address potential spills at the major mine components during construction, operation, and closure.

1.5.1.1 Mine Site

The Brucejack Mine is situated in British Columbia at 56°28′20″N Latitude and 130°11′31″W Longitude. This is approximately 65 km north-northwest of Stewart by air. Road access is 60 km north from Meziadin Junction via Highway 37, then 73 km west via the Brucejack Access Road (BJAR, Figure 1.4- 1), including a 12 km section over the Knipple Glacier. The Mine Site Area is approximately 40 km upstream of the Canada/USA border and is located on provincial Crown land within the Regional District of Kitimat-Stikine

Figure 1.4-1. Project Location and Components

The Waste Rock and Tailings Storage Facility (WRTSF) catchment, where the Mine Site Area (underground mine, mill, subaqueous tailings and waste rock disposal, and NPAG quarry) is located, drains into Brucejack Creek. Brucejack Creek is a tributary to Sulphurets Creek, which drains into the Unuk River. The Unuk River is transboundary with Alaska.

1.5.1.2 Brucejack Access Road, Wildfire Camp, Bowser Aerodrome, Knipple Transfer Area and Bulk Emulsion Staging Area

The Brucejack Access Road extends 73.5 km west from Highway 37 to the Mine Site. A 30 person camp (Wildfire Camp) is located near km 1 of the access road (approximate Latitude 56°31'31"N Longitude 129°30'11"W). Wildfire Camp provides a base for road maintenance and transport.

The Bowser Aerodrome is located near km 50 of the Brucejack Access Road (approximate Latitude 56°23'44.161"N Longitude 129°56'28.266"W).

The Knipple Transfer Area was constructed near km 55 of the access road (approximate Latitude 56°24'1.886"N Longitude 130°0'19.052"W). This site is where product and materials will be transferred between highway transport vehicles to glacier crossing vehicles. The camp at this location serves road maintenance and transportation needs (particularly the interface between the lower all- weather road and the glacier transport route) during all phases of the mine.

A Bulk Emulsion Staging Area is located near km 48 of the Brucejack Access Road. This is a fenced and locked facility used for the transfer and short-term storage of bulk emulsion containers. Emulsion is delivered in 20,000 kg ISO steel containers for transportation to the Brucejack Mine Site. Any containers that cannot be immediately transported to the Mine Site are stored in the staging area. Outgoing empty emulsion containers can also be staged in this area.

1.5.1.3 Transmission Line

A 55 km long 138 kV transmission line was constructed from the existing Long Lake Hydro substation to the Brucejack Mine Site. Spills along the transmission line are considered unlikely as maintenance is helicopter based, other than at the control station about 1 km north of Long Lake Substation and the Brucejack Substation at Knipple Transfer Area.

1.5.2 Company Information

Pretium has corporate offices in Vancouver and Smithers that would be contacted in the case of a major spill on the Brucejack property:

Pretium Resources Inc. – Head Office
2300 – 1055 Dunsmuir Street
Vancouver, BC V7X 1L4
Tel. 604-558-1784

Pretium Resources Inc. – Smithers Office
2965 Tatlow Road
Smithers, BC V0J 2N5
Tel. 866-241-9772

A full list of contact numbers is provided in Section 4.

1.5.3 Spill Response Equipment

Spill response supplies and equipment are kept at Wildfire Camp, Knipple Transfer Area, the Brucejack Mine Site as well as strategic areas along the Access Road. Smaller kits are kept at any active work sites and all vehicles and equipment are required to have individual spill kits.

See Appendix B for detailed inventories of spill response equipment.

1.5.4 Incident Management Team (IMT)

In the event of a spill requiring an ongoing response an Incident Management Team (IMT) will be assigned and will meet at the designated *Incident Management Centre (IMC)*; the Mine Administration Office at the Brucejack Mine Site is the primary location. If needed, additional IMCs will be added at key locations along the Brucejack Access Road as follows:

- Knipple Transfer Area: Primary Location – Main Conference Room
- Wildfire Camp: Primary Location – Main Office

Functions of the IMT are summarized in Chapter 5 and further details are provided in the MERP.

1.5.5 Mustering/Assembly Areas

If an evacuation of an affected site is required, personnel must assemble upwind of the evacuated area to await further instructions. An employee tally will then be taken.

2. SPILL ALERTING AND REPORTING

There are two categories of spills, defined by set thresholds specified in Table 2.1-1:

- Non-reportable, refers to spills smaller than the set thresholds and are not reported to provincial regulatory bodies. These spills are only reported internally in the mine; and
- Reportable, refers to spill quantities greater than the set thresholds and are reported to provincial regulatory bodies

Regardless of their category, all spills must be cleaned up and reported either internally or to regulatory bodies. The Notification and Alerting Summary chart provided in Figure 2-1 highlights Pretium's reporting and alerting procedures, step 3 is only required for reportable quantities defined by table 2.2-1. These procedures are further addressed in this section.

Table 2.1-1. Thresholds for Reportable Spills

TDG Classification	Substance	Amount
1.5- Explosives	ANFO, emulsion	50 kg, or less if the substance poses a danger to public safety
3-Flammable liquids	Diesel, gasoline, hydraulic, lube, Jet A, solvents, waste oil, Vanfroth	100 L
4.2-Flammable solids	Potassium Amyl Xanthate	25 kg
8- Corrosives	Nitric acid, sulphuric acid, hydrochloric acid, perchloric acid, hydrofluoric acid, sodium Sulphide, ChemTreat CT788	5 kg or 5 L
2.1- Flammable gases	Propane and acetylene	10 kg
Leachable toxic waste	Coolant	25 L
6.1-Toxic substances	Litharge Lead Oxide, hydrofluoric acid	5 kg or 5 L
Not regulated	Borax, anionic polymer, flocculant, ferric sulphate, propylene glycol, methyl ether paint, hydrated lime, ChemTreat ML4428, lithium Chloride	200 kg or 200 L

Figure 2.1-1. Notification and Alerting Summary

2.1 SPILL ALERTING

All spills occurring outside any fluid management system must be reported to:

- Supervisor
- Manager, Environment and Regulatory Affairs
- Health and Safety Manager
- Mine Manager
- General Manager

The general reporting structure for all spills is as follows:

- Environmental incident reports are submitted to the Environmental Superintendent (or Environmental Coordinator/designate) who reviews report before submitting to the Manager, Environmental and Regulatory Affairs and Mine Manager, with copies forwarded to the Health & Safety Manager and General Manager.

- Any spills exceeding the regulatory thresholds (Table 2.1-1) are reported to Emergency Management BC (EMBC) by the Environmental Manager or designate. As per Section 6 of BC's Spill Reporting Regulation, a written End-of-Spill Report is prepared and submitted to BC Ministry of Environment and Climate Change Strategy (MECCS) within 30 days following the emergency response completion date.
- Any spills with potential to cause adverse environmental effects are reported in writing to Impact Assessment Agency of Canada (IAAC) as per Condition 9.3.1 of Decision Statement Issued under Section 54 of the Canadian Environmental Assessment Act, 2012.
- Oil spills <100 litres, spills of dangerous goods <1 litre or any spills of substances below EMBC reporting thresholds must be cleaned up and require internal alerting or reporting only.
- First Nations with Traditional Territories located downstream of the Bowser River (Tsetsaut Skii km Lax Ha, Nisga'a Nation, Gitanyow First Nation, Tahltan Nation) must be notified if the spill enters water and is not contained and/or cleaned and may impact downstream aquatic environments. See Figure 2.1-2 for the potential spill flow pathways along the BJAR east of Brucejack Mine.
- For more detail on reporting structure, roles and responsibilities, refer to section 5.

2.1.1 Gas Release

In the event of a significant release of explosive or other dangerous gas, contact the Mine Manager as soon as possible. The Mine Manager will inform the regional Ministry of Energy Mines and Low Carbon Innovation (MEMCI) Health and Safety Inspector and the Pretium Health & Safety Manager as soon as possible, within 8 hours of a dangerous occurrence, and within one week will send a follow up written report to the MEMCI Health & Safety Inspector.

2.2 SPILL REPORTING

Substances spilled on land or ice in reportable quantities (refer to Table 2.1-1), and any quantity of substance spilled to water that might result in deleterious impacts must be reported to the **Emergency Management BC Program 24 hour Spill Report Hotline 1-800-663-3456** within 24 hours of the initial spill observation**.**

The Spill Report form (Appendix F) will be used to record the data that is required to be reported to EMBC.

It is not necessarily an offence to spill a substance. It is an offence NOT to report a reportable spill.

All spills, regardless of volume, must be recorded on the Spill Report form. Refer also to Section 3.1 for spills of dangerous goods.

GPS coordinates must be recorded for any reportable spill and should be recorded for any non-reportable spill. Wherever feasible, spill response actions will be photographed from initial control to the proper storage of waste materials.

Figure 2.1-2. Potential Spill Flow Paths Along the Brucejack Access Road

3. ACTION PLAN

3.1 SEVERITY CLASSIFICATION

The response to a spill at the Mine depends on the severity of the incident and its potential impact. Three levels of emergency (Table 3.1-1) can be identified according to:

- the real or potential impacts of the incident;
- the need for outside support resources;
- who is contacted in an emergency; and
- the degree of public/media communication required.

Table 3.1-1 Severity Classification of Spill Incidents

Level 1: Minor	Level 2: Moderate	Level 3: Major
• Volume is less than the BC reportable threshold quantity (see Table 2.1-1). • No public concern or adverse environmental effects. • No release beyond the site. • Completely handled by on-site resources. • Of no interest to the media or the public.	• Volume is greater than the BC reportable threshold quantity (see Table 2.1-1). • No public concern but has potential to cause adverse environmental effects. • Spill is fully or substantially contained within site boundaries, but could possibly extend beyond Pretium property. • Control of incident is probable. • Possible local public or media interest.	• Volume is greater than the BC reportable threshold quantity (see Table 2.1-1). • Potential public concern and adverse environmental effects. • May be beyond local, on-site emergency response resources. Support of off-site personnel or other resources may be required. • May require multi-agency involvement. • High media and public interest.
Emergency Response Actions		
• Internally reportable.	• Notify EMBC. • Notify First Nations downstream of the Bowser River if spill enters water and is not contained and/or cleaned (Tsetsaut Skii km Lax Ha, Nisga'a Nation, Gitanyow First Nation, Tahltan Nation). • Notify IAAC if spill has the potential to cause adverse environmental effects. • Corporate management is notified and provides advice and support.	• Identified as "Emergency" by Pretium. • Maximum Pretium field and corporate response. • Pretium notifies and maintains ongoing communications with the EMBC, MEM*, IAAC and First Nations governments (see Level 2), and other government agencies as required.

** Notify the regional Health and Safety Inspector, MEMPR, who will notify the Chief Inspector if/as required.*

3.2 SPILL RESPONSE ACTIONS

Once the severity of the spill has been determined, personnel should follow the steps as summarized in Figure 3.1 and outlined in Table 3.2-1. Detailed information pertaining to different aspects related to response actions are provided in the following appendices:

- Appendix A: Response guides for specific products used in the mine, including the Water Treatment Plant;
- Appendix B: Spill Response Equipment;
- Appendix C: Spill response strategies
- Appendix D: Storage tanks and fuelling facilities; and
- Appendix F: Standard Operating Procedure (SOP) for hydrocarbon fuel spill response.

Figure 3.1. Spill Action Summary

Table 3.2-1. Spill Response Actions – Brucejack Mine

I. Respond Quickly
1. Identify the spilled material. 2. Ensure safety of yourself and others (evacuate if necessary). 3. Shut off ignition sources–no smoking. 4. Assess the severity of the spill. 5. Report to Supervisor OR Environmental Department – request assistance if required. 6. Attend to any injured personnel. 7. Keep unnecessary people out of the area. 8. Donn appropriate PPE – impervious clothing, goggles, gloves, respiratory protection. 9. Approach spill from upwind if safe to do so. 10. Stop product flow if possible: o Stop filling or transfer operations. o Turn off valves and/or plug leaks. 11. Contain spill as quickly as possible: o Berm, dike, and block entry to waterways and ditches. 12. Recover spill if safe to do so: o Use sorbents to remove petroleum products from surfaces and place contaminated material into marked containers for temporary storage. o Remove dangerous goods ONLY under supervision of qualified individual. o Transfer recovered materials to empty, labelled tank or container that can be sealed.
II. Respond Safely
1. Do not contain gasoline or solvents (vapours might ignite). 2. Allow gasoline to evaporate where safe to do so. 3. For spills of dangerous goods, consult Health & Safety Manager. 4. See Product Response Guides (Appendix A) for further information.
III. Obtain and Report Spill Details
See Spill Reporting Information form (Appendix F) for more details.

It is mandatory that all Pretium employees and contractors who handle the materials listed in this plan and who must respond to spills be trained in all aspects of spill response including health and safety, PPE, and spill control and cleanup. Only personnel trained in spill response for these materials are to implement these actions. Untrained personnel first on the scene are to report the spill, then close off the spill scene, establish a safe buffer zone and prevent access to anyone but trained personnel.

3.2.1 Disposal

Proper cleanup and disposal methods are prescribed by the Pretium Environmental Department together with the Health & Safety Manager who will ensure that all disposal options conform to BC MECCS requirements. Refer also to Safety Data Sheets (SDSs) for each specific product. SDSs will be updated when a product formulation changes and/or when a new product comes onto site.

SPENT SORBENTS MUST BE REMOVED IMMEDIATELY AFTER THEY ARE USED, BY PLACING IN SUITABLE SEALED AND LABELLED CONTAINERS, FOR PROPER OFF-SITE DISPOSAL. THEY MUST NOT BE LEFT ON THE GROUND.

The following list outlines disposal considerations for different materials.

- All contaminated materials resulting from a spill cleanup must be collected and stored in sealed, labelled containers (see Contacts – Terrapure).
- All contaminated materials must be shipped off site, unless otherwise approved, in waste manifested loads taken by a carrier with a list of emergency contacts and emergency measures clearly indicated.
- Biocells or other on-site means using nutrients, soil or other combinations thereof (i.e., landfarm) are not recommended for the disposal of contaminated soil from small spills. Larger spills may warrant the use of on-site disposal and would be considered at that time (regulatory approval required).
- Section 52 of the Hazardous Waste Regulations as outlined in the Environmental Management Act is also an option for seeking some exemptions (disposal and/or transport) of any/all waste resulting from an emergency/ spill incident.
- Oiled snow may be burned onsite in the incinerator which is permitted to burn waste oil if the ratio of oil to snow is acceptably high and the volume is recorded as per Waste Management Plan.
- Generally, oily sorbents resulting from ongoing operations must not be disposed of by burning in a drum or incinerator.
- Particulate sorbent used to treat spills, including Oil Gator, must be removed and NOT LEFT IN PLACE unless approved by the BC Ministry of Environment & Climate Change Strategy.
- Proper disposal methods may be prescribed by the Environmental Superintendent/ Coordinator if approval by BC MECCS needs to be obtained.

3.2.2 Northwest Fuels Limited Spill Contingency Plan

Spills resulting from Northwest Fuels Limited vehicles will be responded to according to the Northwest Fuels Limited Spill Contingency Plan provided in Appendix G.

4. CONTACTS

Internal emergency contact numbers and radio frequencies are listed in Tables 4.1-1 and 4.1-2.

4.1 INTERNAL EMERGENCY CONTACTS

Table 4.1-1. Phone Numbers – Brucejack Mine

Title/Dept.	Extension
Main Site Office	**778-724-4186**
Switchboard Admin/ Dispatch	**108**
Mine Manager	**127/165**
Mine Superintendent	**383/**
Health & Safety Manager	**392/167**
Environmental Manager/ Superintendent/ Coordinator	**504/ 211/ 103**
First Aid (Brucejack/ KTA/ Wildfire)	**111/ 422/ 222**

5. SPILL REPONSE ROLES AND RESPONSIBILITIES

In the event of an emergency spill, an Incident Management Team (IMT) will be created. Functions of the IMT may include:

- Notification to internal and external personnel and agencies;
- Situation assessment and planning and evaluation of response actions;
- Coordination of mobilization for response equipment, personnel, and resources;
- Liaison with Response Coordinator;
- Documentation of events, decisions and activities; and
- Communication with First Nations governments including:
    - Tsetsaut/ Skii km Lax Ha
    - Nisga'a Lisims Government
    - Gitanyow First Nation
    - Tahltan Nation

The roles and responsibilities for Pretium personnel as well as contractors during a Level 2 or 3 spill response are described in the following sections. Pretium's organizational structure for spill response is provided in Figure 5.1-1.

5.1 PRETIUM PERSONNEL

Spill Observer/All Site Workers

- Assess the initial severity of spill.
- Report all spills to Immediate Supervisor as soon as possible.
- Determine the source of the spill and, if safe, stop or contain it where possible.
- Participate in spill response as member of cleanup crew.

Supervisor

- Starts measures to control the situation and/or minimize the danger.
- Erects barricades and evacuates unauthorized personnel.
- Establishes a limited number of controlled entry points to scene.
- Notifies additional personnel, including Environmental Superintendent/Coordinator, if required to assist with immediate response.
- Requests the services of the Emergency Response Team, if required.
- Identifies possible hazards in the area (fuel tanks, electrical, etc.).
- If required, evacuates employees to a safe area, have all names recorded and conduct tally to determine if anyone is missing.

- Restricts or stops further operations that may interfere with the response to a spill incident.
- Supports all aspects of the investigation and helps prepare reports that may be sent to government agencies, in conjunction with the Environmental Coordinator.

Environmental Superintendent/Coordinator

- Implements protective measures and containment procedures to minimize environmental damage.
- Establishes internal and external communications as required to maintain notification sequence.
- Oversees ongoing Environmental containment, cleanup and remediation activities.
- Determines and oversees requirements to monitor the spill site and adjacent areas for environmental impacts
- Liaises with other managers/supervisors as required.
- Complete the Spill Report Information form on cleanup efforts including possible follow- up rehabilitation, monitoring and sampling program.
- Ensure spill response materials are replaced following the incident.

Environmental Manager or Designate

- Reports spill to EMBC, as required.
- Reviews completed Spill Reporting Information form.
- Ensures any required follow up is implemented.
- Ensures the Spill Response Plan is current

Mine Manager or Designate

- The Mine Manager may or may not have to be called in to oversee spill response efforts.
- The Mine Manager or designate will be kept abreast of all spill response efforts being carried out.
- Is responsible for all inquiries from the public and where necessary re-direct these inquiries to the proper authorities.
- In the event of a sustained emergency situation, ensures communications.

President/CEO

- Liaises with media and concerned outside parties.
- Provides written approved information releases to media, etc.
- Oversees legal and financial matters.

Figure 5.1-1. Pretium Senior Management Emergency Response Structure

5.2 CONTRACTORS

Several contractors operate in all areas of the Brucejack project performing a variety of tasks critical to the success of the Mine. While these contractors operate under Pretium's general direction and supervision, contractors remain as the responsible and regulated parties for any of their spills related to the Brucejack Project. Pretium Resources will assist and support in the response, cleanup and mitigation of all spills directly related to the Project.

APPENDIX A

Product Response Guides

BRUCEJACK MINE

Spill Response Plan

TABLE OF CONTENTS

Product Response Guides 1
Acetylene (UN1001) 3
Actisand (Microsand) 5
ANFO (Ammonium Nitrate) 7
Antifreeze (Ethylene Glycol) 9
Antiscalant (ChemTreat ML5105C) 11
Argon (UN1006) 13
Borax (Sodium Borate CAS 1303-96-4) 15
ChemTreat CT788 .....
Diesel (UN 1202) 17
Ferric Sulphate (LA14501) 19
Flocculant (AN905) 21
Flocculant (AN910) 23
Frother (VanFroth 250) 25
Hydrated Lime 27
Gasoline (UN 1203) 29
Hydraulic Oil 31
Hydrofluoric acid (UN 1790) .....
Jet A-1 (UN 1863) 33
Litharge (Lead Oxide UN 2291) 35
Lithium Chloride .....
Lube Oil 37
MIBC (Methyl Isobutyl Carbinol) 39
Nitric Acid (HNO_3 - UN 2031) 41
PAX (POTASSIUM AMYL XANTHATE, UN3342) 43
Perchloric Acid (UN1873)
Propane (UN1075) 45
Propylene Glycol 47
SODIUM SULPHIDE 50
Solvent (Naphtha Mineral Spirit & Petroleum Ether) 52
Sulphuric Acid (H_2SO_4 UN 1830) 54
Terraflow (mine backfill binder) .....

PRODUCT RESPONSE GUIDES

For more detailed information on specific products, please refer to the Material Safety Data Sheets (MSDSs) provided by the supplier.

MSDSs MUST be updated every 3 YEARS or whenever a new product comes on site.

- ☐ Acetylene (UN1001)
- ☐ Actisand (Microsand)
- ☐ ANFO (Ammonium Nitrate)
- ☐ Antifreeze (Ethylene Glycol)
- ☐ Antiscalant (ChemTreat ML5105C)
- ☐ Argon (UN1006)
- ☐ Borax (Sodium Borate CAS 1303-96-4)
- ☐ ChemTreat CT788
- ☐ ChemTreat ML4428
- ☐ Diesel (UN 1202)
- ☐ Ferric Sulphate (LA14501)
- ☐ Flocculant (AN905)
- ☐ Flocculant (AN910)
- ☐ Frother (Polypropylene glycol methyl ether - VanFroth 250)
- ☐ Hydrated Lime
- ☐ Gasoline (UN 1203)
- ☐ Hydraulic Oil
- ☐ Hydrofluoric acid (UN 1790)
- ☐ Jet A-1 (UN 1863)
- ☐ Litharge (Lead Oxide UN 2291)
- ☐ Lithium Chloride

- Lube Oil
- MIBC (Methyl Isobutyl Carbinol)
- Nitric Acid (HNO_3 - UN 2031)
- PAX (POTASSIUM AMYL XANTHATE, UN3342)
- Perchloric Acid (UN1873)
- Propane (UN1075)
- Propylene Glycol
- SODIUM SULPHIDE
- Solvent (Naphtha Mineral Spirit & Petroleum Ether)
- Sulphuric Acid (H_2SO_4 UN 1830)

Terraflow (mine backfill binder)

PLEASE NOTE:

- The Emergency Response Team will be provided with Material Safety Data Sheets (MSDS) for ALL materials transported, stored and used on-site.
- MSDSs will be available in all strategic locations on-site and near to the hazardous and toxic substances storage, dispensing, and points of use.
- MSDSs will also be available in the Environmental Department office, Security/First Aid Office, Mine Manager's Office, warehouse, mill, maintenance department, First Aid Station and the Health & Safety Manager's Office.
- MSDSs will be maintained and updated as necessary by the Health & Safety Manager.

ACETYLENE (UN1001)

Physical and Chemical Properties			
Danger! Highly flammable gas that burns with explosive force.			
Storage	Various cylinders	**Flammability**	2.5% to 100%
Appearance	Colourless gas	**Flash Point**	-17.8°C
Odour	Garlic-like odour	**Freezing Point**	-82.2°C
Solubility	NA	**Boiling Point**	-75.2°C
Vapour Density	Lighter than air	**Specific Gravity**	Floats on water (0.91)

Safety Measures	
Warnings	☐ EXPLOSION is possible ☐ Vapours instantaneously form that are lighter than air. ☐ Vapours can travel to distant sources of ignition and flash back. ☐ Containers can contain acetone. ☐ Acetylene can accumulate static electricity charges. ☐ Eye contact causes irritation. ☐ Inhalation of vapours can cause dizziness, drowsiness, unconsciousness and death (from asphyxiation).
Personal Protection	☐ Wear impervious clothing, leather welding gloves, footwear, and safety goggles with side shields when appropriate to do so. ☐ Use of breathing protection such as positive pressureSCBA is recommended.
Precautions	☐ Monitor for explosive and oxygen-deficient atmosphere. ☐ Avoid contact with acids, chlorine, chlorine dioxide and hydrogen peroxide. ☐ Also avoid contact with copper. ☐ Eliminate ignition sources. ☐ Isolate spill or leak for 50 to 100 m. ☐ For large release, consider evacuation area of 800 m.

ACETYLENE (UN1001)

Response to Fires

Consider actions only if safety permits!

- ☐ Wear SCBA in confined spaces. Shut off fuel supply.
- ☐ Extinguish fire with CO_2, dry chemical, alcohol foam or water fog.
- ☐ Use water fog or fine water spray to cool containers exposed to fire.
- ☐ **EXPLOSION is possible**!

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ ***Eliminate ignition sources!***
- ☐ ***Do not attempt to contain or remove spills!***
- ☐ ***Keep hands away from release point since severe frostbite can occur!***
- ☐ Knock down and disperse with water spray if safe to do so.

Storage, Transfer and Disposal

- ☐ It is not possible to collect released acetylene gas.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with plenty of fresh, warm water (**not hot water**) for 15 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- ☐ Remove and thoroughly air contaminated clothing.
- ☐ Discard saturated leather articles.
- ☐ Warm frostbite areas with warm (not hot) water.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform Artificial Respiration if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ N/A.

ACTISAND (MICROSAND)

Typical Physical and Chemical Properties			
Avoid chronic exposure to Actisand dust.			
Storage	22.7 kg bags	**Flammability**	Not flammable
Appearance	(Off-) white granular solid	**Flash Point**	NA
Odour	Slight;	**Pour Point**	NA
Solubility	Insoluble	**Flammability**	Non-flammable
Viscosity	NA	**Toxicity**	TWA 0.025 mg/m^3
Vapour Density	NA	**Specific Gravity**	Greater than water

Safety Measures	
Warnings	Ensure adequate ventilation especially in confined areas. Dust contains crystalline silica that can damage lungs. Avoid chronic exposure to Actisand. Contact with eyes and skin may cause irritation. Repeated inhalation of dust may cause cancer.
Personal Protection	Wear impervious clothing, leather gloves, footwear, and goggles with side shields when appropriate to do so. Use of breathing protection such as filter respirator is recommended.
Precautions	Avoid prolonged exposure. Avoid contact with oxidizers (acids), chlorine. Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Avoid confined spaces.
- Shut off fuel supply.
- Actisand is not flammable and will not burn.
- Adjacent fires can be extinguished with CO_2, dry chemical, sand, earth, water spray or regular foam

ACTISAND (MICROSAND)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, do not flush into water.
- ☐ Block entry into waterways.
- ☐ Contain spill by diking with earth or other barrier, if necessary.
- ☐ Remove minor spills with shovels.
- ☐ Remove large spills with mechanical equipment.
- ☐ **On water**, Actisand sinks but does not mix.
- ☐ Contain spill by damming or diverting contaminated water.

Storage, Transfer and Disposal

- ☐ Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials including acids.
- ☐ Segregate waste types and place in marked containers.
- ☐ Consult Environment Technician on transportation and disposal requirements.
- ☐ Actisand is a WHMIS regulated product. No known eco-toxic effects.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with plenty of fresh, warm water (not hot water) for 15 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to dust.

Skin

- ☐ Remove contaminated clothing.
- ☐ Wash skin thoroughly with soap and warm water.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method and not mouth-to-mouth method if victim inhaled or ingested the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ Do NOT induce vomiting.
- ☐ If victim is conscious, give two glasses of water to rinse mouth out.

ANFO (AMMONIUM NITRATE)

Typical Physical and Chemical Properties			
Soluble, irritant, toxic non-flammable liquid			
Appearance	White pellets or granules Also colourless liquid	**Flash Point**	n/a
Odour	Slight	**Pour Point**	n/a
Solubility	completely soluble	**Flammability**	Decomposes explosively
Viscosity	n/a	**Toxicity**	n/a
Vapour Density	n/a	**Specific Gravity**	Sinks in water (1.35)

Safety Measures

Warnings

- Inhalation may cause dizziness, nausea, intestinal upset.
- Ingestion of large amounts may be harmful.
- Eye contact causes irritation, redness and tearing.
- Prolonged and repeated skin contact can cause irritation.

Personal Protection

- Wear impervious, chemical-resistant clothing, gloves, footwear, and goggles when appropriate to do so; PVC and Viton are suitable materials.

Precautions

- Prevent from contacting water.
- Dry material can decompose explosively when confined and exposed to high temperatures.
- Keep away from organic materials since these can lower decomposition temperature.

Response to Fires

Consider actions only if safety permits!

- Wear SCBA in confined areas.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog. (Note: Water or foam may cause frothing)
- Use water to cool containers exposed to fire.

ANFO (AMMONIUM NITRATE)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, do not flush into water.
- ☐ Block entry into waterways.
- ☐ Contain spill by diking with earth or other barrier.
- ☐ If liquid, remove minor spills with sorbent, large spills with pumps or vacuum equipment.
- ☐ Prills/granules can be shovelled or removed mechanically.
- ☐ **On water**, ammonium nitrate sinks and mixes with water; contain spill by isolating contaminated water through damming or diversion.
- ☐ Flushing with water can be tried, if spill area cannot be isolated.

Storage, Transfer and Disposal

- ☐ Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- ☐ Segregate waste types.
- ☐ Place contaminated materials into marked containers.
- ☐ Consult Environmental Technician on final disposal.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with fresh, warm water (**not hot water**) for 20 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- ☐ Remove contaminated clothing.
- ☐ Wash skin thoroughly with soap and water.
- ☐ Get medical attention.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ Induce vomiting immediately.
- ☐ If victim is conscious, give two glasses of water and stick finger down throat.
- ☐ Get prompt medical attention.

ANTIFREEZE (ETHYLENE GLYCOL)

Physical and Chemical Properties			
Soluble, irritant, toxic liquid			
Appearance	Clear colourless to green liquid	**Flash Point**	116°C
Odour	Slight; undetectable <25 ppm	**Pour Point**	-13°C
Solubility	Very soluble in all proportions	**Flammability**	3.2 to 15.3%
Viscosity	Not viscous (22 cSt)	**Toxicity**	TLV 50 ppm
Vapour Density	Will sink to ground levels	**Specific Gravity**	Same as water

Safety Measures

Warnings

- Vapours are heavier than air.
- Empty containers can, but are unlikely to, contain explosive vapours.
- Ingestion of very small quantities (several ml) can be lethal.
- Eye contact causes irritation.
- Skin contact can cause intoxication due to absorption.
- Inhalation of vapours can cause intoxication, headache, vomiting, and unconsciousness with convulsions.

Personal Protection

- Wear impervious, chemical-resistant clothing, gloves, footwear, and goggles when appropriate to do so; neoprene, nitrile and PVC are suitable protective materials.
- Use of breathing protection such as a cartridge respirator may be necessary but is unlikely.

Precautions

- Eliminate ignition sources.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog. (**Note:** Water or foam may cause frothing.)
- Use water to cool containers exposed to fire.

ANTIFREEZE (ETHYLENE GLYCOL)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, do not flush into water.
- ☐ Block entry into waterways.
- ☐ Contain spill by diking with earth or other barrier.
- ☐ Remove minor spills with Universal sorbent.
- ☐ Remove large spills with pumps or vacuum equipment.
- ☐ **On water**, ethylene glycol sinks and mixes.
- ☐ Contain spill by damming or diverting contaminated water.

Storage, Transfer and Disposal

- ☐ Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- ☐ Segregate waste types and place in marked containers.
- ☐ Consult Environment Technician on transportation and disposal requirements.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with fresh, warm water (**not hot water**) for 20 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- ☐ Remove contaminated clothing.
- ☐ Wash skin thoroughly with soap and water.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ Induce vomiting immediately.
- ☐ If victim is conscious, give two glasses of water and stick finger down throat.

ANTISCALANT (CHEMTREAT ML5105C)

Physical and Chemical Properties			
Non-flammable liquid with low toxicity			
Storage	1000 L Totes	**Flammability**	No
Appearance	Clear liquid	**Flash Point**	None
Odour	Moderate	**Freezing Point**	-3 °C
Solubility	Soluble in water	**Boiling Point**	Not Available
Vapour Density	Not Available	**Specific Gravity**	1.17

Safety Measures

Warnings

- No significant health risks expected from normal exposure
- Do not freeze. If frozen, mechanical mixing is required

Personal Protection

- Safety glasses
- Butyl rubber or neoprene gloves. Wash or dispose of after use
- Respirator if misting occurs

Precautions

- Do not get in eyes, on skin or clothing
- Use with adequate ventilation

Response to Fires

Consider actions only if safety permits!

- Product is non-flammable
- Extinguish with media suitable for surrounding fire

ANTISCALANT (CHEMTREAT ML5105C)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ Contain and recover liquid in closed container
- ☐ Flush spill area with water
- ☐ Avoid runoff to environment

Storage, Transfer and Disposal

- ☐ Store away from strong oxidizers
- ☐ Keep in closed container
- ☐ Dispose with appropriate waste facility

First Aid

Get prompt medical attention!

Eyes	☐ Rinse with water for several minutes
Skin	☐ Call poison centre if symptoms occur
Inhalation	☐ Call poison centre if symptoms occur
Ingestion	☐ Rinse mouth
	☐ Call poison centre if symptoms occur

ARGON (UN1006)

Physical and Chemical Properties			
Non- flammable gas that does not burn.			
Storage	Various cylinders	**Flammability**	Non-flammable
Appearance	Colourless gas	**Flash Point**	NA
Odour	Odourless	**Freezing Point**	-189.4°C
Solubility	NA	**Boiling Point**	-185.9°C
Vapour Density	1.38 (heavier than air)	**Specific Gravity**	Sinks in water (1.40)

Safety Measures

Warnings

- Argon is an asphyxiant. It can displace oxygen.
- Vapours instantaneously form that are heavier than air.
- Inhalation of vapours can cause dizziness, drowsiness, unconsciousness and death (from asphyxiation).
- No harm is expected from contact with eyes or skin.

Personal Protection

- Wear impervious clothing, leather welding gloves, footwear, and safety goggles with side shields when appropriate to do so.
- Use of breathing protection such as positive pressureSCBA is recommended.

Precautions

- Monitor for adequate oxygen levels.
- Argon is chemically inert. It does not react with chemicals.
- Isolate spill or leak for 50 to 100 m.

Response to Fires

Consider actions only if safety permits!

- Wear SCBA in confined spaces. Shut off fuel supply.
- Argon is not flammable
- Use water to cool containers exposed to fire.
- Rupture of cylinders can occur if these are exposed to heat.

ARGON (UN1006)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ***Do not attempt to contain or remove spills!***
- ***Keep hands away from release point since severe frostbite can occur!***
- Knock down and disperse with water spray if safe to do so.

Storage, Transfer and Disposal

- It is not possible to collect released argon gas.

First Aid

Get prompt medical attention!

Eyes

- Flush eyes immediately with plenty of fresh, warm water (**not hot water**) for 15 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- Flush with water.
- ☐ Seek medical attention if discomfort persists.
- ☐ Warm frostbite areas with warm (not hot) water.

Inhalation

- Move victim to fresh air.
- ☐ Perform Artificial Respiration if victim not breathing
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- NA

BORAX (SODIUM BORATE CAS 1303-96-4)

Typical Physical and Chemical Properties			
Non-flammable, stable solid with low water solubility			
Storage	25 kg bags	**Flammability**	Not flammable
Appearance	White granular solid	**Flash Point**	NA
Odour	Odourless	**Melting Point**	741°C
Solubility	Partially soluble	**Flammability**	Non-flammable
Viscosity	NA	**Toxicity**	TWA 0.3 mg/m^3
Vapour Density	NA	**Specific Gravity**	2.37 (sinks in water)

Safety Measures

Warnings

- Ensure adequate ventilation in confined areas.
- Contact with eyes and skin may cause irritation.
- Avoid chronic exposure to Borax.
- Repeated inhalation of dust may cause cancer.

Personal Protection

- Wear safety glasses with side shields, dust respirator, nitrile, PVC or other gloves, lab coat or equivalent clothing, regular work boots are OK for small releases.
- For large spills, full chemical suit and SCBA are recommended.

Precautions

- Avoid ingestion and prolonged exposure.
- Avoid contact with reducers, alkali, chemicals, metallic salts.
- Combines with moisture to form hydrate. Keep dry.

Response to Fires

Consider actions only if safety permits!

- Borax is not flammable and will not burn.
- Avoid confined spaces.
- Shut off fuel supply.
- Adjacent fires can be extinguished with CO_2, dry chemical, sand, earth, water spray or regular foam.

BORAX (SODIUM BORATE CAS 1303-96-4)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, do not flush into water.
- ☐ Block entry into waterways.
- ☐ Contain spill by diking with earth or other barrier, if necessary.
- ☐ Remove minor spills with shovels.
- ☐ Remove large spills with mechanical equipment.
- ☐ **On water**, Borax sinks but does not mix.
- ☐ Contain spill by damming or diverting contaminated water.

Storage, Transfer and Disposal

- ☐ Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials including acids.
- ☐ Segregate waste types and place in marked containers.
- ☐ Consult Environment Technician on transportation and disposal requirements.
- ☐ Borax is not a WHMIS regulated product in Canada. No known eco-toxic effects.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with plenty of fresh, warm water (**not hot water**) for 15 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to dust.

Skin

- ☐ Remove contaminated clothing.
- ☐ Wash skin thoroughly with soap and warm water.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ Do NOT induce vomiting.
- ☐ If victim is conscious, give two glasses of water to rinse mouth out.

ChemTreatCT788

Typical Physical and Chemical Properties			
Danger! Causes severe skin burns and eye damage.			
Storage	Store at ambient temps	**Flammability**	N/D
Appearance	Liquid, colourless, clear	**Flash Point**	N/D
Odour	Odourless	**Freezing Point**	<-25°C
Solubility	Soluble	**Viscosity**	N/A
Vapour Density	N/D	**Specific Gravity**	1.424 @ 20°C

Safety Measures

Warnings

- Causes severe skin burns and eye damage.
- Causes serious eye damage.
- Harmful in contact with skin.
- Harmful if inhaled.
- Harmful if swallowed.
- Harmful to aquatic life.

Personal Protection

- Wear chemical splash goggles or safety glasses with full−face shield. Maintain eyewash fountain in work area.
- Maintain quick−drench facilities in work area. Wear butyl rubber or neoprene gloves. Wash them after each use and replace as necessary. If conditions warrant, wear protective clothing such as boots, aprons, and coveralls to prevent skin contact.
- If misting occurs, use NIOSH approved organic vapor/acid gas dual cartridge respirator with a dust/mist prefilter in accordance with 29 CFR 1910.134.

Precautions

- Wear protective gloves/clothing and eye/face protection.
- Do not breathe dust/fume/gas/mist/vapors/spray.
- Do not eat, drink or smoke when using this product.
- Wash hands thoroughly after handling.
- Use only outdoors or in a well−ventilated area.
- Avoid release into the environment.

Response to Fires

- Not flammable.
- Use extinguishing media suitable to surrounding fire.
- Use water spray to keep containers cool.

- If product is involved in a fire, wear full protective clothing including a positive- pressure, NIOSH approved, self-contained breathing apparatus.

Response to Spills

- Use appriate PPE
- Avoid dispersal of spilled material and runoff and contact with soil, waterways, drains and sewers.
- Contain and recover liquid when possible.
- Flush spill area with water spray.

First Aid

- Inhalation: Remove victim to fresh air and keep at rest in a position comfortable for breathing. Immediately call a poison center or doctor/physician.
- Eyes: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing. Immediately call a poison center or doctor/physician. Skin: Immediately remove/take off all contaminated clothing. Rinse skin with water/shower. Wash contaminated clothing before re−use. Immediately call a poison center or doctor/physician.
- Ingestion: DO NOT INDUCE VOMITING. Rinse mouth. Call a POISON CENTER or doctor/physician.

DIESEL (UN 1202)

Typical Physical and Chemical Properties			
Danger! Combustible liquid.			
Storage	Various tanks	**Flammability**	Combustible liquid
Appearance	Clear, pale yellow or red	**Flash Point**	38 to 55°C
Odour	Petroleum	**Freezing Point**	-50 to -6°C
Solubility	Insoluble	**Viscosity**	Not viscous
Vapour Density	Will sink to ground levels	**Specific Gravity**	Floats on water

Safety Measures

Warnings

- Vapours heavier than air form at high temperatures and may persist in depressions.
- Empty containers can contain explosive vapours.
- Toxic gases form upon combustion.
- Eye contact causes irritation.
- Diesel can accumulate static electricity charges.

Inhalation of vapours can cause irritation of the respiratory tract, headache, vomiting and unconsciousness.

Personal Protection

If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.

Precautions

Eliminate ignition sources.

- Electrically ground and bond containers when transferring diesel.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog.
- Use water to cool containers exposed to fire.

DIESEL (UN 1202)

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- **On land**, block entry into waterways.
- Do not flush into ditches or drainage system.
- Contain spill by diking with earth or other barrier.
- Remove minor spills with sorbent.
- **On water**, use booms to contain and concentrate spill.
- Remove spill using sorbent, skimmer or vacuum truck.
- Protection booming can be considered for water intakes/marinas.

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- Electrically ground/bond containers and vehicles during transfer.
- Segregate waste types.
- Place contaminated materials into marked containers.
- Consult Environment Technician on transportation and disposal requirements.

First Aid

Get prompt medical attention!

Eyes

- Flush eyes immediately with fresh, warm water (**not hot water**) for 20 minutes while holding the eyelids open.
- Remove contact lenses, if exposed to vapours or liquid.

Skin

- Remove and launder contaminated clothing.
- Discard saturated leather articles.
- Wash skin thoroughly with soap and water.

Inhalation

- Move victim to fresh air.
- Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- Provide oxygen if victim is having difficulty breathing.

Ingestion

- **Do not** induce vomiting.
- If victim is conscious, give milk or water to drink.
- If victim vomits, keep head below hips to prevent aspiration.

FERRIC SULPHATE(LA14501)

Typical Physical and Chemical Properties			
Danger! Creates acidic solutions; Harmful to skin, eyes, and respiratory system			
Storage	800 kg Bulk bag	**Flammability**	Low
Appearance	Light yellow powder	**Flash Point**	None
Odour	Slight	**Freezing Point**	Not available
Solubility	Soluble in water	**Viscosity**	Not available
pH	2-3 (1% solution)	**Specific Gravity**	3.097

Safety Measures

Warnings

- Irritating to skin and eyes; dust is irritating to mucous membranes
- Harmful if swallowed due to iron poisoning
- Creates acidic solution of 2-3 pH at low concentrations
- Reacts with strong bases, carbonates, and oxidizing materials
- Loses water in dry air and oxidizes on exposure to moisture, forming coating of extremely corrosive basic ferric sulphate

Personal Protection

- Chemical resistant gloves (nitrile or PVC)
- Suitable skin protection depending on exposure potential
- Safety goggles

Precautions

- Use process enclosure or exhaust ventilation to keep airborne levels low
- Ensure eyewash stations and safety showers are nearby

Response to Fires

Consider actions only if safety permits!

- Ferric Sulphate is not flammable
- Contact with sulphuric acid can produce heat and flammable hydrogen gas
- Extinguish with media suitable for surrounding fire

FERRIC SULPHATE(LA14501)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ Ventilate spill area
- ☐ Isolate hazard area and put solids in appropriate sealed container

Storage, Transfer and Disposal

- ☐ Empty containers can contain hazardous residues
- ☐ Keep in sealed container and dispose with an approved waste management facility

First Aid

Get prompt medical attention!

Eyes
- ☐ Immediately flush eyes with large amount of water for at least 20 minutes
- ☐ Hold eyelids apart to flush entire surface

Skin
- ☐ Flush skin with large amount of water
- ☐ Seek medical attention if irritation persists
- ☐ Launder contaminated clothing

Inhalation
- ☐ Move to fresh air
- ☐ If not breathing, give artificial respiration
- ☐ Give oxygen if breathing is difficult

Ingestion
- ☐ Do not induce vomiting unless directed by a medical professional

FLOCCULANT (AN905)

Typical Physical and Chemical Properties			
Stable powder with low toxicity			
Storage	Plastic pails	**Flammability**	Low
Appearance	White Granular Solid	**Flash Point**	Not applicable
Odour	None	**Freezing Point**	Not applicable
Solubility	Completely in water	**Specific Gravity**	0.6-0.9 (dry powder)

Safety Measures

Warnings

- Makes surfaces extremely slippery when wet

Personal Protection

- Respirator not expected to be required unless airborne concentration exceeds 10 mg/m^3
- Nitrile or PVC gloves
- Safety glasses with side shields

Precautions

- Avoid contact with skin and eyes
- Avoid dust formation; do not breathe dust

Response to Fires

Consider actions only if safety permits!

- Extinguish fire with CO_2, dry chemical, or water
- Thermal decomposition may produce NOx and COx
- Wear self-contained breathing apparatus if these compounds are produced

FLOCCULANT (AN905)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ Do not remove with water as it will create a slippery, gel-like compound
- ☐ Clean up dry powder with sweeping or vacuum
- ☐ Afterwards, flush traces with water
- ☐ If wet, remove with vacuum

Storage, Transfer and Disposal

- ☐ Keep in suitable and closed containers for disposal
- ☐ Can be landfilled or incinerated

First Aid

Get prompt medical attention!

Eyes
- ☐ Rinse thoroughly with plenty of water, including under the eyelids
- ☐ Get medical attention

Skin
- ☐ Wash with water and soap as a precaution
- ☐ Irritation not likely, but get medical attention if it persists

Inhalation
- ☐ Move to fresh air

Ingestion
- ☐ Rinse mouth with water
- ☐ Do not induce vomiting
- ☐ Get medical attention if symptoms occur

FLOCCULANT (AN910)

Typical Physical and Chemical Properties			
Stable powder with low toxicity			
Storage	Plastic pails	**Flammability**	Low
Appearance	White Granular Solid	**Flash Point**	Not applicable
Odour	None	**Freezing Point**	Not applicable
Solubility	Completely in water	**Specific Gravity**	0.6-0.9 (dry powder)

Safety Measures

Warnings

- Makes surfaces extremely slippery when wet

Personal Protection

- Wear respirator if dust is generated
- Nitrile or PVC gloves
- Safety glasses with side shields

Precautions

- Avoid contact with skin and eyes
- Avoid dust formation; do not breathe dust

Response to Fires

Consider actions only if safety permits!

- Extinguish fire with CO_2, dry chemical, or water
- Thermal decomposition may produce NOx and COx
- Wear self-contained breathing apparatus if these compounds are produced

FLOCCULANT (AN910)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ Do not remove with water as it will create a slippery, gel-like compound
- ☐ Clean up dry powder with sweeping or vacuum
- ☐ Afterwards, flush traces with water
- ☐ If wet, remove with vacuum

Storage, Transfer and Disposal

- ☐ Keep in suitable and closed containers for disposal
- ☐ Can be landfilled or incinerated

First Aid

Get prompt medical attention!

Eyes
- ☐ Rinse thoroughly with plenty of water, including under the eyelids
- ☐ Get medical attention

Skin
- ☐ Wash with water and soap as a precaution
- ☐ Irritation not likely, but get medical attention if it persists

Inhalation
- ☐ Move to fresh air

Ingestion
- ☐ Rinse mouth with water
- ☐ Do not induce vomiting
- ☐ Get medical attention if symptoms occur

LITHIUM CHLORIDE

Typical Physical and Chemical Properties			
Laboratory chemical			
Storage	Keep in a dry, cool and well-ventilated place. Keep container tightly closed. Keep away from direct sunlight. Store under an inert atmosphere.	**Flammability**	No information available
Appearance	White solid	**Flash Point**	No information available
Odour	None	**Freezing Point**	No information provided
Solubility	No information available	**Specific Gravity**	2.060

Safety Measures	
Warnings	☐ Harmful if swallowed ☐ Causes serious eye irritation
Personal Protection	☐ Wear appropriate protective eyeglasses or chemical safety goggles ☐ Wear appropriate protective gloves and clothing to prevent skin exposure ☐ Wear a respirator if exposure limits exceeded or if irritation or other symptoms are experienced

Precautions

- Wash face, hands and any exposed skin thoroughly after handling
- Do not eat, drink or smoke when using this product
- Wear protective gloves/protective clothing/eye protection/face protection
- Do not breathe dust/fume/gas/mist/vapors/spray
- Use only outdoors or in a well-ventilated area

Response to Fires

Consider actions only if safety permits!

- Extinguish fire with water spray, carbon dioxide, dry chemical, chemical foam
- Thermal decomposition can lead to release of irritating gases and vapors
- Hazardous combustion products include hydrogen chloride gas and chlorine
  - Wear self-contained breathing apparatus if these compounds are produced

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ Sweep up or vacuum up spillage and collect in suitable container for disposal
- ☐ Avoid dust formation

Storage, Transfer and Disposal

- ☐ Keep in a dry, cool and well-ventilated place.
- ☐ Keep container tightly closed.
- ☐ Keep away from direct sunlight.
- ☐ Store under an inert atmosphere.

First Aid

Get prompt medical attention!

Eyes ☐ Rinse thoroughly with plenty of water, also under the eyelids, for at least 15 minutes
☐ Get medical attention

Skin ☐ Wash off immediately with plenty of water for at least 15 minutes.

Inhalation ☐ Move to fresh air. If breathing is difficult, give oxygen. Get medical attention immediately if symptoms occur.

Ingestion ☐ Do not induce vomiting. Call a physician or Poison Control Center immediately

POLYPROPYLENE GLYCOL METHYL ETHER (VANFROTH 250)

Typical Physical and Chemical Properties			
Danger! Irritant to skin, eyes, and respiratory system.			
Storage	Large Tote	**Flammability**	Low
Appearance	Light Amber Liquid	**Flash Point**	>93C
Odour	Odourless	**Freezing Point**	Very Low
Solubility	Soluble in Water	**Viscosity**	Not Available
Vapour Density	Not Available	**Specific Gravity**	1.00

Safety Measures

Warnings

- Can cause respiratory irritation
- Can cause irritations of mucous membranes and eyes
- Chronic exposure may cause dizziness, nausea, and death

Personal Protection

- Use chemical safety goggles
- Wear impervious clothing, including gloves, to prevent skin contact
- Use respirator if fumes are generated

Precautions

- Ensure ventilation is adequate
- Avoid contact with skin and eyes

Response to Fires

Consider actions only if safety permits!

- May form explosive mixture with air
- Extinguish with water spray or dry chemical media

FROTHER (VANFROTH 250)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ Absorb with inert dry material
- ☐ Put into metal salvage drum for disposal

Storage, Transfer and Disposal

- ☐ Keep in tightly closed container
- ☐ Store in cool, dry, well-ventilated area

First Aid

Get prompt medical attention!

Eyes	☐ Immediately flush eyes with water for 15 minutes
Skin	☐ Remove contaminated clothing
	☐ Wash skin with soap and water for 20 minutes
Inhalation	☐ Move to fresh air
	☐ Apply artificial respiration or oxygen if necessary
Ingestion	☐ Do not induce vomiting

HYDRATED LIME

Typical Physical and Chemical Properties			
Danger! Burns skin and eyes. Stable powder which makes highly basic solution			
Storage	Bulk Bags	**Flammability**	Non-Flammable
Appearance	Solid White Powder	**Flash Point**	Not Applicable
Odour	Odourless	**Freezing Point**	Not Applicable
Solubility	1.6 g/L in Water	**Viscosity**	Not Applicable
pH	12.44	**Specific Gravity**	0.4-0.7

Safety Measures

Warnings

- Strongly basic. Reacts violently and with high heat when mixed with acid

Personal Protection

- Use safety glasses or goggles. Do not wear contact lenses
- Use nitrile or PVC gloves to prevent skin contact
- Wear respirator if airborne dust is generated

Precautions

- Ensure eyewash stations and safety showers are nearby
- Avoid contact with skin and eyes
- Ensure ventilation is adequate to prevent dust generation

Response to Fires

Consider actions only if safety permits!

- Hydrated lime is not flammable, and is not considered an explosive hazard
- Extinguish with dry chemical media
- Do not use halogenated compounds to extinguish

HYDRATED LIME

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ Use dry methods to collect spilled powder
- ☐ Avoid generating dust
- ☐ Collect in closed plastic or metal containers
- ☐ Wash residue with water or dilute vinegar

Storage, Transfer and Disposal

- ☐ Keep in closed containers
- ☐ Keep away from moisture and acidic compounds
- ☐ Not considered a hazardous waste in dry form

First Aid

Get prompt medical attention!

Eyes

- ☐ Causes severe irritation and permanent damage
- ☐ Flush eyes immediately with diphoterine (if available) and generous amounts of water for several minutes
- ☐ Pull back eyelid to wash out lime dust; do not rub eyes

Skin

- ☐ Can cause severe burning of skin
- ☐ Wash exposed area with diphoterine (if available) and generous amounts of water for several minutes

Inhalation

- ☐ Can cause severe irritation
- ☐ Move to fresh air
- ☐ Give artificial respiration if breathing stops

Ingestion

- ☐ Causes severe burning of gastrointestinal tract
- ☐ Do not induce vomiting

GASOLINE (UN 1203)

Typical Physical and Chemical Properties			
Danger! Highly flammable liquid – explosive vapours can form!			
Storage	Various tanks	**Flammability**	Flammable liquid
Appearance	Colourless liquid (can be dyed)	**Flash Point**	-40 to -50°C
Odour	Gasoline/petroleum	**Freezing Point**	-60°C
Solubility	Insoluble	**Viscosity**	Not viscous
Vapour Density	Will sink to ground levels	**Specific Gravity**	Floats on water

Safety Measures

Warnings

- Vapours instantaneously form that are heavier than air.
- Empty containers can contain explosive vapours.
- Vapours can travel to distant sources of ignition and flash back.
- Eye contact causes irritation.
- Gasoline can accumulate static electricity charges.
- Inhalation of vapours can cause irritation of the respiratory tract, headache, vomiting and unconsciousness.

Personal Protection

- Wear impervious, chemical-resistant clothing, gloves, footwear and goggles when appropriate to do so; nitrile and Viton are suitable materials (**do not** use natural rubber, neoprene or PVC).
- If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.

Precautions

- Monitor for explosive atmosphere.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Eliminate ignition sources.
- Electrically ground and bond containers when transferring fuel.
- Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog.
- Use water to cool containers exposed to fire.

GASOLINE (UN 1203)

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, block entry into waterways.
- ☐ Do not flush into ditches or drainage system.
- ☐ Contain spill by diking with earth or other barrier.
- ☐ Remove minor spills with sorbent.
- ☐ **On water**, do not attempt to contain or remove spills.
- ☐ Disperse with water spray.

Storage, Transfer and Disposal

- ☐ Store closed, sealed, labelled containers in cool, well-ventilated areas away from acids, fuels and solvents.
- ☐ Electrically ground containers and vehicles during transfer.
- ☐ Segregate waste types and place in marked containers.
- ☐ Consult Environment Technician on transportation and disposal needs.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with fresh, warm water (not hot water) for 20 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- ☐ Remove and launder contaminated clothing.
- ☐ Discard saturated leather articles.
- ☐ Wash skin thoroughly with soap and water.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ **Do not** induce vomiting.
- ☐ If victim is conscious, give milk or water to drink.
- ☐ If victim vomits, keep head below hips to prevent aspiration.
- ☐ If victim vomits, keep head below hips to prevent aspiration

HYDRAULIC OIL

Typical Physical and Chemical Properties			
Combustible liquid that can generate toxic fumes in fire.			
Storage	20 L pails, 200 L drums	**Flammability**	Combustible liquid
Appearance	Straw-yellow liquid	**Flash Point**	215°C
Odour	Petroleum	**Pour Point**	-25°C
Solubility	Generally insoluble	**Viscosity**	Medium (265 cSt @ 15°C)
Vapour Density	Few vapours emitted	**Specific Gravity**	Floats on water (0.88)

Safety Measures	
Warnings	Vapours are heavier than air and may persist in depressions. Toxic gas can form in fire and at high temperatures. CO, CO_2 and dense smoke are produced upon combustion. Material can accumulate static charges. Oil mist or vapour from hot oil can cause irritation of the eyes, nose, throat and lungs.
Personal Protection	Wear impervious, chemical-resistant clothing, gloves, footwear and goggles when appropriate to do so; nitrile, neoprene and Viton are suitable materials (**do not** use natural rubber or PVC). If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.
Precautions	Avoid excessive heat, which can cause formation of vapours. Avoid contact with acids, chlorine, ozone and peroxides. Eliminate ignition sources. Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Wear eye protection when responding to hydraulic oil fires.
- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog. (**Note:** Water or foam may cause frothing.)
- Use water to cool containers exposed to fire.

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- **On land**, block entry into waterways.
- Do not flush into ditches or drainage system.
- Contain spill by diking with earth or other barrier.
- Remove minor spills with sorbent.
- **On water**, use boom or other barrier to contain and concentrate spill.
- Remove spill using sorbent, pump or vacuum system.

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- Electrically ground containers and vehicles during transfer.
- Segregate waste types.
- Place contaminated materials into marked containers.
- Consult Environment Technician on transportation and disposal requirements.

First Aid

Get prompt medical attention!

Eyes

- Flush eyes immediately with fresh, warm water (**not hot water**) for 20 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- Remove and launder contaminated clothing.
- ☐ Discard saturated leather articles.
- ☐ Wash skin thoroughly with soap and water.

Inhalation

- Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- **Do not** induce vomiting.
- ☐ If victim is conscious, give milk or water to drink.

Hydrofluoric acid

Physical and Chemical Properties			
Toxic liquid, corrosive			
Appearance	Colourless liquid	**Flash Point**	No data available
Odour	No data available	**Pour Point**	No data available
Solubility	No data available	**Flammability**	No data available
Viscosity	No data available	**Toxicity**	No data available
Relative Density	1.16 g/cm³ (20 °C)	**Specific Gravity**	No data available

5.3 Safety Measures

Warnings

- Fatal if in contact with skin, if swallowed, or if inhaled.
- Causes severe skin burns and eye damage.

Personal Protection

- Protective gloves, protective clothing, eye protection and face protection are required.
- Respiratory protection required if insufficient ventilation.

Precautions

- Rinse mouth if swallowed, do not induce vomiting.
- Rinse skin with plenty of water if in contact with skin.
- Move to fresh air if inhaled.
- Contact Poison Center or a doctor if exposed.
- Store with container tightly closed in a well-ventilated location.

5.4 Response to Fires

CONSIDER ACTIONS ONLY IF SAFETY PERMITS!

- The product itself does not burn, therefore respond to fires according to measures required by surroundings.
- Hydrogen fluoride may be liberated because of fire.
- Once the fire reaches explosives, do not fight the fire.
- Firefighters must wear appropriate personal protection including a self-contained breathing apparatus and chemical protective clothing.
- In case of fire, evacuate the area and do not inhale the combusted gases.
- Do not allow run-off from firefighting to enter drains or water courses.

5.5 Response to Spills

CONSIDER ACTIONS ONLY IF SAFETY PERMITS!

Accidental Release

- Ensure that there is adequate ventilation and do not breathe gas/vapor/spray.
- Use personal protective equipment and clear the spill immediately.
- Do not allow the spill to enter into drains or water and avoid discharge to the environment.
- Do not return the spilled material to the original container. Collect into a suitable closed container for disposal.

Safe Handling and Storage

- Store in a tightly closed contained in a well-ventilated area with a temperature of 15-25°C.
- Use an extractor hood when using in a laboratory.
- Adequate ventilation (exhaust ventilation) is required when uncovering the product.
- Protect from moisture.

5.6 First Aid

First aiders must ensure that they are adequately protected with the required personal protective equipment. Symptoms may develop several hours after exposure. Contact the Poison Center or a doctor immediately upon exposure.

Eyes

- Flush eyes with water immediately for 10-15 minutes.
- Remove contact lenses if present and continue rinsing.

Skin

- Immediate medical treatment required.
- Rinse with water thoroughly and remove all contaminated clothing.
- Wash off wit calcium gluconate solution.

Inhalation

- Move to fresh air immediately and rest.
- If breathing stops, do not perform mouth-to-mouth, administer artificial respiration (Ambu bag or ventilator).

Ingestion

Rinse mouth thoroughly with water followed by washing with calcium gluconate solution.

Jet A-1 (UN 1863)

Typical Physical/Chemical Properties			
Danger! Flammable liquid – explosive vapours can form!			
Storage	Various tanks	**Flammability**	Flammable liquid
Appearance	Clear, pale yellow or red	**Flash Point**	38°C
Odour	Petroleum	**Freezing Point**	-40°C
Solubility	Insoluble	**Viscosity**	Not viscous
Vapour Density	Will sink to ground levels	**Specific Gravity**	Floats on water

Safety Measures	
Warnings	Vapours heavier than air form at high temperatures and may persist in depressions. • Empty containers can contain explosive vapours. • Toxic gases form upon combustion. • Eye contact causes irritation. • Jet A-1 can accumulate static electricity charges when stored and transferred. • Inhalation of vapours can cause irritation of the respiratory tract, headache, vomiting and unconsciousness.
Personal Protection	Wear impervious, chemical-resistant clothing, gloves, footwear and goggles when appropriate to do so; nitrile and Viton are suitable protective materials (**do not** use natural rubber, neoprene or PVC for prolonged periods). If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.
Precautions	Eliminate ignition sources. Electrically ground and bond containers when transferring Jet A. Avoid contact with acids, chlorine, ozone and peroxides. Restrict access and work upwind of spill.

Response to Fires
Consider actions only if safety permits!
Avoid confined spaces. Shut off fuel supply. Extinguish fire with CO_2, dry chemical, alcohol foam or water fog. Use water to cool containers exposed to fire.

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, block entry into waterways.
- ☐ Do not flush into ditches or drainage system.
- ☐ Contain spill by diking with earth or other barrier.
- ☐ Remove minor spills with sorbent.
- ☐ **On water**, use boom or other barrier to contain and concentrate spill.
- ☐ Remove spill using sorbent, pump or vacuum system.

NOTE: Jet A evaporates at various rates depending on the spill and weather conditions. Do not assume complete evaporation will occur.

Storage, Transfer and Disposal

- ☐ Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- ☐ Electrically ground/bond containers and vehicles during transfer.
- ☐ Segregate waste types.
- ☐ Place contaminated materials into marked containers.
- ☐ Consult Environment Technician on transportation and disposal needs.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with fresh, warm water (**not hot water**) for 15 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- ☐ Remove and launder contaminated clothing.
- ☐ Discard saturated leather articles.
- ☐ Wash skin thoroughly with soap and water.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ **Do not** induce vomiting.
- ☐ If victim is conscious, give milk or water to drink.
- ☐ If victim vomits, keep head below hips to prevent aspiration.

LITHARGE (LEAD OXIDE UN 2291)

Typical Physical and Chemical Properties			
Danger! Highly toxic, non-flammable solid that reacts with many chemicals.			
Storage	25 kg bags	**pH**	NA
Appearance	Orange powder/crystal	**Flash Point**	NA
Odour	Odourless	**Freezing Point**	886°C
Solubility	Insoluble	**Flammability**	Non-flammable
Viscosity	NA	**Toxicity (lead)**	TWA 0.05 mg/m^3
Vapour Density	NA	**Specific Gravity**	Sinks in water (9.4-10)

Safety Measures

Warnings

- Litharge can be fatal by ingestion, inhalation and skin adsorption.
- Contact with eyes and skin may cause irritation.
- Ingestion may cause lead poisoning: fatigue, abdominal pain, nausea, dizziness, joint pain, paralysis, convulsions, coma, and death.
- Damage may be caused to unborn fetus.
- ***Avoid repeated or prolonged exposure to Litharge!***

Personal Protection

- Wear impervious clothing, nitrile gloves, footwear, and goggles with side shields, SCBA and Level A suit when appropriate to do so.
- Use of skin and breathing protection is recommended.

Precautions

- Avoid contact with all sources of ignition, high temperatures.
- Avoid acids, chlorinated rubber, metals, hydrogen peroxide, ammonium nitrate ***Reaction with chemicals can be violent!***
- Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Litharge is not flammable and will not burn.
- Degradation products in a fire are toxic fumes of lead and lead oxide.
- Avoid confined spaces. Wear SCBA with full facepiece.
- Shut off fuel supply.
- Use water spray or fog to fully cool containers.

LITHARGE (LEAD OXIDE UN 2291)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, do not flush into water.
- ☐ Block entry into waterways.
- ☐ Contain spill by diking with earth or other barrier, if necessary.
- ☐ Remove minor spills with shovels.
- ☐ Remove large spills with mechanical equipment.
- ☐ **On water**, Litharge quickly sinks and does not mix.
- ☐ Contain spill by damming or diverting contaminated water.

Storage, Transfer and Disposal

- ☐ Store closed, sealed, labelled containers in cool, ventilated areas away from heat and incompatible materials including acids, hydrogen peroxide and metals.
- ☐ Segregate waste types and place in marked containers.
- ☐ Consult Environment Technician on transportation and disposal needs.
- ☐ Litharge is a TDG regulated product. Eco-toxic effects are possible.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with plenty of fresh, warm water (**not hot water**) for 15 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to dust.

Skin

- ☐ Remove contaminated clothing.
- ☐ Wash skin thoroughly with soap and warm water for 15 minutes.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method or CPR and not mouth-to-mouth method if victim inhaled or ingested Litharge).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ Do NOT induce vomiting.
- ☐ If victim is conscious, give two glasses of water to rinse mouth out.
- ☐ Seek immediate medical attention.

LUBE OIL

Typical Physical and Chemical Properties			
Combustible liquid that can generate toxic fumes in fire.			
Storage	2o L pails, totes	**Flammability**	Combustible liquid
Appearance	Amber liquid	**Flash Point**	190 to 220°C
Odour	Petroleum	**Pour Point**	-37°C
Solubility	Generally insoluble	**Viscosity**	Medium (255 cSt @ 15°C)
Vapour Density	Few vapours emitted	**Specific Gravity**	Floats on water (0.89)

Safety Measures

Warnings

- Toxic gas can form in fire and at high temperatures.
- CO, CO_2 and dense smoke are produced upon combustion.
- Material can accumulate static charges.
- Hot oil vapours can irritate the eyes, nose, throat and lungs.

Personal Protection

- Wear chemical-resistant clothing, gloves, footwear and goggles when appropriate to do so; nitrile and Viton are suitable materials (**do not** use natural rubber, neoprene or PVC).
- If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.

Precautions

- Avoid excessive heat, which can cause formation of vapours.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Eliminate ignition sources.
- Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Wear eye protection when responding to lube oil fires.
- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog. (**Note:** Water or foam may cause frothing.)
- Use water to cool containers exposed to fire.

LUBE OIL

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, block entry into waterways.
- ☐ Do not flush into sewer or drainage system.
- ☐ Contain spill by diking with earth or other barrier.
- ☐ Remove minor spills with sorbent.
- ☐ **On water**, use boom or other barrier to contain and concentrate spill.
- ☐ Remove spill using sorbents pump or vacuum system.

Storage, Transfer and Disposal

- ☐ Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- ☐ Electrically ground/bond containers and vehicles during transfer.
- ☐ Segregate waste types and place in marked containers.
- ☐ Consult Environment Technician on transportation and disposal needs.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with fresh, warm water (**not hot water**) for 15 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- ☐ Remove and launder contaminated clothing.
- ☐ Discard saturated leather articles.
- ☐ Wash skin thoroughly with soap and water.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ **Do not** induce vomiting.
- ☐ If victim is conscious, give milk or water to drink.
- ☐ If victim vomits, keep head below hips to prevent aspiration.

MIBC (METHYL ISOBUTYL CARBINOL)

Physical and Chemical Properties			
Toxic liquid that can react with acids.			
Storage	Tanks	**pH**	Not applicable
Appearance	Colourless liquid	**Flash Point**	41°C
Odour	Faint odour	**Boiling Point**	Decomposes
Solubility	Slightly soluble	**Exposure Limits**	Not available
Vapour Density	Not applicable	**Specific Gravity**	Floats on water (0.80)

Health and Safety

Warnings

- Inhalation may cause slight irritation of nose and throat.
- Prolonged skin contact may cause irritation and dermatitis.
- Eye contact may cause irritation.
- Avoid ingestion; MIBC is toxic.
- Static electricity discharge can occur when MIBC is transferred.

Personal Protection

- Wear goggles, gloves, boots.
- Wear SCBA where ventilation is not adequate.
- Plastic or rubber gloves are recommended.
- Ventilate at rate of ten changes/hr.

Precautions

- Avoid contact with strong oxidizing agents and acids.
- Ground and bond when transferring MIBC.

Response to Fires

Consider action only if safe!

- Wear SCBA.
- Products of combustion are CO_X, N_XO_X.
- Use dry chemical, foam, CO_2 to extinguish small fires.
- Use water to extinguish large fires.

MIBC (METHYL ISOBUTYL CARBINOL)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, prevent entry into water.
- ☐ Ventilate area.
- ☐ Wear PPE.
- ☐ Collect material into a waste container - avoid raising dust.
- ☐ Wash spill site after material pickup.
- ☐ Caution: water solutions are very slippery and may constitute a hazard.
- ☐ **On water**, MIBC partially mixes with water.
- ☐ Contain spill by damming or diverting contaminated water.

Storage, Transfer and Disposal

- ☐ Store in a cool, dry location away from fuels, acids.
- ☐ Consult Environmental Technician on transportation and disposal needs.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with fresh, warm water (**not hot water**) for **15** minutes.
- ☐ Remove contact lenses if exposed to dust or liquid.

Skin

- ☐ Remove contaminated clothing.
- ☐ Wash exposed area with soap and water.

Inhalation

- ☐ Move victim to fresh air and keep warm and at rest.
- ☐ Perform AR if victim not breathing.
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ If victim is conscious, wash out mouth with water and dilute with two glasses of water.
- ☐ **Do not** induce vomiting.
- ☐ If victim vomits, keep head below hips to prevent aspiration.

NITRIC ACID (HNO_3 - UN 2031)

Physical and Chemical Properties			
Danger! Highly corrosive, toxic liquid that reacts with many chemical and metals.			
Storage	Glass vessels	**pH**	1 (68-70%)
Appearance	Colourless to slight brown	**Flash Point**	Not flammable
Odour	Acrid suffocating odour	**Boiling Point**	122°C
Solubility	Soluble in water.	**Freezing Point**	-42°C
Vapour Density	Heavier than air (2.5)	**Specific Gravity**	Sinks in water (1.42)

Health and Safety

Warnings

- **Highly corrosive** to all body tissues: skin, eyes, mucous membranes.
- Direct skin contact may cause deep painful burns, shock and collapse.
- **Highly toxic** and may be fatal if ingested.
- Inhalation may cause breathing difficulties, irritation and (@ 25 ppm) death.

Personal Protection

- Wear face shields, splash-proof safety goggles, rubber boots, heavy rubber gloves, rubber aprons/suits.
- Wear respirator with acid cartridge for pools, SCBA for mist, as required.
- Rubber, neoprene are recommended.

Precautions

- Avoid contact with water, most metals and oxidizers.
- Avoid alcohols, organic solvents, carbides, sulfides.
- Can generate explosive hydrogen gas in contact with metals.
- **Do not add water to concentrated acid**; heat, splattering occurs.

Response to Fires

Consider action only if safe!

- Generates NO_X in fire.
- Use dry chemical or CO_2 to extinguish small fires.
- Not flammable. Use appropriate media for adjacent larger fires.
- Water added to concentrated acid results in heat, violent spattering.

NITRIC ACID (HNO_3 - UN 2031)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

On Land

- ☐ Remove ignition sources. Ventilate area.
- ☐ **Inside buildings**: neutralize with soda ash or lime.
- ☐ Do not flush into ditches and drains.
- ☐ Call for help if significant quantity is spilled or people are affected.
- ☐ **Outside buildings**: contain spill by diking with sand or earth.
- ☐ Use only chemical-rated pump.
- ☐ Neutralize and remove minor spills with Universal sorbent.
- ☐ Rinse residuals with water and mild alkali.

On Water

- ☐ Will sink and mix completely with water.
- ☐ Contain spill: isolate contaminated water by damming or diversion.

Storage, Transfer and Disposal

- ☐ Store closed, sealed, labelled containers in cool, well-ventilated areas.
- ☐ Keep away from incompatible materials such as water, metals and fuels.
- ☐ Segregate waste types and place in marked containers.
- ☐ Consult Environmental Technician on transportation and disposal.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with fresh, warm water (**not hot water**) for at least 15 minutes.
- ☐ Remove contact lenses if exposed to vapours or liquid.

Skin

- ☐ Remove contaminated clothing.
- ☐ Flush with water for at least 15 minutes.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing. Do not use mouth-to mouth.
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ Administer large quantities of water, if victim is conscious.
- ☐ **Do not** induce vomiting.
- ☐ If victim vomits, keep head below hips to prevent aspiration.

Page 1 of 2

5.6.1.1 PAX (POTASSIUM AMYL XANTHATE, UN3342)

Physical and Chemical Properties			
Danger! Creates explosive vapours. Highly toxic.			
Storage		**Flammability**	Vapours/dusts may explode
Appearance	Solid Yellow	**Flash Point**	None
Odour	Not Available	**Freezing Point**	Not Available
Solubility	Soluble in Water	**Boiling Point**	Not Available
Vapour Density	Not Available	**Specific Gravity**	Not Available

Safety Measures	
Warnings	☐ Vapours or dusts may explode ☐ Solid PAX is stable when cool and dry, but decomposes slowly at room temperature
Personal Protection	☐ Impervious rubber or neoprene gloves ☐ Suitable impermeable clothing and footwear ☐ Chemical goggles ☐ Face shield if splashing could occur ☐ Respirator if exposure exceeds limits
Precautions	☐ Ensure eyewash and shower stations are close to the work area ☐ Avoid exposure to heat, acids, and oxidizing agents

Response to Fires

Consider actions only if safety permits!

- ☐ Product decomposes to flammable carbon disulphide, with flash point of -30C
- ☐ Extinguish with water, CO2, or dry chemical
- ☐ Firefighters should wear full protective clothing and SCBA
- ☐ In fire, produces potassium, sulphur, and carbon oxides

5.6.1.2 *PAX (POTASSIUM AMYL XANTHATE, UN3342)*

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ Prevent release to environment
- ☐ Pick up solids and put in sealed container
- ☐ Do not touch or walk through spilled material
- ☐ Flush small spills with water
- ☐ Collect large spills for disposal

Storage, Transfer and Disposal

- ☐ Keep containers grounded, well ventilated, and away from heat and flame
- ☐ Store under cool, dark, dry conditions
- ☐ Empty containers may contain hazardous residues
- ☐ Dispose with approved waste management facility

First Aid

Get prompt medical attention!

Eyes
- ☐ Immediately flush with water for at least 15 minutes

Skin
- ☐ Immediately flush with water for at least 15 minutes
- ☐ Remove contaminated clothing and launder before reuse

Inhalation
- ☐ Move to fresh air
- ☐ If not breathing, give artificial respiration

Ingestion
- ☐ Do NOT induce vomiting
- ☐ If vomiting occurs, keep head below hips to prevent aspiration of liquid into lungs

Perchloric acid

Physical and Chemical Properties			
Oxidizing liquid, Corrosive, Toxic liquid, Irritant			
Appearance	Colourless liquid	**Flash Point**	No data available
Odour	Odourless	**Pour Point**	No data available
Solubility	No data available	**Flammability**	No data available
Viscosity	No data available	**Toxicity**	No data available
Relative Density	1.67 g/cm³ (20 °C)	**Specific Gravity**	No data available

5.7 Safety Measures

Warnings

- Oxidizing liquid; may cause fires or explosions.
- Corrosive to metals.
- Toxic; harmful if swallowed; may damage organs.
- Corrosive; can cause skin burns and eye damage.

Personal Protection

- Protective gloves, protective clothing, eye protection and face protection are required.

Precautions

- Rinse mouth if swallowed, do not induce vomiting.
- Rinse skin with plenty of water if in contact with skin.
- Move to fresh air if inhaled.
- Contact Poison Center or a doctor if exposed.
- Store away from heat, hot surfaces, sparks, flames, other ignition sources, and combustible materials.
- In case of fire or major accidental release, evacuate immediately.

5.8 Response to Fires

CONSIDER ACTIONS ONLY IF SAFETY PERMITS!

- The product does not burn, but may intensify fire since it is an oxidizer.
- Once the fire reaches explosives, do not fight the fire.

- Firefighters must wear appropriate personal protection including a self-contained breathing apparatus and chemical protective clothing.
- In case of fire, evacuate the area and do not inhale the combusted gases (Hydrogen chloride).
- Do not allow run-off from firefighting to enter drains or water courses.

5.9 Response to Spills

CONSIDER ACTIONS ONLY IF SAFETY PERMITS!

Accidental Release

- Ensure that there is adequate ventilation and do not breathe gas/vapor/spray.
- Use personal protective equipment and clean the spill immediately.
- Do not allow the spill to enter into drains or water and avoid discharge to the environment.
- Do not return the spilled material to the original container. Collect into a suitable closed container for disposal.

Safe Handling and Storage

- Store in a tightly closed contained in a well-ventilated area with a temperature of 15-25°C.
- Use an extractor hood when using in a laboratory.
- Adequate ventilation (exhaust ventilation) is required when uncovering the product.

5.10 First Aid

First aiders must ensure that they are adequately protected with the required personal protective equipment. Symptoms may develop several hours after exposure. Contact the Poison Center or a doctor immediately upon exposure.

Eyes

- Flush eyes with water immediately for 10-15 minutes.
- Remove contact lenses if present and continue rinsing.

Skin

- Immediate medical treatment required.
- Rinse with water thoroughly and remove all contaminated clothing.

Inhalation

- Move to fresh air immediately and rest.
- If breathing stops, administer artificial respiration.

Ingestion

- Rinse mouth thoroughly with water.
- Do not induce vomiting.

Do not drink or eat.

PROPANE (UN1075)

Physical and Chemical Properties			
Danger! Extremely flammable gas that burns with explosive force.			
Storage	Various tanks and cylinders	**Flammability**	2.2% to 9.5%
Appearance	Colourless gas	**Flash Point**	-104°C
Odour	Natural gas odour	**Freezing Point**	-190°C
Solubility	Insoluble	**Boiling Point**	- 42°C
Vapour Density	Sinks to ground levels (1.52)	**Specific Gravity**	Floats on water (0.53)

Safety Measures	
Warnings	EXPLOSION is possible Vapours instantaneously form that are lighter than air. Vapours can travel to sources of ignition and flash back. Containers can contain acetone. Acetylene can accumulate static electricity charges. Eye contact causes irritation. Inhalation of vapours can cause dizziness, drowsiness, unconsciousness and death (from asphyxiation).
Personal Protection	Always wear impervious, chemical-resistant clothing, insulated gloves, footwear and goggles when appropriate to do so. Nitrile and Viton are suitable materials; cotton clothing is OK. If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate; otherwise wear positive pressure SCBA. Avoid frostbite burn to skin and eyes from contact with escaping gas.
Precautions	Monitor for explosive atmosphere. Avoid contact with acids, chlorine, chlorine dioxide and hydrogen peroxide. Eliminate ignition sources. Isolate spill or leak for 50 to 100 m. For large release, consider evacuation area of 800 m. For fire, isolate area and evacuate for 1600 m in all directions.

PROPANE (UN1075)

Response to Fires

Consider actions only if safety permits!

- ☐ Wear SCBA in confined spaces. Shut off fuel supply.
- ☐ Extinguish fire with CO_2, dry chemical, alcohol foam or water fog.
- ☐ Use water fog or fine water spray to cool containers exposed to fire.
- ☐ **EXPLOSION is possible!**

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ☐ ***Eliminate ignition sources!***
- ☐ ***Do not attempt to contain or remove spills!***
- ☐ ***Keep hands away from release point since severe frostbite can occur!***
- ☐ Knock down and disperse with water spray if safe to do so.

Storage, Transfer and Disposal

- ☐ It is not possible to collect released propane gas.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with plenty of fresh, warm water (**not hot water**) for 15 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- ☐ Remove and thoroughly air contaminated clothing.
- ☐ Discard saturated leather articles.
- ☐ Warm frostbite areas with warm (not hot) water.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform artificial respiration if victim not breathing.
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ NA

PROPYLENE GLYCOL

Typical Physical and Chemical Properties			
Storage	Keep in cool area	**Flammability**	2.6% To 12.5%
Appearance	Liquid [Oily Liquid]	**Flash Point**	188 C
Odour	N/A	**Freezing Point**	N/A
Solubility	In Hot/cold H2O, acetone	**Viscosity**	N/A
Vapour Density	2.62	**Specific Gravity**	1.036

Safety Measures	
Warnings	Absorbed through skin. Eye contact
	May cause damage to the following organs: central nervous system
	Hazardous in case of ingestion. Slightly hazardous in case of skin contact [irritant, permeator], or inhalation
	May affect genetic material (mutagenic). May cause adverse reproductive effects and birth defects (teratogenic) based on animal test data
Personal Protection	Splash goggles. Lab coat. Vapor respirator. Be sure to use an approved/certified respirator or equivalent. Gloves.
Precaution	Keep away from heat
	Keep away from sources of ignition
	Empty containers pose a fire risk, evaporate the residue under a fume hood
	Ground all equipment containing material
	Do not ingest
	Do not breathe gas/fumes/vapor/spray
	Wear PPE
	In case of insufficient ventilation, wear suitable respiratory equipment
	If ingested, seek medical advice immediately and show the container or the label
	Avoid contact with skin and eyes
	Keep away from incompatibles such as oxidizing agents, reducing agents, acids, alkalis, moisture

5.10.1.1 PROPYLENE GLYCOL

Response to Fires

Consider actions only if safety permits!

- Flammability of the Product: May be combustible at high temperature.
- Auto-Ignition Temperature: 371°C (699.8°F)
- Flash Points: CLOSED CUP: 99°C (210.2°F). OPEN CUP: 107°C (224.6°F) (Cleveland).
- Flammable Limits: LOWER: 2.6% UPPER: 12.5%
- Products of Combustion: These products are carbon oxides (CO, CO2).
- Fire Hazards in Presence of Various Substances: Slightly flammable to flammable in presence of heat.
- Explosion Hazards in Presence of Various Substances:
- Risks of explosion of the product in presence of mechanical impact: Not available. Risks of explosion of the product in presence of static discharge: Not available.
- Fire Fighting Media and Instructions:
  - SMALL FIRE: Use DRY chemical powder.
  - LARGE FIRE: Use water spray, fog or foam. Do not use water jet.
  - Special Remarks on Fire Hazards: When heated to decomposition it emits acrid smoke and irritating fumes.
- Special Remarks on Explosion Hazards: Not available.

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- **Small Spill:** Dilute with water and mop up, or absorb with an inert dry material and place in an appropriate waste disposal container. Finish cleaning by spreading water on the contaminated surface and dispose of according to local and regional authority requirements
- **Large Spill:** Absorb with an inert material and put the spilled material in an appropriate waste disposal. Finish cleaning by spreading water on the contaminated surface and allow to evacuate through the sanitary system. Be careful that the product is not present at a concentration level above TLV. Check TLV on the MSDS and with local authorities

Storage, Transfer and Disposal

- Keep container tightly closed. Keep container in a cool, well-ventilated area. Do not store above 23°C (73.4°F).

5.10.1.2 PROPYLENE GLYCOL

First Aid	
	Get prompt medical attention!
Eyes	Check for and remove any contact lenses. Immediately flush eyes with running water for at least 15 minutes, keeping eyelids open. Cold water may be used. Get medical attention
Skin	In case of contact, immediately flush skin with plenty of water. Cover the irritated skin with an emollient. Remove contaminated clothing and shoes. Cold water may be used. Wash clothing before reuse. Thoroughly clean shoes before reuse. Get medical attention
	Wash with a disinfectant soap and cover the contaminated skin with an anti-bacterial cream. Seek immediate medical attention.
Inhalation	If inhaled, remove to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention.
Ingestion	Do NOT induce vomiting unless directed to do so by medical personnel. Never give anything by mouth to an unconscious person. If large quantities of this material are swallowed, call a physician immediately. Loosen tight clothing such as a collar, tie, belt or waistband

SODIUM SULPHIDE (TO BE VERIFIED ONCE SUPPLIER CHOSEN)

Physical and Chemical Properties			
Yellow flakes, odourless or slight rotten egg smell			
Storage	Super sack	**Flammability**	NA
Appearance	Solid Flake	**Flash Point**	NA
Odour	None or rotten egg smell	**Freezing Point**	NA
Solubility	Soluble in water, 178 g/L	**Boiling Point**	NA
Vapour Density	NA	**Specific Gravity**	1.64

Safety Measures

Warnings

- Can generate toxic and deadly hydrogen sulphide gas if exposed to acids and in some cases water
- Ensure ambient H_2S detectors are kept in good working order
- Use a hydrogen sulphide gas detector when handling this product and when dealing with spills of any size
- Corrosive

Personal Protection

- Wear suitable respiratory equipment in case of poor ventilation
- Use certified respirators if exposed to concentrations above exposure limit
- Use chemical resistant gloves: PVC, Neoprene, Natural rubber
- Use goggles
- Use dust impervious protective suit, apron, boots

Precautions

- Keep away from flames and hot surfaces
- keep away from moisture
- Avoid carbon dioxide, acids, oxidizing agents and metals

Response to Fires

Consider actions only if safety permits!

- Use foam or powder
- Do not use water or carbon dioxide
- Not combustible, may produce hazardous decomposition products (sulphur oxides)**. Wear self-contained breathing apparatus.**

SODIUM SULPHIDE (TO BE VERIFIED ONCE SUPPLIER CHOSEN)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- ***Do not flush into surface water or sanitary sewer system***
- ***Isolate area***
- ***Wear self-contained breathing apparatus***
- ***Prevent further leakage if safe to do so ***
- ***Pick up solids manually with appropriate PPE***

Storage, Transfer and Disposal

- Use product only in closed system
- Ensure adequate ventilation
- Keep away from heat and incompatible materials
- Keep dry, avoid dust formation
- Package in original container, steel drum, or polyethylene container

First Aid

Get prompt medical attention!

Eyes

- Call physician immediately
- ☐ Rinse eyes with water and under eyelids for 15 minutes
- ☐ In case of difficulty of opening the lids, administer and analgesic eye wash (oxybupocaine)
- ☐ Take victim to hospital

Skin

- Take off contaminated clothing and shoes immediately
- ☐ Wash area with water
- ☐ Keep warm and in a quiet place
- ☐ Call physician
- ☐ Clean contaminated clothing before wearing

Inhalation

- Move to fresh air, provide oxygen or artificial respiration if needed

Ingestion

- Do NOT induce vomiting
- ☐ Rinse mouth with water if conscious

SOLVENT (NAPHTHA MINERAL SPIRIT & PETROLEUM ETHER)

Physical and Chemical Properties			
Use caution. Solvents are combustible liquids.			
Appearance	Clear liquid	**Flash Point**	Spirit: 41 to 138°C Ether: -49 to -18°C
Odour	Hydrocarbon/aromatic	**Pour Point**	Spirit: -69°C
Solubility	Insoluble @ 20°C	**Viscosity**	Similar to water
Vapour Density	Will sink to ground levels	**Specific Gravity**	Lighter than water

Safety Measures

Warnings

- Vapours are heavier than air. Ether vapours can be **extremely flammable** and **explosive** even in low concentrations.
- Empty solvent containers may contain explosive vapours.
- CO, CO_2 and unspecified compounds form upon combustion.
- Material may accumulate static electricity.
- Eye contact causes irritation.
- Inhaling vapours can cause respiratory irritation, headache, vomiting, unconsciousness with convulsions, and chemical pneumonitis.

Personal Protection

- Wear chemical-resistant clothing, gloves, footwear, and goggles when appropriate to do so; neoprene, nitrile and PVC are suitable protective materials.
- Cartridge respirator may be required.

Precautions

- Monitor for explosive atmosphere.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Eliminate ignition sources. Electrically ground/bond transfers.
- Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog.
- Use water to cool containers exposed to fire.

SOLVENT (NAPHTHA MINERAL SPIRIT & PETROLEUM ETHER)

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- ☐ **On land**, block entry into waterways.
- ☐ Do not flush into sewer or drainage system.
- ☐ Contain spill by diking with earth or other barrier.
- ☐ Remove minor spills with sorbent.
- ☐ **On water**, do not try to contain or remove petroleum ether spills.
- ☐ Use boom, barrier to contain and concentrate spills of mineral spirits.
- ☐ Remove mineral spills using sorbent, pump or vacuum system.

Storage, Transfer and Disposal

- ☐ Store closed labelled containers in cool, well-ventilated areas away from acids and fuels.
- ☐ Electrically ground/bond containers and vehicles during transfer.
- ☐ Segregate waste types and place in marked containers.
- ☐ Consult Environment Technician on transportation and disposal needs.

First Aid

Get prompt medical attention!

Eyes

- ☐ Flush eyes immediately with fresh, warm water (**not hot water**) for 20 minutes while holding the eyelids open.
- ☐ Remove contact lenses, if exposed to vapours or liquid.

Skin

- ☐ Remove contaminated clothing.
- ☐ Wash skin thoroughly with soap and water.

Inhalation

- ☐ Move victim to fresh air.
- ☐ Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- ☐ **Do not** induce vomiting.
- ☐ If victim is conscious, give milk or water to drink.
- ☐ If victim vomits, keep head below hips to prevent aspiration.

SULPHURIC ACID (H_2SO_4 UN 1830)

Typical Physical/Chemical Properties			
Danger! Highly corrosive, toxic liquid that reacts with many chemical and metals.			
Storage	1000 tote	**pH**	0.3
Appearance	Colourless oily liquid	**Flash Point**	Not flammable/combustible
Odour	Acrid odour	**Boiling Point**	276 to 330°C
Solubility	Soluble in water.	**Freezing Point**	-11°C
Vapour Density	Heavier than air (3.4)	**Specific Gravity**	Sinks in water (1.67 to 1.84)

Safety Measures

Warnings

- Highly corrosive to all body tissues including skin, eyes, teeth, lungs.
- Direct skin contact may cause deep painful burns, shock and collapse.
- Highly toxic and may be fatal if ingested.
- Inhalation may cause breathing difficulties, irritation and death.
- Sulphuric acid is classified as a Group1 Carcinogen.

Personal Protection

- Wear face shields, splash-proof safety goggles, rubber boots, heavy rubber gloves, rubber aprons/suits.
- Wear respirator for pools, SCBA and Level A suit for mist, as required.
- Rubber, PVC gloves are recommended. Neoprene, nitrile are OK.

Precautions

- Avoid contact with organic materials, most metals and oxidizers.
- Avoid methanol, hydrogen peroxide, sulphides and sodium chlorate.
- Can generate explosive hydrogen gas in contact with metals.
- Do not add water to concentrated acid; heat, splattering occurs.

Response to Fires

Consider action only if safe!

- Generates SO_2 and SO_3 in fire.
- Use dry chemical or CO_2 to extinguish small fires.
- Use water spray or fog for larger fires.
- Water added to concentrated acid results in heat, violent spattering.

SULPHURIC ACID (H_2SO_4 UN 1830)

Response to Spills

Consider actions only if safety permits!

Containment and Removal

On Land

- Remove ignition sources. Ventilate area.
- **Inside buildings**: neutralize with soda ash or lime.
- Do not flush into ditches and drains. Eco-toxic effect can occur.
- Call for help if significant quantity is spilled or people are affected.
- **Outside buildings**: contain spill by diking with sand or earth.
- Use only chemical-rated pump.
- Neutralize and remove minor spills with Universal sorbent.
- Rinse residuals with water and mild alkali.

On Water

- Will sink and mix completely with water.
- Contain spill: isolate contaminated water by damming or diversion.

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, well-ventilated areas.
- Keep away from incompatible materials such as water, metals and fuels.
- Segregate waste types and place in marked containers.
- Consult Environmental Technician on transportation and disposal needs.

First Aid

Get prompt medical attention!

Eyes

- Flush eyes immediately with plenty of fresh, warm water (**not hot water**) for at least 15 minutes.
- ☐ Remove contact lenses if exposed to vapours or liquid.

Skin

- Remove contaminated clothing.
- ☐ Flush with water for at least 15 minutes.

Inhalation

- Move victim to fresh air.
- ☐ Perform AR if victim not breathing. Do not use mouth-to mouth.
- ☐ Provide oxygen if victim is having difficulty breathing.

Ingestion

- Administer large quantities of water, if victim is conscious.
- ☐ **Do not** induce vomiting.
- ☐ If victim vomits, keep head below hips to prevent aspiration.

TERRAFLOW (MIXTURE OF CEMENT, LIMESTONE, CALCIUM OXIDE, GYPSUM, MAGNESIUM OXIDE & QUARTZ)

Typical Physical/Chemical Properties			
Danger! Serious eye damage, may cause cancer, causes damage to organs through prolonged or repeated exposure.			
Storage	Silo	**pH**	12 – 13 (in water)
Appearance	Gray or white powder	**Flash Point**	NA
Odour	None	**Boiling Point**	>1,000°C
Solubility	Soluble in water.	**Freezing Point**	NA
Vapour Density	NA	**Specific Gravity**	3 – 3.2

Safety Measures	
Warnings	May cause an allergic skin reaction. Causes serious eye damage. May cause respiratory irritation. May cause cancer. Causes damage to organs through prolonged or repeated exposure.
Personal Protection	
Precautions	Obtain special instructions before use. Do not handle until all safety precautions have been read and understood Do not breathe dust Wash hands, forearms, and exposed areas thoroughly after handling. Do not eat, drink or smoke when using this product. Use only outdoors or in a well ventilated area. Contaminated work clothing must not be allowed out of the workplace Individuals with lung disease (e.g. bronchitis, emphysema, COPD, pulmonary disease) can be aggravated by exposure.

Response to Fires

Consider action only if safe!

- Do not use a heavy water stream. Use of heavy stream may spread fire.

Response to Spills

Consider actions only if safety permits!

- Use HEPA vacuum or thoroughly wet with water to clean up dust.
- Place spilled material into a container. Avoid actions that cause the TerraFlow to become airborne.
- Scrape wet TerraFlow and place in container. Allow material to dry or solidify before disposal. Do not wash TerraFlow down sewage and drainage systems or into bodies of water (e.g. streams)
- Do not breathe dust. Do not get in eyes on skin, or on clothing.
- Use appropriate personal protection equipment (PPE).
- Equip cleanup crew with proper protection.
- Ventilate area.
- Prevent entry to sewers and public waters

First Aid

Get prompt medical attention!

Eyes Rinse eyes thoroughly with water for at least 60 minutes, including under lids, to remove all particles.

Skin Wash with cool water and a pH neutral soap or mild skin detergent.

Inhalation Move victim to fresh air.

Ingestion Do NOT induce vomiting. Drink plenty of water. Immediately call a POISON CENTER or doctor.

5.11 SPILL RESPONSE EQUIPMENT

INTRODUCTION

Bulk spill response supplies and equipment as well as mobile spill response trailers are kept at Wildfire Camp, Brucejack mine site and Knipple Transfer Area. Large scale spill supply caches are staged on the Brucejack Access Road at 30.5 km, 58.5 km and 72 km, and in the Pilsner Valley. Smaller kits will be kept at exploration drill sites and as well as at temporary worksites as needed.

These supplies and equipment are to be used only for their intended purpose. Under no circumstances will emergency supplies be used in non-emergency situations. Spill response equipment is located at all sites where fuels, oil and other materials are stored. They are maintained, inspected, and replenished to ensure that they are available for immediate use. **Note: Any equipment or materials used during a spill must be replaced as soon as possible following a spill.** A written regular review and inspection program will be developed and applied.

The Health & Safety Manager or their designate will inspect and maintain the emergency supplies. The inspection will be documented and records retained.

Resources available on the Brucejack Project to control, contain, and clean up spills include:

- haul trucks
- dozers
- front-end loaders
- motor graders
- Snowcats
- excavators
- small pumps
- hand-sized tools
- containment and cleanup supplies

Three types of spill kits are kept at Project facilities, all include personal protective equipment (PPE). More inclusive PPE with chemicals suits and Self-Contained Breathing Apparatus (SCBAs) is maintained at the Brucejack mine site - see last page this section.

Level "A" Spill Response Kit – Mobile Spill Response Trailer

Each camp is equipped with an identically stocked mobile spill response trailer which can be deployed at a moments notice to any road accessible spill on the project. These trailers are designed and stocked to be mobile command centers for spill response to be deployed day or night year round.

Level "A" Mobile Spill Response Trailer – 1 per Camp

Quantity	Item	
1	14′ Spill Response Trailer	
1	Pneumatic grooved drum oil skimmer	
1	210 L steel drum	
1	propane heater and spare bottles	
1	gas powered portable generator with jerry can	
1	set of LED work lights and stand	
2	PFDs	
2	sets of chest waders	
1	water rescue throw bag	
1	2″ gas powered pump with suction and 200′ of discharge hose	
2	headlamps	
1	Bear deterrent kit including bear spray and bear bangers	
1	15 minute eyewash station and Level 1 first aid kit	
8 bales	sorbent booms (4 per bale)	10' x 5"
1 length	PVC 6x6 River Boom	25′
10 bales	sorbent pads (100 pads to a bale)	
6 bales	sorbent socks (12 per bale)	3" x 4'
1	sorbent roll (150′ x 30″)	
12	stakes	3 ft
4	2″ x 4″ boards	16′
1	sledge hammer	6 lbs
1 set	tools (wire cutters, pliers, hammer, utility knife , nails)	
1	pipe for inverted weir	8' x 4"
1	Watergate® Barrier	
1	Roll of heavy duty oil spill disposal bags	
2	"No Smoking" signs	
1 roll	"Caution Do Not Enter" tape	
4	safety triangles	
2	poly tarps (18' x 20')	
2 jars	hand cleaner	
1 jar	Plug N′ Dike	
2	Rake	
4	round nose shovel	
200 feet	polypropylene rope	1/4"
1 box	Rags	

NOTE: SCBAs and chemical suits are also located at the mine site proper. Refer to next page.

Personal Protective Equipment - Mine Site

Item	Quantity/Size
Coveralls (Tyvek or Saranex)	12-XL, 12-XXL
Oil-resistant rubber boots	12 pairs
Chemical splash goggles with side shields- A/O (fit eyeglasses)	12 pairs
PVC, rubber, leather, and nitrile gloves	12 pairs
Dust respirators (NIOSH-approved)	12
Cartridge respirators (NIOSH-approved)	12
Cartridges for respirators (organic vapour, acid, base)	12
SCBA, positive pressure full face piece	6
Level A chemical suits (Hazmat)	6
Level B chemical suits (Hazmat)	6
Rain gear61XL, 2-XXL, 3XXXLHigh visibility vests	6

Gas monitors/detectors	3
Personal flotation devices	6
Hearing protection	5 Packages
Sunblock	12-75 ml – SPF 60
Level B chemical suits (Hazmat)	6

Level “B” Spill Response Kit – Remote Spill Response Caches

Pretium has identified that fast access to key spill response resources is paramount to an effective response to large scale releases or releases to sensitive environments. To reduce the delay to spill response resources, Pretium has placed Remote Spill Response Caches along the BJAR at km 30.5, km 58.5, km 71.6 and in the Pilsner Valley. These serve as immediate stores of larger volumes of spill supplies and some larger spill response equipment that is otherwise available at each camp.

Level "B" Spill Response Kit – Remote Spill Response Caches

Quantity	Item	
1	Container to store all major response items , inventory list	
2 pairs	coveralls (Tyvek or Saranex)	1-XL, 1-XXL
10	sorbent socks	3" x 4'
24 bales	sorbent pads (12 oil only, 12 universal)	18" x 18" x 3/8"
1 Roll	Heavy duty spill disposal bags	
1 each	round nose shovel, flat nose shovel	
1 pair	chemical goggles - A/O (fit eyeglasses)	
2 pair	PVC gloves	
1	poly tarp	18' x 20'
1	Plywood culvert block	
1	Watergate	
10	Sandbags	
2	10′ long 2″x4″	
1	Plywood culvert block	30″x 30″
1	Watergate spill containment dam	21″ x 15′
2	“No Smoking” signs	
1 roll	“Caution Do not Enter” tape	
1	hand cleaner	
200 feet	Polypropylene rope	1/4"
1 box	Rags	
1 unit	Plug N′ Dike	
6	Hi-Vis delineators	45″ H

Level “C” Spill Response Kit – Mobile Equipment

Small caches of spill response materials are kept in a carrying case or other container on all pieces of equipment as well as light vehicles on site. They are clearly identified and readily accessible. Spills up to several tens of litres can be cleaned up. Refer to table: Level “C” Spill Response Kit.

Level "C" Spill Response Kit - Mobile Equipment

Quantity	Item	
1	Carrying bag or case, inventory list	
4	sorbent socks	3" x 4'
20	sorbent pads (10 Oil, 10 Universal)	18" x 18" x 3/8"
3	heavy duty oil spill disposal bags	
1	round nose shovel	
1 pair	chemical goggles - A/O (fit eyeglasses)	
1 pair	PVC gloves	
1	Spill containment berm	3′ x 3′
1 unit	Plug N′ Dike

SPILL RESPONSE STRATEGIES

INTRODUCTION

The equipment, strategies, and techniques that will be applied to control and clean up releases of fuels and other substances at the Brucejack Mine Project will depend on many factors. These include the circumstances of the incident, the type of substance(s) involved, the volume of the release, the nature of both the source and receiving environment, and the prevailing weather conditions. Basic spill response information is outlined that is applicable to the Brucejack mine site, Brucejack Access Road, Knipple Transfer Area, bulk emulsion staging area, Bowser Aerodrome, Tide Staging area, and Wildfire and Bowser camps.

SPILLS ON LAND

Safety permitting, spills on land should be prevented from entering watercourses such as ditches, creeks and streams, rivers, and lakes. This localizes the hazard and makes cleanup easier. For small spills, if safe to do so, use:

- loose sorbent
- sorbent pads and booms
- on land only, particulate, if available and safe to add, including Oil Gator
- non-combustible material (sand, earth)
- neutralizers with colour indicators for chemicals such as acids and alkalis

For larger spills, and if safe to do so, consider collection /removal by:

- trench or berm or both
- pumping or vacuum system, as available
- In-situ burning (away from facilities, vehicles, tanks, etc.) approved by BC MOE

Spills on land should be contained as close to the source as possible, if safety allows. Every effort should be made to ensure that a spill does not reach water, where its containment and recovery are much more difficult and the potential environmental impacts are much greater. Berms can be constructed from earth or sand bags, as available. The type and size of the containment method will depend on the following factors:

Size of Spill

Berms surrounding large oil spills which cover extensive areas will be difficult and time-consuming to build. For this reason, earth or snow berms may be more easily deployed than sand bags (see next section). It is also important to build the berm as close to the source as possible to minimize the spill's tendency to spread.

Terrain

Steep terrain can make work difficult, particularly with heavy equipment, while large flat areas will require longer barriers to contain the spill. Oil will also travel much faster on steep inclines while it will move more slowly and tend to pool on flat ground allowing more time for the construction of barriers.

Soil Type

Oil will soak into loose, coarse, or dry soils while packed or frozen soil can create a natural barrier. Frozen soil will also require relatively heavy machinery in order to build a trench or berm. Soft, wet soil ground can also impede vehicle and machinery access.

Presence of Ice and Snow (see also next section)

Oil can be soaked up by snow and pool on glacial or lake ice. Marking the boundaries of a spill will be necessary if snowfall is expected. Caution should be exercised **before** equipment is used on Knipple Glacier and other situations involving ice to contain or remove a spill. The ice thickness must support both people and equipment.

Proximity to Water

Precautions must be taken to ensure that an oil spill does not enter a waterway. If there is any possibility of contamination, a stream, river or lake should be protected with a berm.

Weather

Weather plays an important role in spill response operations, particularly if the ground is frozen or if rainfall is heavy or prolonged. Since oil floats on water, any pooled water that collects in a trench or against a berm will effectively increase the volume of liquid needed to be contained. Water can also significantly increase the tendency of oil to spread thus hindering effective cleanup. During spring runoff, containment can be difficult.

Location

The location of a spill will play an important role in determining the most feasible type of containment barrier. Spills involving a fuel truck will generally occur in areas where there is good road access although a truck can leave the roadway along the Brucejack Access Road and release its cargo some distance away from a facility. Accessibility of both equipment and personnel could be hindered by difficult terrain or the dense tree growth at Pretium. Consideration must also be given to determining areas where a helicopter might initially land as well as one or more designated locations where equipment could be staged for later deployment at strategic locations.

Earth Berm/Trench

If possible, locate the berm or trench sufficiently downslope of the release point to complete its construction before the spill arrives. Dig the trench along a natural drainage contour. It should be approximately 0.5 m deep with a relatively flat bottom. The excavated material can then be combined with other available material to build a berm.

Sand Bag Berm/Trench

Sand bags can be used where available and if the earth is too hard or frozen and does not lend itself to excavation or compacting. A plastic liner can be used to seal the trench and bags and should be anchored with gravel or rocks and be woven between layers of bags.

SPILL RESPONSE IN ICE AND SNOW

Oil Behaviour

Snow will be present at the Brucejack Mine Project for more than half the year. Knipple Glacier has snow cover and ice year-round. The movement of oil on and into snow, including spreading, depends on:

1. type of snow (fresh or compacted, smooth or rough)
2. air temperature (the snow may be melting or dry)
3. gradient (sloped, steep or flat)
4. the type of oil (diesel, gasoline, hydraulic, or lube)

Ice will sometimes halt the downward movement of a spill. Expect cracks, however, to result in the possible migration of a release below the surface on Knipple Glacier. During summer weather, snow melt will result in contaminants either floating on water or, if soluble, entering water and moving down-gradient. Planning the response to a spill on Knipple Glacier may involve interception at the outflow of the glacier if lost to surface runoff.

Overall Strategies

Oil can remain relatively fresh, i.e., in an unweathered state, under snow and ice for several months

after a spill. Evaporation rates will still be very high when the oil is exposed to the atmosphere except in very low temperatures approaching its freezing point (-20 to -50°C). Oil can also move up and down small hills (several metres high) due to the capillary action of the snow. During snow melt, the Watergate® barrier (see picture on page C-6) may have application to halt fuel spills that follow a discrete pathway on Knipple Glacier. In frozen conditions, the following response strategies will be used:

Containment

- Oil spilled into snow will likely be contained by the snow. Snow is a good sorbent. The oil content may be very low (<1%) for low-viscosity oils, e.g., diesel, or if the oil has spread over a wide area. Oil content is higher for lube and hydraulic oils.
- Oil content is lowest on firm compacted snow surfaces in below-freezing temperatures and higher for fresh snow.
- Heavy oils can cause snow to melt but spread less than gasoline, which moves more quickly in snow and over a larger area. Light oils can spread upslope in snow through capillary action.
- Fresh snow that blows over oil tends to stick and migrate down into the oil, causing an increase in the volume of materials to be recovered.
- Snow falling onto oil tends to accumulate on the oil surface.
- Snow and ice can be used to create berms to keep spills from spreading.

Snow Berm

In the winter conditions common to the Brucejack Mine Project, snow may provide a quick and efficient berm construction material. The snow should be well packed and water should be sprayed to form an ice layer on the top and sides of the berm to make it impermeable to oil.

Removal Options

- Very light oils, e.g., gasoline, can evaporate during thaw periods.
- Manual removal (using shovels and rakes) is appropriate for small amounts of surface or subsurface oil or insoluble chemicals, but is less efficient as the amount of affected area and volume of contaminated snow increases.
- Pooled oil on the surface of a snow-covered area, or contaminant that has been collected in trenches or by containment berms, can be recovered by pumps.
- On flat surfaces, or where a mechanical arm can reach an oiled area, oil/snow can be scraped for removal and disposal. Include melting to separate the oil and snow, or burning.
- Surface oil can sometimes be removed by sorbents. Effectiveness decreases as the oiled area or volume of oiled snow increases.
- Pooled oil on snow or oil that has been contained by berms, can sometimes be removed by burning.

Typical Combinations of Response Methods

- Manual removal methods can be used such as hand tools, vacuums, and sorbents.
- Mechanical scraping is possible followed by manual removal of any oily residues.

RESPONSE TO SPILLS IN CREEKS AND RIVERS

Twenty-three bridges have been built along the access road between Highway 37 and the Bowser Camp, including 13 bridges between km 35 and 50. In most cases, should a spill occur at a bridge, containment efforts would need to be in close proximity to the bridge using sorbent booms. No- or low-velocity flowing water (< 0.25 m/s) would have to be present.

Responding to spills that escape source control into a river will be difficult at the Brucejack Mine Project, they might also require river bank cleanup. Various considerations will affect whether or not the removal of oil proceeds:

- On the Brucejack Mine Project, booming off creeks that lead into waterways should be a priority action where this is feasible to consider - 25 feet of boom should be sufficient for this purpose. Containment of a spill is feasible to achieve.
- In ditches and smaller waterways, the Watergate® barrier can be deployed to contain fuel spills. A tarp and 2x4 can also be applied (see also below).
- Conditions must be safe if a response is to be attempted. Monitors must be used to safeguard the health and safety of response personnel. An explosive, toxic atmosphere can develop in spills of volatile oils (e.g. gasoline) and some chemicals (e.g. hydrogen peroxide).
- Burning in-situ on water is prohibited by DFO on any in-land streams or water courses.
- If working in a stream and silt is created, set up a filter fence to reduce or eliminate silt.
- In current velocities of 0.5 to 1.0 m/s (1 to 2 knots), spill control in flowing cold water (off the Brucejack Access Road) will not only be difficult but also dangerous. A small fuel spill will dissipate quickly in turbulent water and not be amenable to cleanup.
- When required, specialists should determine whether ice, if present, will safely support the weight of equipment and personnel.
- Attempts to control moving oil should be considered only on slicks several millimetres or more thick using booms. Observers/planners and spill response specialists are required to position equipment on spills in rivers.

Note: Slicks thinner than 1 mm will likely dissipate, and usually cannot be efficiently removed in rivers using skimming or boom systems.

- Medium viscosity and heavy oils, as well as diesel, can persist in colder weather, possibly making it necessary to consider river bank protection/treatment.

- Spilled oil that becomes distributed in ice may be skimmed and burned if sufficiently thick (2 - 3 mm). Removal of thin slicks (less than 1 mm), oil droplets, globules and particles mixed with ice using any response option is impractical, unless melting results in concentrated slicks. Monitoring the spill may be the only practical response alternative.

Snow can be slippery on sloping surfaces, particularly if there is ice below the snow. Care should be taken to avoid slips, trips, and falls.

Slotting/Augering

In frozen rivers, angled slots about 1 m wide can be cut in the ice, where safety permits, to allow possible spill recovery. The oil will rise up into the slots where it will move toward the shore, concentrate, and be available for recovery using skimmers or pumps. At the Brucejack Mine Project, it is unlikely that this strategy will be applied as it might be in other situations. Nevertheless, the concept of making an opening in ice could be tried when safety and the feasibility of the operation warrant this approach.

CONTAINMENT IN SMALL WATERCOURSES

Containment methods are discussed in this section for diesel, hydraulic and lube oil (i.e. products that do not dissolve but float on water). Other products may mix with water and can only be contained by completely blocking flow. Gasoline can only be contained if safety permits and it has not evaporated. Often it is best left to evaporate.

Watergate®

A containment device was used by Pretium and contractor personnel during preliminary fuel spill training at the Brucejack Mine Project. The Watergate® barrier is a portable dam kept at the mine site that can be quickly deployed in a small waterway to halt the surface flow of spilled fuel. A weighted belt helps maintain the vertical position of the device and adjustable openings along the bottom allow the flow of water beneath the contained fuel. Its use on spills on Knipple Glacier is also possible.

Culvert Dams

Culverts under roadways can carry product away from the spill site causing contamination. Water running through a culvert or ditch adds to this problem.

To halt the flow of oil, completely blocking the culvert on the upstream side may be possible using various available materials or sorbents. Culverts in which water flow must be maintained can be partially blocked with plywood that holds back the surface oil but permits water to pass below.
The position of the plywood can be adjusted vertically to maintain the water at the desired level.

Tarp and Board

A tarp that is rolled on a simple 2x4 piece of lumber can also be tried to block the movement of oil as well as soluble contaminants in a ditch with low water flow. The tarp is unrolled from the 2x4 so that it contains flow in the ditch. The upstream end is weighted with rocks. Holes can be cut in the tarp to allow subsurface water flow if this is deemed to be needed. Surface contaminants can be directed to one side with the use of a second 2x4 and a spill response boom, if available to facilitate the removal of oils.

Other Containment Methods for Ditches and Streams

Dry ditches may be plugged with non-combustible material or sorbent. Use mechanical equipment, if required. For ditches containing water and streams, use these options:

Sorbent Boom

Sorbent boom is available in 3 m (10') lengths (4 to a bag) with a 13 - 25 cm (5 - 10") diameter and has fireman's hooks (carabineers) fitted toward each end to link lengths together. It can be used to contain spills in no-to low velocity waterways.

Filter Fence

Wire mesh or netting, anchored by stakes as a back-stop for sorbent, can limit the spread of oil and oily debris.

A second mesh can be deployed slightly upstream of the first to act as a debris screen. The sorbent material is then placed between the two mesh screens.

To allow changing soiled or saturated sorbents, without escape of oil, additional fences can be constructed downstream of the second screen.

Siphon Dams (Inverted Weirs)

Siphon dams can be used to retain oil and allow the continuous flow of water in a ditch or stream. One or more pipes are placed at an angle through a soil or sandbag dam, with the upstream end of the pipe being close to the bottom of the ditch or stream and the downstream end at a level that permits water to drain away. If more than one pipe is used, these should be placed at slightly different angles.

NOTE: *Whenever the construction of a berm or siphon is considered for a spill response operation, the impacts of the disturbance must be weighed against the potential impacts of the uncontained spill. Care must be taken to minimize any harmful effects. Local Fish and Wildlife officers should be consulted in all cases prior to construction unless immediate action is necessary. Fisheries and Oceans Canada (DFO) should also be consulted if fish spawning streams are involved.*

Barriers can be constructed from earth or rocks, although if large rocks are used, plastic sheets or packed mud should be used to ensure that a complete seal is made. Choosing and positioning the pipe(s) is critical to effective operation of the weir. The pipe should be low enough at the inlet end to ensure that an increase of the slick thickness or substantial lowering of the water will not result in a loss of oil through the pipe. Larger pipes which allow greater volume (and slower) flows will minimize the tendency of oil to become entrained in the water at the inlet side. The outlet end of the pipe should be positioned to create a continuous, smooth flow. Underflow of oil (under the pipe) should also be prevented by ensuring that the pipe inlet is not located on loose gravel.

Ideally, a shallow angled pipe should run at a high flow rate without reducing the water level. Any other pipes should be angled to compensate for blockages in the primary pipe or increased water levels caused by rainfall. A simple weir holds back surface oil and allows water underflow. Relatively easy to install using plywood or a board, several can be quickly placed in a stream or ditch. Ensure the sides are cut well into the banks, otherwise the oil will escape around the ends. Sorbents can be used to plug any gaps. When planning containment, anticipate removal and other cleanup steps. **Monitor** and **remove barrier** when appropriate to do so.

Preventing spills of soluble chemicals from entering watercourses is a priority emergency measure.

Ensure safe operations.

ADDITIONAL GUIDANCE

BC has published guides that provide additional information on spill response.

Guide to Selecting Containment Techniques for Spills on Water*

Technique	Primary Use	Resources Required
Containment Boom	• best at location where spill enters water	• booms totaling 1.5 to 2 times slick diameter • recovery device such as a skimmer (if needed)
Sorbent Boom	• best across small ditches	• disposal containers or incinerator for used sorbents • chicken wire and supports to make "fence" • earth moving or digging equipment • operators, foreman, labourers
Earth Berm	• best across shallow ditches	• boom and recovery device such as a skimmer • may also require sandbags, liner material, sheets of metal or wood • a 10 X 4 X 2 m berm requires one hour to build

**from Aggregate Operators Best Management Practices Handbook for British Columbia*

Guide to Selecting Containment Techniques for Spills on Land*

Technique	Primary Use	Controlling Variables	Resources Required
Earth Dike	• best suited for spills on relatively flat areas	• sufficient earth may not be available, depending on location and season • crew of four can create dike at 5 m/hr	• earth-moving machine or digging equipment (e.g., bulldozer or backhoe) • sandbags, liner material, sand or gravel • labour
Sorbent Dike	• can provide temporary containment and cleanup • applicable in all seasons	• requires sufficient sorbent material • may become impractical for large spill volumes	• sorbent materials • temporary storage or a facility to burn used sorbents
Snow/Ice Dike	• best suited on relatively flat areas in winter	• requires sufficient snow or ice • only applicable when ice is >1 m thick • a crew of four with a bulldozer can create dike at 10 m/h	• earth moving machine • ice chain saws • equipment to spray water onto snow • labour
Land Trench	• best on relatively flat areas	• during the winter, frozen earth may be too difficult to excavate • in some areas, soil may be too thin to create trench • can create 30 m/h per machine in summer, half that in winter.	• earth digging equipment (backhoe or shovels) • operators, labourers, foreman • an oil recovery unit (pump)

** from Aggregate Operators Best Management Practices Handbook for British Columbia*

Guide to Selecting Cleanup Techniques for Spills on Land*

Technique	Controlling Variables	Environmental Effects	Resources Required
Excavation by Bulldozer	• heavy equipment site access • facility to receive excavated material • difficult in frozen soil	• removes 10 to 25 cm of surface material • can lead to erosion or surface instability • removes all shallow biota/vegetation • vegetation is slow to recover	• bulldozer, fuel and operator • work crew and foreman • method to handle or dispose of excavated material
Excavation by Front-end Loader	• heavy/light equipment site access • facility to receive excavated material • difficult in frozen soil	• as above, but excavation may be to depth of 50 cm • vegetation is slow to recover	• loader, fuel and operator • work crew and foreman • method to handle or dispose of excavated material
Excavation by Backhoe	• heavy/light equipment site access • facility to receive excavated material • difficult in frozen soil	• disturbs surface of soil • removes some organisms	• pressurized equipment • downslope containment and recovery facilities • water supply • work crew
High-pressure Flushing	• light equipment site access • water supply • not applicable in winter	• disturbs surface of soil • removes some organisms	• pressurized equipment • downslope containment and recovery facilities • water supply • work crew
Low-pressure Flushing	• light equipment site access • water supply • not applicable in winter	• as above but to a lesser degree	• as above
Steam Cleaning	• light equipment site access • water supply • not applicable in winter	• heat will damage surface vegetation and shallow organisms	• as above
Sand-blasting	• light equipment site access • adequate supply of sand • impractical for most sites	• adds material to the environment • potential recontamination, erosion or deeper penetration into soil • destroys surface vegetation and shallow organisms	• pressurized equipment • downslope containment and recovery facilities • supply of sand • work crew
Pumping	• nearby storage • heavy equipment access if vacuum truck is used	• surface disturbance if sump is excavated	• pump or vacuum truck and operator • storage facility

(continued)

Guide to Selecting Cleanup Techniques for Spills on Land* (completed)

Technique	Controlling Variables	Environmental Effects	Resources Required
Manual Removal	• labour intensive and time consuming • best suited for areas lightly contaminated or where equipment access is unavailable	• removes up to 5 cm of soil • some surface disturbance and removal of shallow organisms and vegetation • more rapid repopulation of organisms than other excavation techniques	• work crew with hand tools (rakes, shovels, wheelbarrows) • disposal facilities
Manual Scraping	• labour intensive and time consuming • best suited for man-made structures or contaminated rocks and boulders	• surface disturbance • removes, crushes surface vegetation and organisms	• work crew with hand tools • downslope containment facilities • disposal facilities
Sorbent Application	• adequate supply of sorbents	• relatively little damage except surface disturbance of foot traffic	• sorbents • work crew • disposal facility for used sorbents

Sample Inspection Checklist D-1

STORAGE TANKS AND FUELLING FACILITIES

This Appendix summarizes the fuelling and storage facilities currently in place at the Brucejack Mine Project. This inventory will be updated as changes are made to existing facilities or new facilities are constructed. All company and contractor personnel must ensure that fuelling is conducted according to protocol to minimize the probability of accidents. Wastes must be stored in designated areas only.

A sample inspection checklist (see below) is to be applied weekly to ensure that all facilities meet Pretium standards.

Sample Inspection Checklist

Fuel Dispensing			
Inspection Item	**Y**	**N**	**Actions Required**
Garbage, other refuse, in area?			
Signs of new spillage?			
Tanks - signs of wear and tear, drips/leaks from nozzles, pipes, hoses, connections, etc.			
Nozzle containment used but not full?			
Hose off ground? In good condition?			
Legible signage - At least two content ID signs one hazardous materials placard and one attention required while fuelling sign			
Spill response kits fully stocked? 1 shovel, 1 bale 100 sorbent pads, 6 3"x48" sorbent socks, 1 bag 30 lb Oil Gator, PVC gloves, safety goggles, 1 Plug N' Dyke (or similar), 1 poly drum 55 gallon, 8 garbage bags			
Driver stays at nozzle while delivering fuel or fuelling equipment/vehicles?			
Spent sorbents removed?			
Lighting functions?			
Other observations			
Fuel Storage			
Inspection Area	**Y**	**N**	**Actions Required**
Area free of garbage?			
Signs of spillage/staining?			
Pumps, hoses, piping leaking?			
Signs of deterioration on hoses, connections nozzles?			
Spent sorbents picked up and removed?			
Water or oil level visible in containment under hoses, pumps, nozzles?			
Barrier protection intact and in place?			
Other Observations			

STORAGE TANKS AND FUELLING FACILITIES INVENTORY

Wildfire Main Diesel Dispensing Facility

Contents	diesel
Volume	16,000 litres/7,000 litres
Year Manufactured	1997
Type	double-walled/2 compartments ULC – S601
Collision Protection	4 cement lock blocks
Monitoring	no vacuum registers
Fire Extinguishers	1
Spill Kits	1 at tank
Hoses	retractable hose reel
Nozzles	auto-shutoff in holster with spill compartment
Labelling	placard and contents
Lighting	not explosion-proof (light bulb on cord)
Signage	No Smoking, Fueling Procedure, Spill Procedure
Security	fill box with secure lid, unlocked
Transfer Area	sediment, no concrete, no liner
Spills/Waterways	no drainage to water courses
Remote Shut-offs	no
Grounding	no

Comments

An electric pump on the tank top dispenses fuel via a nozzle on a hose reel. Filling is done directly from the top hatch.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

Wildfire Gasoline Dispensing Facility

Contents	gasoline
Volume	4,630 litres
Year Manufactured	May 2011
Type	CAN/ULC – S601-07
Collision Protection	four concrete blocks
Monitoring	plug access at bottom
Fire Extinguishers	1
Spill Kits	1 kept at tank
Hoses	not retractable, no reel or hooks
Nozzles	auto-shutoff nozzle with drip containment
Labelling	placards and contents
Lighting	none at tank, remote in yard
Signage	No Smoking, Fueling Procedure, Spill Procedure
Security	fill box with secure lid
Transfer Area	sediment/gravel, no concrete, no liner
Spills/Waterways	no drainage to water courses
Remote Shut-offs	no
Grounding	yes

Comments

An electric pump on the tank top dispenses fuel via nozzle. Filling is done directly from the top hatch.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

Wildfire Stationary Generator Fuel Tank and Dispensing Facility

Contents	diesel
Volume	4,530 litres
Year Manufactured	2011
Type	double-walled CAN/ULC-S601-07
Collision Protection	4 concrete blocks
Monitoring	plug access at bottom
Fire Extinguishers	1
Spill Kits	1 kept at tank
Hoses	hoses connect tank to generator
Nozzles	N/A
Labelling	placards and contents
Lighting	none at tank, remote in yard
Signage	No Smoking, Fueling Procedure, Spill Procedure
Security	fill box with secure lid
Transfer Area	sediment/gravel, no concrete, no liner
Spills/Waterways	no drainage to water courses
Remote Shut-offs	no
Grounding	yes

Comments

Tank supplies fuel to the main and backup diesel power generators at Wildfire Camp.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

Knipple Transfer Area Fuel Storage and Dispensing Facility

Contents	diesel/gasoline
Volume	150,000/ 9,100 litres Diesel and 9,100 litres Gas
Year Manufactured	2016
Type	double-walled CAN/ULC-S601-07
Collision Protection	concrete blocks
Monitoring	plug access at bottom
Fire Extinguishers	2
Spill Kits	2 kept at tanks, multiple within 200m
Hoses	Arctic fuel hoses with break-away valves
Nozzles	Auto shutoff
Labelling	placards and contents
Lighting	Yes on at bulk transfer station, remote in yard
Signage	No Smoking, Fueling Procedure, Spill Procedure
Security	fill box with secure lid
Transfer Area	Lined and plumbed to oil water separator
Spills/Waterways	no drainage to water courses
Remote Shut-offs	yes
Grounding	yes

Comments

Smaller tanks supply mobile equipment and light vehicles while larger tank is temporary storage for transfer to Brucejack Mine Site.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

KM 58.5 Diesel Dispensing Facility

Contents	diesel
Volume	14,950 litres
Year Manufactured	2011
Type	double walled, CAN/ULC – S601-07
Collision Protection	4 concrete blocks
Monitoring	plug access at bottom
Fire Extinguishers	Yes
Spill Kits	1 kept at tank
Hoses	not retractable, no reel or hooks
Nozzles	auto-shutoff with nozzle containment
Labelling	placards and contents
Lighting	yes
Signage	No Smoking, Fueling Procedure, Spill Procedure
Security	fill box with secure lid
Transfer Area	sediment/gravel, no concrete, no liner
Spills/Waterways	N/A
Remote Shut-offs	no
Grounding	yes

Comments

Fueling station to serve glacier maintenance equipment. Adjacent to tank is a “Level B” Remote Spill Supply Cache.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

Procon Diesel Dispensing Facility

Contents	diesel
Volume	25,000 litres
Year Manufactured	2012
Type	double-walled CAN/ULC-S601-07
Collision Protection	5 concrete lock blocks protect tank
Monitoring	Access cap for visual assessment
Fire Extinguishers	1
Spill Kits	2 at tank
Hoses	coiled on hooks
Nozzles	manual in holster with spill compartment
Labelling	placard only, no contents
Lighting	explosion-proof on adjacent building
Signage	no
Security	fill box/secure lid not used; pressure relief valve and bung hole used to fill tank
Transfer Area	sediment, no concrete, no liner
Spills/Waterways	no drainage to water courses
Remote Shut-offs	no
Grounding	no

Comments

A wooden shed houses a fuel pump driven by an electric motor that delivers fuel from ISO-containers to the tank via a hose system. Diesel from the tank is dispensed from a hose kept on a rack.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

Pretium Diesel Dispensing Facility

Contents	diesel
Volume	45,000 litres
Year Manufactured	2016
Type	double-walled CAN/ULC-S601-07
Collision Protection	4 concrete lock blocks protect tanks
Monitoring	vacuum
Fire Extinguishers	1 in shed
Spill Kits	1 at tanks
Hoses	retractable fuel dispensing hose
Nozzles	manual in holster with spill compartment
Labelling	placard on each tank end, no contents
Lighting	explosion-proof on shed
Signage	no
Security	fuel accepted via pump/hose/piping system
Transfer Area	sediment, no concrete, no liner
Spills/Waterways	drainage is possible to water course
Remote Shut-offs	no
Grounding	no

Comments

A wooden shed houses a fuel pump contained in a plastic berm and driven by an electric motor that delivers fuel from cubes via a hose and pipe system to the three tanks. Valves can then be turned to use the pump to deliver fuel from the tanks to equipment and vehicles. Diesel from the tanks is dispensed from a retractable hose.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

Pretium Gasoline Dispensing Cube Tank

Contents	Gasoline
Volume	3,000 litres
Year Manufactured	2012
Type	tank within a box UN 31A
Collision Protection	2 concrete lock blocks
Monitoring	visual assessment
Fire Extinguishers	1 in shed
Spill Kits	1
Hoses	hose placed on top of lube cube
Nozzles	auto-shut-off
Labelling	placards , contents noted on 4 sides
Lighting	Explosion-proof on shed
Signage	No
Security	pressure relief cap inside secured lid
Transfer Area	sediment, no concrete, no liner
Spills/Waterways	water course down-gradient from tank area
Remote Shut-offs	No
Grounding	No

Comments

The pump within the fuel cube and that delivers fuel to the adjacent diesel tanks is powered by electricity generated at the mine site.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

Pretium Diesel Tanks for Generators

Contents	Diesel
Volume	4 @ 150,000 litres
Year Manufactured	2016
Type	double-walled CAN/ULC-S601-07
Collision Protection	2 concrete lock blocks protect pump, tanks
Monitoring	vacuum
Fire Extinguishers	1 mounted on shed
Spill Kits	1 at tanks
Hoses	retractable fuel dispensing hose
Nozzles	manual in holster with spill compartment
Labelling	4 placards on each tank, no contents
Lighting	explosion-proof on shed, light bulb inside shed
Signage	no
Security	fuel delivered via pump/hose/piping system
Transfer Area	sediment, no concrete, no liner
Spills/Waterways	drainage is possible to water course
Remote Shut-offs	no
Grounding	yes

Comments

A wooden shed houses a fuel pump contained in a plastic berm and driven by an electric motor that delivers fuel from cubes via a hose and pipe system to the two tanks. A piping system then delivers fuel to the generators.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

Pretium Jet A-1 Fuel Tank

Contents	Jet A-1
Volume	31,000 litres
Year Manufactured	2018
Type	double-walled ULC-S601-14
Collision Protection	yes
Monitoring	
Fire Extinguishers	1
Spill Kits	yes
Hoses	hose reel
Nozzles	auto shut-off, stored in bunghole of drum
Labelling	placards , contents
Lighting	no
Signage	no
Security	open cam-lock connector on top of tank
Transfer Area	HDPE liner plumbed to Oil Water Separator
Spills/Waterways	water course is down-gradient from tank
Remote Shut-offs	no
Grounding	No, bonding wire is present

Comments

The pump for jet A-1 consists of a self-contained ISO-Container set on top of a lined pad plumbed to an oil-water separator.

STORAGE TANKS AND FUELING FACILITIES INVENTORY

Slip Tanks and Fuel Cubes – Wildfire, Bowser, Brucejack

Slip tanks are used at the Wildfire, Bowser, and Brucejack sites that vary in size from less than 450 L to greater than 450 litres. These are grounded and bonded when they accept and deliver fuels including diesel and gasoline. All tanks are labelled and placarded.

Pressure caps are secured and locked when not in use.

All slip tanks are properly secured to vehicles that transport them on site.

APPENDIX E

Spill Response Training Exercises

Schedule of Training and Practice Drills E-1

Training Program E-2

Training Course Outline E-2

Initial Spill Response Training E-5

1. Legal E-5

2. Chemical Characteristics E-6

3. Response Actions E-6

Training and Awareness for Chemical Reagents E-7

SPILL RESPONSE TRAINING AND EXERCISES

INTRODUCTION TO TRAINING NEEDS

Pretium Resources Inc. (Pretium) and/or its contractors, as appropriate and needed, will continue to implement the following training-related needs:

- Design and implement a training program that certifies employees who handle fuels and chemicals to be capable of effectively dealing with the containment of fuel and chemical spills. All relevant Pretium employees and contractors involved with fuel and chemicals or other materials handling and transport for the Mine are to be trained in spill prevention and response.
- Review credentials of contractors and employees to ensure that they meet Pretium requirements before issuing a certificate authorizing them to dispense fuel or handle chemical reagents.
- Establish and maintain a register of persons who have successfully completed training and have been awarded certificates.
- Ensure that all persons attending site orientation are shown spill containment and treatment materials and where they are located. Managers and supervisors will also ensure that the proper procedures for transferring and handling fuel and chemicals from tanks, totes, and small containers and the proper use of fire extinguishers, are demonstrated during the site orientation, for those individuals whom it is applicable to.
- Ensure that any driver delivering propane, fuel, or chemicals to the site has had appropriate training and issue him/her a certificate following site orientation.

SCHEDULE OF TRAINING AND PRACTICE DRILLS

Pretium spill Prevention and response training will outline the following:

- Provide details of the training courses for personnel involved in preventing and responding to an emergency.
- Specify the amount, type and frequency of training for each member of the team.
- Note when training should be provided (i.e., new employee orientation, change of duties for existing employees, new equipment/materials, revised emergency procedures, when a practice drill is improved).
- Establish regular practice drills, mock exercises.

Training Program

Response personnel will be trained by a qualified instructor(s) in all aspects of their roles and responsibilities as well as spill prevention, cleanup, and the reporting procedures to be followed during a spill. A training course will include the following elements:

- Spill Response Plan
- Reporting Requirements
- Emergency Contacts
- Responsibilities of Personnel
- Sources and Causes of Spills
- Fate and Impacts of Spills
- Hazards, Risks and Prevention
- Health & Safety Aspects
- Containment Options
- Control and Cleanup Methods
- Storage and Disposal
- Post-Spill Activities
- Spill Response Exercise

Personnel working with hazardous materials will be required to take a spill response and prevention course that provides training on spill response. A mock emergency response exercise is to be conducted at least on an annual basis to ensure the availability and readiness of internal emergency response services. Any deficiencies or suggestions to improve the emergency procedures will be noted and incorporated into this plan. Level A and B chemical suits and SCBAs will be included.

Training may be held in conjunction with other companies, agencies, and organizations involved in emergency planning and response. Training will usually reflect countermeasures that can be applied in a relatively small operation. Cleanup Supervisors and crews will also receive training at industry or government training seminars, as appropriate and available. Both training and exercise records will be kept at the mine site Smithers and offices. Personnel attending the training program will receive a certificate indicating the date and type of training.

TRAINING COURSE OUTLINE

Title

Effective Oil and Chemical Spill Prevention & Response

Objectives

Upon completion of the course, attendees will be able to respond safely and effectively to oil spills, using equipment located at the Brucejack Mine Site, as well as additional equipment which might be required from other locations, such as skimmers, pumps and storage tanks.

Module 1 Spill Response Planning

- sources and causes of fuel and chemical spills
- physical and chemical properties fuels and chemical reagents
- fate and behaviour
- impacts on natural resources and property
- response priorities

Module 2 Prevention

- introduction
- site assessment
- upgrading existing facilities
- self-assessment procedures and checklist

Module 3 Administration

- reporting requirements and procedures
- regulations
- record keeping
- contingency plan/Spill Reporting Information form

Module 4 Health and Safety

- health risks and hazards
- spill response safety guidelines
- personal protection equipment
- site security

Module 5 Containment

- spills on land
- spills into small watercourses
- spills into water
- spills on ice and snow including glacier

Module 6 Neutralization/Recovery

- using neutralization methods on chemicals
- selecting recovery methods (manual and mechanical)
- skimmers
- sorbents
- controlling spills in creeks, streams, rivers, lakes

Module 7 Transfer

- application of pumps including chemical-rated units
- hoses and connections
- selection criteria
- main pump types
- vacuum systems

Module 8 Storage and Disposal

- overview
- separation of wastes/labelling
- selecting storage options
- waste reduction
- disposal options
- regulations

Module 9 Post-spill Activities

- cleanup options
- site remediation
- personnel decontamination
- equipment cleaning and maintenance
- debriefing and equipment review

Prerequisites

The course is intended for all company and contractor personnel who are involved in the transfer of fuel and chemicals and/or are part of the Spill Response Team. All attendees are expected to be familiar with the company's emergency response plans and any health and safety guidelines.

Duration

The course will take four to six hours to complete and include classroom and field sessions with spill countermeasures and personal protective equipment suitable for fuels and chemicals.

Training Supplier

Training will be provided by a qualified spill response training company.

Location

Training will be conducted at a site where classroom and fieldwork can be conducted.

Instructors Qualifications

The instructors chosen to conduct the training will be fully qualified in oil and chemical spill response and prevention methods.

INITIAL SPILL RESPONSE TRAINING

Initial spill response training was conducted at the Brucejack Project, and was based upon an audit of all the Bruecjack fuel facilities and site facilities viewed in June 2014. Subsequent third party training occurred in 2016, 2017 and 2018. The training consisted of the following components:

Spill Response Overview (90 minutes)

a. Overview of Assess
b. Legislative Requirements
c. Chemical Characteristics
d. Safety
e. Spill Response Scenarios (Water)
f. Spill Response Scenarios (Land, snow, and ice)

Practical Session - Spill Response *(90 minutes)*

g. Legislative Review & Fines
h. Chemical Characteristics
i. Safety
j. Assessments
k. Response Actions
l. Cleanup and Remediation
m. Disposal

1. Legal

Reportable pills

- Internally vs. Externally
- Spill Reporting Regulation – *Volume Based*
- Deleterious Products – *Product Based*

Due Diligence

A legal defense that you took reasonable measures to prevent the incident from occurring.

- Prevention
- Preparedness
- Risk Reduction
- Impact Reduction

2. Chemical Characteristics

- WHMIS
- MSDS
  - Flash Point: The temperature at which a product will emit sufficient vapours and could ignite.
  - Gasoline (-40°C)
  - Diesel (40°C)
  - Lube Oil (80°C)
- Rules of Thumb
  - *Evaporation*
  - *Dispersion*
  - *Dissolved*

3. Response Actions

Assessments

- Spill
  - Source
  - Product
  - Size/Volume
  - Cause/Effect
- Safety
  - Personal Protection
  - Fire/Explosive Risk
  - Site Security
  - Legal Obligations
- Environment
  - Water: Assessment

  - Land: Assessment
  - Air: Assessment
  - Environmental Sensitive Areas
  - Minimize Impact on the Environment

Initial Actions

- Stop the spill
  - Plug
  - Shut off valves/pumps
  - Shift or move tank
- Contain the spill
  - Culvert Blocks
  - Tarp Containment
  - Under Flow with PVC Pipes
  - Sandbag Diversion
  - Containment booms
  - Watergate®

Notification

- Notify Internal/ External
- Notify EMBC (formerly PEP)

Recover and Mop-up

- Recovery Equipment
- Sorbent Pads
- Sphagsorb (peat moss)
- Oil Gator (cotton seed)

Disposal

- Burner/Open Burn
- Treatment - Phytoremediation
- Bioremediation
- Waste Disposal Company

TRAINING AND AWARENESS FOR CHEMICAL REAGENTS

Pretium employees who may deal with hazardous materials will receive specific awareness training to maximize the safe management of these products. Employee training will consist of an

education program for all employees (including operators, emergency responders, and security personnel) who have access to or work in areas containing or processing hazardous materials:

- Pretium will oversee the design and supervision of the training programs to address the wide array of reagents and the specific hazard levels present at each specific facility.
- The training will include proper handling, equipment operation, and emergency procedures as well as the consequences of failing to follow the procedure.
- Pretium provides training for all new employees. Refresher programs are also provided, as needed, for current employees and contractors.

In general, the program includes:

a. The hazards created by the materials in use.
b. The proper operation or shutdown of the equipment under normal and emergency conditions. Critical procedures would be printed and posted for quick reference.
c. Proper material handling procedures (i.e., bonding/grounding, self-closing valves, safety bungs, spill cleanup, etc.).
d. Hazardous liquid piping system operation and shutdown including the location of all local and remote shutoff valves.
e. Proper hazardous material transfer and dispensing procedures.
f. The location, proper type and proper use of fire extinguishers, neutralizers and other materials for the hazard present.
g. Fixed extinguishing systems operation and function.

Additional procedures are addressed in training to deal with fires, spills, and other hazards:

- storage containers (types, features, means of closing, labeling, materials of construction)
- control of ignition sources and limiting storage of fuels and chemicals
- incompatible materials/segregation
- use and maintenance of engineering controls used in the workplace (such as ventilation)
- required personal protective equipment (PPE) for handling hazardous materials
- fire protection and prevention
- special circumstances (e.g., confined spaces, hot work) requiring added precautions and training
- other emergency procedures (medical, evacuation, etc.).

In addition to routine site orientation, employees and contractors will be guided through the Hazard Identification process which covers fire prevention and response, hot work, and chemical hazards.

APPENDIX F

BJ-ENV-SOP-025 Hydrocarbon Fuel Spill Response

BRUCEJACK MINE

Spill Response Plan

Objective

To provide a standard operating procedure for controlling and cleaning hydrocarbons (i.e., diesel, gasoline, hydraulic oil, Jet A-1, lube oil, and waste oil) spills at Pretivm facilities.

Scope

This SOP applies to all Pretivm employees and contractors working at Pretivm facilities who encounter hydrocarbon spills. Specific clean-up instructions are provided for various hydrocarbons in different media. A spill report template is provided in Appendix A. A simplified spill response flow chart is provided in Appendix B, and some examples of spill response techniques are presented in Appendix C. Spill supplies available in the yellow and red spill kits are presented in Appendix D.

Relevant Regulations

Applicable legislation and regulations include the following:

- BC Fire Code 2006; Office of Fire Commissioner Interpretation Bulletins
- Fire Services Act
- Fisheries Act
- Motor Vehicle Act
- Transportation of Dangerous Goods Act and Regulation
- ULC/CSA standards
- BC Water Act
- BC Environmental Management Act:
- Petroleum Storage and Distribution Facilities Storm Water Regulation
- Hazardous Waste Regulation
- Spill Reporting Regulation
- Workplace Hazardous Materials Information System (WHMIS)
- BC Mines Act
- Environmental Code of Practice for Aboveground and Underground Storage Tank Systems
- Containing Petroleum and Allied Petroleum Products (Canadian Council of Ministers of the Environment (CCME)), Document PN1326,2003
- BC Fuel Guidelines, 6th Edition February 2014, Northwest Response Ltd.
- BC Guidelines for Industry Emergency Response Plans updated July 2002

Definitions

Hydrocarbon – fuel substances including diesel, hydraulic oil, Jet A-1, lube oil, waste oil, and gasoline.

Preparation

Hazards by Hydrocarbon Type

Diesel

- Combustible liquid
- Vapours heavier than air form at high temperatures and may persist in depressions

- Empty containers can contain explosive vapours
- Toxic gases form upon combustion
- Eye contact causes irritation.
- Diesel can accumulate static electricity charges.
- Inhalation of vapours can cause irritation of the respiratory tract, headache, vomiting and unconsciousness.

Gasoline

- Flammable liquid
- Vapours instantaneously form that are heavier than air
- Empty containers can contain explosive vapours.
- Vapours can travel to distant sources of ignition and flash back
- Eye contact causes irritation
- Gasoline can accumulate static electricity charges
- Inhalation of vapours can cause irritation of the respiratory tract, headache, vomiting and unconsciousness

Hydraulic Oil

- Flammable liquid
- Vapours are heavier than air and may persist in depressions
- Toxic gas can form in fire and at high temperatures
- CO, CO2 and dense smoke are produced upon combustion
- Material can accumulate static charges
- Oil mist or vapour from hot oil can cause irritation of the eyes, nose, throat and lungs

Jet A-1

- Flammable liquid
- Vapours heavier than air form at high temperatures and may persist in depressions
- Empty containers can contain explosive vapours
- Toxic gases form upon combustion
- Eye contact causes irritation
- Jet A-1 can accumulate static electricity charges when stored and transferred
- Inhalation of vapours can cause irritation of the respiratory tract, headache, vomiting and unconsciousness

Lube Oil

- Flammable liquid
- Toxic gas can form in fire and at high temperatures
- CO, CO2 and dense smoke are produced upon combustion
- Material can accumulate static charges
- Hot oil vapours can irritate the eyes, nose, throat and lungs

Responsibilities

Mine Manager or Designate:

- Ensures this SOP is implemented and maintained.
- Ensures on-site personnel have up-to-date information regarding this SOP.

Departmental Manager / Supervisor:

- Ensures on-site personnel have up-to-date information regarding this SOP.

Health and Safety Manager/Coordinator:

- Monitors the implementation of this procedure.

Environmental Superintendent / Coordinator:

- Monitors the implementation of this procedure.

Personnel performing this task:

- Follow this SOP as outlined and directed by the appropriate departmental Supervisor.

Employees:

- Follow this SOP as outlined and directed by the appropriate departmental Supervisor.

Procedure

For all spills, use the appropriate spill supplies provided in the various spill kits located in vehicles and around site. Remember to place used spill materials in yellow Hazmat bags and dispose of the bags in blue Terrapure bins (if available).

DIESEL, HYDRAULIC OIL, JET A-1, LUBE OIL, WASTE OIL

- Begin spill response procedure ONLY IF SAFE to do so.
- Eliminate ignition sources (turn of vehicle engines and NO SMOKING).
- Stop spill source if safe to do so.
- Block entry of spills into waterways by building berm or trench.
- Wear PPE (impervious clothing, Nitrile or Viton gloves, footwear and goggles).
- Avoid contact with solvents and all other chemicals.
- Plan for and request additional cleanup assistance, if required.

Spill on Land

- Contain with earth berm, spill socks, or other barrier.
- DO NOT flush into any ditch or drainage system that leads to water.
- Mark off large spill perimeters with spray paint, flagging, or pylons.
- Remove minor spills with WHITE sorbent pads.
- Remove large spills with pumps or vacuum equipment.
- Excavate ALL contaminated materials with shovel or excavator and place contaminated materials in marked sealed containers (if available, clean up materials should be placed in blue Terrapure bins). Transfer and placement of large quantities of contaminated soil/gravel will be determined under the direction and permission of the Environmental Supervisor.

Spill on Lakes/Ponds

- Use sorbent boom or socks to contain spills, if possible (booms will not contain oil in fast flowing, turbulent water).
- On small spills, use WHITE sorbent pads to pick up contained oil.
- On larger spills, obtain and use pump or skimmer on contained slicks.

Spill on Rivers/ Streams

- Intercept moving slicks in backwater or quiet areas using sorbent booms, logs or other containment device, as available.
- Spills from fuel trucks should be contained as close to the source as possible especially along the access road to Bowser.
- Do not use sorbent booms/pads in fast currents and turbulent water.

Spill on Ice/Snow

- Block entry into waterways and contain with snow or other barrier.
- Trench or ditch to intercept or contain oil on snow, where possible.
- Mark off spill perimeter with spray paint, flagging, or pylons.
- Construct a dike with snow, either manually with shovels or with heavy equipment such as graders, dozers, and Snowcat, where available.
- Remove contaminated snow to designated area.

Storage/ Transfer

- Use a pump to transfer recovered fluid to a holding tank or drums.
- Store closed, labelled containers outside away from flammable items.
- Electrically ground containers and vehicles during transfer.
- Do not transfer petroleum products near waterways.

Disposal

- Segregate waste types.
- Place contaminated materials in marked sealed containers (if available, clean up materials should be placed in blue Terrapure bins). Transfer and placement of large quantities of contaminated soil/gravel will be determined under the direction and permission of the Environmental Supervisor.
- Consult Environmental Department on transportation and disposal needs.

Reporting

- Complete a Spill Report Form (Appendix A)
- Submit report to area Supervisor and Environmental Department

GASOLINE

- Begin spill response procedure ONLY IF SAFE to do so.
- Gasoline can form vapours that will ignite and explode!
- NO SMOKING – Eliminate ALL ignition sources.
- Stop spill source, if safe to do so.
- Wear PPE (impervious, chemical-resistant clothing, nitrile gloves, footwear, and goggles).
- Avoid contact with acids, hydrogen peroxide, and fuels.

- Static charge can build during transfer – ground and bond when transferring.
- Monitor for explosive atmosphere.

Spill on Land

- Block entry into waterways by diking with earth or other barrier(s).
- DO NOT flush into ditches or drains that lead to waterways.
- Do not contain spill if there is any chance of igniting vapours.
- Mark off larger spill perimeters with spray paint, flagging, or pylons.
- Remove minor spills with sorbent pads and rolls.
- On shop floors, apply particulate sorbents.

Spill on Lakes/Ponds

- Do not attempt to contain or remove spills.
- Sometimes distributing gasoline with water spray is the safest action.
- Sorbent booms could be deployed to deflect slicks from sensitive areas, if safe to do so.

Spill on Ice/Snow

- Block entry into waterways and contain with snow or other barrier.
- Trench or ditch to intercept or contain fuel on snow, where feasible.
- Mark off spill perimeter with spray paint, flagging, or pylons.
- Constructing a dike or dam out of snow, either manually with shovels or with heavy equipment such as graders and dozers where available.
- Remove contaminated snow to designated area and place contaminated materials in marked sealed containers (if available, clean up materials should be placed in blue Terrapure bins). Transfer and placement of large quantities of contaminated soil/gravel will be determined under the direction and permission of the Environmental Supervisor.

Storage/ Transfer

- Store closed, labelled containers in cool, well-ventilated areas away from fuels and acids. Add inert material (sand) to eliminate explosive atmosphere.
- Electrically ground containers and vehicles during transfer.
- Do not transfer petroleum products near waterways.

Disposal

- Segregate waste types, if necessary.
- Place contaminated materials in marked sealed containers (if available, clean up materials should be placed in blue Terrapure bins). Transfer and placement of large quantities of contaminated soil/gravel will be determined under the direction and permission of the Environmental Supervisor.
- Consult Environmental Department on transportation and disposal needs.

Reporting

- Complete a Spill Report Form (Appendix A).
- Submit report to area Supervisor and Environmental Department.

Appendix B – Spill Response Flow Chart

Appendix C – Spill Response Techniques

Response on Land

A trench should be dug downstream of the spill flow, following natural drainage channels, to catch the spill before it reaches a waterway. The material from the trench, along with other materials, can be used to construct an earth berm on the downslope of the trench.

Earth Berm/Trench

Response in Ice and Snow

Snow provides a quick and efficient material to construct a berm. Snow should be piled in the direction of flow, compacted, and sprayed with water if possible, as ice will prevent further migration.

Snow Berm

Response in Creeks and Rivers

Linkable absorbent socks can be deployed across ditches or low flow creeks/streams where the spill enters the water. Additional linkable socks can be deployed downstream to ensure the spill is collected.

Containment booms are best deployed near the source of the spill, or where there is sufficient space and relatively low flow downstream. Hydrocarbons will collect upstream of the boom, where they can be collected with absorbent spill materials.

Appendix D – Spill Response Supplies

The following is a list of spill materials that are readily available at Pretivm facilities. Spill kits are stocked with absorbent materials (spill pads, socks, pillows) and Plug n'Dike.

Spill Material/Equipment		Description
Absorbent Materials		
White Absorbent Spill Pads		• Used to manually clean spilled hydrocarbons (diesel, hydraulic oil, gas) • Will not absorb water • Floats on water
Black/Grey Absorbent Spill Pads		• Used to manually clean water-based products and oils • All-purpose absorbent
Yellow Absorbent Spill Pads		• Used to manually clean spilled hazardous/chemical liquids • Absorbs acids, bases, and harsh chemicals
Absorbent Spill Socks		• Absorbent tubes used to prevent flowing spill material from migrating • Various sizes, and include white, black, and yellow variants, similar to spill pads (above) • Typically used on land
Linkable Absorbent Booms		• Absorbent booms that float on water, even when fully saturated • Linkable • Ideal for spills on calm water
Absorbent Pillows		• Absorbent pillows used to contain leaks and constant drips • Useful in tight spaces • Large absorption capacity
Containment		
Mini-Berms/Spill Trays		• Light berms to catch and contain leaks • Traps spills at the source
Barriers		

Inshore Containment Boom		• Lightweight boom to be deployed in sheltered waters • Prevents migration of spilled material • Deployed downstream of spill
Water-Gate Spill Barrier		• Inflatable dam to restrict water flow • Intercepts spilled material, reducing the recovery zone • Contains contaminant for clean-up
Miscellaneous		
Plug n'Dike		• Forms an immediate seal to control leaks and spills • Temporary repairs of drum/tank punctures

Northwest Fuels Limited Spill Contingency Plan

BRUCEJACK MINE

Spill Response Plan

Spill Contingency Plan

NORTHWEST FUELS LIMITED

1 PREFACE

Response Action Chart

The Response Action Chart outlines the GENERAL STEPS to follow when a spill occurs. The actual actions taken will vary from situation to situation depending on the type and volume of substance released, the circumstances of the incident, and the nature of the receiving environment.

Alerting/Notification

ALL spills, regardless of size, must be reported to, and are recorded internally by, Northwest Fuels. Spills that threaten the environment, i.e., that are outside of containment and that require government notification are noted below. Refer also to Appendix A Contacts for phone numbers and to Section 12 Spill Response Procedures for more detailed countermeasures. NOTE: A spill to water includes a spill to pooled water or to a ditch leading to water.

Distribution

The following personnel must be familiar with this Spill Contingency Plan (SCP). Their ICS roles are indicated (see Glossary for acronyms). Printed hard copies are used for reference only. NOTE: Only the SCP on the Northwest Fuels website is considered to be fully up-to-date and current.

Location	Spill Role(s)	Primary/Alternate

Section 17 of the BC Spill Contingency Regulation requires that each truck transporting diesel, Jet A, and/or gasoline will be provided with sections of this plan that at a minimum indicate driver responsibilities relating to initial assessment, notification/reporting, and spill response. These are all included in detail in Section 12 Spill Response Procedures.

Declaration

Ministry of Environment and Climate Change Strategy

Declaration that the Spill Contingency Plan is true, accurate, and complete

As an authorized representative of the regulated person, I declare that a Spill Contingency Plan (SCP) has been prepared for the substance(s) for which the regulated person is defined as a regulated person under the *Environmental Management Act 2003*. I declare that the SCP is true, accurate, and complete and that Tables 1 and 2 below are complete and contain accurate information.

This declaration must be attached to the front of all copies of the SCP, including required sections in motor vehicles.

Regulated Person[1]:

Northwest Fuels Limited	Ainscow, Gary	General Manager
Legal company name	Surname, given name	Job title
		31-03-2019
	Signature	Date (day-month-year)

5138 Keith Avenue
Address
Terrace, BC

V8G 1K9

Designated contact[2]:

Northwest Fuels Limited	Ainscow, Gary	General Manager
Legal company name	Surname, given name	Job title
	gary@northwestfuels.ca	250-635-2066
	Email address	Phone number

5138 Keith Avenue
Address
Terrace, BC

Log of Revisions

Section 9 of the Spill Preparedness Response and Recovery Regulation requires that changes to this spill plan be recorded with the date of the change and the reason for it. The plan is to be reviewed and revised annually as per the "Plan Review & Updating" section noted below.

Rev #	Date	Page Numbers and Reason for Revision	Initials

Plan Review & Updating

This plan will be reviewed and updated as deemed necessary by the Regulated Person as stipulated in **Section 15** of the Contingency Planning Regulation:

- Within one month of:
  - A significant change in the quantity or types of listed substances handled by the company that could increase the risk of a spill
  - A change in personnel that affects the Incident Command System
  - A significant change in equipment, personnel or outside help identified in this plan under the heading "Pre-Emergency Planning", subheading "Equipment, Personnel and Other Resources".
- At least annually with particular attention to:
  - Changes in contact information
  - New regulatory requirements (e.g. Federal: TDG; Provincial EMA)
  - New company processes
- Drill results and incident investigations that identify opportunities for improvement

2.INTRODUCTION

Purpose & Scope

Purpose

The purpose of this Spill Contingency Plan is to:

1. Provide readily accessible emergency information to management, cleanup crews, and government agencies in the event of a spill;
2. Comply with our customers petroleum and hazardous waste management standards
3. Comply with federal, provincial, regional, and municipal regulations pertaining to the preparation of contingency plans and notification requirements
4. Promote safe and effective recovery of spilled materials
5. Minimize the environmental impacts of spills into water or land
6. Facilitate management of wastes according to environmental legislation

Scope

This plan addresses preparedness and procedures to mitigate the potential impacts as a result of releasing petroleum product or antifreeze to the ground or to an aquatic environment. Should such an event occur, the order of priorities when responding are:

1. Human safety (the general public as well as workers and emergency responders),
2. Infrastructure and property protection, and
3. Environmental protection (particularly the aquatic environment as that is the one most likely impacted by the products transported by Northwest Fuels)

Legislation

This plan is intended to ensure compliance with legislation regulating spill preparedness and response:

- Transportation of Dangerous Goods Regulations Canada
- BC Environmental Management Act and its Regulations
    - Spill Preparedness, Response and Recovery Regulation
    - Spill Reporting Regulation
    - Spill Contingency Planning Regulation

Substances

Because Northwest Fuels Limited transports diesel, gasoline, and Jet A by tanker truck in quantities greater than 10,000 litres the company is required to have a Spill Contingency Plan in accordance with the Spill Contingency Planning Regulation (SCPR) under the BC Environmental Management Act. Other substances that could be involved in a mishap are hydraulic fluid, lube oil and antifreeze that are stored in 200 litre drums and in 1,100 litre Intermediate Bulk Containers (IBCs)

Worst-Case Spill

Section 3 of the SCPR requires a worst-case scenario spill, i.e., the simulation of a spill of the maximum quantity that could be transported by a single motor vehicle, including trailers. Tanker trucks operated by Northwest Fuels have a capacity of 20,000 litres and may tow a 4-axle pup trailer with a capacity of 27,000 litres. A maximum capacity spill of the entire contents of gasoline would be 54,000 litres. The truck and pup tanks have individual compartments ranging in size from 1,400-to-12,000 litres with their capacities labeled at the top of each tank. Tank truck capacities are presented in Appendix D for the Northwest Fuels fleet of tank trucks including trailers.

A detailed spill scenario for a fuel truck incident with step--by-step- response procedures has been prepared for a higher probability event (see Appendix B).

Environmental Health & Safety Policy

Northwest Fuels Limited is committed to the protection of all its employees, customers and property. Accidental loss can be controlled through good management in combination with active employee involvement. Safety is the direct responsibility of all managers, supervisors, employees and contractors.

Northwest Fuels Limited is committed to reducing vehicle accidents and helping to ensure that all Northwest Fuels drivers and equipment are ready for all jobs they are assigned to. We hope to reduce maintenance costs and repairs of, and accidents involving, Northwest Fuels Limited vehicles.

To carry out this commitment **management** shall:

1. Provide a safe and healthy work environment which will meet or exceed industry standards and legislated requirements.
2. Eliminate or reduce any foreseeable hazards that could lead to injuries or property damage
3. Comply with safety and loss prevention requirements as they apply to the operation and maintenance of facilities and equipment.
4. Work with supervisors, employees, and drivers to resolve any safety concerns they may have.
5. Ensure that all drivers are qualified, trained, and certified.
6. Ensure that all employees are familiar with motor vehicle safety policies and procedures and accident/incident reporting requirements, and frequently check on their compliance.
7. Maintain all vehicles adequately for safe operation and ensure that only authorized personnel are allowed to operate vehicles.
8. Review each incidents/accident report to determine if the employee's actions were consistent with Northwest Fuels policies and procedures.
9. Ensure that unsafe vehicles are not driven until safety deficiencies have been corrected.
10. Determine what additional training or other positive action is required to deal with driver error.
11. Maintain complete records on fleet vehicle maintenance accidents.

To carry out this commitment **supervisors** and **employees** shall:

1. Perform their job to accepted standards in accordance with company policies, procedures and all legislated requirements.
2. Report any current or foreseeable hazards to management.
3. Report any incidents, accidents, or near-misses to management, regardless of how serious they may appear.

To carry out this commitment **employees driving** Northwest Fuels vehicles shall:

1. Operate trucks in a safe and responsible manner in compliance with the Northwest Fuels Limited *Driver Policy.*
2. Become familiar with and obey all motor vehicle safety policies and procedures, and provincial highway traffic rules and regulations.
3. Understand the "right to refuse unsafe work" legislated by WorkSafeBC OHS Regulation Section 3 and exercise this right when appropriate.
4. Do pre-trip and post-trip inspections and fill out "driver repair request form" when needed.
5. Report any current or foreseeable hazards to management whether on-site or during their delivery route.
6. Report all motor vehicle accidents/incidents immediately in accordance to the event reporting matrix.
7. Report immediate to supervisor any tickets or inspection reports given while operating a company vehicle.
8. Report immediately to management any suspension of driving privileges and cease to operate any fleet vehicle until his or her privileges are reinstated.

We pledge to continue improving our environmental, health and safety program and we trust that you will join us in our commitment to maintaining and operating a safe workplace and fleet of fuel trucks. Northwest Fuels Limited aims to not only meet current legislation and industry standards but strives to be a leader in our industry and adopt safety and loss prevention as a way of life.

3 CONTENTS OF THE SPILL CONTINGENCY PLAN

This Spill Contingency Plan contains Sections 4 to 13 as required by BC's Contingency Planning Regulation and as listed in the Declaration (see Preface). Information has been added to help guide responders.

1.Preface	Quick reference guide for responders: Response Action and Notification Charts Distribution List which includes ICS titles/roles Declaration by the Regulated Person Log of Revisions, Plan Review and Updating (Regulated Person) Glossary of terms used in the SCP Table of Contents
2.Introduction	Purpose & Scope Legislation regulating SCP preparation and spill response Substances of concern and worst-case spill Northwest Fuels Health, Safety & Environmental Policy
3.Contents of SCP	More detailed contents of SCP to facilitate finding information
4.Hazard Assessment	The risks of a worst-case spill along with impacts and mitigation measures
5.Spill Response Planning Map	Maps of the routes that Northwest Fuels tank trucks travel.
6.Equipment, Personnel & Other Resources	**C**ompany spill response trailer, equipment, responders.
7.Incident Command System	The primary roles in an ICS structure including IC and Officers.
8. Human Health & Safety	Specific toxicity and safety issues and mitigation for fuel spills.
9.Communication Procedures	Northwest communication protocols for spill response
10.Waste Management	External assistance Northwest will seek to comply with regulations
11.Wildlife	Brief indication of mitigation and external help Northwest will seek.
12.SPILL RESPONSE PROCEDURES	**Spill notification and reporting, 3 spill levels, initial response actions, Emergency Condition Report form**
13.Training	**O**utline of subjects covered that conform to MOE requirements
Appendix A Contacts	Emergency contacts for all areas Northwest transports fuel
Appendix B Response Tactics & Scenarios	Spill response tactics and detailed spill response scenarios
Appendix C Product Response Guides	Key data from SDSs for quick reference to help guide responders
Appendix D Tank Truck Capacities	Listing of volumes of tanks on Northwest Fuels tank trucks and trailers
Appendix E TDG Report	Report form for notifying Transport Canada of a spill

4 HAZARD ASSESSMENT

Hazards, Fate & Effects

Section 4 of the SCPR requires a hazard assessment and mitigation for all transported fuels. See also Section 8 Human Health & Safety. The hazards of diesel, gasoline, and jet fuel are similar with gasoline posing the highest risk of a fire or explosion. Appendix C Product Response Guides summarizes the properties, fire and spill response, and first aid measures for all substances that could be involved in a spill.

Hazardous Properties of Gasoline, Diesel and Jet A as per the Safety Data Sheets (SDSs):

- Gasoline: Highly flammable liquid and vapour (Average Flash Point -45°C)
- Diesel: Flammable liquid and vapour (Average Flash Point 40°C)
- Jet A: Flammable liquid and vapour (Flash Point 37.8°C)
- May be fatal if swallowed and enters airways causing pneumonia
- Causes skin irritation
- May cause drowsiness or dizziness
- Suspected of causing cancer
- Damages organs (eyes, blood) through prolonged or repeated exposure
- Considered toxic to aquatic life with long-term effects

Potential Hazards Associated with Fuel Spills

- *Fire* can start from spark, hot exhaust, static electricity and many other sources.
- *Explosions* can occur if the vapour/fuel mixtures reach critical levels.
- *Toxic g*asoline vapours can cause asphyxiation if sufficiently concentrated.
- Fuels are very *toxic* to most animals (both aquatic and terrestrial) when ingested or absorbed through the skin; plants in the spill area or along shores and banks of ditches may also be affected.

Other Substances

A release of lube oil and/or antifreeze (ethylene glycol) could pose toxicity concerns but not generally flammability hazards. Any release of either liquid would not be a component of a worst-case scenario but would require a response operation to contain and remove the spill as outlined in this SCP.

Fate & Behaviour of spills

The impacts of a worst-case spill are largely dictated by the nature of the receiving environment:

General Characteristics of Fuels When Spilled on Land:

- Fuels will usually *migrate* to a waterway, either on the surface or underground
- Soil *penetration* will depend on the permeability and moisture content of the soil (gravel, sand, clay, etc.). If the ground is sufficiently wet, the product will float on the water and soil penetration will be limited but surface migration will be more rapid. If the ground is dry, fuel will penetrate the ground more easily resulting in contaminated soil.

- Product that *seeps* into the ground may settle at the top of the water table and can reappear months later, some distance away, on the surface or in water well.
- Product release onto pavement or concrete will spread rapidly across the surface and *evaporate* quickly. Penetration into the concrete or pavement should be minimal if the spill is cleaned up quickly

General Characteristics of Fuels When Spilled on Water:

- Fuel will *spread* quickly across the surface of the water in a thin film or sheen.
- Fuel may *cover* a wide area, if uncontained.
- A fairly strong *odour* may be present even at non-toxic levels.
- Fuel will tend to *evaporate* fairly rapidly compared to thicker or more viscous oils.
- In a sheltered environment, evaporation of the product may be slow; evaporation and *wave action* are significant on small spills in a relatively high energy environment.
- Spilled fuel may form water-in-oil or oil-in-water *emulsions* or mousse.

Potential Impacts of Worst-Case Fuel Spill Scenario

On Human Health:

- A worst-case scenario would be a motor vehicle accident in a populated area on a hot day resulting in ignition and a large fire and possible explosion. In addition to the danger presented by the fire, workers and members of the public could be exposed to vapours at harmful concentrations from product evaporation, or more seriously, from product combustion.

On Infrastructure:

- A worst-case scenario for infrastructure would be similar where the motor vehicle accident and fire resulted in the destruction of a public structure or facility located adjacent to a roadway.

On the Environment:

- A worst-case scenario would likely be a motor vehicle accident resulting in the entire contents of a fuel truck being spilled into an aquatic resource such as a highly productive fish spawning or rearing area or marsh where endangered aquatic species might be present.

Mitigation

Evacuation

Should a large fuel spill occur, the immediate area around the spill site would be *isolated* and the downwind area temporarily *evacuated* until the level of risk is clearly and accurately assessed (i.e., type of product, size of spill, risk of fire/explosion). Unprotected emergency responders would not be allowed to enter the isolation zone.

NOTE: ***Evacuate*** means to move all people from the threatened area to a safer place.
Isolate means to keep everybody away from the area if they are not directly involved in response

The graphic on the following page shows the isolation and evacuation area for a large spill of gasoline, diesel or Jet A. The immediate evacuation zone will vary depending on the product spilled, migration of spill, prevailing wind speed, air temperature, and general weather conditions. The table that follows, shows the immediate isolation and initial evacuation distances for larger spills and also for fires involving large containers (tank trucks, storage tanks) for diesel, Jet A and gasoline (Source 1996 North American Emergency Response Guide (NAERG)).

Large Spill	Immediate Isolation Distances*	Initial Evacuation\Isolation Distances*
	25-50 m (all directions)	Consider initial evacuation for 300 m (downwind)
Large Container Fire	**25-50 m** (all Directions)	Isolate **800M** (all Directions) Consider initial evacuation for **800m** (all directions)

Safety Precautions

The following safety precautions would be taken by responders whenever approaching a spill site:

- ☐ **Never** rush in.
- ☐ **Verify the** type of product.
- ☐ **Assess** the risk of fire.
- ☐ **Confirm** wind direction.
- ☐ **Approach the** spill from an upwind direction.
- ☐ **Do not** walk or wade though spill material.
- ☐ **Use** appropriate personnel protective equipment.
- ☐ **Keep** unauthorized personnel away from the site.
- ☐ **Test** vapour levels regularly using available testing equipment.
- ☐ **Use** foam or fine water spray/water fog to suppress vapors if necessary.
- ☐ **Avoid** low-lying areas (e.g. ditches, culverts) and confined spaces since petroleum product vapors are usually heavier than air.

Risk Management – Spill Prevention

The prevention of incidents is a key part of Northwest Fuels risk management policy as outlined in its Fleet Safety Management Manual. The program addresses vehicle inspections, driver awareness, safety, and preventative maintenance and includes an annual road test and assessment of drivers as well as refresher training if deemed to be required. Northwest follows Petro-Canada's 1998 *Enhanced Marketer's Fleet Safety Manual "Full Circle" Fleet Safety Program.* This program covers all essentials for fleet safety from rules and regulations to the hiring of new drivers.

The Fleet Safety Manual is stored electronically and is modified to meet the needs of Northwest Fuels Ltd as these evolve:

Section 1 Leadership

1.1 Self-Assessment
1.2 Manual
1.3.1 Fleet Safety Policy
1.3.2 Fleet Safety Policy (Driver Sign-Off)
1.4.1 Safe Driving Procedures
1.4.2 Fatigue Management
1.4.3 Drug and Alcohol Policy
1.4.4 Working Alone
1.5 Driver Hiring
1.6 Recognition and Discipline Process

Section 2 Training

2.1.1 Training & Review Procedures
2.2.1 Refresher Training Frequency
2.2.2 Annual Road Tests
2.2.3 Provisions
2.2.4 Driver's Abstract
2.3.1 On-Site Refuelling

Section 3 Inspections

3.1.1 Pre-Trip Vehicle Inspections
3.1.2 Preventative Maintenance Inspections

Section 4 Emergency Preparedness

4.1.1 Emergency/Hazard Kits in Fleet Vehicles
4.1.2 Vehicle Emergency Response Plan
4.1.3 Emergency Contact List

Section 5 Event Reporting and Investigation

5.1.1 Event Management
5.1.2 Vehicle Investigation to Prevent Reoccurrence

Hazards of Spills Entering Water

Should there be a risk of a spill entering water, safety meetings are held to ensure personnel are aware of the specific risks involved and the means to mitigate these risks. Four forms itemize the procedures that are followed to minimize risks and the nature of the safety plan that results (source: WCMRC).

WCMRC Burrard Clean Operations/ Western Canada Marine Response Corporation

STOP and THINK!

Step 1 – Risk Assessment Step 2 – Tailgate Safety Meeting – Agenda Step 3 – Tailgate Safety Meeting - Record of Attendance

Customer:_____ Incident #: _____

Step 1 –Risk Assessment

Complete this risk assessment before the start of each shift (spill response) or when using the vessels (steady state). **Risks shall be reassessed any time conditions change.** Action plans to mitigate the hazards identified in the "Yes" column **MUST** be reviewed with all workers during the Tailgate Safety Meeting. Reference HS&LC Manual for "Critical Procedures".

Hazard	Yes	No	Suggested Control Measures
Hazardous materials			**Control measures are developed based on the Material Safety Data Sheet (MSDS)**
Inhalation: vapours, mists, fumes			Perform air monitoring and if required: mechanical ventilation, exclusion zones, respirators, SCBA.
Eye contact			Wear eye protection: safety face shield, safety goggles, safety glasses, eye wash stations.
Skin contact			Use chemically resistant: coveralls, gloves, special barrier cream. Clean exposed areas immediately.
Ingestion			Seek immediate medical attention.

Critical tasks

Is a Critical Procedure(s) to be reviewed prior to starting this job?
☐ Hot Work ☐ Confined Space Entry* ☐ Energy Lockout ☐ Crane Operations ☐ Working from a height
Procedures from HS&LC Manual must be followed

*** Confined space hazards: includes but not limited to barge/vessel tanks or holds, shoreline caves, under wharves or docks or logs, deep trenches.**

Weather hazards			
Tides, currents			Check tide charts and area currents, keep vessel crew and shoreline worker aware of changes.
Fog, ice, rain, snow, winds/waves			Maintain safe working distances, clear ice and snow from area of travel, wear appropriate PPE and/or clothing.
Darkness			Use portable lighting.
Hot or Cold weather			Stay hydrated (drink fluids), take rest breaks, warm-up breaks, use sunscreen, wear appropriate clothing.

Wind speed: knots	Wind direction:	Wave height: meters	Precipitation: ☐ Rain ☐ Snow
Air temperature: C	Current: knots	High tide at:	Low tide at:

General hazards			
Trips, slips and falls			Keep equipment, supplies, cords and/or air-lines out of the path of travel or secured; clean-up all oils, standing water, ice/snow or post warning sign; use handrails; secure ladders; maintain three-point contact when climbing or when on a vessel; take small, deliberate steps when walking in congested areas and along rugged shorelines.
Employee working alone			Communications **MUST** be done at four (4) hour intervals between worker and supervisor, and documented.
Working on or near water			PFDs **MUST** be worn at all times when working within 1m (3 feet) of the water unless protected by other means.
Person overboard			Be familiar with "overboard" procedures, location of life rings.
Abandon vessel			Be familiar with "abandon vessel" procedures, location and operation of survival suits and life rafts.
Repetitive motion injuries			Use different muscle groups and take rest breaks during repetitive tasks, vary tasks if possible.
Injuries from sharp material, needles, glass, etc.			Wear appropriate gloves, safety footwear. Make any cuts with blade facing away from the body. Store blades safely when not in use.
Pinch injuries			Watch mooring lines, don't get caught in the bight, avoid hand traps.
Lifting injuries			Use safe lifting techniques, **bend your knees, ask for help**; use mechanical lifting equipment when possible.
Fatigue			Work reasonably length shift, take breaks periodically.
Hearing damage			If you have to raise your voice to be heard, you need hearing protection.
Eye injuries			Wear eye protection; safety glasses or goggles/safety glasses and face shield.
Burns injuries			Maintain a safe working distance, wear gloves.
Miscellaneous injuries			Keep exit routes clear at all times; stack equipment and supplies in a place and manner where it will not cause injury; keep clear of tow-lines; beware of snap back from failed lines.

STOP and THINK!

Step 1 – Risk Assessment Step 2 – Tailgate Safety Meeting – Agenda Step 3 – Tailgate Safety Meeting - Record of Attendance

Step 1 –Risk Assessment cont'd

Hazard	Yes	No	Suggested Control Measures
Vehicle hazards			
Trucks, heavy equipment, forklifts			Wear appropriate PPE; activate back up alarm; use a back up spotter; inspect equipment before use, use only trained operators.
Traffic congestion			Ensure site traffic and parking plans are in place.
Vacuum truck noise, hose failure or explosion			Wear appropriate PPE; operator(s) trained and experienced in petroleum handling; inspect equipment before use.
Other task specific hazards			
Aircraft hazards			
Working around helicopter landing areas			**Never** approach the helicopter unless signaled to do so by the pilot. **Always** maintain eye contact with the pilot as you approach. **Never** approach from the uphill side. **Never** wear loose clothing around a helicopter.
In flight hazards			**Never** speak to the pilot during takeoff or landing (unless it is an emergency). **Always** wear your seat belt. Wear warm clothing. Take extra food and drink along.
Working around fixed wing aircraft			**Never** approach the aircraft while engines are running. **Never** touch anything on the fuselage, wings or propellers – they may be hot and/or brittle. Stay behind the wings at all times.
Other task specific hazards			
Wildlife			
Injury, disease, potential of attack			Be aware of the dangers from bears, cougars, wolves, dogs, raccoons, moose, deer, otters, wild fowl, rats, snakes and insects. Keep bear spray and insect repellent on hand. Use a safety watch. Only trained personnel to handle wildlife. Safety watch in bear/cougar/wolf country may need to be armed and/or have the use of a purpose trained dog.

Personal Protective Equipment

- ☐ Hard Hat
- ☐ Safety Glasses
- ☐ Safety Goggles
- ☐ Hearing Protection
- ☐ Tyvec Coveralls
- ☐ Fire Resistant (NOMEX) Coveralls
- ☐ Rain Gear
- ☐ Fall Protection (harness)
- ☐ Personal Floatation Device
- ☐ Respiratory Protection (specify cartridge type)
- ☐ Hand Protection (specify type of gloves)
- ☐ Safety footwear

MSDS PPE complied with - Yes / No –please circle

Safety Equipment Required

- ☐ Atmosphere Tester
- ☐ Fire Extinguisher
- ☐ Life Raft
- ☐ Life Ring
- ☐ First Aid Kit
- ☐ Eye wash

5 SPILL RESPONSE PLANNING MAP

As required by Section 5 of the SCPR, roads on which the company regularly transports regulated substances (gasoline, diesel, and Jet A) are shown on the map below, typically Highways 16 and 37 from Prince Rupert to Burns Lake and south to Kitimat. Travel includes barge from Kitimat to Kemano. Fuels are taken north to Good Hope Lake including through Deas Lake, Iskut, Telegraph Creek, and Stewart. Fuels are delivered to two mining sites: Pretium's Brucejack and Imperial Metals Red Chris.

6 EQUIPMENT, PERSONNEL & OTHER RESOURCES

Section 6 of the SCPR requires identification of the resources to be used in responding to a worst-case spill scenario. Northwest Fuels fully stocked spill response trailer stationed in Terrace would be dispatched to the incident site. The trailer is inspected monthly using the itemized form below and verified by the Regulated Person.

The responders to a spill and other resources are subsequently indicated in this section.

Equipment

Northwest Fuels Spill Response Trailer Inventory		
Category	**Quantity**	**Item**
Sorbents	20 bales	Hydrophobic spill pads (100 pads/bale)
	4	Boom 5"X10'
	2	Boom 8"X10'
	1	Boom 8"X20'
	2	Snares (bags of 30 rope attached)
	2	Snares (bags of 30 no rope)
	4	Sorbent
Hoses & Fittings	2	2"X20' pressure fuel hose
	1	3"X3" Male Camlock
	1	2"Female X 1" Male Camlock
	1	2" X 2" Male Camlock
	1	2" X 2" Female Camlock
	1	3" Female X 2" Female Camlock
	1	4" Female X 2" Male Camlock
Power Tools	1	Coleman Generator 3700 Watt
	1	Air Compressor 8hp
	1	2" Trash Pump
	1	1/2" Air Drill
	1	Reciprocating Saw
Specialized Tools	1	20" Hatch Cone Device
	1	3.5" Hole Saw
	1	Vent Hookup
	4	48" Drain Stoppers
	4	Adjustable dome clamps
		Wood plugs

Hand Tools	2	6' Spade
	3	D handled Aluminum Shovels
	2	Garden Rakes
	1	Pick
	1	Pitch Fork
	1	2.5lb Axe
	1	Sledge Hammer
	1	24" Squeegee
	1	24" Broom
	2	Deck Brushes
Tools	1	Multi tool socket set
	1	Multi Air tool set
	1	14" Pipe Wrench
	1	Rubber mallet
	1	Wire Brush
	1	Ballpeen Hammer
	1	Flat File
	1	Hack Saw
	2	Hacksaw blades
	1	Allen key Set
	1	15" Crescent wrench
	1	Groove joint pliers
	1	8" Diagonal Pliers
	2	Funnels
	1	Box Drill bits
	1	Brass Hammer
PPE	4	Pairs Red Chemical gloves
	1	Box Nitrile Gloves size x-large
	1	Box Nitrile Gloves size large
	12	Safety Glasses
	4	Goggles
	6	Hi Viz Safety vest
	6	Hard Hats
	25	Tyvek Coverall size large
	25	Tyvek Coverall size x-large
	25	Tyvek Coverall size xx-large
	6	3-piece raingear size small (2), medium (2), large (2)
	6	3-piece raingear size X-large (2), XX-large (2), XXX-large (2)
	6	Steel toed rubber boots 2@size 10; 2@size 11; 2@size 12
	6	Full-face respirators
	6	half-face respirators

Safety	2	3-head gas monitors
	1	Megger ground monitor
	1	Basic First Aid Kit (10 man)
	1	Biomed Eyewash 7oz
	4	Flashlights
	2	Disposable Flashlights
	1	Foghorn
	1	20lb ABC Fire Extinguisher
	4	42"Delineator posts (safety cone)
	1	1000' roll "Danger" tape
Ropes & Chains	1	20' Chain with hooks
	1	Roll 335 ft 1/2" Polyrope
	1	100' 1/4 rope
	1	Roll 550' twine
	8	ratchet tiedown
Cleaners	1	bottle Superclean
	1	bottle bilge cleaner
	1	hand cleaner
	1 case	36"X50" Garbage bags
	1 Roll	6 mm Garbage bags XXL
Miscellaneous	1	7' X 14' Tandem axle covered trailer 7000 lb GVW
	1	Set of shelving 12' L 4' High
	2	rolls duct tape
	1	2 5/16" Trailer hitch
	1	roll tie wire
	3	various tarps
	1	box D batteries
	1	Tube Amazing Goop
	2	Galvanized Buckets
	2	Packages Zip Ties
	2	2 X 500 watt light with stands
	1	50' #12 extension cord
	4	3' Steel stakes
	12	3' stakes
	6	plastic tent pegs
	3	3' X 15' Plastic Fence
	1	10' X 10' Tent
	6	Resin Chairs
	1	4' x 4' x 4' "Fish Tote"

Northwest Fuels Equipment that Could be Transported to an Incident Site

- Megger meters to ensure the proper grounding of trucks prior to the transfer of fuel.
- Gas monitors to (1) measure the presence of flammable vapours in a damaged truck and to (2) measure concentrations of volatiles released at ground level to atmosphere
- Half- and full-face respirators for the protection of responders.
- Sorbents, hoses/connections, power/special/hand tools, other PPE, safety gear, ropes/chains, cleaners, and miscellaneous items as listed above.
- Spare fuel truck and pup trailer to accept fuel from the damaged truck
- Fuel transfer pump trailer to pump fuel from one truck or trailer to another
- Boom truck to stabilize the damaged fuel truck or trailer or to safely move debris or other items.
- Spill kits and fire extinguishers carried on company vehicles.
- Spill kit stored on the fuel truck.

Records of inspections and maintenance of the above required by section 6(1)(a) are kept separate from this plan and are available on request.

Personnel

In the event of a worst-case spill, in addition to the company deploying its response trailer to the accident site in a timely manner and members of its Emergency Response Team (ERT)., external resources will also be needed. A driver may be the only company person initially on-site but communications will be available by cellular phone, VHF radio, and/or satellite phone and an Incident Commander (IC) will be immediately dispatched to the site. Information, Liaison and Safety Officers will also be alerted to contribute to the response according to their role in an Incident Command System (ICS).

Company employees are trained in first aid as per the requirements of the BC Occupational Health and Safety Regulation. A lone driver is not required to be trained under that regulation so may or may not be trained. See also Section 13 Training.

Outside Assistance

External inputs are key to dealing with worst-case scenarios. The following inputs would provide vital resources to control a large spill:

- 911 Emergency Responders (Fire, Ambulance, and Police)
- For initial response on some Level 2 spills and on Level 3 spills (see Section 12 Spill Response Procedures:
  - Ram Environmental Services (24-hour onsite spill response.)
  - Northwest Response Limited (24-hour onsite spill response.)
  - Western Canada Marine Response Corp (on-water response, not handled by Ram)
  - Terrapure Environmental (recycling and disposal)
- CANUTEC Technical Advice (Northwest Fuels registers annually with CANUTEC)
- WCMRC (Northwest Fuels is a member - 24-hour on-water spill response.)
- GHD Consultants (biological impacts)

7 INCIDENT COMMAND SYSTEM

SCPR section 7(2) requires the roles of Incident Commander, Information Officer, Liaison Officer and Safety Officer to be assigned with alternates by Northwest Fuels (see Distribution List and forms in this section) according to an Incident Command System (ICS). ICS is utilized by most response agencies and can be expanded from one person to as many persons required in a response. ICS roles in a spill response are briefly defined below.

COMMAND

- Sets objectives and priorities,
- Has overall responsibility at the incident or event

OPERATIONS

- Conducts tactical operations to carry out the plan
- Develops the tactical objectives, organization, and
- Directs all resources

PLANNING

- Develops the action plan to accomplish the response objectives
- Collects and evaluates information,
- Maintains resource status

LOGISTICS

- Provides support to meet incident needs,
- Provides resources and all other services needed to support the Incident

FINANCE/ADMINISTRATION

- Monitors costs related to incident
- Provides accounting, procurement, time recording, and cost analyses

SAFETY, INFORMATION AND LIAISON OFFICERS

- According to assigned roles, carry out functions relating to implementing a site safety plan, keeping media informed of the incident, and notifying and updating government agencies as the response to the incident progresses.

The assignment of ICS roles is guided through the use of ICS Form 201 Incident Briefing (see below).

ICS 201
Incident Briefing

Purpose. The Incident Briefing (ICS 201) provides the Incident Commander (and the Command and General Staffs) with basic information regarding the incident situation and the resources allocated to the incident. In addition to a briefing document, the ICS 201 also serves as an initial action worksheet. It serves as a permanent record of the initial response to the incident.

Preparation. The briefing form is prepared by the Incident Commander for presentation to the incoming Incident Commander along with a more detailed oral briefing.

Distribution. Ideally, the ICS 201 is duplicated and distributed before the initial briefing of the Command and General Staffs or other responders as appropriate. The "Map/Sketch" and "Current and Planned Actions, Strategies, and Tactics" sections (pages 1–2) of the briefing form are given to the Situation Unit, while the "Current Organization" and "Resource Summary" sections (pages 3–4) are given to the Resources Unit.

Notes:

- The ICS 201 can serve as part of the initial Incident Action Plan (IAP).
- If additional pages are needed for any form page, use a blank ICS 201 and repaginate as needed.

Block Number	Block Title	Instructions
1	**Incident Name**	Enter the name assigned to the incident.
2	**Incident Number**	Enter the number assigned to the incident.
3	**Date/Time Initiated** • Date, Time	Enter date initiated (month/day/year) and time initiated (using the 24-hour clock).
4	**Map/Sketch** (include sketch, showing the total area of operations, the incident site/area, impacted and threatened areas, overflight results, trajectories, impacted shorelines, or other graphics depicting situational status and resource assignment)	Show perimeter and other graphics depicting situational status, resource assignments, incident facilities, and other special information on a map/sketch or with attached maps. Utilize commonly accepted ICS map symbology. If specific geospatial reference points are needed about the incident's location or area outside the ICS organization at the incident, that information should be submitted on the Incident Status Summary (ICS 209). North should be at the top of page unless noted otherwise.
5	**Situation Summary and Health and Safety Briefing (**for briefings or transfer of command): Recognize potential incident Health and Safety Hazards and develop necessary measures (remove hazard, provide personal protective equipment, warn people of the hazard) to protect responders from those hazards.	Self-explanatory.
6	**Prepared by** • Name • Position/Title • Signature • Date/Time	Enter the name, ICS position/title, and signature of the person preparing the form. Enter date (month/day/year) and time prepared (24-hour clock).
7	**Current and Planned Objectives**	Enter the objectives used on the incident and note any specific problem areas.

ICS Form 201 Incident Briefing (continued)

Block Number	Block Title	Instructions
8	**Current and Planned Actions, Strategies, and Tactics** • Time • Actions	Enter the current and planned actions, strategies, and tactics and time they may or did occur to attain the objectives. If additional pages are needed, use a blank sheet or another ICS 201 (Page 2), and adjust page numbers accordingly.
9	**Current Organization** (fill in additional organization as appropriate) • Incident Commander(s) • Liaison Officer • Safety Officer • Public Information Officer • Planning Section Chief • Operations Section Chief • Finance/Administration Section Chief • Logistics Section Chief	• Enter on the organization chart the names of the individuals assigned to each position. • Modify the chart as necessary, and add any lines/spaces needed for Command Staff Assistants, Agency Representatives, and the organization of each of the General Staff Sections. • If Unified Command is being used, split the Incident Commander box. • Indicate agency for each of the Incident Commanders listed if Unified Command is being used.
10	**Resource Summary**	Enter the following information about the resources allocated to the incident. If additional pages are needed, use a blank sheet or another ICS 201 (Page 4), and adjust page numbers accordingly.
	• Resource	Enter the number and appropriate category, kind, or type of resource ordered.
	• Resource Identifier	Enter the relevant agency designator and/or resource designator (if any).
	• Date/Time Ordered	Enter the date (month/day/year) and time (24-hour clock) the resource was ordered.
	• ETA	Enter the estimated time of arrival (ETA) to the incident (use 24-hour clock).
	• Arrived	Enter an "X" or a checkmark upon arrival to the incident.
	• Notes (location/ assignment/status)	Enter notes such as the assigned location of the resource and/or the actual assignment and status.

8 HUMAN HEALTH & SAFETY

SCPR Section 8 requires procedures for protecting the health and safety of individuals involved in spill response actions and controlling access to and ensuring safety at locations where such actions are carried out as described below. Refer also to Section 4 Hazard Assessment and Appendix C Product Response Guides of this SCP for summaries of the health and safety concerns of diesel, gasoline, and Jet A.

Diesel and Jet A spills can generally be safely treated. **Gasoline spills require CAUTION!**

1. **Gasoline can be too volatile to attempt to clean up! Flushing the liquid and vapours with water might be required if an immediate fire and/or explosion could result.**
2. All transported fuels produce vapours that are heavier than air.

   Vapours can accumulate in low areas and pose a health hazard particularly on a calm, hot day. Responders must be prepared to move themselves or other persons out of the vapours if feeling dizzy or nauseous. The hazard area should be isolated and non-essential persons moved upwind at a safe distance (several hundred metres) if practical.
3. All fuels have increased carcinogenetic effects when they are burned. Inhaling combustion exhaust or smoke fumes should be avoided when possible.
4. All fuels can irritate the eyes and skin. Wearing goggles or wrap around safety glasses and/or a face shield and appropriate gloves are mandatory Personal Protection Equipment (PPE). Disposable coveralls and impermeable footwear are also recommended when responding to a spill.
5. The precautions and response procedures for spills of gasoline, diesel and Jet A are similar.

Precautions

- No smoking
- Remove ignition sources
- Ground/bond container and receiving equipment,
- Use non-sparking tools
- Avoid fumes (they are heavier than air).
- Deploy gas monitor to determine vapour levels
- Don respirators if a vapour hazard is determined to be present
- Extinguish with alcohol-resistant foam, CO2, Dry chemical
- Can cool with water mist

First Aid

- Call poison control immediately if swallowed. Do not induce vomiting or give milk or alcoholic beverage.
  - Vomiting can cause aspiration resulting in deadly pneumonia. If vomiting commences position the head low so that gravity help keep the liquid out of the lungs.
- If product gets in the eyes, flush with water for 15 minutes. Seek medical help if irritation persists.
- Remove person to fresh air if feeling unwell or dizzy after inhaling. Get medical advice if symptoms persist.
  - Give artificial respiration if not breathing

- Give oxygen if breathing is difficult
- Remove contaminated clothing and wash with soap and water if skin is exposed.

PPE

- Gloves: Nitrile, Viton, chlorinated polyethylene chlorosulfonated polyethylene, polyurethane.
- Boots: oil-resistant
- Eye protection: chemical safety goggles and/or full face shield.
- Respiratory Protection: cartridge respirator, organic vapour cartridge where ventilation is limited.
- Wear long sleeves, preferably coveralls

Waste Disposal

- Collect contaminated fire extinguishing/cleanup water
- Contain spillage then collect with sorbent booms and pads.
- Final cleanup with sand, diatomaceous earth, vermiculite, etc. Contact authorized disposal company.

Storage & Handling

- Keep containers tightly sealed and upright.
- Locate out of harm's way, well off roadway and away from any other traffic.
- Open drums carefully as they may be under pressure
- NOTE: Add additional inert material (e.g.., sand, dirt, silica or clay-based sorbent) and store gasoline-soaked materials, if present, in closed, sealed containers in cool ventilated area.

General Health & Hygiene

Fuels require good handling practices. For detailed information on health, safety, and hygiene for proper handling of fuels and related products, refer to the *Safety Data Sheets (SDS).*

Good Hygiene Practices

The following precautions are recommended when using petroleum products:

- **DO** wash and change work garments at least once a week for outer wear (i.e., uniform, coveralls).
- **DO** wear neoprene or PVC gloves or apply protective hand cream ("barrier cream") before starting work and after each periodic washing.
- **DO** cleanse hands and arms thoroughly with mild soap and warm water before eating and at the end of work shifts.
- **DO** get prompt treatment for any sign of skin irritation and all cuts and scratches.
- **DO NOT** wear clothing soaked with product, especially boots, shoes, belts, or watch bands.
- **DO NOT** use gasoline, kerosene, cleaning solvent and similar materials for the removal of oil or grease from the skin. Soap can be used and also baby oil is very effective.
- **AVOID** any ignition sources in the area of petroleum products. The hazard of fire, the greatest danger from fuels, is often overlooked but can result in serious bums or death.

Dermatitis and Petroleum Products

Normal skin has a protective layer of natural oils to retard moisture evaporation and to act as a chemical shield. Consequently, anything which tends to remove the natural oils from the skin may cause dermatitis. *Dermatitis (*inflammation of the skin) can be caused by use of solvent, gasoline or fuel oil. Lighter complexioned people tend to have the "driest" skin and therefore tend to be the most susceptible to developing skin problems from contact with fuel or solvent.

Skin areas subject to excess perspiration and clothing friction are the most sensitive to dermatitis: head, underarms, genitals, legs, and feet. Jewelry such as rings and watch bands can hold liquids against the skin for extended periods, leading to localized dermatitis. People who notice severe reddening, hardening, or cracking of the skin when working with solvents or fuels should seek medical advice.

Exposure to Vapours & Mists

Chronic or long term, exposure to fuel vapours should be minimized. Fuel vapours can cause headaches, nausea, dizziness or more serious medical problems if exposure is extensive or long-term.

Exposure to fuel or oil mist, or fine droplets is dangerous to the lungs, and must be avoided (by better ventilation, or by wearing breathing apparatus). Fuel or oil droplets in the lungs can cause a condition known as *"oil pneumonia",* which is serious. For this reason, it has been common practice in treating people who have swallowed fuel or solvent ~ to NOT cause them to vomit unless medically monitored. Without suitable medical precautions, a person vomiting may get fuel into the lungs.

Toxicity

Under normal handling conditions, gasoline, diesel and Jet A, have low toxicity to average healthy adults. Brief contact, or "one time exposure" to these products, is unlikely to cause lasting medical problems. However, exposure to these products can present significant hazards to susceptible groups such as children, pregnant women, and people suffering from certain chronic medical conditions. Such individuals should seek medical advice following exposure to petroleum products.

Increased health hazards (from skin contact, inhalation, or ingestion) due to specific components are possible: Some of these components have high toxicity or are suspected carcinogens.

- Gasoline (benzene);
- Jet fuels (may contain glycol-type anti-icing additive); and
- Diesel fuel (low level or polynuclear aromatic hydrocarbons).

Allergic Reactions

Many people handle or use petroleum fuels or solvents for years without experiencing health problems. Occasionally, however, an individual will suddenly become allergic or reactive to these substances. In such instances, medical evaluation is warranted.

Medical Treatment

Acute exposure: Seek immediate medical assistance (doctor, health clinic, or hospital emergency room) for significant exposure to petroleum products (especially for susceptible individuals).

Chronic exposure or chronic effects: Seek medical assistance from your doctor. Summary

Common sense, good safety practices, and good personal hygiene are the key factors in the safe use of petroleum fuels and solvents. Refer to product SDS for greater detail.

9 COMMUNICATON PROCEDURES

SCPR section 9 requires communications procedures for spill responders. Cellular phones would be the primary means of communication. Associated responsibilities are summarized below. Section 12 Spill Response Procedures details the alerting and notification protocols that Northwest Fuels would follow when mounting a response. Appendix A provides emergency contacts.

The Terrace Office will mobilize the NorthWest Fuels ERT 1-8000-308-2066

SPILL OBSERVER		
PRIORITY	***NOTIFY***	***ADDITIONAL INFORMATION***
1	**All personnel in the immediate working area**	Employees, Customers, Public
2	**Emergency Agencies (Fire, Police, Ambulance)**	Depending on the situation the responsibility can be left to the Person-In-Charge
3	**Person-In-Charge**	Usually the Plant Operator or Driver
PERSON-IN-CHARGE		
1	**Emergency Agencies (Fire, Police, Ambulance**	Fire Department very important for gasoline spills
2	**Northwest Fuels office**	Give all known details of incident.
3	**Emergency Response Team**	Contact all available trained Members
4	**Provincial Environmental Authority (as directed by Northwest Fuels ERT)**	Both PEP and AEP will normally notify other provincial government agencies and Environment Canada
5	**Other Contractors**	Contact as necessary.
6	**Neighbours**	All neighbours who could potentially be affected by the incident.
NORTHWEST FUELS EMERGENCY RESPONSE TEAM		
1	**Home Office Incident Management Team**	
2	**Regulatory Agencies** (Provincial Environmental Authority, DFO, Environment Canada, Canadian Coast Guard, WorksafeBC	Ensure Appropriate regulatory agencies have been notified.
3	**Local Government**	

10 WASTE MANAGEMENT

SCPR Section 10 requires the identification of waste management procedures for the waste resulting from any spill, including contaminated sorbents and equipment, recovered and contaminated fuel, contaminated water, contaminated soil, and contaminated debris.

A waste management plan that meets the BC Hazardous Waste Regulation will be developed in consultation with outside assistance, namely Ram Environmental and TerraPure Environmental. Should a spill enter a waterway, additional input would be obtained from Western Canada Marine Response Corporation.

Basic waste management practices would be followed by Northwest Fuels responders as part of the storage of spent materials that result from cleanup activities and their subsequent transportation:

- Segregation of oily liquids and solids from each other and from other wastes
- Clear labelling of collected wastes in closed, sealed storage containers
- Storage of wastes out of harm's way and protected from weather
- Inerting of any wastes containing gasoline using dirt, sand, particulate sorbent or other means.
- Proper manifesting and packaging of spent materials designated to be hazardous wastes prior to their transportation.
- Close consultation with MOE.

11 WILDLIFE

As required by SCPR section 11, impact on fish and aquatic wildlife will be minimized by:

- Containing the spill to prevent its entry into streams or drainage
- Recovering product from the surface of any standing water as soon as possible
- Cleaning up and properly disposing of contaminated materials as described above
- Applying well-founded biological principles to move fish and/or aquatic wildlife from contaminated areas in consultation with GHD Consultants.
- Focus Wildlife would be called to provide their expertise should the rehabilitation of affected birds, mammals, or other wildlife be required.

12 SPILL RESPONSE PROCEDURES

Notification & Reporting

Internal Notification

All spills regardless of size are to be reported by the Spill Observer immediately to the Person-In-Charge, usually the Plant Manager or Driver (**See Appendix A Contacts**). The Person-In-Charge is responsible for:

- Assessing the situation (size, severity, and circumstances of the spill)
- Determining the appropriate level of response (minor, moderate or major)
- Initiating the notification of appropriate internal and external contacts and resources.

If the Spill Observer cannot contact the Person-In-Charge, the Terrace Office is contacted immediately and will mobilize the NorthWest Fuels ERT 1-8000-308-2066

Depending on the assessment of the situation, the Person-In-Charge has the responsibility to call his or her direct supervisor, (Plant Operator, and Dispatcher). If unable to reach them, the Northwest Fuels Emergency Response Team (ERT)is called.

External Reporting

As soon as it is safely possible to do so, in consultation with Northwest Fuels Management, the Person-In-Charge or a designated ERT member will notify agencies that must be advised of the spill. Spills that are reportable to EMBC (formerly the Provincial Emergency Program – PEP) are releases that enter water and/or that threaten the environment, i.e., they have occurred outside of containment and they exceed reportable quantities:

EMBC (PEP) 1 800-663-3456
• 100 litres of petroleum products • 5 litres of toxins, e.g., antifreeze • ALL spills to water, i.e., direct into water or into pooled water or a ditch leading to water

Spills of ≥30 litres on a roadway that affect persons or infrastructure must be reported to CANUTEC:

CANUTEC 888-226-8832
Spill is 30 L or more and there is <u>one or more of the following criteria</u>: • Damage to a fuel tank of a truck or trailer has resulted in its integrity being compromised • Injury to one or more persons requiring medical treatment • Danger to the public (evacuation necessary) • Closure of a facility, railway or public road, or main waterway

It is Northwest Fuel policy to notify other agencies directly although EMBC and other organizations might indicate they intend to make these calls. See also Appendix A Contacts for specific areas.

• Transport Canada – actual or anticipated release of any quantity that could endanger public safety • Canadian Coast Guard – Marine Communications & Traffic Services – spills to water, at OHFs • Environment & Climate Change Canada – spills on First Nations land, Enforcement Officers • Worksafe BC – truck accident involving injury and/or spill

Categorizing Spills

Spills are categorized by Northwest Fuels as Tier or Level 1, 2 or 3 depending on the size, severity, and response to the spill and taking into account:

- the real or potential impacts of the incident
- the need for outside assistance
- who is contacted in an emergency
- the degree of public/media/agency communication required

Level 1 An incident that can be handled by on-site personnel. The spill is contained and removed. Contaminated waste is safely stored and proper disposal arranged.

Level 2 The scope of an incident is beyond what can be handled by on-site personnel. Assistance is required from off- site trained responders. There is no danger to the public.

Level 3: A major incident beyond the resources of Northwest Fuels. This would involve a major spill of fuel possibly complicated by fire, explosion or other threat to life, infrastructure or environment. It would include the "worst case scenario" where the entire contents of a pup and trailer (54,000 litres) are spilled. Assistance is required from local, regional, and/or provincial organizations. The media will be present and agencies might demand action.

The three tiers or levels of spills are summarized below in terms of the circumstances and actions required.

Classification of Spills		
Level 1: Minor	**Level 2: Moderate**	**Level 3: Major**
• Volume is small and contained on site (**ALL** spills must be reported to Northwest Fuels) • No risk to personnel, public, environment, or equipment • Volume is less than30 L (reportable to CANUTEC). • Handled by on-site resources. • Of no interest to the media or danger to the public.	• Volume exceeds CANUTEC reportable spill (30L). • No significant public danger or environmental impact, contained within site but possibly extends beyond site • Control of incident is probable • Possible local public or media interest and outside-assisted response • May exceed local, on-site emergency response resources	• Leaves roadway or site boundaries and/or remains on site with potential for: injury, fire, explosion, property damage, or impacts to environment or public safety • Volume exceeds EMBC reportable amount (100L). • Support of off-site personnel or other resources required. • Multi-agency response. • High media and public interest.

Emergency Response Actions		
• Limited amount of materials required for cleanup. • Spill Report Form is filled out	• Notify appropriate agencies • Northwest Fuels Terrace office is notified and provides advice and support • Lead agency may activate its own Emergency Ops Centre	• Identified as "Emergency" • Police are called out. • Maximum response. RAM, Environmental, NW Response might be called out. • Northwest Fuels notifies and communicates with lead and other agencies.

Initial Response Actions

The initial response actions are critical to the outcome of a tank truck accident including a spill. The Person-in Charge oversees an assessment of the situation and the safe, quick, and effective actions needed to be initially taken at the incident site:

INITIAL RESPONSE ACTIONS	
STEP	**ACTION**
ENSURE SAFETY	0 **STOP, THINK, AND ASSESS THE SITUATION. SAFETY FIRST ALWAYS** 0 **NEVER RUSH IN. WARN PUBLIC IN THE IMMEDIATE AREA.** 0 **SHUT OFF TANK TRUCK IGNITION AND ELIMINATE ALL AVOIDABLE SOURCES OF IGNITION. HAVE OTHER VEHICLES IN THE VICINITY TURN OFF ENGINES.** 0 **IMMEDIATELY ISOLATE THE SPILL AREA (25-50M FOR LARGER SPILLS).** 0 **TEND TO ANY SERIUOS INJURIES OR OBTAIN HELP FROM CAPABLE MOTORISTS.** 0 **USE APPROPRIATE PERSONAL PROTECTIVE EQUIPMENT.** 0 **STAY UP WIND OF SPILL VAPOURS. STAY OUT OF LOW AREAS.** 0 **DO NOT TOUCH OR WALK THROUGH SPILLED PRODUCT.**
STOP PRODUCT FLOW	0 **ACT QUICKLY. ONLY ATTEMPT TO STOP THE PRODUCT FLOW IF IT IS SAFE TO DO SO.** 0 **ACTIVATE TANK TRUCK EMERGENCY STOP BUTTON.** 0 **IF TANK TRUCK IS PUNCTURED, ATTEMPT TO PLUG LEAK IF POSSIBLE TO DO SO SAFELY. USE NON-SPARKING MATERIALS CLOTH, WOOD PLUGNDIKE.** 0 **SET CONTAINERS UP RIGHT (DRUMS, PAILS).**
SECURE THE SPILL SITE	0 **KEEP THE PUBLIC AWAY FROM THE AREA. HAVE MOTORISTS INVOLVED IN THE ACCIDENT LEAVE THEIR CARS AND MOVE A SAFE DISTANCE AWAY FROM TANKER.** 0 **INITIALLY ISOLATE LARGER SPILLS FOR 25-50M IN ALL DIRECTIONS AND CONSIDER INITIAL DOWNWIND EVACUATION OF 300M FOR BOTH DISTILLATES AND GASOLINES.** 0 **OBTAIN THE HELP OF THE POLICE AND OTHER MOTORISTS TO SECURE THE AREA.** 0 **ENFORCE SAFETY PROCEDURES**
ASSESS THE SITUATION	0 **QUICKLY AND ACCURATELY GATHER SPILL DETAILS THAT NEED TO BE COMMUNICATED TO RESPONSE PERSONNEL AND AUTHORITIES.** 0 **RECORD INFORMATION ON THE REPORT** 0 **ADDITIONAL DATA SHOULD INCLUDE: EQUIPMENT INVOLVED, AFFECTED AREAS, SITUATION UNDER CONTROL OR ESCALATING.**
NOTIFICATION	0 **ENSURE THE POLICE; FIRE AND AMBULANCE HAVE BEEN NOTIFIED AS NECESSARY.** 0 **NORTHWEST FUELS EMERGENCY RESPONSE TEAM (ERT) 1-800-308-2066 DOUG 250-615-2110 GARY 250-631-7209 ANGELA 250-975-0246 THEY WILL USUALLY MAKE THE REST OF THE PHONE CALLS AS NEEDED BUT VERIFY WHO WILL BE DOING WHAT. MAKE UP A SHORTTERM ACTION PLAN WITH HELP FROM ERT** **NOTE: PROVIDE INFORMATION CLEARLY AND CONCISELY. VERIFY THAT INFORMATION HAS BEEN UNDERSTOOD. CONFIRM TIME AND MODE OF NEXT CALL.**

INITIAL RESPONSE ACTIONS (continued)	
STEP	**ACTION**
CONTAIN DIESEL SPILL **1202**	o ALWAYS THINK "WHAT IS GOING TO HAPPEN TO ME OR ANYONE ELSE IF THIS SPILL IGNITES? IF UNSURE THEN WAIT FOR HELP. o APPROACH SPILL FROM UPWIND. o PREVENT ENTRY INTO WATERWAYS, SEWERS OR CONFINED AREAS BY BLOCKING DRAINS, CULVERTS, DITCHES, AND OTHER ESCAPE POINTS. o CONTAIN SPILL WITH SORBENTS, EARTH, SAND OR OTHER NON-COMBUSTIBLE MATERIALS. o FOR PRODUCT ENTERING DRAINAGE DITCHES OR STORM DRAINS, DETERMINE THE POTENTIAL DESTINATION(S) OF FLOW.
CONTROL GASOLINE SPILL **1203**	GASOLINE IS VERY VOLITILE AND SHOULD ONLY BE CONTAINED IF SAFE TO DO SO, IF UNSURE THEN WAIT FOR FIRE DEPARTMENT o APPROACH SPILL FROM UPWIND DIRECTION AND AVOID LOW LYING AREAS. o PREVENT ENTRY INTO WATERWAYS, SEWERS OR CONFINED AREAS BY BLOCKING DRAINS, CULVERTS, DITCHES, AND OTHER ESCAPE POINTS. o CONTAIN SPILL WITH SORBENTS, EARTH, SAND OR OTHER NON-COMBUSTIBLE MATERIALS. o USE WATER FOG/MIST OR FOAM TO CONTROL OR DISPERSE GASOLINE VAPOURS. o FOR PRODUCT ENTERING DRAINAGE DITCHES OR STORM DRAINS, DETERMINE THE POTENTIAL DESTINATION(S) OF FLOW. NOTE: THE VAPOUR OF FLAMMABLE GAS IS USUALLY HEAVIER THAN AIR AND WILL SETTLE IN LOW PLACES AND PLACES SHELTERED FROM THE WIND.
RECOVERY A& CLEANUP	o FOR SMALL SPILL, USE SORBENTS TO RECOVER PRODUCT. o FOR LARGE QUANTITIES OF POOLED PRODUCT, PUMP TO APPROPRIATE STORAGE DEVICE. DO NOT USE VACUUM TRUCKS TO RECOVER SPILLED GASOLINE. o RECOVERED PRODUCT CAN BE STORED IN EMPTY DRUMS, TANK TRUCKS, PORT-A-TANKS, OR IN THE CASE OF DISTILLATES, VACUUM TRUCKS. o REMOVE CONTAMINATED SOIL.
WASTE DISPOSAL	o COLLECT USED SORBENTS USING CLEAN NON-SPARKING TOOLS. o PLACE WASTE MATERIALS IN LEAK PROOF SEALED CONTAINERS OR APPROPRIATE 6 MIL PLASTIC BAGS. o STORE WASTE CONTAINERS TEMPERORARILY IN A SECURE LOCATION. USED SORBENT MATERIAL REPRESENTS AN EXTREME FIRE HAZARD (PARTICULARLY GASOLINE SOAKED SORBENTS). USED SORBENTS SHOULD BE KEPT IN A WELL VENTILATED AREA AWAY FROM HEAT SOURCES, DIRECT SUNLIGHT, WET WEATHER, AND GENERAL PUBLIC. o CONSULT WITH THE TERRACE ERT TEAM AND THE APPROPRIATE PROVINCIAL AUTHORITY BEFORE REMOVING WASTE FROM THE SPILL SCENE.

Roles & Responsibilities

On-site Personnel

1. Assess the situation. If anyone is injured, an area must be evacuated, a public road must be closed or there is any danger to the public, elevate the spill response to Level 3.
2. Advise coworkers, if any, on site that there is a spill. Ask someone on site, or if no one is available, report to a Person-in-Charge.
3. Assess the safety of the situation and potential impacts.
4. If unsafe, evacuate the area and report the spill to a Person-in-Charge. This becomes a Level 3 spill, follow the actions in the chart for gasoline or diesel/Jest fuel
5. If the substance is gasoline, do not attempt to recover it. Evacuate the area, double check that all possible ignition sources have been removed and call for help or wait for it to evaporate if the quantity is small enough and it is safe to do so.
6. If, at any time, you feel that you may need outside help, make the call.
7. Access spill kit and PPE (gloves, eye and/or face protection, coveralls, boots).
8. Use PPE and spill equipment to control the spill in the following order of priority
   a. Stop the leak
   b. Contain the spilled product. If containment isn't possible redirect the flow away from areas of higher impact and/or to a location where the product can be contained.
   c. Recover as much of the product as possible and clean the area.
9. If at any time you or a co-worker feels unwell or dizzy, remove yourself from the immediate area (preferably upwind to higher ground)
10. As soon as the spill is contained, report the spill to the Person-in-Charge, if this has not already been done by a co-worker.
    a. Estimate the volume of the spill particularly if it exceeds 30- litres of fuel, <u>5 litres, if antifreeze) or if ANY amount into a stream or drainage ditch</u>.
    b. Advise of any actual or possible impacts on health, safety, property orenvironment.

Person-in-Charge

1. Ensure the spill has been properly cleaned up
2. Arrange for disposal of contaminated materials (Terrapure Environmental).
3. Confirm with responders that the Initial Actions were followed. Record comments.
4. Confirm that the product or products spilled were correctly identified
5. Estimate the volume of the product(s) spilled
6. Ensure the spill has been reported to the Terrace Office.
7. Provide any additional information required by the Terrace Office

Terrace Office Personnel

1. Organize Management Team and implement ICS: IC, Information, Liaison, and Safety Officers
2. Check to confirm product type and quantity
3. Review cleanup methods used.
4. Verify reporting to ensure all required information is submitted.
5. Arrange to have the incident investigated.

13 TRAINING

Drivers and Supervisors identified in this plan as an "Officer" or "Incident Commander" must be trained in their roles and responsibilities in an ICS structure. The pertinent information (as required by SCPR section 13) can be found in Section 12 Spill Response Procedures.

Additional training will be provided by having the same personnel participate in plan tests (drills) and in discussions of the learnings of those tests.

Testing of the Plan

As per **Section 15** (2) (a) of the SCPR, although a highway transporter is not required to test a worst-case scenario, tests of this spill contingency in every year over a 3 year period will include:

- At least one discussion-based test
- At least one operations-based test (e.g., application of spill trailer contents, fire extinguisher use, first aid response, air quality monitoring)

Individuals who would respond or implement this SCP would participate in the testing with results available to the Ministry of Environment and Climate Change Strategy as well as the opportunity of MOE to observe the testing if requested to do so. The plan sections to be tested are listed below:

(a) Section 12 (3) *[notification]*

(b) Section 12 (4) (c) *[mobilization, deployment and ongoing sufficiency]* as it relates to the mobilization and deployment of spill response equipment and spill response personnel;

(c) Section 12 (4) (c) as it relates to maintaining the ongoing sufficiency of equipment, personnel and other resources;

(d) Sections 7 *[incident command system]* and 12 (4) (d) *[incident command post]*;

(e) Section 12 (4) (e) *[source control]*;

(f) Section 12 (2) and (4) (b) *[initial and ongoing assessments]*;

(g) Section 12 (4) (f) *[stabilizing, containing, removing and cleaning up]*;

(h) Section 12 (4) (g) *[protection of aspects of environment, human health and infrastructure]*;

(i) Section 12 (1) (d) *[monitoring and documentation]*;

(j) Section 9 *[communication]*;

(k) Section 10 *[waste management]*.

APPENDIX B RESPONSE TACTICS & SCENARIO

This section presents an overview of the tactics and countermeasures that may be applied to contain, recover, and clean up a land based spill. A detailed spill scenario involving a tank truck is also presented. For evacuation and isolation procedures refer to Section 4 Hazard Assessment.

The actual tactics used will depend on the unique circumstances of each incident (time of day, weather conditions, product(s) and the spill location). No two spills are the same.

Tactical Priorities

Once the safety of all personnel has been ensured, the source of the discharge secured, and initial notification activated, the overall tactical priorities should be:

- Identification of impacted or likely to be impacted areas
- Containment and recovery of spilled product
- Spill site cleanup

Development of an Incident Command Post (ICP) will be set up and members of the ERT will be notified and assembled as needed. Representatives of key government agencies will provide critical advice. The Incident Commander will decide what resources are needed and whether or not to bring in extra help from Ram Environmental and/or Norwest Response for land-based spills or WCMRC for water based spills (see Contacts). All of these organizations are on retainer by Northwest Fuels Limited and are ready to assist if needed.

The behaviour of diesel, gasoline, and Jet A determines the most appropriate and effective response tactics to be taken to contain and recover spilled product, to protect sensitive environmental resources, and to cleanup the spill site and other affected areas.

Response to a Spill to Land

Potential equipment for containing/cleaning up a spill on land

- Personal protective equipment (PPE);
- Sorbents;
- Sandbags
- Sand or earth; plastic/plywood sheeting, or neoprene mat
- Clean and empty drums
- Portable pump
- Vacuum truck
- Front end loader
- Heavy duty 6 mil plastic bags
- Non-sparking hand tools

General response steps for a land based spill

- **Carry out** initial response actions as outlined in Section 12 Response Actions
- **Identify all potential destinations of spilled product by anticipating the flow of spilled product.**
- Block drains, culverts, ditches and other escape points to prevent entry into waterways, sewers, basements, or confined areas.
- Attempt to prevent further spreading of product by building barriers to contain it. Use commercial sorbents, booms, earth, sand or other non-combustible materials. Storm drains can be blocked using prefabricated manhole covers (neoprene mats). Sandbags or earth on top of Sorbent pads, plywood, or plastic sheeting can also be used. (see Diagram 3.3)

Product which is contained in sumps, catch basins, oil/water separator, berms, or trenches should be pumped out as soon as possible using portable pumps and temporary storage containers such as drums, or by using a vacuum truck***. Do not use vacuum trucks for recovery of gasoline spills***. Catch basins and oil/water separator have limited oil retaining capacity and will eventually discharge oil to storm sewer systems. Consider closing inlet and/or outlet valves to/from separators. Small pools of standing product can be cleaned up using sorbents.

Waste materials (sorbents, contaminated earth) should be stored in a secure area such as the tank farm containment area or barrel storage area and should be disposed of according to BC regulations. Used sorbent materials are a fire hazard particularly gasoline soaked sorbents and should be kept in a well ventilated area away from heat sources, direct sunlight and wet weather. Contaminated earth may have to be removed for treatment.

3.4.1 Containment of Spills

For a spill of diesel, gasoline, or Jet A on concrete or asphalt, whenever possible, keep response operations on the uphill and upwind side of the spill area. Try to avoid working in areas where fuel has pooled and which would result in fuel flowing towards you. Spills on unpaved land can be encouraged to flow into open drainage ditches by flushing with a hose or can be contained by making temporary pits or dikes to hold the product. Spills that can be directed into open ditches are relatively easily blocked off with a barrier of straw, sorbent boom, logs, weirs, or other barrier that will hold back oil on the surface but allow water to pass through. Wire mesh or snow fences can be used for this purpose. Before a spill is directed into a temporary pit it should be lined with heavy gauge plastic to limit the soil contamination by the product. Water fog or mist should be used to control or disperse gasoline vapours.

Special Considerations for Gasoline Spills

Spills of gasoline are unlikely to result in long-term environment impacts but pose a maximum fire or explosion hazard. In any response to a gasoline spill, the risk of explosion or fire is the main concern. Immediate steps should be taken to stop all sources of spark or ignition. Fuel vapour is heavier than air and will form an invisible blanket which, in the absence of any wind, will spread out along the ground and settle in low areas. Open basement windows can provide access for the vapour to reach pilot light flames and ignite. In populated areas, depending on the size and location of the spill, it may be necessary to evacuate the adjacent properties,

request police assistance to cordon off the area to all traffic, and have the utility company cut the power to the affected area. Some fire departments are equipped with petroleum fire fighting foam which can be used to blanket the spill and reduce fire or explosion hazard.

Recovery Techniques

When a fuel spill is contained, various methods can be considered to recover it. Depending on the volume of the product, a vacuum truck may be used (**Do not use vacuum trucks for gasoline spills!**); hand trash pump, sorbents, straw or peat moss. Straw or peat moss should not be used if you are using any kind of pump as it could plug. Port-a-tanks or drums can be used to store recovered product. Port-a-tanks are better suited for this as they are commonly equipped with a bottom discharge valve to draw off water.

For a spill within a tank farm, it may be possible to use the tank farm sump pump with a few minor discharge piping changes that will allow the pumping of product to temporary storage. Portable explosion-proof pumps can also be used. Residual product can be flushed to the sump using water. Manual recovery is best suited for small spills and thin sheens, sorbent pads are well suited for this procedure. For a fast response, sorbent pads should be applied generously. Mechanical and manual recovery techniques are not mutually exclusive. An effective response can involve both techniques.

NOTE: Used sorbents are classified as hazardous waste under BC legislation and must be treated accordingly. The flammability of used sorbents must be taken into consideration when temporarily storing them. Keep sorbents away from other combustibles and in a well-ventilated area.

If the product has seeped into the ground, it should be recovered by digging an open trench or well to expose the water table, and using pads or skimmers to collect the product. Soil that has been contaminated may have to be removed to an approved site for disposal or treatment. Therefore, all efforts should be made to minimize size of the affected area and thus the volume of the contaminated soil.

General Containment Strategies For Land Spills

Blocking a Manhole or Storm Drain

The graphic below shows a simple method for blocking a manhole or storm drain to prevent product from entering a storm sewer system. Prefabricated neoprene mats, plastic sheets, or plywood sheets can be used along with sand or dirt for this purpose.

Scenario: Diesel Fuel Spill Resulting from a Road Accident

A tandem axle tank truck is involved in a single vehicle highway road accident in which the truck rolls over en route to a customer delivery location. Diesel fuel immediately begins to leak from a hole punctured in the shell of the overturned tank truck. No injuries to the driver or public are incurred.

Location	Rural Highway
Time and Date	1100 Hours, January
Weather	Light snow -6°C
Wind	Calm
Surrounding Activities	Few vehicles on highway due to weather conditions. On site managers at respective offices.

Hour 0 – 0.5 (1100 – 1130 Hours)	
Step	**Actions Taken**
Safety & Security	**The safety of the public, driver and responders is the highest priority.** The driver eliminates all sources of ignition nearby the tank truck by shutting off the trucks ignition and requesting drivers in the immediate area to shut off engines and to extinguish other ignition sources. All non emergency personnel are evacuated. They remain upwind of the spill area. Using pylons, the road is blocked to all vehicles other than emergency. The driver has one of the motorists at the incident scene notify the police and fire department of the incident. The driver ensures that all suitable personal safety precautions have been taken. He does not leave the accident scene unless injured or relieved.
Stop the discharge	The driver quickly determines that the punctured tank shell is too badly damaged to be plugged with a simple wedge, block of wood, or other available material.
Situation Assessment	The driver Conducts a brief but thorough assessment of the situation identifying: o Estimate quantity of spilled product. o Potential spread of the product. o Initial response actions taken so far. o Level and type of assistance required.

Hour 0 – 0.5 (1100 – 1130 Hours) cont.	
Step	**Actions Taken**
Notification & Reporting	The driver determines that the spill is substantial and at first opportunity (by radio, cellular phone, or third party) notifies the dispatcher at the office, thereby starting the predetermined notification process. The Dispatcher contacts the following: 1 Terrace ERT Team 2 EMBC (PEP). 3 All available ERT members who immediately deploy to the accident scene (e.g. other truck drivers and agency employees). 4 Emergency agencies to ensure they are on the way
Containment & Control	The released product is uncontained and migrating towards a drainage ditch. Using a snow shovel from the truck the driver attempts to build a dam by shovelling snow/dirt into the ditch. Sorbent pads are placed at the leading edge of the spill.

Hour 0.5 -2 (1130-1300 Hours)	
STEP	**Actions taken**
Safety & Security	The police and fire department assist in securing the area. A "Tailgate" Safety Meeting is held to go over what needs to be done and what safety procedures are to be followed.
Notification & Reporting	A Terrace ERT member contacts the provincial environment authority to confirm earlier notification by the dispatcher. A ow truck, Excavator, Dump Truck, Vacuum Truck and outside help from Ram Environmental are all called in to help.
Incident Management	The nearest On site Manager arrives at the accident site with spill supplies and conducts a situation assessment briefing with key staff and government agency representatives in attendance. The On site Manager takes over as Incident Commander. ERT members begin to show up from Terrace An ERT member walks along the drainage ditch to monitor product movement.
Containment & Control	It is estimated that a total of 2,000 litres was released from the overturned tank truck before flow of product was stopped. Sorbent boom is deployed downstream in the ditch. Minor trenching and build-up of the drainage ditch dam is required to help contain the spilled diesel in a small an area as possible.
Recovery & Cleanup	Sorbents are wrung out into barrels brought to the site by the SRT.

Hour 2-6 (1300-1700 Hours)	
STEP	**Actions taken**
Safety & Security	Appropriate safety procedures continue to be observed Response personnel only precipitate in operations they have been trained for. The security of the incident site continues to be handled by the police and fire department.
Incident Management	A basic Incident Command System is now in place with the on site manager as the Incident Commander and the Operations Chief. Planning, Logistics and Finance being taken care out of the Terrace office. The Incident Commander and Government Representatives discuss the various options for removing the remaining product from the overturned tank truck (i.e. cold tap, hatch cone device, piping modifications to truck) or right the truck without removing product. The Incident Commander and the Provincial Environmental Authority representative agree to issue a joint information release, following a request from a local newspaper reporter. A portable generator and emergency lighting is ordered from a local rental equipment business.
Recovery & Clean up	Clean pooled product in the drainage ditch is pumped directly to an empty tank truck. Using an explosion proof trash pump, the remaining product in the drainage ditch is pumped to empty drums. Following a decision to modify the truck piping, the product in the overturned tank truck is pumped to an empty agency tank truck.

Hour 6-12 (1700-2300 Hours)	
Step	**Actions Taken**
Safety & Security	Appropriate safety procedures continue to be observed. Emergency lighting is set up and operating. A Quantum Environmental Representatives shows up and takes over as Incident Commander for final cleanup.
Containment & Recovery	A temporary weir dam is constructed in the drainage ditch to help contain any remaining product that may seep to the surface over time.
	Pumping of clean pooled product in the drainage ditch is completed. Pumping out of overturned truck is completed.

Recovery & Clean up	The over turned tank truck is righted and towed back to the agency or other suitable, secure yard. Recovery and clean up operations continue until all spilled product and contaminated materials have been recovered. Remaining product is absorbed using Sorbent pads and granular Sorbent.
Waste Management	Drums containing diesel fuel from drainage ditch are taken to the agency and stored for pick up by Newalta. Solid wastes are packaged and also taken to the agency and stored for pick up by Newalta. Prior to preparing for disposal plan for recovered waste materials, the provincial environmental authority is consulted and agreement is reached for off site disposal of varies waste materials.
Business Resumption	The Terrace Incident Commander, Police Fire department, the provincial environmental authority, conducts a joint inspection of the spill area to determine that the spill is satisfactorily cleaned up prior to officially terminating response operations. Normal traffic patterns at the accident site are allowed to resume.

Hour 12+	
Step	**Actions Taken**
Monitoring & Cleanup	For an appropriate period of time following the incident, the drainage ditch is checked for oil showing up on the surface of storm water, at the weir dam. Depending on the location and level of soil contamination, BC MOE may require soil remediation activities at the accident site.
Formal Report	The ERT incident commander undertakes a full and through investigation of the incident and complete a formal incident reports.

APPENDIX C PRODUCT RESPONSE GUIDES

For more detailed information, refer to the Safety Data Sheets (SDSs) provided by the supplier.

SDSs MUST be updated every 3 YEARS or whenever a new product is used.

- Antifreeze
- Diesel
- Gasoline
- Hydraulic Fluid
- Jet A
- Lube Oil
- Sulphuric Acid (battery acid)

NOTE:

- The Emergency Response Team will be provided with Safety Data Sheets (SDS) for ALL transported fuels.
- SDSs will be available in all strategic locations including storage, dispensing, and points of use.
- SDSs will also be available in all regional offices of Northwest Fuels.
- SDSs will be maintained and updated as necessary by the Operations Manager.

Antifreeze (Ethylene Glycol)

Typical Physical and Chemical Properties			
Soluble, irritant, toxic liquid			
Appearance	Clear colourless to green liquid	**Flash Point**	116°C
Odour	Slight; undetectable <25 ppm	**Pour Point**	-13°C
Solubility	Very soluble in all proportions	**Flammability**	3.2 to 15.3%
Viscosity	Not viscous (22 cSt)	**Toxicity**	TLV 50 ppm
Vapour Density	Will sink to ground levels	**Specific Gravity**	Same as water

Safety Measures

Warnings

- Vapours are heavier than air.
- Empty containers can, but are unlikely to, contain explosive vapours.
- Ingestion of very small quantities (several ml) can be lethal.
- Eye contact causes irritation.
- Skin contact can cause intoxication due to absorption.
- Inhalation of vapours can cause intoxication, headache, vomiting, and unconsciousness with convulsions.

Personal Protection

- Wear impervious, chemical-resistant clothing, gloves, footwear, and goggles when appropriate to do so; neoprene, nitrile and PVC are suitable protective materials.
- Breathing protection, e.g., cartridge respirator may be necessary but is unlikely.

Precautions

- Eliminate ignition sources.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog. (**note:** Water or foam may cause frothing.)
- Use water to cool containers exposed to fire.

Response to Spills

Consider actions only if safety permits!

Containment and Removal

- **On land,** do not flush into water.
- Block entry into waterways.
- Contain spill by diking with earth or other barrier.
- Remove minor spills with Universal sorbent.
- Remove large spills with pumps or vacuum equipment.

- **On water**, ethylene glycol sinks and mixes.
- Contain spill by damming or diverting contaminated water.

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- Segregate waste types and place in marked containers.
- Consult disposal company on transportation and disposal requirements.

First Aid

Get prompt medical attention!

Eyes
- Flush eyes immediately with fresh, warm water (**not hot water**) for 20 minutes while holding the eyelids open.
- Remove contact lenses, if exposed to vapours or liquid.

Skin
- Remove contaminated clothing.
- Wash skin thoroughly with soap and water.

Inhalation
- Move victim to fresh air.
- Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- Provide oxygen if victim is having difficulty breathing.

Ingestion
- **Induce vomiting immediately**.
- If victim is conscious, give two glasses of water and stick finger down throat.

Diesel (UN 1202)

Typical Physical and Chemical Properties			
***Danger! Combustible liquid*.**			
Storage	Various tanks	**Flammability**	Combustible liquid
Appearance	Clear, pale yellow or red	**Flash Point**	38 to 55°C
Odour	Petroleum	**Freezing Point**	-50 to -6°C
Solubility	Insoluble	**Viscosity**	Not viscous
Vapour Density	Will sink to ground levels	**Specific Gravity**	Floats on water

Safety Measures

Warnings

- Vapours heavier than air form at high temperatures and may persist in depressions.
- Empty containers can contain explosive vapours.
- Toxic gases form upon combustion.
- Eye contact causes irritation.
- Diesel can accumulate static electricity charges.
- Inhalation of vapours can cause irritation of the respiratory tract, headache, vomiting and unconsciousness.

Personal Protection

- Wear impervious, chemical-resistant clothing, gloves, footwear and goggles when appropriate to do so; nitrile and Viton are suitable protective materials (**do not** use natural rubber, neoprene or PVC for prolonged periods).
- If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.

Precautions

- Eliminate ignition sources.
- Electrically ground and bond containers when transferring diesel.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog.
- Use water to cool containers exposed to fire.

Diesel (UN 1202)

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- **On land**, block entry into waterways.
- Do not flush into ditches or drainage system.
- Contain spill by diking with earth or other barrier.
- Remove minor spills with sorbent.

- **On water**, use booms to contain and concentrate spill.
- Remove spill using sorbent, skimmer or vacuum truck.
- Protection booming can be considered for water intakes/marinas.

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- Electrically ground/bond containers and vehicles during transfer.
- Segregate waste types.
- Place contaminated materials into marked containers.
- Consult disposal company on transportation and disposal requirements.

First Aid

Get prompt medical attention!

Eyes
- Flush eyes immediately with fresh, warm water (**not hot water**) for 20 minutes while holding the eyelids open.
- Remove contact lenses, if exposed to vapours or liquid.

Skin
- Remove and launder contaminated clothing.
- Discard saturated leather articles.
- Wash skin thoroughly with soap and water.

Inhalation
- Move victim to fresh air.
- Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- Provide oxygen if victim is having difficulty breathing.

Ingestion
- **Do not** induce vomiting.
- If victim is conscious, give milk or water to drink.
- If victim vomits, keep head below hips to prevent aspiration.

Gasoline (UN 1203)

Typical Physical and Chemical Properties			
Danger! Highly flammable liquid – explosive vapours can form!			
Storage	Various tanks	**Flammability**	Flammable liquid
Appearance	Colourless liquid (can be dyed)	**Flash Point**	-40 to -50°C
Odour	Gasoline/petroleum	**Freezing Point**	-60°C
Solubility	Insoluble	**Viscosity**	Not viscous
Vapour Density	Will sink to ground levels	**Specific Gravity**	Floats on water

Safety Measures

Warnings

- Vapours instantaneously form that are heavier than air.
- Empty containers can contain explosive vapours.
- Vapours can travel to distant sources of ignition and flash back.
- Eye contact causes irritation.
- Gasoline can accumulate static electricity charges.
- Inhalation of vapours can cause irritation of the respiratory tract, headache, vomiting and unconsciousness.

Personal Protection

- Wear impervious, chemical-resistant clothing, gloves, footwear and goggles when appropriate to do so; nitrile and Viton are suitable materials (**do not** use natural rubber, neoprene or PVC).
- If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.

Precautions

- Monitor for explosive atmosphere.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Eliminate ignition sources.
- Electrically ground and bond containers when transferring fuel.
- Restrict access and work upwind of spill.

Response to Fires

Consider action only if safety permits!

- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog.
- Use water to cool containers exposed to fire.

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- **On land**, block entry into waterways.
- Do not flush into ditches or drainage system.
- Contain spill by diking with earth or other barrier.
- Remove minor spills with sorbent.

- **On water**, do not attempt to contain or remove spills.
- Disperse with water spray.

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, well-ventilated areas away from acids, fuels and solvents.
- Electrically ground containers and vehicles during transfer.
- Segregate waste types and place in marked containers.
- Consult disposal company on transportation and disposal requirements.

First Aid

Get prompt medical attention!

Eyes
- Flush eyes immediately with fresh, warm water (**not hot water**) for 20 minutes while holding the eyelids open.
- Remove contact lenses, if exposed to vapours or liquid.

Skin
- Remove and launder contaminated clothing.
- Discard saturated leather articles.
- Wash skin thoroughly with soap and water.

Inhalation
- Move victim to fresh air.
- Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- Provide oxygen if victim is having difficulty breathing.

Ingestion
- **Do not** induce vomiting.
- If victim is conscious, give milk or water to drink.
- If victim vomits, keep head below hips to prevent aspiration.

Hydraulic Oil

Typical Physical and Chemical Properties			
Combustible liquid that can generate toxic fumes in fire.			
Storage	20 L pails, 200 L drums	**Flammability**	Combustible liquid
Appearance	Straw-yellow liquid	**Flash Point**	215°C
Odour	Petroleum	**Pour Point**	-25°C
Solubility	Generally insoluble	**Viscosity**	Medium (265 cSt @ 15°C)
Vapour Density	Few vapours emitted	**Specific Gravity**	Floats on water (0.88)

Safety Measures

Warnings

- Vapours are heavier than air and may persist in depressions.
- Toxic gas can form in fire and at high temperatures.
- CO, CO_2 and dense smoke are produced upon combustion.
- Material can accumulate static charges.
- Oil mist or vapour from hot oil can cause irritation of the eyes, nose, throat and lungs.

Personal Protection

- Wear impervious, chemical-resistant clothing, gloves, footwear and goggles when appropriate to do so; nitrile, neoprene and Viton are suitable materials (**do not** use natural rubber or PVC).
- If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.

Precautions

- Avoid excessive heat, which can cause formation of vapours.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Eliminate ignition sources.
- Restrict access and work upwind of spill.

Response to Fires

Consider action only if safety permits!

- Wear eye protection when responding to hydraulic oil fires.
- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog. (**note:** Water or foam may cause frothing.)
- Use water to cool containers exposed to fire.

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- **On land**, block entry into waterways.
- Do not flush into ditches or drainage system.
- Contain spill by diking with earth or other barrier.
- Remove minor spills with sorbent.

- **On water**, use boom or other barrier to contain and concentrate spill.
- Remove spill using sorbent, pump or vacuum system.

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- Electrically ground containers and vehicles during transfer.
- Segregate waste types.
- Place contaminated materials into marked containers.
- Consult disposal company on transportation and disposal requirements.

First Aid

Get prompt medical attention!

Eyes

- Flush eyes immediately with fresh, warm water (**not hot water**) for 20 minutes while holding the eyelids open.
- Remove contact lenses, if exposed to vapours or liquid.

Skin

- Remove and launder contaminated clothing.
- Discard saturated leather articles.
- Wash skin thoroughly with soap and water.

Inhalation

- Move victim to fresh air.
- Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- Provide oxygen if victim is having difficulty breathing.

Ingestion

- **Do not** induce vomiting.
- If victim is conscious, give milk or water to drink.
- If victim vomits, keep head below hips to prevent aspiration.

Jet A-1 (UN 1863)

Typical Physical and Chemical Properties			
Danger! Flammable liquid – explosive vapours can form!			
Storage	Various tanks	**Flammability**	Flammable liquid
Appearance	Clear, pale yellow or red	**Flash Point**	38°C
Odour	Petroleum	**Freezing Point**	-40°C
Solubility	Insoluble	**Viscosity**	Not viscous
Vapour Density	Will sink to ground levels	**Specific Gravity**	Floats on water

Safety Measures

Warnings

- Vapours heavier than air form at high temperatures and may persist in depressions.
- Empty containers can contain explosive vapours.
- Toxic gases form upon combustion.
- Eye contact causes irritation.
- Jet A-1 can accumulate static electricity charges when stored and transferred.
- Inhalation of vapours can cause irritation of the respiratory tract, headache, vomiting and unconsciousness.

Personal Protection

- Wear impervious, chemical-resistant clothing, gloves, footwear and goggles when appropriate to do so; nitrile and Viton are suitable protective materials (**do not** use natural rubber, neoprene or PVC for prolonged periods).
- If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.

Precautions

- Eliminate ignition sources.
- Electrically ground and bond containers when transferring Jet A.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Restrict access and work upwind of spill.

Response to Fires

Consider actions only if safety permits!

- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog.
- Use water to cool containers exposed to fire.

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- **On land**, block entry into waterways.
- Do not flush into ditches or drainage system.
- Contain spill by diking with earth or other barrier.
- Remove minor spills with sorbent.

- **On water**, use boom or other barrier to contain and concentrate spill.
- Remove spill using sorbent, pump or vacuum system.

NOTE: Jet A evaporates at various rates depending on the spill and weather conditions. Do not assume complete evaporation will occur.

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- Electrically ground/bond containers and vehicles during transfer.
- Segregate waste types.
- Place contaminated materials into marked containers.
- Consult disposal company on transportation and disposal requirements.

First Aid

Get prompt medical attention!

Eyes
- Flush eyes immediately with fresh, warm water (**not hot water**) for 15 minutes while holding the eyelids open.
- Remove contact lenses, if exposed to vapours or liquid.

Skin
- Remove and launder contaminated clothing.
- Discard saturated leather articles.
- Wash skin thoroughly with soap and water.

Inhalation
- Move victim to fresh air.
- Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- Provide oxygen if victim is having difficulty breathing.

Ingestion
- **Do not** induce vomiting.
- If victim is conscious, give milk or water to drink.
- If victim vomits, keep head below hips to prevent aspiration.

Lube Oil

Typical Physical and Chemical Properties			
Combustible liquid that can generate toxic fumes in fire.			
Storage	2o L pails, totes	**Flammability**	Combustible liquid
Appearance	Amber liquid	**Flash Point**	190 to 220°C
Odour	Petroleum	**Pour Point**	-37°C
Solubility	Generally insoluble	**Viscosity**	Medium (255 cSt @ 15°C)
Vapour Density	Few vapours emitted	**Specific Gravity**	Floats on water (0.89)

Safety Measures

Warnings

- Toxic gas can form in fire and at high temperatures.
- CO, CO_2 and dense smoke are produced upon combustion.
- Material can accumulate static charges.
- Hot oil vapours can irritate the eyes, nose, throat and lungs.

Personal Protection

- Wear chemical-resistant clothing, gloves, footwear and goggles when appropriate to do so; nitrile and Viton are suitable materials (**do not** use natural rubber, neoprene or PVC).
- If appropriate, wear full-face organic vapour cartridge respirator where oxygen is adequate.

Precautions

- Avoid excessive heat, which can cause formation of vapours.
- Avoid contact with acids, chlorine, ozone and peroxides.
- Eliminate ignition sources.
- Restrict access and work upwind of spill.

Response to Fires

Consider action only if safety permits!

- Wear eye protection when responding to lube oil fires.
- Avoid confined spaces.
- Shut off fuel supply.
- Extinguish fire with CO_2, dry chemical, alcohol foam or water fog. (**Note:** Water or foam may cause frothing.)
- Use water to cool containers exposed to fire.

Response to Spills

Eliminate ignition sources! Consider actions only if safety permits!

Containment and Removal

- **On land**, block entry into waterways.
- Do not flush into sewer or drainage system.
- Contain spill by diking with earth or other barrier.
- Remove minor spills with sorbent.

- **On water**, use boom or other barrier to contain and concentrate spill.
- Remove spill using sorbents pump or vacuum system.
-

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, ventilated areas away from incompatible materials.
- Electrically ground/bond containers and vehicles during transfer.
- Segregate waste types and place in marked containers.
- Consult disposal company on transportation and disposal requirements.

First Aid

Get prompt medical attention!

Eyes

- Flush eyes immediately with fresh, warm water (**not hot water**) for 15 minutes while holding the eyelids open.
- Remove contact lenses, if exposed to vapours or liquid.

Skin

- Remove and launder contaminated clothing.
- Discard saturated leather articles.
- Wash skin thoroughly with soap and water.

Inhalation

- Move victim to fresh air.
- Perform AR if victim not breathing (use Holger-Nielson method and **not** mouth-to-mouth method if victim inhaled or ingested the substance).
- Provide oxygen if victim is having difficulty breathing.

Ingestion

- **Do not** induce vomiting.
- If victim is conscious, give milk or water to drink.
- If victim vomits, keep head below hips to prevent aspiration.

Sulphuric Acid (Battery Acid UN 1830)

Typical Physical/Chemical Properties			
Danger! Highly corrosive, toxic liquid that reacts with many chemical and metals.			
Storage	Batteries	**pH**	0.3
Appearance	Colourless oily liquid	**Flash Point**	Not flammable/combustible
Odour	Acrid odour	**Boiling Point**	276 to 330°C
Solubility	Soluble in water.	**Freezing Point**	-11°C
Vapour Density	Heavier than air (3.4)	**Specific Gravity**	Sinks in water (1.67 to 1.84)

Health and Safety

Warnings

- **Highly corrosive** to all body tissues including skin, eyes, teeth, lungs.
- Direct skin contact may cause deep painful burns, shock and collapse.
- **Highly toxic** and may be fatal if ingested.
- Inhalation may cause breathing difficulties, irritation and death.
- Sulphuric acid is classified as a Group1 Carcinogen.

Personal Protection

- Wear face shields, splash-proof safety goggles, rubber boots, heavy rubber gloves, rubber aprons/suits.
- Wear respirator for pools, SCBA and Level A suit for mist, as required.
- Rubber, PVC gloves are recommended. Neoprene, nitrile are OK.

Precautions

- Avoid contact with organic materials, most metals and oxidizers.
- Avoid methanol, hydrogen peroxide, sulphides and sodium chlorate.
- Can generate explosive hydrogen gas in contact with metals.
- **Do not add water to concentrated acid**; heat, splattering occurs.

Response to Fires

Consider action only if safe!

- Generates SO_2 and SO_3 in fire.
- Use dry chemical or CO_2 to extinguish small fires.
- Use water spray or fog for larger fires
- Water added to concentrated acid results in heat, violent spattering.

Response to Spills

Consider actions only if safety permits!

On Land

Containment and Removal

- Remove ignition sources. Ventilate area.

- **Inside buildings**: neutralize with baking soda or colour-coded neutralizer.
- Do not flush into ditches and drains. Eco-toxic effect can occur.
- Call for help if significant quantity is spilled or people are affected.

- **Outside buildings**: contain spill by diking with sand or earth.
- Use only chemical-rated pump.
- Neutralize with baking soda or neutralizer with colour indicator.
- Remove minor spills with Universal sorbent.
- Rinse residuals with water deluge and mild alkali.

On Water

- Will sink and mix completely with water.
- Contain spill: isolate contaminated water by damming or diversion.

Storage, Transfer and Disposal

- Store closed, sealed, labelled containers in cool, well-ventilated areas.
- Keep away from incompatible materials such as water, metals and fuels.
- Segregate waste types and place in marked containers.
- Consult Environmental Technician on transportation and disposal needs.

First Aid

Get prompt medical attention!

Eyes

- Flush eyes immediately with plenty of fresh, warm water (**not hot water**) for at least 15 minutes.
- Remove contact lenses if exposed to vapours or liquid.

Skin

- Remove contaminated clothing.
- Flush with water for at least 15 minutes.

Inhalation

- Move victim to fresh air.
- Perform AR if victim not breathing. Do not use mouth-to mouth.
- Provide oxygen if victim is having difficulty breathing.

Ingestion

- Administer large quantities of water, if victim is conscious.
- **Do not** induce vomiting.
- If victim vomits, keep head below hips to prevent aspiration.

APPENDIX D TANK TRUCK CAPACITIES

Individua; tank capacities for the Northwest Fuels Ltd. Fleet are presented in this section for quick reference.

Unit #		Safe Fill	Diesel	Regular	
103					**Tractor**
302	**1**	15000	11000	12500	**Front of B-Train**
	2	7000	4000	5000	
	3	12000	10000	11000	
	Total	**34000**	**25000**	**28500**	
303	**1**	11000	10000	11000	**Rear of B-Train**
	2	17000	14000	16500	
	Total	**28000**	**24000**	**27500**	
103					**Tractor**
42A	**1**	17000	11200	13800	**Front of B-train**
	2	17000	13500	16000	
	Total	**34000**	**24700**	**29800**	
42B	**1**	11000	10000	10000	**Rear of B-train**
	2	17500	15000	17000	
	Total	**28500**	**25000**	**27000**	
501	**1**	2700	1400	2000	**Tandem Fuel Truck**
	2	3800	3700	3700	
	3	5700	5600	5600	
	4	5500	4600	5000	
	Total	**17700**	**15300**	**16300**	
1602	**1**	12400	12000	12000	

	2	11000		9000		11000	**Quad axle fuel trailer**
	3	10000		10000		10000	
	Total	**33400**		**31000**		**33000**	
601	**1**	3600		2200		3300	**Tridem Fuel truck**
	2	6700		6500		6700	
	3	6700		6500		6700	
	4	6700		4500		6500	
	Total	**23700**		**19700**		**23200**	
602	**1**	12000		11500		11800	**Quad axle fuel trailer**
	2	5000		3000		4000	
	3	5000		2500		4000	
	4	10500		10000		10000	
	Total	**32500**		**27000**		**29800**	
605							**Tractor**
35A	**1**	17000		11200		13800	**Front of B-Train**
	2	17000		13500		16000	
	Total	**34000**		**24700**		**29800**

APPENDIX E TDG REPORT FORM

Transport Canada / Transports Canada

TRANSPORTATION OF DANGEROUS GOODS
30-DAY FOLLOW-UP REPORT

PART I: REPORTING TIMELINE

1. Please provide applicable dates and check one box

Date of initial report to CANUTEC (yyyy-mm-dd): _____

30-Day Follow-up Report submission date (yyyy-mm-dd): _____

◯ 30-Day Follow-up Report

◯ Update or amendment to 30-Day Follow-up Report

• Date original 30-Day Follow-up Report submitted (yyyy-mm-dd): _____

FOR INTERNAL USE ONLY

Road, Rail or Marine Reports

◯ Release

◯ Anticipated Release

Air Report

◯ Dangerous Goods Accident or Incident

PART II: CONTACT INFORMATION

2. Information of the person completing this report

☐ Consignor ☐ Consignee ☐ Carrier/Aircraft Operator ☐ Other

First Name	Last Name	Title	
Telephone (999-999-9999)	Company Name		
Address		City	Province/Territory
Country	Postal Code (Z9Z 9Z9)	Email	

3. Information on the Consignor, Consignee and Carrier/Aircraft Operator

Consignor

First Name	Last Name	Title	
Telephone (999-999-9999)	Company Name		
Address		City	Province/Territory
Country	Postal Code (Z9Z 9Z9)	Email	

Consignee

First Name	Last Name	Title	
Telephone (999-999-9999)	Company Name		
Address		City	Province/Territory
Country	Postal Code (Z9Z 9Z9)	Email	

Carrier/Aircraft Operator

PART III: INCIDENT INFORMATION

4. Please indicate the date and time of the incident

Date (yyyy-mm-dd)	Time (24-hour system)

5. Geographic location of the incident

Address

City	Province/Territory	Postal Code (Z9Z 9Z9)	GPS Position

If the incident occured by rail, please indicate the milepost and subdivision	If the incident happened on First Nations Territory, please indicate the Territory name

Origin of consignment	Destination of consignment
◯ Same address as consignor ◯ Same address as consignee	◯ Same address as consignor ◯ Same address as consignee
◯ Other (please provide address):	◯ Other (please provide address):

6. Geographic Area (Check only one box)

◯ **Urban** Mixed use – residential, commercial
◯ **Suburban** Primary residential
◯ **Rural** Small towns, villages, agricultural lands
◯ **Wilderness/Remote** Little or no population

7. Mode of Transport (Check all applicable boxes)

☐ Road ☐ Rail ☐ Air ☐ Marine

8. If MARINE was checked on question 7, please indicate the position of the vessel and the next location at which the vessel will be at anchor or alongside a fixed facility

Position	Next location

9. Phase of Transport (Check only one box)

◯ **In-Transit** Consignment moving between origin and destination
◯ **Loading** Consignment is being packed or loaded into a means of transport at origin
◯ **Unloading** Consignment is being unpacked or unloaded from a means of transport at destination
◯ **Temporary Storage** Consignment is in short term storage pending transportation

10. Type of Incident (Check all applicable boxes)

☐ **Collision/Sideswipe** Moving vehicles striking an object, animal, or another vehicle
☐ **Derailment** Railcar leaving the rail tracks
☐ **Ran off road** Vehicle enters a soft shoulder, ditch or similar area
☐ **Overturn** Vehicle turning on its side or upside down
☐ **Loadshift** Shifting of the consignment within a vehicle
☐ **Dropped** Means of containment falling unexpectedly
☐ **Struck** Means of containment being struck by another object
☐ **Other (Please specify):** _____

11. Type of Release (Check all applicable boxes)

☐ **Spill** Quick, immediate discharge, emission or escape
☐ **Leak** Slow, sporadic or continuous discharge, emission or escape
☐ **Explosion** Violent sudden release of energy from means of containment producing a shock wave that may result in fragment projection and/or fire ball
☐ **Fire** Burning substances combined with oxygen to typically produce flame, heat and smoke
☐ **BLEVE** Boiling Liquid Expanding Vapour Explosion
☐ **Vapour** Dispersion in air of particles of a substance that is liquid or solid in its normal state
☐ **Venting** Controlled release of gas into the environment
☐ **Anticipated Release** Distressed means of containment that is not leaking, venting or otherwise releasing its contents

16-0066E (1611-03)

Please send completed form to dgr-rcdt@tc.gc.ca
A copy of the 30-Day Follow-up Report must be retained for 2 years

Canada

12. Information on the Dangerous Goods

UN Number	Shipping Name	Primary Class	Subsidiary Class(es)	Packing Group or Category	Total Quantity in MOC Before the Release or Anticipated Release	Units *(kg, L, etc.)*	Estimated Quantity Released *(if applicable)*	Units *(kg, L, etc.)*

13. Means of Containment

Please provide a description of the means of containment involved in the incident by completing the appropriate forms from Annex E of the Guide (TP15294)

PART IV: CONSEQUENCES

14. Consequences of the incident (Check all applicable boxes)

NOTE: Refer to the Guide for more information on how to complete this section

☐ Human ☐ Property (e.g. product loss, facility, equipment) ☐ Environmental (e.g. contamination of waterway, ground, air)

15. Evacuation of people and buildings/Shelter in place

Was there an Evacuation as a result of the incident? ◯ Yes ◯ No

Was there Shelter in place as a result of the incident? ◯ Yes ◯ No

If **Yes**, please complete the following table

Evacuation of People and Buildings/Shelter in Place	**Private Residence** Includes houses and other buildings used as dwellings (e.g. Retirement homes)	**Public Buildings** Includes libraries, hospitals, churches, government buildings, etc.	**Workplace** Includes warehouse, facility, etc.	**Public (Outside) Areas** Includes parks, playgrounds, parking lots, etc.
Estimated number of **people evacuated**				
Estimated number of **people sheltered in place**				
Estimated number of **buildings evacuated**				

Size of Evacuation area (square meters)	Duration of Evacuation (hours)	Duration of Shelter in place (hours)

16. Injuries and/or deaths

Were there any injuries and/or deaths? ◯ Yes (please complete the following table) ◯ No

Minor injuries ◯ Yes ◯ No

Number of injured requiring immediate first aid treatment at the scene

Attributed to Dangerous Goods	Attributed to incident	**Total**

Moderate injuries ◯ Yes ◯ No

Number of injured requiring immediate emergency treatment in hospital and release shortly after

Attributed to Dangerous Goods	Attributed to incident	**Total**

Major injuries ◯ Yes ◯ No

Number of injured requiring immediate treatment with overnight hospitalization

Attributed to Dangerous Goods	Attributed to incident	**Total**

Deaths ◯ Yes ◯ No

Number of deaths

Attributed to Dangerous Goods	Attributed to incident	**Total**

Canada

17. Please indicate an estimate of costs in Canadian dollars associated with the incident, as applicable

NOTE: Refer to the Guide for more information on how to fill this section

Material loss of dangerous goods	Damage incurred by the carrier	Property damage	Emergency response cost	Clean-up cost	**Total cost**

18. Infrastructure closure and duration (please use additional sheets for multiple closures)

Was there an infrastructure closure as a result of the incident? ◯ Yes ◯ No

If **Yes**, please complete the following table

Type	Duration of the closure (in hours)
☐ **Aerodrome** – Area of land, water or other supporting surface used either in whole or in part for arrival and departure, movement or servicing of aircraft includes any building, installations and equipment situated thereon or in connection therewith	
☐ **Air cargo facility** – Facility used to receive or transfer cargo carried or to be carried by an aircraft	
☐ **Facility** – Permanent or temporary building or a portion of a building or equipment used in loading or unloading of dangerous goods	
☐ **Railway** – Tracks used by trains	
☐ **Waterway** – Navigable body of water through which a ship or boat can move	
☐ **Roadway** – The strip of land over which motor vehicles circulate, such as dirt road, numbered provincial highway or multiple lane freeway	
☐ **Runway** – the strip of ground on a landing field that aircraft use for landing or takeoff	

19. Geographic location of closure

Address

City	Province/Territory	Postal Code (Z9Z 9Z9)	GPS Position

If the incident occured by rail, please indicate the milepost and subdivision	Name of facility, road, railway or waterway

20. ERAP Requirements

Was an ERAP required under Part 7 of the ***Transportation of Dangerous Goods Regulations***? ◯ Yes ◯ No

If **Yes**, please complete the following table

ERAP Reference Number	ERAP Holder

Address

City	Province/Territory	Postal Code (Z9Z 9Z9)	Telephone of ERAP Holder (999-999-9999)

Email

Level of Response (check all that apply)

☐ No response ☐ First responders on scene ☐ Phone call to ERAP holder ☐ Employee from ERAP holder ☐ Team from ERAP holder

☐ Other: _____

PART V: INCIDENT DESCRIPTION

21. Please describe:

- The sequence of events that led to the incident
- The means of containment damage or failure, including the size/location of holes, cracks, etc.
- The actions taken at the time it was discovered
- What was done to mitigate the effects of the release
- Contributing factors (e.g. human error, mechanical, equipment, packaging, infrastructure, external, weather, etc.)
- The physical environment (e.g. residential, commercial, industrial, etc.)
- The road's appearance (e.g. flat, straight, inclined, curved, intersection, etc.)
- Timeline of event (e.g. how long it lasted, time of release or discovery, time of first responder arrival, etc.)
- Communications with first responders and with your organization

Photographs and diagrams should be submitted, as required, for clarification. Estimate the duration of the release, if possible. Please use additional sheets if necessary.

NOTE: Refer to the Guide for more information on how to complete this section

PART VI: INCIDENT DESCRIPTION – AIR ONLY

22. Please describe:

- Any serious jeopardy to persons on any aircraft or aircraft itself
- Any damages to property or environment
- The route by which the dangerous goods were to be or have been transported, including the name of any aerodromes along the route

Aircraft Operator	Air Cargo Facility

ICS 201
Incident Briefing

Purpose. The Incident Briefing (ICS 201) provides the Incident Commander (and the Command and General Staffs) with basic information regarding the incident situation and the resources allocated to the incident. In addition to a briefing document, the ICS 201 also serves as an initial action worksheet. It serves as a permanent record of the initial response to the incident.

Preparation. The briefing form is prepared by the Incident Commander for presentation to the incoming Incident Commander along with a more detailed oral briefing.

Distribution. Ideally, the ICS 201 is duplicated and distributed before the initial briefing of the Command and General Staffs or other responders as appropriate. The "Map/Sketch" and "Current and Planned Actions, Strategies, and Tactics" sections (pages 1–2) of the briefing form are given to the Situation Unit, while the "Current Organization" and "Resource Summary" sections (pages 3–4) are given to the Resources Unit.

Notes:

- The ICS 201 can serve as part of the initial Incident Action Plan (IAP).
- If additional pages are needed for any form page, use a blank ICS 201 and repaginate as needed.

Block Number	Block Title	Instructions
1	**Incident Name**	Enter the name assigned to the incident.
2	**Incident Number**	Enter the number assigned to the incident.
3	**Date/Time Initiated** • Date, Time	Enter date initiated (month/day/year) and time initiated (using the 24-hour clock).
4	**Map/Sketch** (include sketch, showing the total area of operations, the incident site/area, impacted and threatened areas, overflight results, trajectories, impacted shorelines, or other graphics depicting situational status and resource assignment)	Show perimeter and other graphics depicting situational status, resource assignments, incident facilities, and other special information on a map/sketch or with attached maps. Utilize commonly accepted ICS map symbology. If specific geospatial reference points are needed about the incident's location or area outside the ICS organization at the incident, that information should be submitted on the Incident Status Summary (ICS 209). North should be at the top of page unless noted otherwise.
5	**Situation Summary and Health and Safety Briefing (**for briefings or transfer of command): Recognize potential incident Health and Safety Hazards and develop necessary measures (remove hazard, provide personal protective equipment, warn people of the hazard) to protect responders from those hazards.	Self-explanatory.
6	**Prepared by** • Name • Position/Title • Signature • Date/Time	Enter the name, ICS position/title, and signature of the person preparing the form. Enter date (month/day/year) and time prepared (24-hour clock).
7	**Current and Planned Objectives**	Enter the objectives used on the incident and note any specific problem areas.

Block Number	Block Title	Instructions
8	**Current and Planned Actions, Strategies, and Tactics** • Time • Actions	Enter the current and planned actions, strategies, and tactics and time they may or did occur to attain the objectives. If additional pages are needed, use a blank sheet or another ICS 201 (Page 2), and adjust page numbers accordingly.
9	**Current Organization** (fill in additional organization as appropriate) • Incident Commander(s) • Liaison Officer • Safety Officer • Public Information Officer • Planning Section Chief • Operations Section Chief • Finance/Administration Section Chief • Logistics Section Chief	• Enter on the organization chart the names of the individuals assigned to each position. • Modify the chart as necessary, and add any lines/spaces needed for Command Staff Assistants, Agency Representatives, and the organization of each of the General Staff Sections. • If Unified Command is being used, split the Incident Commander box. • Indicate agency for each of the Incident Commanders listed if Unified Command is being used.
10	**Resource Summary**	Enter the following information about the resources allocated to the incident. If additional pages are needed, use a blank sheet or another ICS 201 (Page 4), and adjust page numbers accordingly.
	• Resource	Enter the number and appropriate category, kind, or type of resource ordered.
	• Resource Identifier	Enter the relevant agency designator and/or resource designator (if any).
	• Date/Time Ordered	Enter the date (month/day/year) and time (24-hour clock) the resource was ordered.
	• ETA	Enter the estimated time of arrival (ETA) to the incident (use 24-hour clock).
	• Arrived	Enter an “X” or a checkmark upon arrival to the incident.
	• Notes (location/ assignment/status)	Enter notes such as the assigned location of the resource and/or the actual assignment and status.

Northwest Fuels Limited

Environmental Response

Step 1 – Incident Type / product information **Step 2 – Risk Assessment** **Step 3 – Record of Attendance** **Step 4 - Debrief**

Date:_____**Customer:** _____ **Incident #:** _____

Step 1- Incident Specifics and Entry Objectives

Description: _____

Location: _____

Incident Type	***Site Entry Objectives***
Spill	Initial assessment
Gas Release	Account for personnel and/or rescue victims
Explosion	Source Control
Fire	Fire Suppression
Other_____	Spill Containment
Unknown	Spill Recovery and/or cleanup

Consult MSDS: If no MSDS call CANUTEC at 613-996-6666 or *666

Product Properties	***Product Hazards***
Name:	Flammable (Flash Point _____ C)
Estimated amount:	Explosive (LEL range _____ to _____%)
MSDS Available:	Corrosive (Corrodes_____)
Gas/ Liquid/ Solid	Reactive (reacts with _____)
Water Soluble?	Toxic (IDHL _____: TLV _____)

PPE Requirements	**Y/N**	**A**	**B**	**C**	**D**	***Equipment Requirements (* depends on situation)***
Responders						SCBA (Self Contained Breathing Apparatus) or Positive Pressure supplied air respirator with es SCBA
LEVEL A						Full Face or Half Mask with appropriate cartridges (specify)
LEVEL B						Escape mask*
LEVEL C						Encapsulating Suit (chemical protective with vapour barrier)
LEVEL D						Outer Gloves (chemically resistant)
Decon Team						Inner Gloves (chemically resistant)
LEVEL A						Boots (chemically resistant, steel toe and shank)
LEVEL B						Disposable Protective suit worn over entire ensemble
LEVEL C						Disposable outer boot covers, chemically resistant *
LEVEL D						Hard Hat
						Face Shield*
						Safety Glasses or chemical splash goggles
						Coveralls*
						Hearing Protection*
						PFD (Personal Flotation Device) within 1 meter of water
						Cold Weather Gear or Rain Gear*
						Fall Protection

Northwest Fuels Limited

Environmental Response

Specific Gravity or Vapour Density	Carcinogenic

Step 2 –Risk Assessment

Complete this risk assessment before the start of each shift (spill response) or when using the vessels (day to day). **Risks shall be reassessed any time conditions change.** Action plans to mitigate the hazards identified in the "Yes" column **MUST** be reviewed with all workers during the Tailgate Safety Meeting. Refer to work Safe BC Standards for critical task procedures.

Hazard	Yes	No	Suggested Control Measures
Hazardous materials			**Control measures are developed based on the Material Safety Data Sheet (MSDS)**
Inhalation: vapours, mists, fumes			Perform air monitoring and if required: mechanical ventilation, exclusion zones, respirators, SCBA.
Eye contact			Wear eye protection: safety face shield, safety goggles, safety glasses, eye wash stations.
Skin contact:			Use chemically resistant: coveralls, gloves, special barrier cream. Clean exposed areas immediately.
Ingestion			Seek immediate medical attention.

Critical tasks

Is a Critical Procedure(s) to be reviewed prior to starting this job?
____ Hot Work ____ Confined Space Entry ____ Energy Lockout ____ Crane Operation ____ Working at Height ____ Fuel Transfer/Grounding & Bonding
Work Safe BC Procedures must be followed

*** Confined space hazards: includes but not limited to tanks, under wharves or docks or logs, deep trenches, fuel tanks, industrial containment**

Weather hazards

River/Creek currents			Check area currents, keep vessel crew and shoreline worker aware of changes.
Fog, ice, rain, snow, winds/waves			Maintain safe working distances, clear ice and snow from area of travel, wear appropriate PPE and/or clothing.
Darkness			Use portable lighting.
Hot or Cold weather			Stay hydrated (drink fluids), take rest breaks, warm-up breaks, use sunscreen, wear appropriate

Wind speed: Km/H	Wind direction:	Precipitation: Rain Snow
Air temperature:	Humidity Wind Chill	Forecast:

General hazards

Trips, slips and falls			Keep equipment, supplies, cords and/or air-lines out of the path of travel or secured; clean-up all oils, standing water, ice/snow or post warning sign; use handrails; secure ladders; maintain three-point contact when climbing or when on a vessel; take small, deliberate steps when walking in congested areas and along rugged shorelines.
Employee working alone			Communications **MUST** be done at four (4) hour intervals between worker and supervisor, and documented.
Working on or near water			PFDs **MUST** be worn at all times when working within 1m (3 feet) of the water unless protected by other means.
Person overboard			Be familiar with "overboard" procedures, location of life rings.
Repetitive motion injuries			Use different muscle groups and take rest breaks during repetitive tasks, vary tasks if possible.
Injuries from sharp material, needles, glass, etc.			Wear appropriate gloves, safety footwear. Make any cuts with blade facing away from the body. Store blades safely when not in use.
Pinch injuries			Watch mooring lines, don't get caught in the bight, avoid hand traps.
Lifting injuries			Use safe lifting techniques, **bend your knees, ask for help**; use mechanical lifting equipment when possible.
Fatigue			Work reasonably length shift, take breaks periodically.
Hearing damage			If you have to raise your voice to be heard, you need hearing protection.
Eye injuries			Wear eye protection; safety glasses or goggles/safety glasses and face shield.
Burn injuries			Maintain a safe working distance; wear gloves.
Working From a height			Safety Harness or barrier is necessary above 10 feet
Miscellaneous injuries			Keep exit routes clear at all times; stack equipment and supplies in a place and manner where it will not cause injury; keep clear of tow-lines; beware of snap back from failed lines.

Northwest Fuels Limited

Environmental Response

Step 2 –Risk Assessment cont'd

Hazard	Yes	No	Suggested Control Measures
Vehicle hazards			
Trucks, heavy equipment, forklifts			Wear appropriate PPE; activate back up alarm; use a backup spotter; inspect equipment before use, use only trained operators.
Traffic congestion			Ensure site traffic and parking plans are in place.
Vacuum truck noise, hose failure or explosion			Wear appropriate PPE; operator(s) trained and experienced in petroleum handling; inspect equipment before use.
Other task specific hazards			
Aircraft hazards			
Working around helicopter landing areas			**Never** approach the helicopter unless signaled to do so by the pilot. **Always** maintain eye contact with the pilot as you approach. **Never** approach from the uphill side. **Never** wear loose clothing around a helicopter.
In flight hazards			**Never** speak to the pilot during takeoff or landing (unless it is an emergency). **Always** wear your seat belt. Wear warm clothing. Take extra food and drink along.
Working around fixed wing aircraft			**Never** approach the aircraft while engines are running. **Never** touch anything on the fuselage, wings or propellers – they may be hot and/or brittle. Stay behind the wings at all times.
Other task specific hazards			
Wildlife			
Injury; disease, potential of attack			Be aware of the dangers from bears, cougars, wolves, dogs, raccoons, moose, deer, otters, wild fowl, rats, snakes and insects. Keep bear spray and insect repellent on hand. Use a safety watch. Only trained personnel to handle wildlife. Safety watch in bear/cougar/wolf country may needed.

Safety Equipment/ Personnel Requirements:

4 Gas Monitor	Fire Extinguisher	First Aid Kit/ attendant	Eyewash
Safety Watch	Traffic Control	Throw Rope or Ring	Other

Notes/ Other:

Risk assessment by: (print) _____ **Signature:** _____

Company name: _____ **Date:** _____

Environmental Response

Step 3 – Tailgate Safety Meeting - Agenda

☐ **Unsafe work**

Every worker has the authority and the responsibility to shut down unsafe work**.** Be watchful of changing, particularly deteriorating, conditions. Advise your supervisor of any unsafe work.

☐ **Site Health and Safety rules**

When working on someone else's site, please take note of and review any local health and safety rules that need to be followed (i.e. exits, assembling procedure, safety vests etc.). Attach a copy.

☐ **Safety Officer/contact method:** _____

☐ **First Aider/contact method:** _____

☐ **First aid kit location:** _____ ☐

Eye wash/emergency shower: _____

☐ **Decontamination process/location:** _____

☐ **Fire/explosion:** emergency signal will sound, assemble at _____

☐ **Incident reporting**: report incidents (including near misses) to your supervisor

☐ **Material Safety Data Sheets (MSDS):** reviewed with workers ☐

WCB Regulations

WCB Regulations and related materials including policies, guidelines and standards apply to all WCMRC/BCO work sites and

are available at the "WorkSafeBC" website. Any worker wishing computer system access and help with the process should contact their supervisor.

Specific Safety Plans (control measures to deal with the hazards identified in the preceding risk assessment)

STOP and THINK!

Northwest Fuels Limited

Environmental Response

Step 3 – Tailgate Safety Meeting - Record of Attendance

Signature on this record of attendance is confirmation that the Tailgate Safety Meeting has taken place, the risks and control measures identified on the risk assessment and any specific safety plans have been reviewed, are understood and will be complied with.

Please print first name, initial and last name clearly.

First Name	Init.	Last Name	Company/Vessel	Signature	Time

SECTION 1. IDENTIFICATION

Product name	:	DIESEL FUEL
Synonyms	:	Seasonal Diesel, #1 Diesel, #2 Heating Oil, #1 Heating Oil, D50, Arctic Diesel, Farm Diesel, Marine Diesel, Low Sulphur Diesel, LSD, Ultra Low Sulphur Diesel, ULSD, Mining Diesel, Naval Distillate, Dyed Diesel, Marked Diesel, Coloured Diesel, Furnace special, Biodiesel blend, B1, B2, B5, Diesel Low Cloud (LC), Marine Gas Oil, Marine Gas Oil Dyed.
Product code	:	102907, 102762, 102763, 102755, 102302, 102744, 101801, 100678, 100677, 101802, 100107, 100668, 100658, 100911, 100663, 100652, 100460, 100065, 101796, 101793, 101795, 101792, 101794, 101791, 100768, 100643, 100642, 100103, 101798, 101800, 101797, 101788, 101789, 101787, 102531, 100734, 100733, 100640, 100997, 100995, 100732, 100731, 100994

Manufacturer or supplier's details

Petro-Canada
P.O. Box 2844, 150 - 6th Avenue South-West
Calgary Alberta T2P 3E3
Canada

Emergency telephone number

Suncor Energy: +1 403-296-3000;
Canutec Transportation: 1-888-226-8832 (toll-free) or 613-996-6666;
Poison Control Centre: Consult local telephone directory for emergency number(s).

Recommended use of the chemical and restrictions on use

Recommended use	:	Diesel fuels are distillate fuels suitable for use in high and medium speed internal combustion engines of the compression ignition type. Mining diesels, marine diesels, MDO and naval distillates may have a higher flash point requirement.
Prepared by	:	Product Safety: +1 905-804-4752

SECTION 2. HAZARDS IDENTIFICATION

Emergency Overview

Appearance	Bright oily liquid.
Colour	Clear to yellow (This product may be dyed red for taxation purposes)
Odour	Mild petroleum oil like.

GHS Classification

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

Flammable liquids	:	Category 3
Acute toxicity (Inhalation)	:	Category 4
Skin irritation	:	Category 2
Carcinogenicity	:	Category 2
Specific target organ toxicity - single exposure	:	Category 3 (Central nervous system)
Specific target organ toxicity - repeated exposure	:	Category 2 (Liver, thymus, Bone)
Aspiration hazard	:	Category 1

GHS label elements

Hazard pictograms :

Signal word : Danger

Hazard statements : Flammable liquid and vapour.
May be fatal if swallowed and enters airways.
Causes skin irritation.
Harmful if inhaled.
May cause drowsiness or dizziness.
Suspected of causing cancer.
May cause damage to organs (Liver, thymus, Bone) through prolonged or repeated exposure.

Precautionary statements : **Prevention:**
Obtain special instructions before use.
Do not handle until all safety precautions have been read and understood.
Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
Keep container tightly closed.
Ground and bond container and receiving equipment.
Use explosion-proof electrical/ ventilating/ lighting equipment.
Use non-sparking tools.
Take action to prevent static discharges.
Do not breathe dust/ fume/ gas/ mist/ vapours/ spray.
Wash skin thoroughly after handling.
Use only outdoors or in a well-ventilated area.
Wear protective gloves/ protective clothing/ eye protection/ face protection.
Response:
IF SWALLOWED: Immediately call a POISON CENTER/doctor.
IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water.
IF INHALED: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTER/doctor if you feel unwell.

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

IF exposed or concerned: Get medical advice/ attention.
Do NOT induce vomiting.
If skin irritation occurs: Get medical advice/ attention.
Take off contaminated clothing and wash it before reuse.
In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
Storage:
Store in a well-ventilated place. Keep container tightly closed.
Store in a well-ventilated place. Keep cool.
Store locked up.
Disposal:
Dispose of contents/ container to an approved waste disposal plant.

Potential Health Effects

Primary Routes of Entry : Eye contact
Ingestion
Inhalation
Skin contact

Aggravated Medical Condition : None known.

Other hazards

None known.

SECTION 3. COMPOSITION/INFORMATION ON INGREDIENTS

Substance / Mixture : Mixture

Hazardous components

Chemical name	CAS-No.	Concentration
Kerosine (petroleum), hydrodesulfurized; Kerosine -unspecified	64742-81-0	70 - 100 %
Kerosine (petroleum); Straight run kerosine	8008-20-6	
Fuels, diesel; Gasoil -unspecified	68334-30-5	
Alkanes, C10-20-branched and linear	928771-01-1	0 - 30 %
Fatty acids, C16-18 and C18-unsatd., Me esters	67762-38-3	0 - 20 %

All concentrations are in percent by weight.

SECTION 4. FIRST AID MEASURES

If inhaled : Move to fresh air.
Artificial respiration and/or oxygen may be necessary.
Seek medical advice.

In case of skin contact : In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes.
Wash skin thoroughly with soap and water or use recognized skin cleanser.

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

		Wash clothing before reuse. Seek medical advice.
In case of eye contact	:	Remove contact lenses. Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Obtain medical attention.
If swallowed	:	Rinse mouth with water. DO NOT induce vomiting unless directed to do so by a physician or poison control center. Never give anything by mouth to an unconscious person. Seek medical advice.
Most important symptoms and effects, both acute and delayed	:	Harmful if inhaled. Respiratory, skin and eye irritation; nausea; cancer.
Notes to physician	:	Treat symptomatically. For specialist advice physicians should contact the Poisons Information Service.

SECTION 5. FIREFIGHTING MEASURES

Suitable extinguishing media	:	Dry chemical Carbon dioxide (CO2) Water fog. Foam
Unsuitable extinguishing media	:	Do NOT use water jet.
Specific hazards during firefighting	:	Cool closed containers exposed to fire with water spray.
Hazardous combustion products	:	Carbon oxides (CO, CO2), nitrogen oxides (NOx), sulphur oxides (SOx), smoke and irritating vapours as products of incomplete combustion.
Further information	:	Prevent fire extinguishing water from contaminating surface water or the ground water system.
Special protective equipment for firefighters	:	Wear self-contained breathing apparatus for firefighting if necessary.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Personal precautions, protective equipment and emergency procedures	:	For personal protection see section 8. Ensure adequate ventilation. Evacuate personnel to safe areas. Material can create slippery conditions.
Environmental precautions	:	If the product contaminates rivers and lakes or drains inform

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

respective authorities.

Methods and materials for containment and cleaning up : Prevent further leakage or spillage if safe to do so.
Remove all sources of ignition.
Soak up with inert absorbent material.
Non-sparking tools should be used.
Ensure adequate ventilation.
Contact the proper local authorities.

SECTION 7. HANDLING AND STORAGE

Advice on safe handling : For personal protection see section 8.
Smoking, eating and drinking should be prohibited in the application area.
Use only with adequate ventilation.
In case of insufficient ventilation, wear suitable respiratory equipment.
Avoid spark promoters. Ground/bond container and equipment. These alone may be insufficient to remove static electricity.
Avoid contact with skin, eyes and clothing.
Do not ingest.
Keep away from heat and sources of ignition.
Keep container closed when not in use.

Conditions for safe storage : Store in original container.
Containers which are opened must be carefully resealed and kept upright to prevent leakage.
Keep in a dry, cool and well-ventilated place.
Keep in properly labelled containers.
To maintain product quality, do not store in heat or direct sunlight.
Ensure the storage containers are grounded/bonded.

SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Components with workplace control parameters

Components	CAS-No.	Value type (Form of exposure)	Control parameters / Permissible concentration	Basis
Kerosine (petroleum), hydrodesulfurized; Kerosine - unspecified	64742-81-0	TWA	200 mg/m3 (As total hydrocarbon vapour)	ACGIH
		TWA	200 mg/m3 (total hydrocarbon vapor)	CA AB OEL
		TWA	525 mg/m3	CA ON OEL
		TWA	200 mg/m3 (As total hydrocarbon vapour)	ACGIH
		TWA	200 mg/m3 (total hydrocarbon	ACGIH

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

			vapor)	
Kerosine (petroleum); Straight run kerosine	8008-20-6	TWA	200 mg/m3 (total hydrocarbon vapor)	CA BC OEL
		TWA	200 mg/m3 (total hydrocarbon vapor)	CA AB OEL
		TWA	200 mg/m3 (total hydrocarbon vapor)	ACGIH
Fuels, diesel; Gasoil - unspecified	68334-30-5	TWA	100 mg/m3 (total hydrocar-bons)	CA AB OEL
		TWA (Va-pour and inhalable aerosols)	100 mg/m3 (total hydrocar-bons)	CA BC OEL
		TWA (Inhal-able fraction and vapor)	100 mg/m3 (total hydrocar-bons)	ACGIH

Engineering measures : Adequate ventilation to ensure that Occupational Exposure Limits are not exceeded.
Use only in well-ventilated areas.
Ensure that eyewash station and safety shower are proximal to the work-station location.

Personal protective equipment

Respiratory protection : Concentration in air determines protection needed.
Use respiratory protection unless adequate local exhaust ventilation is provided or exposure assessment demonstrates that exposures are within recommended exposure guidelines. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.

Filter type : organic vapour cartridge or canister may be permissible under certain circumstances where airborne concentrations are expected to exceed exposure limits. Protection provided by air-purifying respirators is limited. Use a positive-pressure, air-supplied respirator if there is any potential for uncontrolled release, exposure levels are unknown, or any other circumstances where air-purifying respirators may not provide adequate protection.

Hand protection
Material : neoprene, nitrile, polyvinyl alcohol (PVA), Viton(R). Consult your PPE provider for breakthrough times and the specific glove that is best for you based on your use patterns. It should be realized that eventually any material regardless of their imperviousness, will get permeated by chemicals. Therefore, protective gloves should be regularly checked for wear and tear. At the first signs of hardening and cracks, they should be changed.

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

Remarks	:	Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary.
Eye protection	:	Wear face-shield and protective suit for abnormal processing problems.
Skin and body protection	:	Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place.
Protective measures	:	Wash contaminated clothing before re-use.
Hygiene measures	:	Remove and wash contaminated clothing and gloves, including the inside, before re-use. Wash face, hands and any exposed skin thoroughly after handling.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance	:	Bright oily liquid.
Colour	:	Clear to yellow (This product may be dyed red for taxation purposes)
Odour	:	Mild petroleum oil like.
Odour Threshold	:	No data available
pH	:	No data available
Melting point	:	No data available
Boiling point/boiling range	:	150 - 371 °C (302 - 700 °F)
decomposition temperature		No data available
Flash point	:	> 40 °C (104 °F) Method: closed cup
Auto-Ignition Temperature	:	225 °C (437 °F)
Evaporation rate	:	No data available
Flammability	:	Flammable in presence of open flames, sparks and heat. Vapours are heavier than air and may travel considerable distance to sources of ignition and flash back. This product can accumulate static charge and ignite.
Upper explosion limit	:	6 %(V)
Lower explosion limit	:	0.7 %(V)
Vapour pressure	:	7.5 mmHg (20 °C / 68 °F)

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

Relative vapour density	:	4.5
Relative density	:	0.8 - 0.88
Solubility(ies)		
Water solubility	:	insoluble
Partition coefficient: n-octanol/water	:	No data available
Viscosity		
Viscosity, kinematic	:	1.3 - 4.1 cSt (40 °C / 104 °F)

SECTION 10. STABILITY AND REACTIVITY

Reactivity	:	Stable at normal ambient temperature and pressure.
Chemical stability	:	Stable under normal conditions.
Possibility of hazardous reactions	:	Hazardous polymerisation does not occur.
Conditions to avoid	:	Extremes of temperature and direct sunlight.
Incompatible materials	:	Reactive with oxidising agents and acids.
Hazardous decomposition products	:	May release COx, NOx, SOx, smoke and irritating vapours when heated to decomposition.

SECTION 11. TOXICOLOGICAL INFORMATION

Information on likely routes of exposure
Eye contact
Ingestion
Inhalation
Skin contact

Acute toxicity

Product:

Acute oral toxicity	:	Remarks: No data available
Acute inhalation toxicity	:	Acute toxicity estimate: 1.2 mg/l Exposure time: 4 h Test atmosphere: dust/mist Method: Calculation method
Acute dermal toxicity	:	Remarks: No data available

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

Components:

Kerosine (petroleum), hydrodesulfurized; Kerosine -unspecified:

Acute oral toxicity	:	LD50 (Rat): > 5,000 mg/kg,
Acute inhalation toxicity	:	LC50 (Rat): > 5.2 mg/l Exposure time: 4 hrs Test atmosphere: dust/mist
Acute dermal toxicity	:	LD50 (Rabbit): > 2,000 mg/kg,

Kerosine (petroleum); Straight run kerosine:

Acute oral toxicity	:	LD50 (Rat): > 5,000 mg/kg,
Acute inhalation toxicity	:	LC50 (Rat): > 5 mg/l Exposure time: 4 h Test atmosphere: dust/mist
Acute dermal toxicity	:	LD50 (Rabbit): > 2,000 mg/kg,

Fuels, diesel; Gasoil -unspecified:

Acute oral toxicity	:	LD50 (Rat): 7,500 mg/kg,
Acute dermal toxicity	:	LD50 (Mouse): 24,500 mg/kg,

Skin corrosion/irritation

Product:

Remarks: Causes skin irritation.

Serious eye damage/eye irritation

Product:

Remarks: No data available

Respiratory or skin sensitisation

Product:

Remarks: Based on available data, the classification criteria are not met.

Germ cell mutagenicity

Product:

Genotoxicity in vitro	Remarks: No data available
Genotoxicity in vivo	Remarks: No data available

Carcinogenicity

Product:

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

Carcinogenicity - Assessment	Suspected of causing cancer.

Reproductive toxicity

Product:

Effects on fertility	Remarks: Based on available data, the classification criteria are not met.

STOT - single exposure

Product:

Remarks: May cause drowsiness or dizziness.

STOT - repeated exposure

Product:

Remarks: May cause damage to organs through prolonged or repeated exposure.

No data available

Aspiration toxicity

Product:

May be fatal if swallowed and enters airways.

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

Product:

Toxicity to fish	:	Remarks: No data available
Toxicity to daphnia and other aquatic invertebrates	:	Remarks: No data available
Toxicity to algae	:	Remarks: No data available
Toxicity to bacteria	:	Remarks: No data available

Persistence and degradability

Product:

Biodegradability	:	Remarks: No data available

Bioaccumulative potential

No data available

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

Mobility in soil

No data available

Other adverse effects

No data available

SECTION 13. DISPOSAL CONSIDERATIONS

Disposal methods

Waste from residues	:	The product should not be allowed to enter drains, water courses or the soil. Offer surplus and non-recyclable solutions to a licensed disposal company. Waste must be classified and labelled prior to recycling or disposal. Send to a licensed waste management company. Dispose of as hazardous waste in compliance with local and national regulations. Dispose of product residue in accordance with the instructions of the person responsible for waste disposal.

SECTION 14. TRANSPORT INFORMATION

International Regulations

IATA-DGR

UN/ID No.	:	UN 1202
Proper shipping name	:	Diesel fuel
Class	:	3
Packing group	:	III
Labels	:	Class 3 - Flammable Liquid
Packing instruction (cargo aircraft)	:	366

IMDG-Code

UN number	:	UN 1202
Proper shipping name	:	DIESEL FUEL
Class	:	3
Packing group	:	III
Labels	:	3
EmS Code	:	F-E, S-E
Marine pollutant	:	no

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code

National Regulations

TDG

UN number	:	UN 1202
Proper shipping name	:	DIESEL FUEL
Class	:	3
Packing group	:	III

Petro-Canada is a Suncor Energy business. ™ Trademark of Suncor Energy Inc. Used under licence.

Labels	:	3
ERG Code	:	128
Marine pollutant	:	no

SECTION 15. REGULATORY INFORMATION

This product has been classified according to the hazard criteria of the Hazardous Products Regulations (HPR) and the SDS contains all of the information required by the HPR.

The components of this product are reported in the following inventories:

DSL	On the inventory, or in compliance with the inventory

SECTION 16. OTHER INFORMATION

For Copy of SDS	:	Internet: www.petro-canada.ca/msds Canada-wide: telephone: 1-800-668-0220; fax: 1-800-837-1228 For Product Safety Information: 1 905-804-4752
Prepared by	:	Product Safety: +1 905-804-4752
Revision Date	:	2018/12/19

The information provided in this Safety Data Sheet is correct to the best of our knowledge, information and belief at the date of its publication. The information given is designed only as a guidance for safe handling, use, processing, storage, transportation, disposal and release and is not to be considered a warranty or quality specification. The information relates only to the specific material designated and may not be valid for such material used in combination with any other materials or in any process, unless specified in the text.

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

SECTION 1. IDENTIFICATION

Product name	:	GASOLINE - ETHANOL
Synonyms	:	SuperClean, SuperClean 94 (Montreal), GASOHOL, Regular, Mid-Grade, Plus, WinterGas, RegularClean, PlusClean, marked or dyed gasoline, Super Premium (94 RO), E-10, Ultra 94, Ethanol blended gasoline, P10
Product code	:	102823, 100494, 102797, 102795, 102803, 102802, 102801, 102799, 102793, 102792, 102751, 101836, 100505, 100503, 100482, 102073, 101828, 101825, 102071, 101827, 100481, 101826, 101824, 100479, 100480, 101832, 101831, 101835, 100504, 101829
Manufacturer or supplier's details		Petro-Canada P.O. Box 2844, 150 - 6th Avenue South-West Calgary Alberta T2P 3E3 Canada
Emergency telephone number		Suncor Energy: +1 403-296-3000; Canutec Transportation: 1-888-226-8832 (toll-free) or 613-996-6666; Poison Control Centre: Consult local telephone directory for emergency number(s).

Recommended use of the chemical and restrictions on use

Recommended use	:	Gasoline-Ethanol is used in spark ignition engines including motor vehicles, farm vehicles, inboard and outboard boat engines, small engines and recreational vehicles.
Prepared by	:	Product Safety: +1 905-804-4752

SECTION 2. HAZARDS IDENTIFICATION

Emergency Overview

Appearance	Clear liquid.
Colour	Clear to slightly yellow, undyed liquid. May be dyed for taxation purposes.
Odour	Gasoline

GHS Classification

Flammable liquids	:	Category 1
Skin irritation	:	Category 2
Eye irritation	:	Category 2A

Petro-Canada is a Suncor Energy business. TM Trademark of Suncor Energy Inc. Used under licence.

Germ cell mutagenicity	:	Category 1B
Carcinogenicity	:	Category 1A
Reproductive toxicity	:	Category 2
Specific target organ toxicity - single exposure	:	Category 3 (Central nervous system)
Specific target organ toxicity - repeated exposure	:	Category 1
Aspiration hazard	:	Category 1

GHS label elements

Hazard pictograms :

Signal word : Danger

Hazard statements : Extremely flammable liquid and vapour.
May be fatal if swallowed and enters airways.
Causes skin irritation.
Causes serious eye irritation.
May cause drowsiness or dizziness.
May cause genetic defects.
May cause cancer.
Suspected of damaging fertility or the unborn child.
Causes damage to organs through prolonged or repeated exposure.

Precautionary statements : **Prevention:**
Obtain special instructions before use.
Do not handle until all safety precautions have been read and understood.
Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
Keep container tightly closed.
Ground and bond container and receiving equipment.
Use explosion-proof electrical/ ventilating/ lighting equipment.
Use non-sparking tools.
Take action to prevent static discharges.
Do not breathe dust/ fume/ gas/ mist/ vapours/ spray.
Wash skin thoroughly after handling.
Do not eat, drink or smoke when using this product.
Use only outdoors or in a well-ventilated area.
Wear protective gloves/ protective clothing/ eye protection/ face protection.
Response:
IF SWALLOWED: Immediately call a POISON CENTER/doctor.
IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water.

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

IF INHALED: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTER/doctor if you feel unwell.
IF IN EYES: Rinse cautiously with water for several minutes. Remove contact lenses, if present and easy to do. Continue rinsing.
IF exposed or concerned: Get medical advice/ attention.
Do NOT induce vomiting.
If skin irritation occurs: Get medical advice/ attention.
If eye irritation persists: Get medical advice/ attention.
Take off contaminated clothing and wash it before reuse.
In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
Storage:
Store in a well-ventilated place. Keep container tightly closed.
Store in a well-ventilated place. Keep cool.
Store locked up.
Disposal:
Dispose of contents/ container to an approved waste disposal plant.

Potential Health Effects

Primary Routes of Entry	:	Eye contact Ingestion Inhalation Skin contact
Inhalation	:	Inhalation may cause central nervous system effects. May cause respiratory tract irritation.
Skin	:	Causes skin irritation.
Eyes	:	Causes eye irritation.
Ingestion	:	Ingestion of this material may cause irritation to the mouth, throat and gastro-intestinal tract. Aspiration hazard if swallowed - can enter lungs and cause damage.
Chronic Exposure	:	Chronic exposure to benzene may result in increased risk of leukemia and other blood disorders.
Aggravated Medical Condition	:	None known.

Other hazards

None known.

IARC	Group 1: Carcinogenic to humans	
	Benzene	71-43-2
ACGIH	Confirmed human carcinogen	
	Benzene	71-43-2

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

Confirmed animal carcinogen with unknown relevance to humans	
Gasoline	86290-81-5
Ethanol	64-17-5

SECTION 3. COMPOSITION/INFORMATION ON INGREDIENTS

Substance / Mixture : Mixture

Hazardous components

Chemical name	CAS-No.	Concentration
gasoline	86290-81-5	70 - 97 %
toluene	108-88-3	0 - 20 %
ethanol	64-17-5	3 - 10 %
benzene	71-43-2	0 - 1.5 %

SECTION 4. FIRST AID MEASURES

If inhaled : Move to fresh air.
Artificial respiration and/or oxygen may be necessary.
Seek medical advice.

In case of skin contact : In case of contact, immediately flush eyes or skin with plenty of water for at least 15 minutes while removing contaminated clothing and shoes.
Wash skin thoroughly with soap and water or use recognized skin cleanser.
Wash contaminated clothing before reuse.
Seek medical advice.

In case of eye contact : Remove contact lenses.
Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes.
Obtain medical attention.

If swallowed : Rinse mouth with water.
DO NOT induce vomiting unless directed to do so by a physician or poison control center.
Never give anything by mouth to an unconscious person.
Seek medical advice.

Most important symptoms and effects, both acute and delayed : Respiratory, skin and eye irritation; nausea; cancer.

TM Trademark of Suncor Energy Inc. Used under licence.

Protection of first-aiders	:	First Aid responders should pay attention to self-protection and use the recommended protective clothing It may be dangerous to the person providing aid to give mouth-to-mouth resuscitation.

SECTION 5. FIREFIGHTING MEASURES

Suitable extinguishing media	:	Dry chemical Carbon dioxide (CO2) Alcohol-resistant foam Water spray Water fog.
Unsuitable extinguishing media	:	Do NOT use water jet.
Specific hazards during fire-fighting	:	Cool closed containers exposed to fire with water spray.
Hazardous combustion products	:	Carbon oxides (CO, CO2), nitrogen oxides (NOx), polynuclear aromatic hydrocarbons, phenols, aldehydes, ketones, smoke and irritating vapours as products of incomplete combustion.
Further information	:	Prevent fire extinguishing water from contaminating surface water or the ground water system.
Special protective equipment for firefighters	:	Wear self-contained breathing apparatus and full protective wear. Wear a positive-pressure supplied-air respirator with full face-piece.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Personal precautions, protective equipment and emergency procedures	:	For personal protection see section 8. Ensure adequate ventilation. Evacuate personnel to safe areas. Material can create slippery conditions.
Environmental precautions	:	Do not allow uncontrolled discharge of product into the environment.
Methods and materials for containment and cleaning up	:	Prevent further leakage or spillage if safe to do so. Remove all sources of ignition. Soak up with inert absorbent material. Non-sparking tools should be used. Ensure adequate ventilation. Contact the proper local authorities.

SECTION 7. HANDLING AND STORAGE

Advice on safe handling	:	For personal protection see section 8.

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

Smoking, eating and drinking should be prohibited in the application area.
Do not ingest.
Avoid contact with skin, eyes and clothing.
Use only with adequate ventilation.
Keep away from heat and sources of ignition.
Keep container closed when not in use.
In case of insufficient ventilation, wear suitable respiratory equipment.
Avoid inhalation of vapour or mist.
Use explosion-proof equipment.
Ensure all equipment is electrically grounded before beginning transfer operations.

Conditions for safe storage : Store in original container.
Containers which are opened must be carefully resealed and kept upright to prevent leakage.
Keep in a dry, cool and well-ventilated place.
Keep in properly labelled containers.
To maintain product quality, do not store in heat or direct sunlight.
Ensure the storage containers are grounded/bonded.

SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Components with workplace control parameters

Components	CAS-No.	Value type (Form of exposure)	Control parameters / Permissible concentration	Basis
gasoline	86290-81-5	TWA	300 ppm	CA AB OEL
		STEL	500 ppm	CA AB OEL
		TWA	300 ppm	CA BC OEL
		STEL	500 ppm	CA BC OEL
		TWA	300 ppm	ACGIH
		STEL	500 ppm	ACGIH
toluene	108-88-3	TWA	50 ppm 188 mg/m3	CA AB OEL
		TWA	20 ppm	CA BC OEL
		TWAEV	50 ppm 188 mg/m3	CA QC OEL
		TWA	20 ppm	ACGIH
ethanol	64-17-5	TWA	1,000 ppm 1,880 mg/m3	CA AB OEL
		STEL	1,000 ppm	CA BC OEL
		TWAEV	1,000 ppm 1,880 mg/m3	CA QC OEL
		STEL	1,000 ppm	ACGIH
benzene	71-43-2	TWA	0.5 ppm 1.6 mg/m3	CA AB OEL
		STEL	2.5 ppm 8 mg/m3	CA AB OEL
		TWA	0.5 ppm	CA BC OEL
		STEL	2.5 ppm	CA BC OEL

Petro-Canada is a Suncor Energy business. TM Trademark of Suncor Energy Inc. Used under licence.

		TWA	0.5 ppm	CA ON OEL
		STEL	2.5 ppm	CA ON OEL
		TWAEV	1 ppm 3 mg/m3	CA QC OEL
		STEV	5 ppm 15.5 mg/m3	CA QC OEL
		TWA	0.5 ppm	ACGIH
		STEL	2.5 ppm	ACGIH

Biological occupational exposure limits

Components	CAS-No.	Control parameters	Biological specimen	Sam-pling time	Permissible concentra-tion	Basis
Toluene	108-88-3	Toluene	In blood	Prior to last shift of work-week	0.02 mg/l	ACGIH BEI
		Toluene	Urine	End of shift (As soon as possible after exposure ceases)	0.03 mg/l	ACGIH BEI

Engineering measures : Use only in well-ventilated areas.
Adequate ventilation to ensure that Occupational Exposure Limits are not exceeded.
Use explosion-proof ventilation equipment.

Personal protective equipment

Respiratory protection : Use a properly fitted, air-purifying or air-fed respirator complying with an approved standard if a risk assessment indicates this is necessary.
Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.

Filter type : A NIOSH-approved air-purifying respirator with an organic vapour cartridge or canister may be permissible under certain circumstances where airborne concentrations are expected to exceed exposure limits. Protection provided by air-purifying respirators is limited. Use a positive-pressure, air-supplied respirator if there is any potential for uncontrolled release, exposure levels are unknown, or any other circumstances where air-purifying respirators may not provide adequate protection.

Hand protection
Material : polyvinyl alcohol (PVA), Viton(R). Consult your PPE provider for breakthrough times and the specific glove that is best for you based on your use patterns. It should be realized that eventually any material regardless of their imperviousness, will get permeated by chemicals. Therefore, protective gloves should be regularly checked for wear and tear. At the first

Petro-Canada is a Suncor Energy business. ™ Trademark of Suncor Energy Inc. Used under licence.

signs of hardening and cracks, they should be changed.

Remarks	:	Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary.
Eye protection	:	Wear face-shield and protective suit for abnormal processing problems.
Skin and body protection	:	Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place.
Protective measures	:	Wash contaminated clothing before re-use.
Hygiene measures	:	Remove and wash contaminated clothing and gloves, including the inside, before re-use. Wash face, hands and any exposed skin thoroughly after handling.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance	:	Clear liquid.
Colour	:	Clear to slightly yellow, undyed liquid. May be dyed for taxation purposes.
Odour	:	Gasoline
Odour Threshold	:	No data available
pH	:	No data available
Pour point	:	No data available
Boiling point/boiling range	:	26 - 225 °C (79 - 437 °F)
Flash point	:	-43 °C (-45 °F) Method: Cleveland open cup
Auto-Ignition Temperature	:	No data available
Evaporation rate	:	No data available
Flammability	:	Extremely flammable in presence of open flames and sparks. May accumulate static electrical charge. Vapours are heavier than air and may travel considerable distance to sources of ignition and flash back.
Upper explosion limit	:	7.6 %(V)
Lower explosion limit	:	1.4 %(V)
Vapour pressure	:	307 - 802 mmHg (15 °C / 59 °F)

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

Relative vapour density	:	3 Air = 1
Relative density	:	No data available
Density	:	0.7 - 0.78 kg/l (15 °C / 59 °F)
Solubility(ies)		
Water solubility	:	Hydrocarbon components slightly soluble in water., Ethanol is soluble in water.
Partition coefficient: n-octanol/water	:	No data available
Viscosity		
Viscosity, kinematic	:	0.6 cSt (40 °C / 104 °F)
Explosive properties	:	Do not cut, weld, heat, drill or pressurize empty container. Containers may explode in heat of fire. Runoff to sewer may create fire or explosion hazard.

SECTION 10. STABILITY AND REACTIVITY

Possibility of hazardous reactions	:	Hazardous polymerisation does not occur. Stable under normal conditions.
Conditions to avoid	:	Extremes of temperature and direct sunlight.
Incompatible materials	:	Reactive with oxidising agents, acids and interhalogens.
Hazardous decomposition products	:	May release COx, NOx, aldehydes, ketones, phenols, polynuclear aromatic hydrocarbons, smoke and irritating vapours when heated to decomposition.

SECTION 11. TOXICOLOGICAL INFORMATION

Information on likely routes of exposure
Eye contact
Ingestion
Inhalation
Skin contact

Acute toxicity

Product:

Acute oral toxicity	:	Remarks: No data available
Acute inhalation toxicity	:	Remarks: No data available

Petro-Canada is a Suncor Energy business.
™ Trademark of Suncor Energy Inc. Used under licence.

Acute dermal toxicity : Remarks: No data available

Components:

gasoline:

Acute oral toxicity : LD50 (Rat): 13,600 mg/kg,

Acute dermal toxicity : LD50 (Rabbit): > 3,750 mg/kg,

toluene:

Acute oral toxicity : LD50 (Rat): 5,580 mg/kg,

Acute inhalation toxicity : LC50 (Rat): 7585 ppm
Exposure time: 4 h
Test atmosphere: dust/mist

Acute dermal toxicity : LD50 (Rabbit): 12,125 mg/kg,

ethanol:

Acute oral toxicity : LD50 (Rat): 7,060 mg/kg,

Acute inhalation toxicity : LC50 (Rat): > 32380 ppm
Exposure time: 4 h
Test atmosphere: vapour

benzene:

Acute oral toxicity : LD50 (Rat): 2,990 mg/kg,

Acute inhalation toxicity : LC50 (Rat): 13700 ppm
Exposure time: 4 h
Test atmosphere: dust/mist

Acute dermal toxicity : LD50 (Rabbit): > 8,240 mg/kg,

Skin corrosion/irritation

Product:

Remarks: No data available

Serious eye damage/eye irritation

Product:

Remarks: No data available

Respiratory or skin sensitisation

No data available

Germ cell mutagenicity

No data available

Carcinogenicity

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

No data available

Reproductive toxicity

No data available

STOT - single exposure

No data available

STOT - repeated exposure

No data available

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

Product:

Toxicity to fish	:	Remarks: No data available
Toxicity to daphnia and other aquatic invertebrates	:	Remarks: No data available
Toxicity to algae	:	Remarks: No data available
Toxicity to bacteria	:	Remarks: No data available

Persistence and degradability

Product:

Biodegradability	:	Remarks: No data available

Bioaccumulative potential

No data available

Mobility in soil

No data available

Other adverse effects

No data available

SECTION 13. DISPOSAL CONSIDERATIONS

Disposal methods

Waste from residues	:	The product should not be allowed to enter drains, water courses or the soil. Offer surplus and non-recyclable solutions to a licensed disposal company. Waste must be classified and labelled prior to recycling or disposal. Send to a licensed waste management company.

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

Dispose of as hazardous waste in compliance with local and national regulations.
Dispose of product residue in accordance with the instructions of the person responsible for waste disposal.

SECTION 14. TRANSPORT INFORMATION

International Regulations

IATA-DGR

UN/ID No.	:	UN 1203
Proper shipping name	:	Gasoline
Class	:	3
Packing group	:	II
Labels	:	Class 3 - Flammable Liquid
Packing instruction (cargo aircraft)	:	364

IMDG-Code

UN number	:	UN 1203
Proper shipping name	:	GASOLINE
Class	:	3
Packing group	:	II
Labels	:	3
EmS Code	:	F-E, S-E
Marine pollutant	:	no

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code

National Regulations

TDG

UN number	:	UN 1203
Proper shipping name	:	GASOLINE
Class	:	3
Packing group	:	II
Labels	:	3
ERG Code	:	128
Marine pollutant	:	no

SECTION 15. REGULATORY INFORMATION

This product has been classified according to the hazard criteria of the Hazardous Products Regulations (HPR) and the SDS contains all of the information required by the HPR.

The components of this product are reported in the following inventories:

DSL On the inventory, or in compliance with the inventory

TM Trademark of Suncor Energy Inc. Used under licence.

SECTION 16. OTHER INFORMATION

For Copy of SDS	:	Internet: www.petro-canada.ca/msds Canada-wide: telephone: 1-800-668-0220; fax: 1-800-837-1228 For Product Safety Information: 1 905-804-4752
Prepared by	:	Product Safety: +1 905-804-4752
Revision Date	:	2018/10/23

The information provided in this Safety Data Sheet is correct to the best of our knowledge, information and belief at the date of its publication. The information given is designed only as a guidance for safe handling, use, processing, storage, transportation, disposal and release and is not to be considered a warranty or quality specification. The information relates only to the specific material designated and may not be valid for such material used in combination with any other materials or in any process, unless specified in the text.

™ Trademark of Suncor Energy Inc. Used under licence.

SECTION 1. IDENTIFICATION

Product name	:	JET A/A-1 AVIATION TURBINE FUEL
Synonyms	:	Jet A-1; Jet A-1-DI; Aviation Turbine Kerosene (ATK); JP-8; NATO F-34; Jet F-34; Aviation Turbine Fuel, Kerosene Type (CAN/CGSB 3.23 & CAN/CGSB 3.24)
Product code	:	101851, 100123
Manufacturer or supplier's details		Petro-Canada P.O. Box 2844, 150 - 6th Avenue South-West Calgary Alberta T2P 3E3 Canada
Emergency telephone number		Suncor Energy: +1 403-296-3000; Canutec Transportation: 1-888-226-8832 (toll-free) or 613-996-6666; Poison Control Centre: Consult local telephone directory for emergency number(s).

Recommended use of the chemical and restrictions on use

Recommended use	:	Used as aviation turbine fuel. May contain a fuel system icing inhibitor. In the arctic, Jet A-1 may also be used as diesel fuel (if it contains a lubricity additive) and heating oil.
Prepared by	:	Product Safety: +1 905-804-4752

SECTION 2. HAZARDS IDENTIFICATION

Emergency Overview

Appearance	Clear liquid.
Colour	Clear and colourless
Odour	Kerosene-like.

GHS Classification

Flammable liquids	:	Category 3
Skin irritation	:	Category 2
Reproductive toxicity	:	Category 2
Specific target organ toxicity - single exposure	:	Category 3 (Central nervous system)
Aspiration hazard	:	Category 1

Petro-Canada is a Suncor Energy business. ™ Trademark of Suncor Energy Inc. Used under licence.

GHS label elements

Hazard pictograms :

Signal word : Danger

Hazard statements : Flammable liquid and vapour.
May be fatal if swallowed and enters airways.
Causes skin irritation.
May cause drowsiness or dizziness.
Suspected of damaging fertility or the unborn child.

Precautionary statements : **Prevention:**
Obtain special instructions before use.
Do not handle until all safety precautions have been read and understood.
Keep away from heat, hot surfaces, sparks, open flames and other ignition sources. No smoking.
Keep container tightly closed.
Ground and bond container and receiving equipment.
Use explosion-proof electrical/ ventilating/ lighting/ equipment.
Use non-sparking tools.
Take action to prevent static discharges.
Avoid breathing dust/ fume/ gas/ mist/ vapours/ spray.
Wash skin thoroughly after handling.
Use only outdoors or in a well-ventilated area.
Wear protective gloves/ protective clothing/ eye protection/ face protection.
Response:
IF SWALLOWED: Immediately call a POISON CENTER/doctor.
IF ON SKIN (or hair): Take off immediately all contaminated clothing. Rinse skin with water.
IF INHALED: Remove person to fresh air and keep comfortable for breathing. Call a POISON CENTER/doctor if you feel unwell.
IF exposed or concerned: Get medical advice/ attention.
Do NOT induce vomiting.
If skin irritation occurs: Get medical advice/ attention.
Take off contaminated clothing and wash it before reuse.
In case of fire: Use dry sand, dry chemical or alcohol-resistant foam to extinguish.
Storage:
Store in a well-ventilated place. Keep container tightly closed.
Store in a well-ventilated place. Keep cool.
Store locked up.
Disposal:
Dispose of contents/ container to an approved waste disposal plant.

Potential Health Effects

Primary Routes of Entry : Eye contact
Ingestion

TM Trademark of Suncor Energy Inc. Used under licence.

Inhalation
Skin contact

Inhalation : Inhalation may cause central nervous system effects. Symptoms and signs include headache, dizziness, fatigue, muscular weakness, drowsiness and in extreme cases, loss of consciousness.

Skin : May irritate skin.

Eyes : May irritate eyes.

Ingestion : Ingestion may cause gastrointestinal irritation, nausea, vomiting and diarrhoea.
Aspiration hazard if swallowed - can enter lungs and cause damage.

Aggravated Medical Condition : None known.

Other hazards

None known.

IARC No component of this product present at levels greater than or equal to 0.1% is identified as probable, possible or confirmed human carcinogen by IARC.

ACGIH Confirmed animal carcinogen with unknown relevance to humans

Kerosene 8008-20-6

SECTION 3. COMPOSITION/INFORMATION ON INGREDIENTS

Substance / Mixture : Mixture

Hazardous components

Chemical name	CAS-No.	Concentration
kerosine (petroleum)	8008-20-6	90 - 100 %
2-(2-methoxyethoxy)ethanol	111-77-3	0 - 0.2 %

SECTION 4. FIRST AID MEASURES

If inhaled : Move to fresh air.
Artificial respiration and/or oxygen may be necessary.
Seek medical advice.

In case of skin contact : In case of contact, immediately flush skin with plenty of water for at least 15 minutes while removing contaminated clothing

Petro-Canada is a Suncor Energy business. TM Trademark of Suncor Energy Inc. Used under licence.

		and shoes. Wash skin thoroughly with soap and water or use recognized skin cleanser. Wash clothing before reuse. Seek medical advice.
In case of eye contact	:	Remove contact lenses. Rinse immediately with plenty of water, also under the eyelids, for at least 15 minutes. Obtain medical attention.
If swallowed	:	Rinse mouth with water. DO NOT induce vomiting unless directed to do so by a physician or poison control center. Never give anything by mouth to an unconscious person. Seek medical advice.
Most important symptoms and effects, both acute and delayed	:	First aider needs to protect himself.

SECTION 5. FIREFIGHTING MEASURES

Suitable extinguishing media	:	Dry chemical Carbon dioxide (CO2) Water fog. Foam
Unsuitable extinguishing media	:	Do NOT use water jet.
Specific hazards during firefighting	:	Cool closed containers exposed to fire with water spray.
Hazardous combustion products	:	Carbon oxides (CO, CO2), nitrogen oxides (NOx), sulphur oxides (SOx), smoke and irritating vapours as products of incomplete combustion.
Further information	:	Prevent fire extinguishing water from contaminating surface water or the ground water system.
Special protective equipment for firefighters	:	Wear self-contained breathing apparatus for firefighting if necessary.

SECTION 6. ACCIDENTAL RELEASE MEASURES

Personal precautions, protective equipment and emergency procedures	:	Use personal protective equipment. Ensure adequate ventilation. Evacuate personnel to safe areas. Material can create slippery conditions.
Environmental precautions	:	If the product contaminates rivers and lakes or drains inform respective authorities.

Petro-Canada is a Suncor Energy business. TM Trademark of Suncor Energy Inc. Used under licence.

Methods and materials for containment and cleaning up : Prevent further leakage or spillage if safe to do so.
Remove all sources of ignition.
Soak up with inert absorbent material.
Non-sparking tools should be used.
Ensure adequate ventilation.
Contact the proper local authorities.

SECTION 7. HANDLING AND STORAGE

Advice on safe handling : For personal protection see section 8.
Smoking, eating and drinking should be prohibited in the application area.
Use only with adequate ventilation.
In case of insufficient ventilation, wear suitable respiratory equipment.
Avoid spark promoters. Ground/bond container and equipment. These alone may be insufficient to remove static electricity.
Avoid contact with skin, eyes and clothing.
Do not ingest.
Keep away from heat and sources of ignition.
Keep container closed when not in use.

Conditions for safe storage : Store in original container.
Containers which are opened must be carefully resealed and kept upright to prevent leakage.
Keep in a dry, cool and well-ventilated place.
Keep in properly labelled containers.
To maintain product quality, do not store in heat or direct sunlight.

SECTION 8. EXPOSURE CONTROLS/PERSONAL PROTECTION

Components with workplace control parameters

Components	CAS-No.	Value type (Form of exposure)	Control parameters / Permissible concentration	Basis
kerosine (petroleum)	8008-20-6	TWA	200 mg/m3 (total hydrocarbon vapor)	CA BC OEL
		TWA	200 mg/m3 (total hydrocarbon vapor)	CA AB OEL
		TWA	200 mg/m3 (total hydrocarbon vapor)	ACGIH

Engineering measures : Use only in well-ventilated areas.
Ensure that eyewash station and safety shower are proximal to the work-station location.

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

Personal protective equipment

Respiratory protection	:	Use respiratory protection unless adequate local exhaust ventilation is provided or exposure assessment demonstrates that exposures are within recommended exposure guidelines. Respirator selection must be based on known or anticipated exposure levels, the hazards of the product and the safe working limits of the selected respirator.
Filter type	:	A NIOSH-approved air-purifying respirator with an organic vapour cartridge or canister may be permissible under certain circumstances where airborne concentrations are expected to exceed exposure limits. Protection provided by air-purifying respirators is limited. Use a positive-pressure, air-supplied respirator if there is any potential for uncontrolled release, exposure levels are unknown, or any other circumstances where air-purifying respirators may not provide adequate protection.
Hand protection		
Material	:	polyvinyl alcohol (PVA), Viton(R). Consult your PPE provider for breakthrough times and the specific glove that is best for you based on your use patterns. It should be realized that eventually any material regardless of their imperviousness, will get permeated by chemicals. Therefore, protective gloves should be regularly checked for wear and tear. At the first signs of hardening and cracks, they should be changed.
Remarks	:	Chemical-resistant, impervious gloves complying with an approved standard should be worn at all times when handling chemical products if a risk assessment indicates this is necessary.
Eye protection	:	Wear face-shield and protective suit for abnormal processing problems.
Skin and body protection	:	Choose body protection in relation to its type, to the concentration and amount of dangerous substances, and to the specific work-place.
Protective measures	:	Wash contaminated clothing before re-use.
Hygiene measures	:	Remove and wash contaminated clothing and gloves, including the inside, before re-use. Wash face, hands and any exposed skin thoroughly after handling.

SECTION 9. PHYSICAL AND CHEMICAL PROPERTIES

Appearance	:	Clear liquid.
Colour	:	Clear and colourless
Odour	:	Kerosene-like.

Petro-Canada is a Suncor Energy business. ™ Trademark of Suncor Energy Inc. Used under licence.

Odour Threshold	:	No data available
pH	:	No data available
Pour point	:	-51 °C (-60 °F)No data available
Boiling point/boiling range	:	140 - 300 °C (284 - 572 °F)
Flash point	:	> 38 °C (100 °F) Method: Tagliabue
Auto-Ignition Temperature	:	210 °C (410 °F)
Evaporation rate	:	No data available
Flammability	:	Flammable in presence of open flames, sparks and heat. Vapours are heavier than air and may travel considerable distance to sources of ignition and flash back. This product can accumulate static charge and ignite. May accumulate in confined spaces.
Upper explosion limit	:	5 %(V)
Lower explosion limit	:	0.7 %(V)
Vapour pressure	:	5.25 mmHg (20 °C / 68 °F)
Relative vapour density	:	4.5
Relative density	:	0.775 - 0.84 (15 °C / 59 °F)
Solubility(ies)		
Water solubility	:	No data available
Partition coefficient: n-octanol/water	:	No data available
Viscosity		
Viscosity, kinematic	:	1.0 - 1.9 cSt (40 °C / 104 °F)
Explosive properties	:	Do not pressurise, cut, weld, braze, solder, drill, grind or expose containers to heat or sources of ignition. Containers may explode in heat of fire.

SECTION 10. STABILITY AND REACTIVITY

Possibility of hazardous reactions	:	Hazardous polymerisation does not occur. Stable under normal conditions.
Conditions to avoid	:	Extremes of temperature and direct sunlight.

Petro-Canada is a Suncor Energy business.
TM Trademark of Suncor Energy Inc. Used under licence.

Incompatible materials	:	Reactive with oxidising agents, acids and alkalis.
Hazardous decomposition products	:	May release COx, NOx, SOx, aldehydes, acids, ketones, smoke and irritating vapours when heated to decomposition.

SECTION 11. TOXICOLOGICAL INFORMATION

Information on likely routes of exposure
Eye contact
Ingestion
Inhalation
Skin contact

Acute toxicity

Product:

Acute oral toxicity	:	Remarks: No data available
Acute inhalation toxicity	:	Remarks: No data available
Acute dermal toxicity	:	Remarks: No data available

Components:

kerosine (petroleum):

Acute oral toxicity	:	LD50 (Rat): > 5,000 mg/kg,
Acute inhalation toxicity	:	LC50 (Rat): > 5 mg/l Exposure time: 4 h Test atmosphere: dust/mist
Acute dermal toxicity	:	LD50 (Rabbit): > 2,000 mg/kg,

Skin corrosion/irritation

Product:

Remarks: No data available

Serious eye damage/eye irritation

Product:

Remarks: No data available

Respiratory or skin sensitisation

No data available

Germ cell mutagenicity

No data available

Carcinogenicity

No data available

Reproductive toxicity

No data available

STOT - single exposure

No data available

STOT - repeated exposure

No data available

SECTION 12. ECOLOGICAL INFORMATION

Ecotoxicity

Product:

Toxicity to fish	:	Remarks: No data available
Toxicity to daphnia and other aquatic invertebrates	:	Remarks: No data available
Toxicity to algae	:	Remarks: No data available
Toxicity to bacteria	:	Remarks: No data available

Persistence and degradability

Product:

Biodegradability	:	Remarks: No data available

Bioaccumulative potential

No data available

Mobility in soil

No data available

Other adverse effects

No data available

SECTION 13. DISPOSAL CONSIDERATIONS

Disposal methods

Waste from residues	:	The product should not be allowed to enter drains, water courses or the soil. Offer surplus and non-recyclable solutions to a licensed disposal company. Waste must be classified and labelled prior to recycling or disposal. Send to a licensed waste management company. Dispose of product residue in accordance with the instructions of the person responsible for waste disposal.

Petro-Canada is a Suncor Energy business. ™ Trademark of Suncor Energy Inc. Used under licence.

Contaminated packaging	:	Do not re-use empty containers.

SECTION 14. TRANSPORT INFORMATION

International Regulations

IATA-DGR

UN/ID No.	:	UN 1863
Proper shipping name	:	Fuel, aviation, turbine engine
Class	:	3
Packing group	:	III
Labels	:	Class 3 - Flammable Liquid
Packing instruction (cargo aircraft)	:	366

IMDG-Code

UN number	:	UN 1863
Proper shipping name	:	FUEL, AVIATION, TURBINE ENGINE
Class	:	3
Packing group	:	III
Labels	:	3
EmS Code	:	F-E, S-E
Marine pollutant	:	no

Transport in bulk according to Annex II of MARPOL 73/78 and the IBC Code

National Regulations

TDG

UN number	:	UN 1863
Proper shipping name	:	FUEL, AVIATION, TURBINE ENGINE
Class	:	3
Packing group	:	III
Labels	:	3
ERG Code	:	128
Marine pollutant	:	no

SECTION 15. REGULATORY INFORMATION

This product has been classified according to the hazard criteria of the Hazardous Products Regulations (HPR) and the SDS contains all of the information required by the HPR.

The components of this product are reported in the following inventories:

DSL	On the inventory, or in compliance with the inventory
TSCA	All chemical substances in this product are either listed on the TSCA Inventory or are in compliance with a TSCA Inventory exemption.
EINECS	On the inventory, or in compliance with the inventory

Petro-Canada is a Suncor Energy business. ™ Trademark of Suncor Energy Inc. Used under licence.

SECTION 16. OTHER INFORMATION

For Copy of SDS	:	Internet: www.petro-canada.ca/msds Canada-wide: telephone: 1-800-668-0220; fax: 1-800-837-1228 For Product Safety Information: 1 905-804-4752

ACRONYMS AND ABBREVIATIONS

The following acronyms and abbreviations are used throughout this Traffic and Access Management Plan (TAMP).

ANFO	Ammonium Nitrate Fuel Oil
ATV	All-Terrain Vehicle
BJAR	Brucejack Access Road
CEAA	Canadian Environmental Assessment Agency
EAC	Environmental Assessment Certificate (EAC #15-01)
EAO	BC Environmental Assessment Office
HSRC	Health, Safety and Reclamation Code for Mines in BC, 2022
Hwy	Highway
LHD	Load-Haul-Dump (Underground Loader)
Lakeshore Drive	BJAR km 71-73.3 (segment extending between the top of the Knipple Glacier (km 71) and the Mine Site (km 73.3)
Lower BJAR	BJAR km 0-59 (segment extending from Hwy 37 intersection (km 0) to the access onto the Knipple Glacier (km 59)
Mine Site	Core mine infrastructure area at the southwest end of Brucejack Lake
Mine Site Area	Mine infrastructure west of upper Knipple Glacier (km 71.6), including the NPAG Quarry, upper Brucejack Access Road, and the Mine Site
MFLNRORD	BC Ministry of Forests, Lands, Natural Resources Operations, and Rural Development
MHz	Megahertz
Mountain Safety	Avalanche Technician
NPAG	Non Potentially Acid Generating
PPE	Personal Protective Equipment
Pretium	Pretium Resources Inc.
ROPS	Rollover Protective Structure

ROW	Right-of-Way
TAMP	Traffic and Access Management Plan
UWR	Ungulate Winter Range
VHF	Very High Frequency
VOK	Valley of the Kings

1 INTRODUCTION

1.1 PURPOSE

The Brucejack Mine Traffic and Access Management Plan (TAMP) provides the management framework and directs implementation of the following:

- Access control and management for (1) the Brucejack Access Road (BJAR) between Highway 37 and the Mine Site, and (2) within the Mine Site;
- Road design and maintenance to maximize the safety of BJAR and Mine Site road users;
- Measures to minimize vehicle to vehicle and vehicle to pedestrian incidents on all roads;
- Measures to minimize potential adverse effects on the environment, including wildlife; and
- Measures to protect the security of Pretium Resources Inc. (Pretium) and contractor assets.

Restricting access to lands made accessible by the BJAR is particularly important, along with prohibiting hunting and/or fishing by persons accessing the road, since increased access can potentially expose wildlife to increased pressure from fishing, hunting, and trapping activities. Similarly, an increase in vehicular traffic along the BJAR resulting from uncontrolled access could elevate direct wildlife mortality and disruption of movement.

Road access to the Mine Site is via the 73 km long BJAR, which extends west from Hwy 37 (Figure 1.1-1). The first 59 km are via all-weather gravel surfaced access road, with a Security Gate located at km 1; the section from km 59 to 71 traverses the Knipple Glacier; and the remaining section to the Mine Site is via all-weather gravel surfaced access road (Figure 1.1-2).

1.2 ROAD OVERVIEW

The start of the BJAR is located near km 215 on Hwy 37, approximately 60 km north of Meziadin Junction (Figures 1.1-1 and 1.1-2). Road distances from population centres are shown in Table 1.2-1.

Table 1.2-1. Distances from Brucejack Access Road to Population Centres

City or Landmark	Highway Distance to Start of Access Road
Bell II	33 km
Meziadin Junction	60 km
Stewart	120 km
Gitlaxt'aamiks	202 km
Kitwanga	216 km
Dease Lake	272 km
Terrace	300 km
Smithers	326 km
Prince George	697 km
Vancouver	1,476 km

Figure 1.1-1. Brucejack and Access Road Location

Figure 1.1-2. BJAR Overview

1.3 INSTRUCTIONS FOR TRAVELLING TO THE BRUCEJACK SITE

When travelling to the Brucejack Mine site from the south, use the following driving instructions (refer to BJAR Standard Operating Procedures (SOP; Appendix 1):

- From Smithers take Hwy 16 west to Kitwanga (115 km).
- From Terrace take Hwy 16 east to Kitwanga (95 km).
- At Kitwanga, turn north onto Hwy 37.
- Follow Hwy 37 north to Meziadin Junction (155 km). This is the last commercial fueling station and the last place to obtain fuel before reaching Wildfire Camp at km 1 of the BJAR.
- Turn right at Meziadin Junction (left goes to Stewart/Hyder) and proceed north. The turn off for the BJAR is on the left hand (west) side of the highway at km 215 (60 km north of Meziadin Junction). There is a large Pretium sign at the entrance, a gate, and a security booth.
- The Hwy 37 entry gate staff will ask your name and you will be required sign in. They will notify Wildfire Security to expect your arrival. Visitors without an appointment will be turned away.
- Drive from the Hwy 37 entry gate to the Wildfire Security gate at km 1.
- If it is your first time traveling on the BJAR, you will be required to receive a road orientation and review of the road travel procedures (Appendix 1) at Wildfire Security.
- All personnel must check in at Wildfire Security for contraband screening. If contraband is found, site access may be denied dependant on the findings. The security gate is open 06:30-18:30 year round; any variation from these time frames must be approved by the Mine Manager or Access Road Manager.
- All vehicles that travel on the BJAR <u>must</u> have all the BJAR SOP listed safety equipment, proper survival gear and a base radio with the required frequencies.
- All vehicles must call on the radio their kilometre marker while traveling on the road (refer to Section 2.7 for full call-out procedure).

1.4 GENERAL COMMUNICATIONS

Communications along the BJAR are currently by VHF radio, with work ongoing to enable conversion to digital communications. There are three repeated frequencies and numerous non-repeated frequencies, as well as a few new digital frequencies. For routine repeated or non-line-of-sight communications use the following channels:

- Channel 1, analog – BJAR from Hwy 37 at Wildfire Camp to km 58.5.
- Channel 2, Repeater 1, analog – BJAR from km 59 to 71 (Knipple Glacier road section), and call-out onto the glacier for the transition from Lakeshore Drive to the Mine Site at km 73.3.

- Ladd 2, analog – Km 71 to km 73, Lakeshore Drive and within the Mine Site for location and travel call-outs.
- Admin Channel 1, digital – Brucejack Underground Emergency.

Emergency call-out channels for accident response or other emergency assistance are as follows:

- Analog Channel 1 – BJAR km 0 – 58.5.
- Channel 2, Repeater 1 – Brucejack Mine Site and Knipple Glacier (km 59 to 71).
- Underground Channel 2, digital – Brucejack Mine, underground.
- Channel 6, Repeater 3 – BJAR km 1 – 36.5 (Wildfire Camp to Scott Creek) – this is a secondary emergency call-out if emergency assistance cannot be reached via Analog Channel 1. This channel will reach Dispatch/Logistics directly.
- Channel 4, Repeater 2 – BJAR km 36.5 – 58.5 (Scott Creek to bottom of Knipple Glacier) - this is a secondary emergency call-out if emergency assistance cannot be reached via Analog Channel 1. This channel will reach Dispatch/Logistics directly.

Local or line of site communications on the BJAR including kilometre callouts must be done using the Analog Channel 1, BJAR. Channel 1 is transmitted and received on the 166.08 MHz frequency. Note that the current site radio frequencies are licensed to others and used by Pretium with permission. Once a permanent communications system has been installed, new frequencies will be licensed to Pretium. The Traffic and Access Management Plan will be updated at that time.

1.5 TRAFFIC VOLUME MITIGATION

The use of a combination of chartered bus and airplanes mitigates traffic volume along the Lower BJAR and Hwy 37. To the extent feasible, all employees and contractors are required to use the charters for transferring personnel. Personal vehicles are NOT allowed past Wildfire Security gate and must be parked in designated parking areas with the keys left with Wildfire Security.

1.6 SECURITY AND ACCESS CONTROL

There are currently two security check points to control access to the Brucejack Project: (1) a check point immediately adjacent to the BJAR intersection with Hwy 37, and (2) a security gate and building at Wildfire Camp (Wildfire Security), located at km 1 of the BJAR. Temporary security check points are used at the Bowser airstrip on an as needed basis.

Persons authorized to use the BJAR include First Nations people conducting traditional use activities under authorization of their respective Nation's government, and mine personnel authorized by the Mine Manager (e.g., employees, contractors, suppliers). Visitors with an appointment are also allowed access to the road (e.g., consultants). Government inspectors are requested to undergo a security check, however inspectors from certain government agencies may be exempt from the security check requirement.

For safety reasons, First Nations people conducting traditional use activities authorized by their Nation's government are requested to park in designated areas.

Transportation via ATV, snowmobile, and motorcycle is prohibited on the BJAR unless required for work being done by Pretium or its contractors.

1.6.1 Highway 37 Security Gate

The security checkpoint at the Hwy 37 intersection consists of a security station and manually operated barrier gate. This checkpoint prevents unauthorized access to the west side of the Bell-Irving River via the BJAR km 0.4 bridge (i.e., prevents access to the west side of the Bell-Irving River for hunting, fishing and any other purposes). The gate is locked when the checkpoint is not staffed. A radio call box is installed outside the gate to communicate with Wildfire Security, who will return to the highway security gate during off-hours if/as necessary.

1.6.2 Wildfire Security

The second security facility is located at km 1 of the BJAR at the entrance to Wildfire Camp. This facility, Wildfire Security, consists of a security building, chain-link fence, and manually controlled gate. The main purposes of this facility is to screen all traffic for contraband and to further prevent unauthorized access to the BJAR beyond km 1.

Wildfire Security is the main check-in and check-out location for all vehicles travelling the BJAR. All of the traffic on the portion of the BJAR from the Hwy 37 intersection to Knipple Camp at km 56 is by conventional, rubber tired, highway legal vehicles. Operators travelling only this section of the road do not require any special glacier transport training.

Wildfire Security implements security screenings for all inbound and outbound personnel (except excluded government inspectors) and vehicles. Wildfire Security provides a road orientation to new BJAR operators, with instruction on safety and environmental requirements including radio channels; road speed limits; spill reporting procedures; taking care to prevent collisions with wildlife; wildlife attractant prevention requirements (no littering, waste disposal requirements); and wildlife interaction reporting procedures/requirements. They also notify operators of any road construction activity, or other hazards or recent wildlife sightings.

1.6.3 Bowser Airstrip Security Facility

A security checkpoint is occasionally operated at the Bowser Airstrip on an as needed basis. The purpose of this facility to check incoming and departing passengers for contraband. Orientations take place at Knipple Camp if required.

1.7 INCIDENT REPORTING

1.7.1 Vehicle Collisions and Medical Emergencies

All motor vehicle collisions on the BJAR, regardless of severity, and medical emergencies, must be reported immediately to the nearest Access Road Supervisor and Dispatch/Logistics. Call-out is directly to Dispatch/Logistics if a collision or medical emergency occurs between km 59 and the Mine Site, or within the Mine Site. Call-out is to 'Access Road Supervisor' if a collision or medical emergency occurs between km 0 and km 58.5. The responding Access Road Supervisor (nearest Access Road Supervisor, Access Road Superintendent or the Access Road Manager) will contact Dispatch/ Logistics as part of the response procedure.

This includes single vehicle collisions, multi-vehicle collisions, and collisions involving wildlife. In the event of a collision or medical emergency, Dispatch/Logistics notifies Brucejack Health and Safety personnel as well as both the Mine and Road Managers, who then organize the appropriate response and investigation.

The response must be prioritized according to the following hierarchy:

1. Human health and safety: The safety of personnel, both those involved in the incident as well as responders is first priority. Once a responder determines that they are not in danger themselves, all efforts are focused on any victims of the collision.
2. Environmental and wildlife safety: Once human life is secure, response efforts are focused on mitigating any further damage to the environment (e.g., by stopping, containing, and cleaning up any spills; addressing injured or deceased wildlife).
3. Recovery of physical assets: Once it is determined that the accident scene is no longer a threat to the environment, recovery of any involved equipment proceeds.

1.7.2 Wildlife/Vehicle Collisions

Any collisions between vehicles and wildlife are documented. The documentation includes information on the collision location, wildlife injuries or fatalities, and follow-up actions if/as appropriate. Employees and other vehicle operators are trained on reporting in the event of a collision with wildlife (Appendix 1). Information on any wildlife collisions on the BJAR is shared with relevant government agencies and the Brucejack Wildlife Advisory Committee (WAC). A Wildlife Collision Protocol specific to the BJAR has been developed (refer to Section 2.3) and is included in the Brucejack Wildlife Management Plan.

1.7.3 Incident Investigation

All motor vehicle near misses and accidents on the BJAR are investigated to determine the underlying cause. The locations and causes of both near misses and accidents are logged to track for trends which might suggest adaptive management is warranted.

A report is prepared for each investigation, and each accident investigation report provides recommendations in an effort to prevent future similar incidents. The recommendations consider mitigating risk to personnel, equipment, and wildlife.

Any locations along the BJAR identified as having a higher likelihood for vehicle collisions with wildlife will be managed adaptively.

1.7.4 Unauthorized Access and Hunting

Access to the BJAR is managed through controlled access security points to prevent its use for hunting and recreational activities. If unauthorized use, including hunting, is observed along the BJAR or anywhere within the Project area including the Brucejack Transmission Line, it will be reported immediately to Wildfire Security and the Brucejack Access Road Manager, who will provide the information to the Environmental Manager and the Environmental Superintendent (or designates). The Environmental Manager will in turn report any hunting activities involving the BJAR to provincial authorities.

Monitoring of hunting activity along the Brucejack Transmission Line Right-of-Way (ROW) is completed on an incidental basis. If hunting, or any use, of the Transmission Line ROW by non-project personnel is observed, it will be reported immediately to the Environmental Superintendent or designates. Trees were felled and left in place along segments of the Brucejack Transmission Line traversing forested terrain to prevent or minimize such unauthorized access. Steep mountainous terrain and difficult stream crossings provide further significant barriers to unauthorized access along the Brucejack Transmission Line.

1.8 RELEVANT ENVIRONMENTAL ASSESSMENT CONDITIONS

Condition 6.3 of the Decision Statement Issued under Section 54 of the *Canadian Environmental Assessment Act, 2012* to Pretium Resources Inc. for the Brucejack Project states that "the Proponent shall prohibit public access to the access road."

Schedule B, Condition 2 of Environmental Assessment Certificate (#M15-01), issued on March 26, 2015 to Pretium Resources Inc. for the Brucejack Project, requires a Component Plan for traffic and access management. The specific wording from Schedule B of the Certificate is provided below.

> *Condition 2*
>
> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*

- *Effects mitigation measures;*
- *Monitoring programs;*
- *Monitoring schedules; and*
- *Reporting requirements.*

The Holder must consult with the Nisga'a Lisims Government (NLG), Tahltan and Tsetsaut / Skii km Lax Ha Nation (TSKLH) on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.

The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."

2 LOWER BRUCEJACK ACCESS ROAD TRAFFIC CONTROL

Although primarily focused on the gravel surfaced portion of the BJAR road between Hwy 37 (km 0) and the bottom of the Knipple Glacier (km 59; lower BJAR), the following also applies to the Lakeshore Drive section of the BJAR between the top of the Knipple Glacier (km 71) and the Mine Site (km 73.3) unless otherwise noted in Section 4.

2.1 ROAD DESIGN

2.1.1 Existing Road Design Parameters

The Lower BJAR (km 0 to 58.5) was originally designed and constructed to the following minimum criteria:

- L100 minimum design loading, with consideration of equivalent D9 track loading;
- 5.0 m road width, with 0.3 m wide by 0.8 m deep ditches between km 0 and 35;
- 30 m right-of-way width;
- 30 km/h design speed, 35 m minimum turning radius;
- Maximum 12% sustained grade, 18% pitches less than 150 m (with exceptions);
- Maximum 500 m turnout spacing, optimum 300 m spacing; and
- 7% maximum grade break per 15 m travel.

Many of the actual road design criteria exceed these minimum criteria. Some upgrades were made to the road during the mine Construction phase and the speed limit of the Lower BJAR was increased to 40 km/h, excluding Wildfire Camp and Security areas, bridge crossings, and Bowser Camp/ Aerodrome areas (km 50 to 52).

The design of the older 'Newhawk' road section from km 35 to 56 can accommodate significantly higher speeds (e.g., to 70 to 80 km/h), however speed limits are kept lower on a precautionary basis due to higher quality moose/ungulate and other wildlife habitat in this road section along the Bowser River (refer to additional details in Section 2.1.2). The focus is generally on moose, as moose are the wildlife species that are expected to be the most vulnerable to vehicle collisions along the BJAR, and are present in the Bowser River Valley.

2.1.2 Proposed Upgrades

Condition 2.08 of Special Use Permit (SUP) S25923 requires that the Lower BJAR be brought up to current forest road standards, and lists inspection/audit and other conditions to identify specific required improvements. Planned gradual improvements include ongoing culvert and bridge

replacements, minor realignments of sharper curves, reductions of steeper grades, and additional surfacing of some sections. Specifically, the work is currently expected to include:

- Replacement of culverts and bridges in accordance with recommendations from the Engineer of Record (EOR) for the BJAR, gradually bringing these to current MFLNRORD forest road standards;
- Variable depth surfacing (pit run gravel or 3" minus shot rock, which has been compacted, of 200 to 300 mm depth) and shaping;
- Upgrading to favourable grades of 12% (14% for pitches less than 150 m) and adverse grades of 8% (10% for pitches less than 100 m);
- Re-working of horizontal curves to a design radius of 65 m; a maximum 3% super-elevation (or crossfall) is prescribed (1/3 of an inch per foot or 3 cm/m);
- Safely addressing two-way traffic in all locations with sight distances below the Minimum Site Stopping Distance of 95 m (blind vertical and horizontal curves) – the road width will be widened to 10 m (double lane) to allow traffic to safely pass; and
- Posting additional signage in both directions of travel to identify road speed zones.

As the BJAR is gradually improved, the potentially allowable speed from a design and human safety perspective will increase in applicable road segments. Km 35 to 56 are already at a design standard that can accommodate significantly increased speeds.

Consistent with the Brucejack EAC/EIS Application (2014), Pretium will keep speed limits on the BJAR at or below 70 km/h as a precautionary measures to minimize the potential for collisions with wildlife. Evidence suggests that vehicle-moose collisions are less severe when speed limits are below 70 km/h compared to above 90 km/h (Lavsund and Sandergren 1991). The rate at which mortality decreases between 90 km/h and 70 km/h is approximately 80% (Seiler 2005).

Following are the maximum speeds currently planned for km 35 to 56 (excluding bridge crossings and the reduced speed zone for Bowser Camp area (km 50 to 52)):

- Km 35 to 40 (adjacent and/or passes through Ungulate Winter Range [UWR]; Figure 2.1-1): maximum speed 50 km/h, year round;
- Km 40 to 56 (passes through high quality moose habitat; Figure 2.1-1): maximum speed 60 km/h during summer (snow free) driving conditions and maximum 50 km/h during winter (snow/ice) driving conditions.

During mine operations, the Lower BJAR is maintained throughout the year by road grooming equipment and snow plows. Regular patrols are conducted in potential avalanche areas and avalanche control measures are utilized.

2.2 GEOHAZARDS

Geohazards identified along the Lower BJAR include debris avalanches, debris floods, floods, and rockfall.

Figure 2.1-1. UWRs and High Quality Moose Habitat in Proximity to the BJAR

No landslide or fluvial geohazards were identified that exceeded a Moderate level of safety risk. For facilities, the only non-avalanche geohazard exceeding Moderate risk was flooding hazards along the BJAR where it runs parallel to the Bowser River (35-59 km), and at the Bowser airstrip.

Additional information on geohazard management including inspections and response is provided in the Brucejack Geohazards Management Plan.

2.2.1 Avalanches

2.2.1.1 Avalanche Zone at 44 km

Several portions of the Lower BJAR intersect avalanche paths. Conditions in each of these paths are monitored throughout the winter and mitigation measures are implemented as necessary.

The avalanche path having the most day-to-day impact on the BJAR is located near km 44 and is known locally as the "Slasher" zone. (Figure 2.2-1 and Plate 2.2-1) The active portion of this zone is just under 1 km long. The BJAR in this area is between the Slasher slope to the north and the Bowser River immediately to the south. Signs warning of the zone are located on either end of the slide paths. Vehicle operators are required to call out on the radio prior to entering and after leaving the zone during the avalanche season. Stopping in this zone is prohibited.

Six Gazex® Avalanche Release Systems have been installed within the Slasher zone to mitigate avalanche hazards in this area. Avalanche control by the use of a helicopter is used as needed to support mitigation of avalanche hazards on the Slasher slope.

2.2.1.2 Other Avalanche Zones

Other avalanche zones with potential to affect the Lower BJAR are listed in Table 2.2-1. Monitoring and hazard mitigation measures, including non-automated avalanche control methods, are used at each of these as needed. Details of mine and BJAR avalanche zones and controls are provided in the Avalanche Safety Plan; a summary is provided below.

Table 2.2-1. BJAR Avalanche Zone Locations

Access Road Km Marker	Local Avalanche Zone Name
2	Wildfire Hill
30	Butch Cassidy
31	Sundance Kid
44	Slasher
56	Fort Knox
58	Sluice Box
59	Crusher
60	DMZ

Figure 2.2-1. Road Avalanche Zones Km 30 to 44

Plate 2.2-1. Slasher paths at km 44 outlined in red. BJAR in orange (Gould, 2014).

2.2.1.3 Avalanche Control

Avalanche control measures used throughout the site, or proposed, include:

- Hand charging;
- Gazex® Avalanche Release Systems;
- Wyssen Towers;
- ANFO prill bags, deployed both on the ground and via helicopter; and

Site avalanche technicians (Mountain Safety) report avalanche conditions to operations crews at the start of each shift and update throughout the day by radio as conditions change.

Unless requested by the Access Road Manager, general traffic travelling through and not working in avalanche areas are not required to carry companion rescue gear. Road maintenance equipment operators are required to wear avalanche transceivers. Rescue caches are situated at start and end of avalanche zones. Workers also receive avalanche rescue training.

Equipment operators must immediately report any avalanche activity to Mountain Safety making sure to note the location of the activity.

As above, Six Gazex® Avalanche Release Systems have been installed at the km 44 "Slasher" area. These systems consist of an exploder, located in in an avalanche start zone, connected by gas lines to a shelter, located on a ridgeline. The shelter houses oxygen and propane gas cylinders that release gases to the exploder through electronically controlled valves. The gases collect in the exploder and are ignited by a pressure actuated firing mechanism creating an explosion. The resulting pressure wave fractures the snow mantle, initiating an avalanche. The entire process is controlled remotely via a radio control system through a computer using sophisticated monitoring software (Lieberman, 2002).

The Gazex exploders are operated and maintained by the Mountain Safety department in conjunction with supporting onsite trades people. Access for maintenance and fueling is via helicopter as required.

Plate 2.2-5 shows a typical GAZEX® installation with the exploder shown in the foreground and the shelter in the background near the helicopter.

Plate 2.2-5. Typical GAZEX® installation.
(Photo courtesy of AvaTek Mountain Systems Inc.)

Additional details of avalanche control and safety measures are provided in the Avalanche Safety Plan.

2.2.2 Flooding

Moderate risk of flooding exists along the Lower BJAR where it runs parallel to the Bowser River between km 35 and 56.

River and tributary conditions are monitored during high water events and the road is closed if/as necessary.

2.3 WILDLIFE COLLISION PROTOCOL

The BJAR is maintained and managed to minimize or prevent wildlife attractants on and adjacent to the road, and to provide egress points during winter, however encounters with wildlife (e.g., moose) along the BJAR may still occur. The radio is used to alert other vehicle operators that there is wildlife in the area and to travel with caution.

If a large number of wildlife (e.g., moose) are present on or adjacent to the Lower BJAR, a temporary road closure may be initiated at the discretion of the Environmental Superintendent (or delegate) in consultation with the Access Road Manager and the Mine Manager.

Drivers are instructed to report encounters with wildlife along the BJAR (including observations or interactions) either directly to the Brucejack Environmental Department, or to Dispatch/Logistics,

who then forward these reports. The Brucejack Environmental Department maintains records of these reports via the wildlife log. Reporting and record keeping specific to collisions with wildlife follows the Wildlife Collision Protocol in the Brucejack Wildlife Management Plan:

- Any collisions between mine vehicles and wildlife are documented and include information on the location of the collisions;
- Wildlife species that are recorded include, but are not limited to, moose, mountain goat, grizzly and black bear, and deer;
- Personnel and drivers are instructed to report any wildlife-vehicle collision to Dispatch/Logistics or directly to Pretium Environmental Department staff; and
- Information on collisions with wildlife is included in the wildlife log, which is provided to the Brucejack Wildlife Advisory Committee (WAC) for review and feedback. If any mortality of Little Brown Myotis (*Myotis lucifugus*) or Northern Myotis (*Myotis septentrionalis*) resulting from vehicle collisions is reported, or if evidence of same is found through monitoring, this information is compiled as required by Condition 8.3 of the Decision Statement under Section 54 of the *Canadian Environmental Assessment Act*, *2012*, for the Brucejack Project.
- The Environmental Manager is responsible for training, providing a reporting system, and reporting collisions as appropriate to government officials.

These records will provide a basis for identifying locations of considerable risk for wildlife/vehicle collisions, and for developing mitigation strategies for such areas if/as appropriate.

2.4 SPEED LIMITS

BJAR speed limit signs are posted at appropriate intervals. Speed limits may be increased to 50 to 60 km/h for km 35 to 40 and km 40 to 56 (excluding bridges and km 50 to 52; refer to Sections 2.1.1 and 2.1.2), and for other sections once upgrades are complete. Lesser speed limits are posted as appropriate for:

- Steep grades;
- Bridges;
- Low visibility curves;
- Approaches through camps; and
- Construction zones.

In addition to speed limit signs, measures to control vehicle speed against appropriate design speed limits may also include installation of “speed bumps” or additional signage for areas where speed limit exceedances are observed on a reoccurring basis.

Vehicle speeds are monitored through unannounced radar speed spot checks via radar sign-equipped trailers.

2.5 MEASURES TO CONTROL TRAFFIC NOISE

Measures to control noise from traffic include:

- Maintaining vehicles regularly;
- Imposing speed limits; and
- Maintaining mufflers on vehicles.

Additional measures to control noise from traffic may include:

- Consideration of noise specifications when selecting equipment;
- Applying noise dampening measures where possible;
- Limiting the use of engine air brakes within 500 m of floodplains during May and October to protect moose;
- Restricting use of engine air brakes on floodplains in June and September to protect grizzly bear; and
- Restricting speed limits and engine air brake use along Bowser River floodplain before July 15 to protect mountain goat.

2.6 VEHICLE PRIORITY

The following is a hierarchy for determining vehicle priority and right-of-way. Vehicles with a lower priority must yield to vehicles of higher priority:

1. Emergency vehicles;
2. Vehicles carrying explosives;
3. Buses and passenger vans/shuttles;
4. Heavy trucks and road maintenance equipment; and
5. Light vehicles.

Loaded vehicles have priority over unloaded vehicles regardless of direction of travel. Loaded vehicles going down have priority over loaded vehicles coming up.

2.7 RADIO CALL OUT PROCEDURES

Each vehicle travelling the BJAR must have a VHF radio programmed with the routine and emergency radio frequencies used for the road. If travelling in a convoy, only the lead vehicle is required to call out as long the vehicles stay together.

At each kilometre marker, vehicles must indicate:

1. Number of vehicles travelling together;
2. Type of vehicle (pickup, semi, grader, etc.);
3. Kilometre marker; and
4. Direction of travel ("up" indicates travel towards Brucejack Mine Site and "down" indicates travel towards Hwy 37).

For instance, a three vehicle convoy of pickup trucks heading towards Hwy 37 would call out "three pickups, 36 km down."

When vehicles are converging towards each other, the vehicles with the lower right-of-way priority must find a location to pull over and yield to the higher priority vehicle. Once safely off of the road, the yielding vehicle must notify the oncoming traffic that they have pulled off safely and give their approximate location. Once the higher priority vehicle(s) has passed, the yielding vehicle is free to resume travel.

At times, it may be convenient for the higher priority vehicle to pull over first. In this case, that operator will notify oncoming traffic of his or her intent.

2.8 PASSING

Passing anywhere along the BJAR is prohibited in all areas unless the lead vehicle pulls over to a complete stop or there is ample passing room for two vehicles to pass and the lead vehicle signals the overtaking vehicle that it is safe to pass. This may be communicated by radio or by physically waving the operator past.

The same procedure must be followed when passing working road maintenance or construction equipment. When passing an excavator, vehicles must use caution to stay out of the machine's swing radius until positive communication is established with the operator. The machine operator will indicate that it is safe to pass by stopping all machine movement and placing the bucket on the ground.

3 KNIPPLE GLACIER TRAFFIC CONTROL

The Knipple Glacier portion of the BJAR extends between km 59 and 71.6(Figure 3-1). Travel on the glacier road has a unique set of hazards that require special equipment and additional training for those traversing the road. No one is allowed to travel across the Knipple Glacier unless the glacier orientation has been completed. Drivers must be escorted by a qualified person for their first trip across the Knipple Glacier.

3.1 ROUTE DELINEATION

Bamboo markers are used on the VOK Bypass Route (winter emergency route when Lakeshore Drive is closed due to avalanche risk or control) to delineate the edge of the safe travel zone. High visibility reflective tape is placed on the markers to improve their visibility in low light conditions. The bamboo delineators are located on the side of the road for traffic incoming to the Brucejack Mine Site.

Local hazards and "Do Not Travel" areas are marked by various methods; including pylons, spray paint and bamboo arranged to form and "X"(Plate 3.1-1).

Plate 3.1-1. Bamboo "X" hazard identifier.

The route is moved from time to time in order to avoid hazards such as crevasses and moulins as the ice melts.

Figure 3-1. Knipple Glacier Portion of the BJAR

3.2 GLACIER HAZARDS

Some hazards unique to glacier travel include:

- Crevasses;
- Moulins or "Mill Holes";
- Slippery conditions;
- Flat light conditions; and
- Low visibility conditions.

3.2.1 Crevasses

As the spring snow melts, crevasses are exposed. Glacier safety and maintenance crews continuously work to keep crevasses on the roadway filled with ice. While the filled crevasses do not pose an entrapment hazard for equipment, driving over one while exceeding the speed limit can damage vehicles. The difference between the natural crevasses and the filled road route can be seen in Plate 3.2-1.

Plate 3.2-1. Crevasses along Knipple Glacier Route.

Procedures require that only trained and properly equipped personnel are allowed to exit their vehicles and walk on the glacier, as crevasses are large enough to entrap a person or cause injury.

Personnel or operators encountering a crevasse in need of filling must report it immediately to the Access Road Supervisor and Dispatch/Logistics.

3.2.2 Moulins

Moulins or "mill wells" are vertical or near vertical holes in the ice formed by moving water. Moulins can range in size from several centimetres (Plate 3.2-2) to tens of metres. They can extend to hundreds of metres in depth and may be full of water or dry.

Plate 3.2-2. Water-filled moulin (8 to 12 inches across).

Moulins are the biggest danger to pedestrians, as they can cause injury ranging from a twisted ankle or entrapment and drowning.

Glacier safety and maintenance crews are always on the lookout for newly exposed moulins. When encountered, locations of moulins are marked with traffic cones and/or bamboo Xs.

Personnel encountering unmarked moulins must note the location and report it to the Access Road Supervisor and Dispatch/Logistics.

3.2.3 Slippery Conditions

Due to slippery condition created by the melting ice, rubber tired equipment must be equipped with tire chains.

All vehicle operators must refer to the BJAR SOP (Appendix 1).

All operators on the glacier ice (km 59 to 71) must know how to install and adjust their own tire chains. Contractors are expected to supply their own chains and receive approval for glacier travel prior to arrival. Approvals are limited to mobilization, demobilization, and essential travel only. For the most part, all contractors are be required to ride in Pretium provided shuttles.

Operators must be cautious of ice grooming equipment operating on the glacier and only overtake that equipment after positive communication has been established.

3.2.4 Flat Light

Flat light conditions occur when fog or blowing snow blends with the white background of the snow. This condition is very disorienting and can quickly cause an operator to leave the road surface.

The edges of the main portion of the Knipple Glacier section of the BJAR (km 59 to 71) are defined by berms left from snow removal and grading. Bamboo delineators are spaced closely along the VOK Bypass Route during the winter and offer some point of reference for the operator. Various tints of sunglasses are also useful in flat light conditions. Tinted safety glasses are provided to the operators.

If an operator encounters flat light conditions where they cannot see the road, berms, or delineators, they must stop all motion and wait for visibility to improve. If visibility does not improve within 15 minutes, the operator must call Dispatch/Logistics and notify them of the situation, making sure to transmit their approximate location. The operator must also communicate with other vehicles operating in the area so that they do not cause a collision with the stopped vehicle. The vehicle operator must not, under any circumstances, leave the safety of the vehicle in these conditions.

3.2.5 Whiteout Conditions

Whiteout conditions occur when blowing snow obscures all points of reference. Blowing snow usually occurs during storms, but can also occur due to windblown ground snow.

If an operator along the VOK Bypass Route encounters whiteout conditions where they cannot see the next bamboo delineator, they must stop all motion and wait for visibility to improve. If visibility does not improve within 15 minutes, the operator must call Dispatch/Logistics and notify them of the situation, making sure to transmit their approximate location. The operator must also communicate with other vehicles operating in the area so that they do not cause a collision with the stopped vehicle. The vehicle operator must not, under any circumstances, leave the safety of the vehicle in these conditions.

As whiteout conditions occur during the winter when snow berms are high, the likelihood of a vehicle getting lost on the glacier is minor. Vehicles wandering from the roadway would tend to get stuck in the deeper snow before completely leaving the roadway.

3.2.6 Bright Light Conditions

Bright sunlight reflected off of the snow causes photokeratitis or “snow blindness”. The reflected ultraviolet light essentially causes sun burning of the cornea. While not always immediately

noticeable, the condition can be severe. Equipment operators are required to wear UV protection sunglasses when operating on the glacier. This condition can even occur on overcast days, so operators must always be cautious about the condition.

Reflected UV light can also quickly cause sunburn to exposed skin. Operators are recommended to apply high SPF sunscreen over exposed skin.

3.3 SUMMER GLACIER OPERATIONS

3.3.1 Summer Glacier Hazards

The main hazards to vehicles on the Knipple Glacier in the summer are slippery conditions, crevasses, and moulins. Another hazard is at the bottom end of the glacier (km 60 and vicinity), where there is a steep uphill grade that can become slippery. All heavy loads must ensure that they contact Knipple operations before they make the glacier trip, as tow vehicles may be required to assist traverse of the steep grade from 59 km up the 60 km hill to 62 km marker.

3.4 WINTER GLACIER OPERATIONS

During the winter months, the glacier surface is kept clear using a combination of motor grader and snow blowers. Snow berms created by the snow blower are lowered and tapered using snow cats.

Glacier traffic includes:

- Conventional rubber tired vehicles with traction chains;
- Tracked haulage equipment;
- Tracked snow cats; and
- Snowmobiles.

3.4.1 Winter Hazards

Winter hazards include flat light, whiteout conditions, and bright light conditions. Conditions on the glacier are very dynamic, varying quickly over both time and elevation.

3.4.2 Valley of the Kings (VOK) Bypass Route

The VOK Bypass route (Figure 3-1) is a winter use only section of road that bypasses the Lakeshore Drive route to the Mine Site. This section of Knipple Glacier has larger crevasses than the rest of the glacier, so it must be deeply covered in snow prior to use. While longer, this section of road provides an alternate route during the management of avalanche hazards along Lakeshore Drive.

Operational procedures discussed for the main Knipple Glacier road also apply to the VOK Bypass, as relevant for tracked equipment.

3.5 SAFE VEHICLE TRAVEL

3.5.1 *Speed Limits*

The speed limit on the glacier is 40 km/h unless otherwise posted. Operators are expected to use good judgment and reduce speed as appropriate for the dynamic glacier conditions.

Certain sections of the glacier with steeper grades have signage requiring the use of the vehicles lowest gear and a brake check. All signed instructions must be followed.

3.5.2 *Glacier Radio Call Out Procedures*

All km call out procedures discussed previously in Section 2.7 apply on the Knipple Glacier road section. Additionally, drivers are required to call certain locations along the glacier section of the BJAR These locations include:

- The transition between the Lower BJAR and the glacier at km 59;
- Km 62 marker on the Knipple Glacier;
- The transition between the Knipple Glacier and Lakeshore Drive at km 71.6;
- The transition between Lake Shore Drive and the Mine Site road at km 73.3; and
- When leaving the Brucejack Mine Site to travel the VOK Bypass road.

3.5.3 *Hazard Monitoring*

Unlike other glaciers in the area, the Knipple Glacier is a frequently maintained glacier road surface and is generally free from large crevasses that present a hazard to equipment. Although the glacier does contain many crevasses that present hazards to ATVs or personnel on foot, seracs (ice cliffs) are not present along the immediate travel route.

As the surface of the glacier and exposure of hazards such as crevasses and moulins is dynamic, even day-to-day, Pretium maintains glacier safety staff, typically Mountain Safety, year round to advise on route alterations. Mountain Safety personnel monitor glacier road conditions for constantly changing hazards such as crevasses and moulins. Mountain Safety personnel also advise operating crews as to expected glacier conditions at the start of each shift, during the pre-shift safety meeting. Crews are updated by radio if conditions change during the shift.

Crevasse surveys are completed on an as needed basis and are used to plan route modifications.

3.5.4 *Glacier Road Maintenance*

3.5.4.1 Winter Glacier Road Maintenance

During the winter months, the Knipple Glacier Road is covered in many metres of snow. Prior to the winter of 2014/15, Pretium used ski resort-type snow cats to prepare the running surface for other tracked equipment. The snow cats are equipped with blades on the front to distribute the snow across

the road surface and break through snow drifts. A hydraulically powered tiller on the rear of the snow cat then mixes the new snow with previous layers, reduces chunks, and beats the air out of the snow. A plastic comb then compresses the snow into a ribbed or "corduroy" running surface. The end result is a snow surface that is dense enough for other tracked equipment to run on.

Beginning during the winter of 2014/15, the Knipple Glacier Road was maintained by snow blowing the road surface and grading down to near ice. This practice allowed for the use of conventional rubber tired vehicles to travel the glacier. Vehicles are required to utilize traction chains while on the glacier.

The berms created along the side of the road from snow blowing operations are pushed out and tapered with snow cats to control runoff during the spring.

Avalanche technicians monitor the glacier and assist operations with selecting a safe route.

As the winter progresses, the road is widened to accommodate multiple lane widths. Having multiple lanes allows one surface to be travelled on while the other is being groomed.

3.5.4.2 Summer Road Maintenance

As temperatures rise in the spring, the snow pack on the glacier turns to slush as it melts. This process starts at the lower elevations and works its way up the glacier as upper elevations warm.

As the snow becomes softer, it is important to clear the snow down to ice to provide a firm running surface. Snow clearing is completed using snow cats, excavators, motor graders, and snow blowers. As the snow is cleared from the road surface, ditches are established to shed water away from the road surface and into crevasses.

As temperatures warm, the dense blue glacier ice becomes very slippery. Motor graders are used to scarify the ice surface, providing additional traction for the mobile equipment. NPAG rock is placed on problematic sections of the glacier road.

Pretium has recorded vertical elevation drops of up to 15 m annually at the bottom of the glacier near km 60 of the BJAR. This causes the gradient between the gravel portion of the BJAR and the ice to increase every summer. This transition is extended using NPAG rock each year to maintain a safe gradient. Realignments of the access ramp onto the glacier are also expected to be necessary periodically, such as the realignment of the km 59 to 60 ramp during 2018.

Additional NPAG fill will be used to fill crevasses between ice ridges at the glacier margins. Pretium occasionally uses white geotextile fabric draped over the ice ridges to reflect sunlight, preserving the ridges as long as possible.

The transition to the gravel road at the top of the glacier near km 71 that leads to Lakeshore Drive is also exhibiting melt conditions, but to a lesser extent. NPAG rock is occasionally placed at this transition from the glacier to the gravel road.

As the surface of the glacier and exposure of hazards such as crevasses and moulins is dynamic, even day-to-day, Pretium maintains glacier safety staff, typically Mountain Safety, year round to advise on route alterations.

Mountain Safety also advise operating crews as to expected glacier conditions at the start of each shift, during the pre-shift safety meeting. Crews are updated by radio if conditions change during the shift.

4 LAKESHORE DRIVE TRAFFIC CONTROL

Lakeshore Drive is an approximately 2 km section of all-weather road between the top of the Knipple Glacier at km 71 and the Brucejack Mine Site at km 73.3. All drivers must call on the radio for each of the following km markers: 71.6, 72, 72.5 and 73. Drivers inbound to the Brucejack Mine must call "vehicle type X km up", and outbound drivers must call "vehicle type X km down". Lakeshore Drive is in a high risk avalanche area; during avalanche season no stopping is allowed anywhere along Lakeshore Drive.

4.1 GEOHAZARDS

Hazards along this section of road include avalanches and occasionally, falling rock.

4.1.1 Avalanches

Nearly all of Lakeshore Drive passes through avalanche zones. This road is actively monitored for avalanche conditions and the use of explosive control measures is frequent.

The active avalanche zone stretches from 71.6 to 74 km. The most active paths are between km 72.7 and km 73.

All of the avalanche control measure procedures discussed previously in this management plan also apply to the Lakeshore Drive zones.

4.1.2 Rock Falls

Sections of Lakeshore Drive are prone to loose rock falling on the roadway. Operators noticing fresh loose rock must notify Brucejack Mine Site Dispatch/Logistics. Dispatch/Logistics will notify mine management and the section of road will be inspected.

Additional information on geohazards is provided in the Brucejack Geohazards Management Plan.

4.2 WILDLIFE INTERACTIONS

Wildlife interactions along Lakeshore Drive are very rare, but operators are required to report any observations or interactions to Mine Site Dispatch/Logistics, or directly to the Environmental Department, noting the species and location.

5 MINE SITE ROADS TRAFFIC CONTROL

Mine Site roads consist of those roads between and around facilities at the Brucejack Mine Site, including:

- Phase 1 and Phase 2 Camp facilities;
- Mill pad and to the VOK Portal;
- Heavy Shop;
- Warehouse, Waste Transfer Facility, and Waste Rock Dump; and
- West Zone pad and Incinerator.

All vehicle traffic considerations discussed for the Lower BJAR and Lakeshore Drive also apply to the Mine Site roads.

5.1 DIRECTION OF TRAVEL

All traffic on the Mine Site is two way. The main traffic patterns are shown in Figure 5.1-1. The northwest side of the Mill is closed to traffic seasonally due to roof snow hazards. The road between the West Zone pad and Brucejack Creek is signed for heavy equipment access only.

5.2 SPEED LIMITS

The maximum Mine Site road speed limit is 20 km/h, with speed limits reduced to 10 km/h anywhere around buildings or high pedestrian traffic areas. Lower speed limits are posted in congested areas.

5.3 VEHICLE RIGHT OF WAY

The right-of-way hierarchy for the Mine Site roads is:

1. Emergency Vehicles;
2. Explosives;
3. Working construction equipment (graders, excavators, etc.);
4. Loaded haulage vehicles (freight or rock);
5. Empty haulage vehicles (freight or rock);
6. Other heavy equipment; and
7. Light vehicles, ATVs, and snowmobiles.

A lower priority vehicle must not overtake or pass a higher priority vehicle without first making positive contact with the operator and until after the higher priority vehicle has yielded way, typically by stopping all movement. Heavy equipment must not be overtaken until communication has been made with the operator and the operator has stopped all motion and grounded attachments.

Figure 5.1-1. Brucejack Mine Site Traffic Patterns

5.4 RADIO CALLOUT PROCEDURE

Operators are also required to announce their departure or entrance from various Mine Site locations, including West Zone, Waste Rock Dump, (Phase 2) Camp Pad, Fire Hall, Mill Pad, Warehouse, Tailings Road, Bunk 6 (upper Phase 1 Camp), and Lakeshore Drive. This notification is not made to Dispatch/Logistics, but rather as a general notification. The operator must announce their starting point, destination, and type of vehicle.

5.5 WARNING SYSTEMS

Site mobile equipment is required to be equipped with backup alarms and strobes. Pickup trucks and vans must be equipped with strobes, backup alarms, and a buggy whip style antenna. ATVs and snowmobiles must be equipped with buggy whip style antenna.

Prior to moving a vehicle or piece of equipment equipped with an audible horn, the operator must indicate the intended movement by honking the horn as follows:

- One Honk – to go forward;
- Two honk – to go backward; and
- One long continuous honk – emergency.

Honk signals are not used around bunkhouses to avoid disturbing employees who are asleep.

5.6 PARKING

Equipment is required to be parked on designated, level surfaces out of the flow of traffic. Wherever possible, vehicles must be parked "back in." Operators are required to use appropriately sized wheel chocks when parking all rubber tired vehicles. Hydraulically driven self-propelled Genie or JLG boom type work platforms are not required to use wheel chocks when operating or parked. The use of wheel chocks on this type of equipment can cause tipping if run over.

Heavy equipment is required to be parked with buckets or blades grounded.

During the winter, operators are required to avoid parking under any roof line that is likely to shed snow. Operators are also required to consider predominant wind direction and avoid parking on the leeward side of a building to avoid the vehicle becoming drifted in. 'No Parking' signs are posted at various locations throughout the Mine Site and drivers are expected to adhere to all posted signage at all times.

6 UNDERGROUND TRAFFIC CONTROL

Traffic travelling underground is diesel or electrically powered only. No gasoline combustion powered engines are permitted to travel underground. All vehicles going underground must meet the following criteria:

- Diesel or electrically powered;
- Diesel engines must be CANMET certified; and
- All vehicles must have appropriate rollover protective structure (ROPS), braking, and fire suppression systems as required by the Health, Safety, and Reclamation Code for Mines in British Columbia (HSRC; BC Ministry of Energy and Mines 2017).

6.1 UNDERGROUND ROAD DESIGN

Development headings are designed with the following design criteria to provide a safe travel way.

- Travel ways have a minimum of 1 m of clearance on each side of the largest vehicle travelling the area;
- Main travel ways have a minimum centreline radius of 25 m;
- Main travel ways are not typically designed to exceed 15% gradient;
- Spiral ramps are avoided to the extent possible;
- Safety bays are provided at regular intervals to allow shelter for pedestrian traffic; and
- Signage is provided at major intersections and at appropriate intervals on levels showing direction to refuge stations and egress points.

6.2 ACCESS

Access to the underground mine is through the West Zone and VOK Portals. Traffic is two way throughout the mine except at designated locations such as the crusher dump pocket and infrastructure area. These areas have been provided with one way drive through loops.

6.3 ACCESS CONTROL

No unauthorized personnel are allowed underground and no person is allowed to operate a piece of equipment that they have not been trained on.

All personnel entering the mine must “tag in” at the mine operation office tag board. Upon exiting the mine, personnel must immediately proceed to the portal office and “tag out” so that mine supervision knows who is underground at all times.

6.4 PRE-SHIFT INSPECTION

All vehicle operators must complete a pre-shift inspection of their vehicle to ensure it is in safe, working order prior to operating it. The inspection shall be documented on a pre-shift card. Any deficiencies found during the inspection must be repaired prior to that vehicle's operation.

6.5 BRAKE TEST

Prior to entering the mine, the operator of the vehicle must perform tests on both the service and parking brakes.

To complete the brake test, the operator must:

1. Come to a complete stop;
2. Depress the service brake fully;
3. With the vehicle in first gear, step on the accelerator;
4. If the vehicle does not move, the service brake has passed;
5. Repeat steps 2 through 4 with the parking brake;
6. If both brakes pass, the operator is cleared to proceed; and
7. If either brake fails, the vehicle may not proceed. The operator must report the issue to the maintenance department. The vehicle will be tagged out until such time as the brakes are repaired.

6.6 VEHICLE PRIORITY

The following list is the priority hierarchy for mobile equipment underground:

1. Emergency response vehicles;
2. Explosives transport vehicles;
3. Loaded haul trucks and LHDs;
4. Empty haul trucks and LHDs;
5. Mine utility equipment such as scissor lifts, fuel/lube vehicles, graders, etc.;
6. Light vehicles such as tractors and small personnel carriers; and
7. Downhill traffic on the ramp always has priority over traffic going uphill.

6.7 FOOT TRAFFIC

Foot traffic is very common in the mine. All personnel must be equipped with mine lights and reflective clothing to increase their visibility. However, personnel must be aware that the heavy equipment operators have limited visibility. Foot traffic must always give mobile equipment a wide berth.

Do not approach operating equipment until you make positive contact with the operator. The operator will stop all machine movement and signal the pedestrian traffic that it is safe to approach. Always approach on the operators cab side of the equipment. At no time shall pedestrian traffic and heavy equipment pass/interact at the same time. Either the pedestrian will stop in a safe location and allow the equipment to pass, or equipment operators will stop and allow the pedestrian traffic to pass.

Whenever and wherever possible pedestrians will pass on the operator's side of the equipment for better visibility and safety. Personnel safety bays and other cut-outs will be provided at regular intervals to allow personnel on foot to get out of the traffic lane.

6.8 PARKING UNDERGROUND VEHICLES

Underground vehicles must be parked out of active travel ways, remucks, and stoping areas. If in doubt of an area's activity, the shift boss will be contacted prior to leaving a vehicle.

Wheel chocks will be used at all times when parking. When parking on a grade such as a ramp, the vehicle must be "ribbed" or parked against a wall and the wheel turned into the wall to prevent vehicle movement in the event of a brake failure; and the parking brake will be set. At no time will personnel walk downhill from an unattended vehicle that is not "ribbed" and chocked. Never rely on a parking brake alone.

At no time is anyone allowed to leave engines running on unattended vehicles. This is extremely unsafe and poses a fire hazard. When leaving the parked vehicle, the master switch must be turned off but the strobe left on. Personnel caught tampering with strobes will be disciplined up to and including loss of camp privileges. The master switch must be turned off on any unattended vehicle underground.

6.9 UNDERGROUND COMMUNICATIONS

The underground communication system currently consists of a leaky feeder line and receivers located through the mine. VHF radios are being used by underground personnel and equipment operators to communicate locations and allow for safe traffic movement. There is a dedicated underground mine emergency channel that will be used in the event of serious injury or fire. All persons working underground must be trained and well versed in calling an emergency on the radio system.

Appendix 1

Brucejack Access Road Standard Operating Procedures

Objective

To provide a clear and concise procedure to ensure safe travel for all vehicles travelling on the access road. All drivers will understand radio calling procedures, be qualified to drive their respective vehicle with skill and proficiency doing so in a safe, responsible manner.

Scope

This procedure applies to all access and service roads from Wildfire Camp-0 km to 59 km at Brucejack Site.

Health, Safety & Reclamation Code for Mines in British Columbia

- 6.8.3 Traffic control
- 4.9.4 Vehicle requirements
- 4.9.5 Vehicle requirements

Occupational Health & Safety (OHS) Regulation (WorkSafe BC)

- 26.14.3 Traffic control.
- 26.18 Landslides/Avalanches

Definitions

- SOP-safe operation procedure
- Bungee cords- Rubber straps

Roles and Responsibilities

The General Manager or Designate shall ensure:

- This SOP is implemented and maintained.
- On-site personnel have up-to-date information regarding this SOP.

The Health and Safety Manager or Designate shall ensure:

- The implementation of this procedure is monitored.

The Area Manager or Designate shall:

- Monitoring the implementation of this procedure.
- Review and revise when changes are needed.

The Worker are responsible for:

- Following and understanding this SOP when operating on the access road.

Preparation

Vehicle Checklist:

- Tire Chains
  - Use of tire chains are required during the winter months.
  - Bungee cords and tie straps are recommended to keep chains secure.
- Pre-operation inspection completed and documented in vehicle logbook
- Straps, tie-downs, chains, and cinches for securing loads.
- Strobe light
- Back up alarm
- Snow Brush when required
- Fire extinguisher
- BC Level 1 First aid Kit
- Spill Kit
- Two-way mobile radio with appropriate frequencies (see frequency list)
  - handheld portable radios not permitted for road travel
- 4 x 4 vehicles only
- 10 ply tires or Load Range "E" - Winter tread required for winter driving
- Spare tire
- Buggy whip with flag

Operator Checklist:

- PPE
  - Standard: Hard hat, safety glasses, hi-vis vest, steel-toed boots
  - Winter: Insulated Jacket, Insulated footwear, headwear, and gloves/mitts.

Right of Way Hierarchy is as follows:

1) Emergency Vehicles
2) Vehicles carrying explosives
3) Buses and Passenger Vans/Shuttles
4) Heavy Trucks or Equipment
5) Light Vehicles

(Right away is given not taken)

Job Step

- Drive within the speed limits and to the prevailing road conditions. Seasonally the road conditions can change
- Speed limit is 15 km/h near camps and bridges, 40 km/hr. on main routes except where posted, reduce speed were posted and gear down whenever descending or climbing hills
- Reduce speed when approaching work crews or working equipment
- The access road up to the glacier (60km) uses the Road Channel **Pretium (channel 1)**
- Call every km from Wildfire to Brucejack **UP** (example: type of vehicle km 1,2,3 'UP')
- Call every km from Brucejack to Wildfire **DOWN** (type of vehicle km 57, 56 'DOWN')
    - **Note: Failure to call KMs may result in forfeiture of driving privileges on Brucejack property**.
- Listen to your radio for voice traffic indicating other vehicle positions and for indications of changing road conditions
- Be aware that heavy loads may be traveling anywhere along the length of the road
- Ensure you have sufficient fuel for your journey.
- Do not stop in any of the posted avalanche or rockfall areas.
- In the event of a vehicle breakdown in an avalanche area
    - **Stay in your vehicle,** you are safer inside (keep all emergency flashers on)
    - On your radio call 'Brucejack dispatch" (Refer to channel table below) with your km location and that you are in an avalanche area,
    - Await instructions from Brucejack Dispatch
- Wheel chocks must be carried in or on the vehicle
- In the case of a medical emergency call Brucejack Dispatch.
- In the event of a spill, shut down engine, try to stop the leak, get assistance and assist in clean up

Tow Assist Parameters:

- A tow assist is required from 56km up if load weight exceeds 60,000lbs and/or is heavily tail loaded and is mandatory for heavy vehicles at 59km down.
- Tow Assist Loader will be used on the steep grades
- C500 trucks do not require to have tow assist unless driver has requested.
- Double towing is required for propane trucks, unstable, or any load deemed too heavy for a single tow at the discretion of the supervisor.

*Please refer to BJ-ACC-SOP-004 - Heavy Vehicle Towing Assist prior to any towing assists

Horn Signals

Activities on the mine site often involve high traffic within a small work area create a high potential for vehicle/pedestrian interactions. The following horn signals are mandatory for vehicle/equipment operators to clearly communicate to pedestrians and other operators in the area an intent to start or move a vehicle. We do not do this close to the bunks

- **1 Honk** - prior to moving forward
- **2 Honk –** prior to moving backward
- **1 Long Continuous Blast –** meant to draw attention to an imminent danger in the area. (Avalanche, runaway vehicle etc.)

Operator Responsibilities

- All operators require appropriate license/training and sign-off for the equipment they are operating.
- All operators must read the Pretium Standard Road Procedures and sign the appropriate form indicating they have read and understand all requirements before operating a vehicle or equipment on the Brucejack property.
- Avalanche Awareness – Operators required to or work in designated avalanche zones must complete the Avalanche Awareness/PPE course and will be issued an avalanche kit (see checklist) as part of their vehicle standard equipment if required.
- **Seat Belts are Mandatory.** Operators are responsible for ensuring that all passengers are always wearing seatbelts while in transit.
- Operators/Carriers are responsible for ensuring vehicles are equipped with a mobile radio with the appropriate channels and output. Handheld portable radios are not permitted for road travel.
- All operators are responsible for ensuring that their vehicle/equipment is in safe mechanical condition by performing a mandatory pre-trip inspection and logbook entry prior to operation. Mechanical problems encountered that pose a safety risk or risk of further mechanical damage must be immediately reported to Site Services Supervisor, Master Mechanic or designate and the vehicle must be tagged out of service until repair is complete.
- Operators/Carriers are responsible for following all relevant environmental regulations and policies that are in force at the mine site, including (but not limited to):
    - **a)** No Littering (i.e., must dispose of garbage at designated receptacles in each camp),
    - **b)** No Harassment of, feeding, or intentionally attracting wildlife,
    - **c)** Immediate response and reporting of any size spill to Pretivm Environmental Dept.
    - **d)** Reporting any direct wildlife related incidents to Dispatch and Pretivm Environmental Dept.

When parking light vehicles/Freight trucks the operator shall:

- Park in designated areas whenever possible. Leave keys in ignition, in case of an emergency.
- Spotter must be used when visibility is impaired in anyway.
- Park on level ground whenever possible with vehicle in a fundamentally stable position.
- Position 2-wheel chocks appropriately for the situation
- Park in a manner that allows for forward departure (drive through or reverse park)
- If required to park on a slope, turn wheel in a direction that will prevent runaway and apply park brake. Position wheel chocks.
- In winter conditions, avoid using parking brake to prevent brake from freezing on.

Hours for Road Travel

Effective September 18th, 2021 any traffic destined for Knipple or Brucejack will **NOT BE** allowed past the Wildfire Security screening area after 16:30 hrs. The Wildfire gate will be closed at 18:00. to all traffic, so it is recommended that those that cannot make the cut-off hours should stay at Meziadin Junction until the following morning. Summer hours are normally 06:30 to 19:30 for all traffic.

*****NOTE: Please check with Wildfire Camp or Wildfire Security for up-to-date times as things will change dependent of the hours of daylight and needs of the project. *****

Passing Mobile, Stationary Equipment, and Pedestrians

- Operators must establish radio or visual communication when approaching mobile, stationary equipment, and/or pedestrians working on or in proximity to the roadway. If radio communication cannot be established, ensure eye contact with the operator and a clear gesture to proceed.
- Do not proceed until the operator of the equipment has acknowledged your intent to pass and wheels, booms, lifts etc. have come to a complete stop.
- Never assume all members of the work crew are aware of your intent to pass. Proceed slowly and watch closely for workers approaching the roadway. If unsure of workers' intentions, Do Not Proceed.
- Proceed at 10 km/hr. through parking areas and watch for pedestrians.

Procedure for calling Kilometers's

Km	Road Channel	To Reach Brucejack Dispatch	Must Calls
0 - 37	Ch. 1/Pretium RoadChannel	Ch. 6/Repeater 3	- Call every Km - Km 2 to Km 3 - Anyone coming down & vice versa
55 - 60	Ch. 1/Pretium RoadChannel	Ch. 4/Repeater 2	- Must Call every Km - At Km 55 up - Is there anyone coming down from Knipple Camp - Leaving Knipple Camp going down is there anyone coming up from 55

RADIO FREQUENCIES

Brucejack Radio Frequencies				
	Name	RX Frequency	TX Frequency	Tone
Ch 1	New Road (NEW)	166.080	166.080	
Ch 2	Repeater 1 (Brucejack)	162.735	167.715	71.9
Ch 4	Repeater 2 (Bowser)	162.810	167.790	123.0
Ch 6	Repeater 3 (Wildfire)	162.105	167.085	156.7
Ch 9	Lad 2	158.940	158.940	

SOP References

BJ-ACC-SOP-004 - Heavy Vehicle Towing Assist

Appendix A

Recommended Vehicle Survival Kit should include the following:

- *Food that won't spoil, such as energy bars*
- *Blanket*
- *Extra clothing and shoes or boots*
- *First aid kit with seatbelt cutter*
- *Small shovel, scraper, and snowbrush*
- *Water – plastic bottles that won't break if the water freezes (replace them every six months)*
- *Candle in a deep can and matches*
- *Wind-up flashlight*
- *Whistle – in case you need to attract attention*
- *Roadmaps*

Road Hazard Rating

LOW	MODERATE	CONSIDERABLE

1. Receive orientation at Wildfire.
2. Check in at one of the camps or with Dispatch to obtain updated road status.
3. Use Pretium radio protocol for check-in/check-out for road transit
4. Ensure sufficient fuel before proceeding
5. Adjust speeds on glacier according to road status and conditions

Hazard level	Pickup	Heavy Traffic
LOW	40 km/hr.	40 km/hr. UP
MODERATE	25-35 km/hr.	20 km/hr.
HIGH	20-25 km/hr.	10-15 km/hr.

6. If there is a mechanical breakdown, or crevasse fall, call Dispatch. Turn the engine off, wait for help.
7. Check in at all posted MUST CALL signs
8. Call road crews on radio BEFORE attempting to pass heavy equipment (remain in vehicle)
10. Report any large holes or open crevasses to Dispatch (remain in vehicle)

HIGH

ROAD IS CLOSED ALL TRAFFIC IS PROHIBITED

LIST OF TABLES

GLOSSARY AND ABBREVIATIONS

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

CIS LRMP	Cassiar Iskut-Stikine Land and Resource Management Plan
m	Metre(s)
Pretium	Pretium Resources Inc.
Project	Brucejack Mine
SARA	*Species at Risk Act* (2002)
VMP	Vegetation Management Plan

1 PURPOSE

The Vegetation Management Plan (VMP) is designed to provide environmentally responsible, realistic, and operationally feasible guidance for ecosystem, soils, and vegetation management. The purpose of this VMP includes the following:

- avoid and minimize adverse effects to ecosystem functions;
- maintain plant and lichen biodiversity through avoidance and application of mitigation strategies; and
- monitor potential effects on wetland extent and function.

The measures provided in the following sections are based on the guiding principles outlined in the *Cassiar Iskut-Stikine Land and Resource Management Plan* (CIS LRMP; BC ILMB 2000) and the *Nass South Sustainable Resource Management Plan* (BC MFLNRO 2012).

2 PERFORMANCE OBJECTIVES

The VMP focuses on ecosystem-based management, which includes consideration of successional processes, such as disturbance type (e.g., fire, insects, avalanches), dispersal mechanisms (e.g., wind, water, animals), site history (e.g., flooding, erosion, fire), site competition (e.g., light, moisture), and germination conditions (e.g., site and climatic conditions). The broad performance objectives of the VMP are to:

- minimize soil loss and degradation (i.e., compaction, erosion, admixing) by adhering to the Surface Erosion Prevention and Sediment Control Management Plan;
- avoid the introduction and spread of invasive plants by adhering to the Invasive Plants Management Plan;
- minimize effects on rare plant and lichen populations through implementation of the Invasive Plants Management Plan;
- avoid and minimize detrimental effects to rare plants, lichens, or their habitat by adhering to guidance provided in the VMP;
- avoid and/or minimize direct harm to rare plant and lichen populations through alignment of footprint boundaries;
- avoid and minimize detrimental effects to wetland functions by adhering to guidance provided in the VMP;
- avoid and minimize loss of ecosystem functions related to Brucejack Mine (the Project) effects specifically due to clearing activities, dust deposition, fragmentation, edge effects, windthrow, and altered hydrology;
- minimize effects on rare plant and lichen populations through implementation of the Invasive Plants Management Plan; and
- identify and monitor effects to wetland extent and hydrological function along the Brucejack Access Road.

3 SCOPE

This plan provides measures for the ongoing management and monitoring of terrestrial and wetland ecosystems, and rare plants and lichens during the Construction, Operation, Closure, and Post-closure phases of the Project. The VMP applies to all Project components and activities that have the potential to result in effects to soils, ecosystems, and/or vegetation.

4 RELEVANT LEGISLATION, REGULATIONS, AND EAC CONDITIONS

4.1 RELEVANT LEGISLATION AND REGULATIONS

Legislation, guidelines, operational statements, and governing agencies applicable or of relevance to the management of vegetation, soils, and ecosystems are listed below. This section will be updated with any further relevant conditions cited in the Environmental Assessment Certificate or the *Mines Act* Permit.

- *Forest and Range Practices Act* (2002a), Forest Planning and Practices Regulation (BC Reg. 14/2004) Section 47-52. This act and regulation applies constraints to when, where, and how forest clearing is undertaken (for forest and range licensees) and applies protection to old forests (through establishment of old-growth management areas) and to riparian ecosystems (through Division 3, Riparian Areas, of the Forest Planning and Practices Regulation). The riparian reserve and management zones are consistent with those previously established under the *Forest Practices Code of British Columbia Act* (1996a; e.g., Riparian Management Area Guidebook).
- *Fisheries Act* (1985). This federal act protects fish and fish habitat across Canada; Subsection 35(1) prohibits "the release of a deleterious substance that results in serious harm to fish that are part of a commercial, recreational or Aboriginal fishery, or to fish that support such a fishery."
- British Columbia (BC) *Mines Act* (1996). This act provides guidance on the operation and reclamation of existing and abandoned mines.
- *Weed Control Act* (1996c). This act regulates the management of noxious plants in BC. The *Weed Control Act* (1996c) requires all land occupiers to avoid establishment and dispersal of noxious weeds as defined by the Act.
- *Species at Risk Act* (SARA; 2002b). Federal legislation that aims to protect species at risk from becoming extinct. Certain species are also protected under SARA as part of wildlife habitat and in accordance with the Canadian Biodiversity Strategy. The Canadian Biodiversity Strategy provides federal legislation that supports the conservation of particular species and populations to ensure continuance of biological diversity over time (Federal-Provincial-Territorial Biodiversity Working Group 1995).
- The BC *Wildlife Act* (1996d) provides for conservation of specific ecosystems and ecosystem components as they provide habitat for species managed by the BC Ministry of Environment.

4.2 GUIDELINES AND PRACTICES

- CIS LRMP (BC ILMB 2000). Provides direction and management of endangered plants.
- BC Conservation Data Centre (BC MOE 2007). This provincial agency, part of the Environmental Protection and Sustainability Division in the BC Ministry of Environment, collects and disseminates information on the plants, animals, and ecosystems at risk in BC.
- *Windthrow Handbook for British Columbia Forests* (Stathers, Rollerson, and Mitchell 1994). This handbook provides guidance on windthrow management.
- *The Federal Policy on Wetland Conservation* (Environment Canada 1991). *The Federal Policy on Wetland Conservation* provides practical direction, support, and tools for environmental management of wetlands:

  > *The Federal Policy on Wetland Conservation complements the goals and objectives of the North American Waterfowl Management Plan, the Federal Water Policy, the Fisheries and Oceans Canada Policy for the Management of Fish, the International Ramsar Convention, the Wildlife Habitat Canada "Common Ground" Initiative, and the Wildlife Policy for Canada adopted by the Wildlife Ministers Council of Canada* (Environment Canada 1991).

- *Measures to Avoid Causing Harm to Fish and Fish Habitat* (DFO 2014). This document provides guidance for riparian management in order to avoid and minimize effects to fish and fish habitat.
- *Towards an Environmental Mitigation and Offsetting Policy for British Columbia: A Discussion Paper* (BC MOE 2010). Provides a framework to consider when setting mitigation strategies for rare organisms and habitats.

4.3 RELEVANT EAC CONDITIONS

Pretium was granted an Environmental Assessment Certificate (#M15-01) on March 26, 2015 that included a series of conditions. This management plan fulfills Condition #2, in relation to a Component Plan for vegetation management, presented within Schedule B of the Certificate and copied below.

> <u>Condition 2</u>
>
> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*
> - *Effects mitigation measures;*
> - *Monitoring programs;*

- *Monitoring schedules; and*
- *Reporting requirements.*

The Holder must consult with the Nisga'a Lisims Government (NLG), Tahltan and Tsetsaut / Skii km Lax Ha Nation (TSKLH) on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.

The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."

5 ENVIRONMENTAL PROTECTION AND MANAGEMENT

An ecosystem-based approach to vegetation and soil management will be used to effectively avoid and minimize loss of ecosystem functions related to potential Project-related effects. Ecosystems are complex interactions of abiotic and biotic components that result in unique species composition, structure, and function. Minimizing effects to these ecological processes will reduce the likelihood of short- and long-term effects to terrestrial ecosystem functions and integrity.

Protection and management direction for rare plants and lichens is required for each species occurrence and must be specific to the requirements of that species. Often rare plant and lichen populations occur in clusters in unique habitats. Because these habitats are uncommon (e.g., cliffs, scree, seepages), protecting habitats where rare plants have been identified will often provide protection to other rare species not identified during surveys and is a good tool to reduce potential adverse Project effects on biodiversity.

5.1 MITIGATION MEASURES AND BEST MANAGEMENT PRACTICES

The effects of the Project on terrestrial ecosystem functions and integrity will be minimized through the actions listed below:

- minimize clearing dimensions during Construction (i.e., along the Brucejack Transmission Line and during upgrades to the Brucejack Access Road);
- coordinate clearing activities with other management and monitoring plans including the Air Quality Management Plan, the Aquatic Effects Monitoring Plan, the Wildlife Management Plan, and the Water Management Plan;
- minimize soil degradation (i.e., erosion) by adhering to the Surface Erosion Prevention and Sediment Control Management Plan and the Reclamation Plan. Specifically, soil will be salvaged during appropriate weather conditions to the extent feasible, transported to stockpiles in a timely manner, and erosion control measures will be implemented to minimize erosion;
- avoid, where feasible, removal of mature and old forests, which provide diverse ecological functions;
- minimize potential adverse environmental effects on alpine, parkland, and riparian habitats; wetlands/wetland complexes; and lake outlets;
- manage riparian areas according to the recommended management zone setbacks and work practices provided in the *Mines Act* (1996b) and *Forest and Range Practices Act* (2002a);
- limit changes to soil hydrology to the extent feasible through best management practices during Construction and Operations. For example, minimize redirection of surface and subsurface flows as much as feasible. Surface runoff will be redirected from hard surfaces (such as roads) to existing drainages (as much as feasible);
- restrict vehicles and machinery travel to designated road or exploration trail surfaces;

- avoid and/or reduce windthrow according to best management practices through retaining windfirm trees, feathering edges, topping/pruning of individual trees, and monitoring for windthrow along clearings and road edges in accordance with the guidance outlined in the *Windthrow Handbook for British Columbia Forests* (Stathers, Rollerson, and Mitchell 1994);
- adopt low-disturbance methods to clear vegetation within identified sensitive areas, such as alpine, parkland, and rare ecosystems and riparian areas, where clearing cannot be avoided;
- carry out dust suppression measures on roads to minimize fugitive dust;
- re-vegetate with native plant species and seeds;
- establish reporting procedures between general site personnel and environmental personnel to facilitate timely reporting of any incident or concern during each phase of the Project. Construction personnel will be instructed to communicate any concerns including erosion and sediment production, windthrow, invasive plants, and unauthorized access to restricted areas; and
- provide appropriate education and training for site personnel as appropriate, outlining how to minimize effects on ecosystems, soils, and vegetation, and why it matters.

Rare plants were assessed at the Project design stage. Impacts to rare plant and lichen populations will be further minimized through the following actions:

- optimizing alternatives to avoid rare plant and lichen populations, where feasible;
- applying adaptive Project design changes that avoid harm to rare plant and lichen populations, where feasible; and
- adherence to best management practices (described below).

The following best management practices will be applied to vegetation-clearing activities as appropriate to help avoid and reduce impacts to rare plants and lichens and their habitats:

- the known location of rare plants and lichens and their habitats will be considered in relation to planned Project activities;
- avoid use of herbicide sprays within 200 metres (m) of rare plant and lichen populations and limit such use to direct application rather than broadcast sprays;
- create no-work-zones (200 m) around known rare plant and lichen habitats, wherever feasible, to avoid direct disturbance and to minimize effects related to fugitive dust transport, weed invasion, vehicular activities, and accidental chemical spills;
- where avoidance is not feasible and development is required within a no-work-area around plant populations, erect temporary fencing or other barriers around the nearby rare plant and lichen populations to avoid further disturbance to the site;
- reduce the impact of fugitive dust on rare plant and lichen populations through adherence to established no-work-zones and dust control measures. Pre-existing roads where traffic is expected to increase will be managed for dust during the growing period (June through August). Water will be used for dust abatement with minimal use of chemicals; and
- minimize alteration and disturbance of light, temperature, surface, and subsurface hydrology that may affect rare plant or lichen populations.

6 ENVIRONMENTAL MONITORING

The purpose of the monitoring program is to evaluate and document if the VMP successfully achieves its performance objectives of avoiding and minimizing Project-related adverse effects to ecosystem extent and function and to rare plants and lichens. Monitoring will determine if performance objectives are being met and provide information to adapt management if objectives are not being met.

6.1 PERFORMANCE MONITORING

Monitoring will include consideration of successional processes, such as disturbance type, site history, site competition, and germination conditions. Consideration of successional processes will help distinguish natural effects from Project-related effects.

Site Environmental Monitors will assess the following:

- Clearing during Construction activities is being minimized.
- Success of re-vegetation efforts (appropriate timing and seed mix, percentage cover of live vegetation, presence of invasive plants, etc.).
- Assessment of the effectiveness of windthrow reduction measures, including number and species of wind-thrown trees and approximate area affected, and identify changes to windthrow mitigation measures if required.
- No rare plants have been found within the planned disturbance. If changes to the location of infrastructure result in intrusion into areas where rare plant communities were detected in the 2012 or 2013 field studies then monitoring will occur during the growing season (June through September). Monitoring will be performed by a qualified rare plant and lichen botanist, under the direction of the Project's Environmental Manager who will ultimately be responsible for the development, implementation, and monitoring of the VMP.
- Monitoring of wetlands to determine changes in extent and/or function. Monitoring will include measurements of surface and subsurface hydrology, wetland extent, and habitat function as described below.
    - Monitoring of subsurface water levels will be accomplished using push-in PVC standpipes and a combination of manual water-level measurements and water-level data loggers. At the three monitoring sites where the wetland is intersected by the Brucejack Access Road (BJ08, BJ12, WO62), standpipes will be placed on both sides of the road to determine the potential influence it may have on subsurface flow within the wetlands. Standpipes elevations will be surveyed on an annual basis in relation to local road survey control.
    - Monitoring of wetland extent will be achieved through a combination of field investigations as well as wetland mapping for the Construction, Operation, and Closure phases.

- General wildlife observations will be made during each environmental monitoring trip and incidentally by the environmental crew while conducting other management and/or monitoring duties in the area of the monitored wetlands.

6.2 WORK PLANNING AND SCHEDULE

Monitoring frequency will vary depending on the Project activity as well as the outcomes of previous year's monitoring (Table 6.2-1). The results of the site visits and mapping will determine if follow-up monitoring in the same or subsequent year is required to confirm that the objectives are being achieved and to determine if future monitoring is required.

Table 6.2-1. Vegetation Monitoring Schedule

Type of Monitoring Activity	Measurable Parameter	Frequency	Timing	Duration/ Phase
Vegetation clearing	Clearing dimension size in relation to planned activity	Variable	Between June and October	Ongoing as required; all phases
Re-vegetation	• Re-vegetation timing and seed mix • Percentage cover of live vegetation • Presence of invasive plants • Erosion	Variable	Between June and September	Ongoing as required; all phases
Windthrow	• Number and species of wind-thrown trees • Approximate area affected	Variable	Between April and June	Construction and Operation
Wetland extent and function	• Subsurface hydrology measurements • Wetland extent survey and mapping • Wildlife observation	Monitoring twice annually, and mapping during each Project phase to track changes over time	Between June and September	Construction and Operation

7 REPORTING AND RECORDING

7.1 REPORTING

7.1.1 Compliance Reporting

Compliance reporting will be subject to Environmental Assessment Certificate and *Mines Act* permit conditions. Annual *Mines Act* (1996b) reporting of environmental monitoring in the Annual Reclamation Report will include a description of the following, as applicable:

- records of rare plants and lichen or invasive plants, monitoring undertaken where activities occur adjacent to identified sites, and reclamation activities will be summarized and available to report, with that year's completed data forms to be made available upon agency request; this information will be used as a means of tracking progress and determining future management activities;
- planning and ecosystem management activities that illustrate coordination with other management plans such as the Surface Erosion Prevention and Sediment Control Management Plan, the Aquatic Effects Monitoring Plan, and the Wildlife Management Plan;
- measures employed to reduce impacts to terrestrial ecosystems that depend on hydrological connectivity and flow (e.g., restoration of natural drainage following decommissioning of temporary access roads);
- evaluation and rationale of whether the environmental protection measures were carried out according to the planned management for the site;
- evaluation of the effectiveness of the environmental protection measure employed in achieving the stated objective(s); and
- proposed revisions to the VMP to address emerging negative trends, or to adjust monitoring programs, if required.

The Project's Environmental Manager will be responsible for the implementation and monitoring of the VMP and for ensuring that the Performance Objectives are achieved and reported.

Should periods of temporary closure or care and maintenance occur, some monitoring will continue. The periodicity of reporting for the Closure and Post-closure phases will be determined prior to commencement of Closure.

7.2 RECORD KEEPING/TRACKING

7.2.1 Monitoring Results

Pretium will maintain records of vegetation monitoring and results. This information will be collected using monitoring forms suitable for the Project. Data will be entered in a format and program that will allow for comparison between years. Monitoring data will be stored for the life of mine. Monitoring will be performed by a suitably qualified Environmental Monitor, under the direction of the Project's Environmental Manager, who will ultimately be responsible for the development, implementation, and monitoring.

7.2.2 Continuous Improvement, Follow-up, and Adaptive Management

Results from the vegetation monitoring programs will be reviewed to determine if any trends are evident and if objectives are being met. The need for any corrective actions to reduce negative effects to soils, vegetation, or ecosystems will be determined on a case-by-case basis. Indications of the need for corrective action or additional control measures may include monitoring data showing an increasing negative trend (e.g., considerable changes to wetland extent or function, sedimentation in fish bearing streams).

The monitoring data will also be used to provide feedback to modify any management and monitoring procedures incorporated at the site, as required. Measures described in the VMP apply to all Project components for the life of the Project, unless otherwise indicated. Components of the VMP may need to be revised over the life of the Project, based on regulatory changes and/or technological advances.

SOP	Standard Operating Procedure
WHMIS	Workplace Hazardous Materials Information System
WMP	Waste Management Plan

1 PURPOSE

The purpose of the Waste Management Plan (WMP) is to provide guidance for the proper handling, transport, and disposal of non-hazardous domestic and industrial solid waste and domestic sewage sludge generated from the Brucejack Gold Mine.

2 PERFORMANCE OBJECTIVES

The objectives of the WMP are to:

- provide practical measures for the handling and disposal of non-hazardous industrial and domestic solid waste and domestic sewage sludge to minimize any potential adverse effects to the environment, wildlife, or employees;
- identify appropriate best management practices (BMPs) for waste treatments, storage, and handling to deter wildlife and prevent wildlife attractants;
- identify site personnel orientation components; and
- identify responsibility for implementation and monitoring of this plan.

3 SCOPE

Under the British Columbia (BC) *Environmental Management Act* (EMA; 2003), "waste" includes air contaminants, litter, effluent, refuse, biomedical waste, hazardous waste, and any other substance prescribed by government enactment. This WMP addresses domestic and industrial materials generally considered kitchen and general camp refuse, as well as domestic sewage sludge and incinerator ash. Some litter/waste has commercial value when recycled or reused; recyclable materials are also identified in this WMP.

This plan does not address the management and storage of hazardous materials, transportation of dangerous goods, or chemical storage and handling; these are covered in the Chemicals and Materials Storage and Handling Plan. Nor does the WMP consider the management of mining waste generated from ore extraction and mineral processing; this is addressed in the Tailings and Waste Rock Subaqueous Deposition Management Plan.

The WMP applies to all aspects and facilities associated with the Brucejack Gold Mine, including the Brucejack Mine Site, Brucejack Access Road, Knipple Transfer Area, Bowser Aerodrome, Brucejack Transmission Line, and Wildfire camp. The plan is applicable to all phases of mine development, including Construction, Operations, and Closure, and is relevant to any employees and contractors handling, using, or transporting waste.

4 RELEVANT LEGISLATION, REGULATIONS, AND EAC CONDITIONS

4.1 RELEVANT LEGISLATION AND REGULATIONS

The management of waste in BC is regulated mainly under the EMA and its regulations (e.g., Hazardous Waste Regulation [BC Reg. 64/2021], Waste Discharge Regulation [BC Reg. 154/2019], Open Burning Smoke Control Regulation [BC Reg. 11/2021]). The EMA governs solid, liquid, and air waste discharges to the environment. Non-hazardous waste management conditions specified in the Environmental Assessment Certificate, *Mines Act* or *Environmental Management Act* Permits are, and will continue to be, incorporated into this plan as relevant.

For waste generation, handling, and disposal at mine sites, the *Health, Safety and Reclamation Code for Mines in British Columbia* (the Code; BC MEMPR 2021) applies as well. The Code specifies waste management requirements in the sections below:

- Section 6.30.1 addresses flammable waste and scrap from underground workings; all waste, including waste timber shall be removed from an underground mine on a regular basis and shall not be piled up nor permitted to decay in the mine; and
- Section 10.1.3 (3)(g) requires that the Mine Plan contain designs for material handling and waste disposal.

In addition, other federal and provincial regulations, guidelines, and statutes influence the handling, transport, and disposal of waste from the mine, through pollution prevention and environmental protection measures or hazardous waste management. Selected examples are summarized in Table 4.1-1.

Table 4.1-1. Regulatory Requirements – Selected Examples

Legislation and Regulations	Applicable Information
EMA (2003)	Prohibits the introduction of waste into the environment in a way that will cause pollution, except in accordance with a regulation, permit, approval, or code of practice issued under the Act
Hazardous Waste Regulation (BC Reg. 64/2021)	Addresses the proper handling and disposal of hazardous wastes, under the EMA
Waste Discharge Regulation (BC Reg. 154/2019)	"Prescribes" which industries and trades are regulated under the EMA
Open Burning Smoke Control Regulation (BC Reg. 11/2021)	Addresses open burning for vegetative matter waste disposal and lists prohibited materials to protect air quality
BC *Public Health Act* (2008)	Provides direction on the management of health hazards
BC *Forest and Range Practices Act* (2002)	Provides direction on the management of forest insects, disease, animals, or abiotic factors causing damage to a forest

(continued)

Table 4.1-1. Regulatory Requirements — Selected Examples (continued)

Legislation and Regulations	Applicable Information
Canada *Hazardous Products Act* (1985a)	Provides direction on the sale, importation, and advertising of hazardous products
Canada *Fisheries Act* (1985b)	Prohibits the release of a deleterious substance to fish habitat
BC *Mines Act* (1996a)	Provides guidance on the operations and reclamation of existing and abandoned mines
BC *Water Act* (1996b)	Provides guidance on wells and groundwater protection
The Code (BC EMLI 2021)	Provides direction regarding the protection of worker health and safety at mines and exploration sites
BC *Wildlife Act* (1996c)	Provides guidance on the disposal of animal remains
Canadian Environmental Protection Act, 1999 (1999)	Provides guidance on the preparation of pollution prevention plans
Controlled Products Regulation (SOR/88-66)	Defines regulations respecting controlled products, including provision of Material Safety Data Sheets
Transportation of Dangerous Goods Act (1992), Transportation of Dangerous Goods Regulations (SOR/2001-286)	Includes a substance classification system and specifies requirements for transportation of dangerous goods

4.2 Relevant Environmental Assessment Certificate Conditions

Pretivm was granted an Environmental Assessment Certificate (#M15-01) on March 26, 2015, that included a series of conditions. This management plan fulfills Condition #2, in relation to a Component Plan for waste management, presented within Schedule B of the Certificate and copied below.

<u>Condition 2</u>

> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*
> - *Effects mitigation measures;*
> - *Monitoring programs;*
> - *Monitoring schedules; and*
> - *Reporting requirements.*
>
> *The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.*
>
> *The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."*

5 ENVIRONMENTAL PROTECTION AND MANAGEMENT

5.1 APPROACH

The approach to the management of non-hazardous domestic and industrial solid waste and domestic sewage sludge at the mine is to practice effective and environmentally sound waste handling and disposal that will result in avoidance of wildlife interactions (e.g., creating wildlife attractants) and minimize potential environmental problems. The Brucejack Mine Site is compact and the storage capacity for waste materials intended for off-site disposal is extremely limited. The off-site shipping of bulky, non-hazardous combustible waste materials is generally cost prohibitive due to the remoteness of the site, although it will be necessary for solid wastes which are non-combustible and select recyclables. Accordingly, the WMP balances the need to minimize storage and handling of waste through burning and incineration of as much non-hazardous waste as possible, minimizing waste generation through inventory management, and reducing, reusing, and recycling materials to the extent possible.

All wastes referred to in this plan are pre-assessed against hazardous waste criteria under the *Hazardous Waste Regulation* (BC Reg. 64/2021) to properly characterize waste prior to storage and disposal.

Some waste products have a residual value as recyclable or alternate use materials which are typically processed through salvage recycling companies. These materials can be diverted from disposal through proper handling and sorting, and typically are either a salvageable commodity (e.g., used copper wire), recyclable material (e.g., beverage containers), or reusable materials (e.g., bulk chemical containers, electronics).

This plan is solely concerned with non-hazardous refuse, some of which is recyclable. Pretium's environmental staff work with warehousing and the service crew to assess the typical/ expected waste that will be generated on site, and identify feasible recyclables to ensure appropriate handing, temporary storage, and disposal procedures are followed. This is primarily based upon the combustibility and composition of a waste item and list of acceptable items for incineration or open burning.

To summarize, waste management practices at the mine include:

- incineration of non-hazardous combustibles (specific practices are discussed in the Air Quality Management Plan);
- open pit burning;
- efficient off-site transportation and disposal;
- reducing, reusing, and recycling (3 Rs) as feasible; and
- properly trained waste management technicians and incinerator operators.

5.1.1 *Types of Waste Generated*

This plan covers non-hazardous domestic and industrial waste generated throughout the life of the mine. The types of waste that are typically generated during mine Construction, Operations, Closure, and Post-closure are listed in Table 5.1-1 along with the disposal method. This list may evolve as the mine advances through the phases. If additional wastes are generated that are not considered here, Pretivm will identify appropriate disposal method(s). Anticipated quantities of materials to be incinerated are discussed in Section 5.2.4 On-site Waste Disposal.

Table 5.1-1. Waste Types and Disposal Method at the Brucejack Gold Mine

	Mine Phase				Disposal				
Waste Type	C	O	Cl	PC	On-site Incineration	Burn Pit	On-site Disposal	Off-site Facility[a]	Off-site Recycling
Aluminum cans	X	X	X	X					X
General refuse from camp (i.e., spent toiletries)	X	X	X	X	X				
Paper and cardboard	X	X	X	X	X

Electronics	X	X	X	X					X

Notes:
C = Construction, O = Operations, Cl = Closure, PC = Post-closure.
[a] *Such as a landfill or other licenced facility.*
[b] *Polyvinylchloride (PVC) plastic will not be incinerated and will be landfilled. Combustion of plastics will be minimized through waste reduction and recycling programs where feasible.*
[c] *Oil contaminated rags containing less than 3% of oil by weight are permitted to be incinerated provided they do not exceed 0.2% of the total waste incinerated per year.*
[d] *Empty totes will be sent offsite for recycling or returned to supplier, spent chemical reagent bags will be incinerated or disposed of offsite depending on the type of chemical reagent and all other plastic chemical containers will be incinerated.*

Residual paint from latex-based paints is dried before disposal in a landfill. The cans from oil-based paints are properly sealed and stored in the waste handling facility before being shipped offsite. Biohazard containers are stationed at the first aid area, under the supervision of the first aid staff, to store bio waste (e.g., blood- and tissue-contaminated materials). Air filters are collected in bins in the mechanic shops before being disposed of in off-site landfills.

The following waste requires special consideration and are not to be burned / incinerated:

- hydrocarbon-contaminated soil;
- radioactive waste including smoke detectors;
- organic compounds containing chlorine including plastics, solvents and polyvinyl chloride piping;
- herbicides/pesticides (if used); items containing mercury, lead, or other heavy metals including paint, computer equipment, and fluorescent bulbs;

- batteries;
- explosives;
- pressurized cans, cylinders, or other containers that may explode when heated;
- synthetic fiber textiles;
- wood treated with pentachlorophenol, inorganic preservatives, lead paint or polychlorinated biphenyls-amended paint; and
- construction and demolition waste including roofing materials, electrical wire, and insulation.

5.2 MITIGATION MEASURES AND BEST MANAGEMENT PRACTICES

5.2.1 Waste Reduction

Reducing the amount of material that is consumed is an effective way of reducing the amount of waste that is generated and supports operations within a compact mine site footprint. Materials consumption are assessed by evaluating opportunities for possible reductions in material usage and generated waste volumes. Examples of waste reduction which may be applicable to the mine include:

- product review, selection, and substitution, e.g., recyclable/reusable and non-hazardous materials will be used instead of non-recyclable/non-reusable and hazardous materials;
- ordering chemicals or lubricants in bulk/returnable containers;
- keeping a workable minimum inventory to prevent expiration of products and resulting generation of waste;
- decreasing the amount of solid waste by reducing the use of disposable items (e.g., use of pump bottles in place of aerosol cans, where possible);
- requesting that suppliers provide less packaging materials on over-packaged products;
- preferential use of voice message devices, telephone, email, or verbal messaging; and
- printing and photocopying on both sides of paper.

5.2.2 Reuse and Recycling

A recycling program are incorporated for the mine to the extent possible given the remoteness of the site. Materials brought to the mine siteare used to the maximum extent feasible, and where applicable, reused on the site. Examples of potentially reusable materials include:

- scrap metal, conveyor belts, and lumber;
- chemical containers that can be returned to the supplier to be refilled; and
- waste oils, glycols, and solvents that can be reused for secondary applications (e.g., fueling the incinerator or waste oil burner for heat generation).

Used/waste oil generated during each Mine phase is collected and stored within specialized "Lube Pro" containers equipped with secondary containment. These units can be transferred safely to the incinerator or mechanic shop where an oil burner is located, for appropriate disposal. Recyclable materials which are not suitable for combustion are shipped off site to the nearest recycling facility. Examples of these products include:

- lead-acid and alkaline batteries;
- e-waste (e.g., computers, printers, scanners, etc.);
- ink cartridges;
- plastic petroleum pails;
- used/damaged vehicle/equipment parts;
- oil-based paints;
- empty drums; and
- beverage containers that are recyclable for cash.

Appropriate containers for storing the various waste types (e.g., batteries, ink cartridges, spent aerosols, e-waste, paper, appropriate plastics, etc.) are placed at relevant locations (e.g., within buildings) around the mine site. These materials are transported and staged at the waste handling facility before being shipped offsite to a suitable recycling facility. Combustible, non-reusable, and non-recyclable materials such as food-soiled packaging and non-reusable wood products are incinerated. The use of personal hot beverage containers and water bottles is prompted in an attempt to minimize the amount of disposable coffee cups and plastic water bottles used on-site.

5.2.3 Recovery

Recovery is the final level of waste minimization and involves extracting usable material or energy as a by-product for other uses. Opportunities for recovery are evaluated.

5.2.4 On-site Incineration (Burn Pits and Incinerators)

For the management of combustible wastes generated by the mine, Pretivm utilizes a combination of burn pits and two incinerators; one located at the Brucejack Mine Site and the other at Knipple Transfer Area. This is an effective and practical mode of waste disposal for combustible non-hazardous wastes which produce an ash by-product. The Brucejack Mine Site incinerator is an EcoWaste Solutions (EWS) ECO M2TN incinerator. The Knipple Transfer Area is equipped with a EWS CA100. The technology used by the CA100 is similar to that used by ECO M2TN, but with a smaller capacity. No sewage sludge will be incinerated in the EWS CA100.

The incinerators are used to dispose of all suitable combustible non-hazardous waste listed in Table 5.1-1 and in compliance with EMA air emissions permit conditions and BMPs. BMPS for the use of incineration and open pit burning are summarized below.

Incinerator feed includes potential wildlife attractants, such as food waste and food-related products and packaging. Kitchen, dining room, office, and accommodation waste, except for recyclable beverage containers, are incinerated in a timely manner to reduce the potential of attracting wildlife. Personnel are instructed and required to segregate wastes at the source, and monitoring will promote that materials are separated as close as possible to the source for designation as incinerator feed or off-site disposal/recycling. A maintenance program is in place for incinerator including regular vendor support.

Sewage sludge is generated from the Sewage Treatment Plant (STP) Filterboxx units (2 x C-75 units), consisting of a standard MBR wastewater treatment system. Sludge from the STP at the Brucejack Mine Site can also be incinerated. As per the Refuse Incinerator Management Plan, a prime rotary fan press is used to dewater the sewage sludge to a minimum of 25-30% solids content and a screw conveyor/feeder system is used to load 20 kg to 25 kg of the dewatered sewage sludge into reinforced combustible plastic bags. Each bag is sealed, then transported to the incinerator, weighed and loaded into the primary incinerator chamber at the appropriate time onto a layer of other solid camp waste. Each incinerator batch is comprised of no more than 20% dewatered sewage sludge. All of the solid waste materials are processed as a mixture.

Metal and glass remaining after incineration that was missed in pre-screening is separated from the incinerator ash for disposal, and the residual ash is then sent offsite to a certified landfill. By following the manufacturer's operating specifications for the incinerator, residual incinerator ash is inert and non-toxic. The incinerator operator has responsibility for efficient operation of the incinerator and a well-separated end-product.

Ash and residue from incineration and open burning is cooled and disposed of at the locations referenced in Waste Discharge Permit 107025. Ash is buried as soon as reasonably possible, weather permitting, to prevent it from becoming a wildlife attractant. Runoff will also be diverted away from any ash disposal site to prevent contact with the buried waste.

There are three active camps (Brucejack Mine Site, Knipple Transfer Area, and Wildfire). The Brucejack Mine Site Camp accommodates 650 people during Operations. Waste for the Knipple Transfer Area incinerator is mainly from Knipple Transfer Camp with less from Wildfire Camp. The maximum mass of refuse for incineration in the Knipple Transfer Area incinerator is 520 kg/day or 189,800 kg/year.

Pretivm's Waste Discharge permit covers the operation of both incinerators and Table 5.2-1 lists anticipated types and quantities of waste to be generated during Operations.

Table 5.2-1. Estimated Combustible Solid Waste Quantities for Incineration at Brucejack Mine Site Incinerator

Waste Category	Amount (kg/year)	Ash Content (% weight)
General domestic camp waste	400,000	5%
Waste food including associated packaging	120,000	15%

Waste Category	Amount (kg/year)	Ash Content (% weight)
Paper and cardboard boxes	60,000	6%
Wood/pallets	40,000	7%
HDPE pipes	680	1%
Air hose	200	1%
1-inch water hose	200	1%
Hydraulic hose	320	1%
1,200-mm vent bag	400	10%
Fuel filter	160	5%
Air filter	160	5%
Hydraulic oil return filter	60	5%
Brake hydraulic oil return filter	120	5%
AC filter	120	5%
Transmission oil filter	60	5%
Oil filters	160	5%
Oily rags	400	5%
Sewage sludge[a]	30,000	15%
Total[b]	**653,040**	

Notes:
This table is based on information provided to EWS. These estimates and calculated data were provided for reference and proposal purposes only. Use of this information has been granted permissions from EWS authorizing the specific use of this table in writing.
[a] *Sewage sludge is semi-solid.*
[b] *Maximum mass of refuse for Brucejack incinerator is 1800 kg/day or 657,000 kg/year.*

BMPs related to the effective operations of the incinerators are detailed in the Refuse Incinerator Management Plan, and include the following:

- train operators to be knowledgeable about critical steps in the incineration cycle, waste characterization, safety procedures, and equipment operations/maintenance;
- follow manufacturers' instructions for installation, maintenance, and operations;
- undertake routine inspections and scheduled maintenance;
- operate incinerator to design specifications to achieve complete combustion;
- discharge ash at least 1.2 m above the highest groundwater table and cover with a minimum of 0.2 m of soil;
- segregate waste prior to burning to ensure all recyclable and reusable waste is diverted and non-combustibles are removed;
- minimize storage duration of kitchen wastes to reduce wildlife attractant potential;
- keep waste as dry as possible;

- sort out high (e.g., oily rags), average (e.g., paper/cardboard) and low (e.g., wet food waste) heat value waste and mix wastes to achieve ideal burn composition, wherever feasible;
- mix wet food waste with dry waste to promote efficient burning;
- utilize appropriate personal protective equipment (PPE) for worker safety;
- segregate hazardous wastes and combustibles (e.g., aerosol cans) at source to prevent erroneous introduction into incinerator;
- safely handle and dispose of residues;
- track and record total amounts of waste incinerated, any problems, and overall performance and disposal method; and
- have fire suppression tools available in case of emergency.

Operations specifics are documented in the Refuse Incinerator Management Plan (Section 5.1 – Incinerator Operation) and the supporting operator manuals.

Burn pits for inert bulk materials (e.g., clean wood debris and large bulky packaging) are also be utilized. Waste Discharge Permit 107025 allows for a total of four burn pits at the Brucejack Mine Site (Upper Camp Creek, West Camp, West Zone and Km 72), and one each at Knipple Transfer Area, Bowser and Wildfire Camp. The locating of all burn pits took into consideration dominant wind direction in relation to accommodations. The following are the approved burn pit locations:

- burn pit at Brucejack Mine Site (Upper Camp Creek) – 56.4637N, 130.1859W;
- burn pit at Brucejack Mine Site (West Camp) – 56.4652N, 130.1902W;
- burn pit at Brucejack Mine Site (West Zone) – 56.4696N, 130.1941W;
- burn pit at Brucejack Mine Site (KM 72) – 56.4674N, 130.1631W;
- burn pit at Knipple Transfer Area – 56.4014N, 130.003W (438104.7 E, 6251184.4 N);
- burn pit at Bowser Laydown – 56.3924N, 129.9515W; and
- burn pit at Wildfire Camp – 56.5207N, 129.5131W.

Note that the burn pit at KM 72 is permitted to migrate within the NPAG quarry as required to avoid areas of active mining.

As per Waste Discharge Permit 107025 the source of waste for the burn pits may be dry, unpainted, untreated demolition and construction wood wastes; broken lumber and pallets; slabs; log ends and branches; brush; and miscellaneous, non-recyclable cardboard and paper products. However, waste will exclude nuisance-causing combustibles such as painted and treated wood, sawdust, mulch, wood chips, stumps, rubber, plastics, tars, insulations, etc. Cardboard packaging, and empty cardboard containers from explosives, may be burned. The paper sources may also include small quantities of office paper.

Open burning is managed as per the conditions outlined in Waste Discharge Permit 10702, the Brucejack Air Quality Management Plan and the Open Burning Smoke Control Regulation (BC Reg. 11/2021). BMPs related to open burning programs that will be practiced include the following:

- train operators to be knowledgeable about open burning practices, safety procedures and regulations;
- site burn pits at least 70 m from water bodies and ensure no habitations are downwind and that non-combustible surfaces are nearby (e.g., rock or quarry pits);
- monitor burn pits during aggressive burns for sparks and embers that may escape towards buildings or adjacent dry vegetation;
- segregate waste prior to burning to divert planned recyclable and/or reusable waste, and to remove non-combustibles (metal, aerosol cans, glass);
- conduct open burning for paper products, paperboard packing, untreated wood waste, and natural fiber textiles (e.g., cotton, wool) only;
- prohibit burning of kitchen waste in a burn pit;
- keep waste as dry as possible and do not burn during high winds;
- pile wastes so high temperatures can build and pre-heat unburned waste to minimize smoke production;
- mix wastes to achieve ideal burn composition;
- utilize appropriate PPE for worker safety;
- segregate hazardous wastes at the source so they are not burned;
- have fire suppression tools available in case of emergency;
- avoid low temperature, smoldering fires – mix as needed while using proper PPE; and
- avoid hot surfaces and utilize PPE to prevent burns and smoke inhalation.

5.2.5 Minimizing Wildlife Attractants

BMPs are used to minimize wildlife attractants and conflict. The overall goal of these practices is to minimize and avoid human/wildlife conflict. Practical steps will be followed that reduce the potential for wildlife to be attracted to and enter into conflict with people or camps. The BMPs also focus on steps to promote worker and wildlife safety to prevent negative outcomes for both groups as well as promote conservation of wildlife resources (Alberta Bear Smart 2014; MPERG 2008).

BMPs related to waste management and wildlife include the following:

- avoid creating wildlife attractant situations by storing odorous food supplies and wastes indoors or burn food and odorous waste immediately;
- store recyclable drink containers indoors;

- operate incinerator to obtain complete combustion of waste;
- fence waste storage areas as appropriate and surround incinerators with appropriate voltage electrified fencing to prevent animal intrusion;
- train applicable site employees in the proper handling and storage of wastes;
- utilize bear- and animal-proof containers as appropriate and schedule garbage pickups to avoid overnight storage of odorous wastes outdoors;
- conduct weekly visual inspections of waste facilities to help minimize possible bear/animal attractants;
- train personnel in bear awareness/safety training and rules for managing waste and minimizing attractants; and
- report wildlife sightings within camp to Environmental Department.

The incinerator and waste transfer facility at the Knipple Transfer Area is fenced with a chain linked electrified fence; the incinerator at the Brucejack Mine site will be fenced if it becomes necessary. The Wildfire Camp accommodations and kitchen are enclosed within electric bear fencing which is installed and uninstalled seasonally to allow effective snow removal during bear hibernation seasons.

5.2.6 Waste Handling Facilities

The Waste Handling Facilities function as temporary storage areas for waste until it is reused, disposed of on-site, or transferred to an off-site facility for recycling or disposal. The Waste Handling Facilities are designed to contain and prevent contamination of the environment. Where required, the Waste Handling Facilities are covered and fenced to prevent attraction of wildlife and to provide protection from weather. In general, the Waste Handling Facilities will consist of the following three parts:

1. **Reuse area**. Reuse areas will contain the items that can be reused on the site. Inert materials to be stored in this area include tires, scrap metals, and waste wood. These items will be placed in designated containers or areas within the reuse area of the waste collection area to allow personnel to search for materials to reuse. Once these containers or areas become full, the contents will be either disposed of in a designated on-site facility or removed from site as applicable to the waste.
2. **Hazardous waste area**. The hazardous waste areas will contain hazardous waste that is required to be shipped off site for appropriate disposal. Hazardous waste, including used glycol, acids, solvents, oil that are not used to fuel the incinerators, absorbent pads, hydraulic fluid, and any other hazardous chemicals, will be stored in a secondary containment area. Hazardous waste will not be permitted to accumulate to excessive volumes, but will be shipped off site to avoid crowding.
3. **Storage and Removal area**. This area will contain waste that will be sent to an off-site facility for disposal, as well as waste that is waiting incineration. Waste temporarily stored for removal will include domestic and industrial waste that is not hazardous or recyclable.

The Brucejack incinerator and is located at a distance from the other facilities to protect personnel from downwind emissions. Rather than transport all materials to this location a sorting facility will be established between the camp and quarry where materials suitable for off-site disposal can be transferred expeditiously. The Knipple Waste Handling Facility was constructed adjacent to the incinerator. The Wildfire Camp will have designated waste collection areas.

The segregated wastes in the waste collection areas are to be stored using accepted management practices including, but not limited to, the following:

- use of fire prevention systems adequately designed for the materials being stored;
- use of spill kits, protective equipment, and other necessary equipment to clean up and mitigate spills;
- only containers in good condition will be used to store items;
- containers and liner materials will be compatible with the waste being disposed;
- containers and drums will be labelled to identify the waste content and initial date of storage;
- containers will be stored on an elevated platform to detect leaks, if required;
- sufficient storage space between containers to allow for safe access and handling of containers; and
- incompatible wastes will not be stored in the same containers and will be stored at a safe distance from each other.

5.2.7 Transporting Waste

Certified transportation contractors are used for the transport of goods and materials to and from the site. Environmental Department staff will periodically inspect the transporters' performance and compliance with BC and federal transport regulations, contract requirements, and overall performance.

5.2.8 Off-site Disposal for Non-combustibles and Recyclable Waste

Non-combustible (and non-hazardous) solid wastes, which are suitable for recycling or must be disposed of in a permitted landfill, are trucked to the Kitimat-Stikine Regional District Meziadin landfill.

Waste for offsite disposal includes metal in the form of machine/mill parts, scrap or building supplies, aerosol containers, large quantities of conveyor belts or mixed rubber/steel products, metal culverts, light ballasts, fiberglass building insulation, large quantities of tires, transformers, wiring, and possibly solid concrete (if not possible to dispose of underground).

Some of the items above may be recyclable through salvage dealers in nearby communities. Additional recyclable waste will include drinking containers (aluminum, glass), wiring, batteries, and some forms of metal or plastic bulk containers for reagents.

5.2.9 Education and Training

The efficiency and overall effectiveness of on-site waste management practices is enhanced through proper education and training provided to all Pretivm employees and contractors working at the mine. Education is provided through site orientation/indoctrination of new employees and contractors, toolbox meetings, and Sunday safety presentations. The Pretivm Environmental Department, through education and monitoring, is working towards developing an environmentally conscious camp culture.

5.3 MINE PHASES

The mine includes activities at a number of sites across the various phases encompassing the Brucejack Mine Site, Brucejack Access Road, Knipple Transfer Area, Bowser Aerodrome, Brucejack Transmission Line, and Wildfire camp.

5.3.1 Construction Phase

The Construction phase took about 18 months. The existing sewage treatment plant located at the Brucejack Mine Site was expanded to accommodate the larger workforce during Construction. Bowser Camps, Knipple Transfer Camp and Wildfire Camp all have septic systems sized for the population in each camp.

The sludge from the Brucejack Mine Site sewage treatment system and the various septic systems was removed by a licensed company and hauled to the Regional District sewage lagoon at Meziadin.

5.3.2 Operations Phase

During the Operations phase, waste collection areas include the incinerators located at the Brucejack Mine Site and Knipple Transfer Area, waste collection and storage areas for recyclables, general and hazardous waste storage areas, and the sewage treatment plant. Waste collection areas have provisions to segregate waste according to disposal methods. The waste treatment areas and sewage effluent/sludge disposal systems have waste containment and runoff control structures as appropriate to prevent the escape of untreated liquid waste to surface or groundwater.

5.3.3 Closure Phase and Decommissioning

Activities during the Closure phase will be similar to the activities during the Construction phase, with the exception of the movement off site of a large component of the infrastructure. Additional equipment may be brought to the site to assist with decommissioning. It is expected that large volumes of waste and recyclable materials will be generated from the dismantling of buildings and process infrastructure.

Waste management during Closure will focus on identification of feasible salvage and recycling options to minimize the amount of solid waste materials and associated disposal costs. This typically involves an experienced salvage contractor who trucks components from the site to an off-site facility for commercial recycling. A range of materials will be dismantled and removed from the site for

disposal. The incinerator and burn pits will be operational at this time. Any equipment or materials with market value will be removed or sold for capital recovery.

Selected waste management facilities will be retained at the Brucejack Mine Site during closure, such as the incinerator and the sewage treatment plant, until no longer required, at which point they will be dismantled and removed from site.

5.4 STANDARD OPERATING PROCEDURES, POLICIES, ETC.

Pretivm has developed Standard Operating Procedures (SOPs) for the handling of waste materials. Current SOPs include:

- Burn Pit SOP;
- Incinerator Operation SOP
- Incinerator primary chamber clean out SOP
- Incinerator waste oil burning
- Terrapure Onsite Waste Management SOP; and
- Aerosol Can Proper Use and Disposal.

6 ENVIRONMENTAL MONITORING

6.1 PERFORMANCE MONITORING

The waste management practices outlined in the WMP have been implemented and are monitored. Waste handling and storage facilities at the Mine Site, such as waste collection containers, the Waste Transfer Facility, incinerators, burn pits, and sewage treatment plants, are monitored through periodic visual inspections and where applicable through sample analysis. Inspections may include a review of related documentation such as inventories, manifests, and logbooks. The frequency of inspections will be determined by the phase. During Operations, the inspection frequency is expected to be on a monthly basis.

Inspection findings are reported to the managers responsible for the inspected sites with copies provided to the Environmental Manager. All reports are reviewed internally by the managers and the Environmental Manager, or designate, in order to identify necessary improvements in waste management practices.

Additionally, the Environmental Manager may appoint an internal audit team, separate from the Environmental Monitor inspections, whose responsibility will be to:

- inspect facilities and waste collection areas for proper waste segregation and storage conditions;
- review the waste collection areas including any associated procedures, training, equipment, records, and employee awareness;
- make an action plan to correct deficiencies, improve procedures, maintain awareness and communication (with appropriate area supervisors, site personnel, transporters, and contractors), recognize positive or negative performance, and alert management when enforcement is necessary to ensure compliance; and
- recommend improvements to the mine's Waste Management Plan for continuous improvement of achieving the performance objectives.

Environmental monitoring of the various sites and facilities vary throughout the different mine phases and may be dependent upon the level of activity and volume of waste generation. Monitoring plans will be modified depending upon the number of employees, types of activities, expected waste streams refinement and employee adherence to the Waste Management Plan. A general approach to environmental monitoring is described below.

The frequency of monitoring at each waste-producing point source varies based upon the volume of waste generated, ease of handling, relative stability of waste for storage, storage conditions, and site access. Generally, sources which produce daily volumes of waste which must be disposed of immediately (e.g., kitchen waste, other liquid wastes) to minimize animal attractants and/or to maintain sanitary conditions, may be inspected as frequently as weekly to ensure waste handling is effective and timely. Waste which is low risk as an animal attractant, is stable outdoors, and has no

risk to the environment (e.g., clean wood waste, recyclable metals, reusable materials) may be inspected as infrequently as monthly to ensure that waste segregation and storage practices are appropriate. Monitoring inspection frequency will be increased if employees use low risk facilities to dispose of higher risk waste.

Waste accumulation and handling is be monitored by each department through their Manager or Superintendent. The key sites with potential for procedural non-compliance will be inspected on a regular basis defined by the level of the risk (weekly, monthly).

6.2 WORK PLANNING AND SCHEDULE

The volume of waste generated has declined as the mine progressed from Construction into Operations. For example, the initial period of Construction saw a larger workforce on site that generated larger amounts of construction waste, including wood waste, electrical and utility piping waste, insulation and large equipment packaging, and pallets. During Operations, a mixture of diverse but more predictable waste streams is generated, which can form the basis of continuous improvement in all facets of waste management and may result in less frequent monitoring and periodic internal audits. As a result, monitoring will change over time.

As part of their initial orientation, employees are made aware of the requirements and reasons surrounding the proper management of waste. The Environmental staff communicate the performance objectives and measures related to waste management to site personnel, and to the Engineering, Procurement, and to any Construction Management Contractor. Personnel requiring specific training in the management of waste will be identified by Pretivm and receive training prior to assuming any related responsibilities.

7 REPORTING AND RECORDING

7.1 REPORTING

7.1.1 Compliance

Reporting is defined in the *Environmental Management Act* Permit and the *Mines Act* Permit.

As per Waste Discharge Permit 107025, the following data related to incineration will be reported on an annual basis:

- results of analyses of waste oil used for incineration;
- results of lab analyses of sewage sludge content;
- mass and percentage of sewage sludge per each batch of incineration; and
- summary of waste streams subject to incineration and open burning including annual quantification and waste storage methods.

This information is included as part of annual reporting outlined in the Air Quality Management Plan (Pretivm 2015), to be submitted on or before March 31 of each year for the previous year's operations. Copies of annual report will be sent to the Tsetsaut/Skii km Lax Ha, the Tahltan Central Council, and Nisga'a Lisims Government, as per the permit condition.

7.1.2 Internal Reporting

Routine internal reporting according to a schedule of monitoring/audit inspections is undertaken and highlights the effectiveness, challenges, and successes in managing waste. Key metrics are the volume and nature of waste generated on site, effectiveness of handling waste, environmental or wildlife problems associated with waste, and any applicable permit compliance results.

7.1.3 Incidents

Emergency or environmental incidents which occur as a result of wildlife encounters, incinerator upset conditions, or non-compliance with the WMP or permits will be documented and reported to the Environmental Superintendent and Mine Manager. An Incident Report Form will be completed and the follow-up for causes and solutions will be led by Environmental staff.

7.2 RECORD KEEPING AND TRACKING

7.2.1 Monitoring Results

Monitoring/inspection records are reviewed internally by the appropriate managers and Environmental staff, in order to identify necessary improvements in the monitoring system.

7.2.2 Audit Results

Findings from internal audits, related action items, and any additional follow-up measures are kept on record for the life of the mine.

7.2.3 Continuous Improvement, Follow Up, and Adaptive Management

Appropriately qualified personnel will be employed throughout the life of the mine to supervise, direct, monitor, and implement any adaptive management actions identified for waste management.

7.2.4 Incident Response Records

The Environmental staff are responsible for maintaining records of incidents and responses throughout the life of the mine.

CONFIRMATION OF REVIEW OF THE OPERATION, MAINTENANCE, AND SURVEILLANCE MANUAL REVISION 8 FOR THE WASTE ROCK AND TAILINGS STORAGE FACILITY, BRUCEJACK MINE, BC

Dear Sir:

At the request of Newcrest Mining Ltd. (Newcrest), this letter confirms that the most current Operation, Maintenance, and Surveillance Manual, Revision 8D for the Waste Rock and Tailings Storage Facility (Pretium 2021) at Brucejack Mine, BC has been reviewed and supported by myself as the Engineer of Record.

I trust this meets your requirements at this time.

Yours very truly,

WSP Canada Inc.

Jeffrey Kwok, P.Eng.

1 Introduction

1.1 Background

The Brucejack Mine, wholly owned by Pretium Resources Inc. (Pretivm), is located approximately 65 km northwest of Stewart, British Columbia (BC) (Figure 1). Major authorizations for the mine include *Mines Act* Permit M-243, first issued to Pretivm on July 22, 2015, and Effluent Permit 107835, first issued on August 31, 2015. Both permits have been subsequently amended. Construction was initiated September 5, 2015, and commercial production began in July 2017.

Operation of the Brucejack Mine generates waste rock and tailings. Waste rock is primarily produced from underground mining. Most waste rock is potentially acid generating (PAG). All Brucejack Mine waste rock is assumed to be PAG and is managed as such, in accordance with the mine's authorizations. All waste rock is either deposited subaqueously within the Waste Rock and Tailings Storage Facility (WRTSF) or backfilled in the underground mine below the ultimate flooding elevation of the mine. Tailings are non-potentially acid generating (NPAG) and are either paste thickened and used for backfilling empty underground production stopes or deposited subaqueously in the WRTSF. Therefore, Pretivm has production flexibility to direct waste rock and tailings to either the WRTSF or the underground mine, depending on operational needs.

Sludge produced from the mine's Water Treatment Plant (WTP) is mixed with the tailings in the thickening tank. The resulting slurry, comprising approximately 1% to 2% of sludge, is then deposited in the WRTSF.

Effluent from the Sewage Treatment Plant (STP) is directed to the WTP discharge tank, where the effluents are combined and discharged through a single line to the WRTSF. The STP/WTP effluent discharge point is to the east of the waste rock dump (WRD) and approximately 75 m from the southern shore of the WRTSF. The maximum authorized rate of discharge from the WTP to Brucejack Lake is 10,000 m^3/day, while the maximum authorized rate of discharge from the STP to Brucejack Lake is 175 m^3/day.

1.2 Purpose and Objective of the OMS Manual

This Operations, Maintenance, and Surveillance (OMS) manual has been prepared to address requirements under the following authorizations, regulations, and legislation for subaqueous waste rock and tailings deposition within the Brucejack Mine WRTSF:

- *Mines Act* Permit M-243
- Effluent Permit 107835 (PE-107835)
- The Health, Safety, and Reclamation Code for Mines in British Columbia (MEMLI 2021)
- Requirements under the BC *Mines Act* and BC *Environmental Management Act*

These requirements pertain to a combination of environmental (primarily metal leaching / acid rock drainage [ML/ARD]), geotechnical, and health and safety aspects. Specific conditions under Permit M-243 applicable to WRTSF operations include geotechnical conditions listed under C.3(c) of this

permit, as well as ML/ARD-related conditions under D.3. This OMS manual also addresses one of the management plan requirements under Brucejack Mine Environmental Assessment Certificate (EAC) #M15-01 and follows requirements of the mine's Decision Statement Issued under Section 54 of the *Canadian Environmental Assessment Act, 2012*. The EAC and federal Decision Statement were both issued in 2015.

This OMS manual was also prepared in accordance with the Mining Association of Canada (MAC) guidelines for OMS manuals of tailings facilities (MAC 2021a). This rigorous framework is typically not required for waste rock deposition; however, in this case, waste rock deposition is a challenging operation where operational personnel safety is of paramount importance. In addition, since waste rock deposition occurs simultaneously with tailings deposition within the WRTSF, a combined OMS manual is appropriate.

This OMS manual is reviewed by the Engineer of Record (EOR) and approved by the manager prior to implementation in accordance with 10.5.2(2) of the Health, Safety and Reclamation Code for Mines in British Columbia (MEMLI 2021). The OMS manual is reviewed at least annually and is considered a live document. Engineer of Record review comments of the OMS manual specific to the WRTSF are provided under separate cover (e.g., the annual facility inspection report).

This OMS manual replaces the Tailings and Waste Rock Subaqueous Deposition Management Plan originally contained as Appendix 6-O of the Application for *Mines Act* and *Environmental Management Act* Permits for the Brucejack Mine (Pretivm 2015). This OMS manual provides the most current information and direction with respect to waste rock and tailings management at the Brucejack Mine and is the primary reference to be used with respect to these activities.

It is important to note that all waste rock and tailings are and will continue to be contained within the natural Brucejack Lake basin (i.e. the WRTSF), without the need for any external containment structure to retain the waste rock and tailings. There are no failure mechanisms that would result in breach or discharge of waste rock or tailings beyond the confines of the WRTSF, and therefore many of the MAC (2021) guidelines do not apply to this OMS manual.

This OMS manual provides the framework for the mine life-cycle subaqueous deposition of waste rock and tailings into the WRTSF, and defines and describes the following components of the operation:

- Roles, accountabilities, responsibilities, and levels of authority for positions associated with waste rock and tailings deposition
- Key elements of the Mine Site (core mine infrastructure area located at the southwest shore of the WRTSF) as it relates to the WRD and tailings deposition design
- Key components of the WRD and tailings design and expected life-cycle performance
- Procedures for waste rock and tailings deposition
- Regulatory and corporate policy compliance and obligation requirements associated with waste rock and tailings deposition

- Requirements for reporting the performance of the waste rock and tailings deposition progress
- Monitoring and surveillance requirements for the WRTSF, described as quantifiable performance objectives (QPOs), and emergency planning and response procedures

1.3 OMS Manual Updates

This OMS manual is the property of Pretivm, which has sole authority over the distribution of this document. Pretivm is the only party authorized to make revisions to the manual or to contract a third party to carry out revisions. Pretivm also assumes responsibility to inform all parties required to receive this OMS manual when updates have been made, and to undertake any necessary training to ensure individuals are familiar with the changes.

The OMS manual is reviewed at a minimum frequency of once per year as required, in accordance with mine authorizations, and updated as appropriate taking into consideration mine development changes that would affect the management of waste rock and tailings. Specific mine changes that would trigger an update to this manual include, but are not limited to:

- Substantial variation of observed WRD performance from predicted performance
- A recommendation by the EOR or any other qualified geotechnical professional that undertook an audit or safety review of the OMS Manual
- Changes in Pretivm's organizational structure and/or position responsibilities
- Changes in the status of the mine, such as temporary or permanent closure, and ultimately post-closure
- Regulatory and/or operational authorization changes including updated best practice guidelines for mine waste management

Notwithstanding the above, revisions are made proactively, as far as practicable, in advance of major mine changes that would affect the waste rock and tailings deposition plans. Revision of the OMS manual may also be required depending on results of WRTSF effluent monitoring required under the mine's authorizations, or monitoring required under the ML/ARD Management Plan (Lorax 2021) and other Environmental Management Plans (EMPs) (Pretivm 2015, 2016, 2017a, 2018, 2019, 2020a, 2021).

The following key supporting documents are considered integral to this OMS manual, and are attached as Appendices A through E, respectively:

- Appendix A: Responsible, Accountable, Support, Consulted, and Informed (RASCI) matrix
- Appendix B1: Standard Operating Procedure (SOP) for Waste Rock Deposition with Stacker/Bailing system
- Appendix B2: SOP for Waste Rock Deposition with Remote Dozer
- Appendix B3: SOP for Remote Dozing Operation
- Appendix B4: SOP for Waste Rock Dump PAG Material Replacement

- Appendix B5: SOP for Waste Rock Haulage
- Appendix C: Water and Ice Emergency Response and Rescue Plan
- Appendix D1: Daily Waste Rock Inspection Checklist
- Appendix D2: Weekly Waste Rock Deposition Audit Checklist
- Appendix E: Tailings Deposition Infrastructure Issued for Construction Drawings
- Appendix F: Waste Rock Dump Area Emergency Evacuation and Re-entry Plan Under Seismic Loading

These supporting documents are stand-alone documents intended to provide detailed guidance on specific elements of waste rock and tailings management; they are included as permanent appendices to the OMS manual for completeness. Should any changes to these plans be required, the OMS manual will require an update. Table 1-1 summarizes the revision history of this document.

With support from: Lorax Environmental Services Ltd	Stuart McPhee, PEng Reviewed by: Calvin Boese, MSc, PEng; and Sylvia Van Zalingen, MS, PAg.	• Update regulatory context. • Update Pretivm Organizational Chart. • Update figures based on current WRD crest surveys. • Update EOR transition from the late Maritz Rykaart to Calvin Boese.
Ver. 8; June 2021 (this document)	Pretium Resources with support from Golder and Associates.	Lyle Morgenthaler, PEng (Pretivm) Reviewed by: Greg Norton, MSc (Pretivm) and Jeffrey Kwok PEng (Golder) (Golder)	• . • Update Pretivm Organization Chart. • Add waste rock deposition procedure with remote controlled dozer. • Add QPO for the waste rock deposition with remote controlled dozer • Add RASCI table

2 Roles and Responsibilities

2.1 Organizational Structure

Pretivm's organizational structure as it relates to the operation, management, surveillance, and emergency preparedness and response of the WRD and tailings management is presented in Figure 2. This OMS manual version applies to the current organizational structure for an operating mine. If the organizational structure, positions, or responsibilities listed herein change, this document will be updated accordingly.

2.2 Position Responsibilities

Position responsibilities for the operation, management, surveillance, and emergency preparedness and response of the Brucejack Mine WRTSF and associated subaqueous mine waste (waste rock and tailings) deposition management are listed in Table 2-1. The positions are also presented in a Responsible, Accountable, Support, Consulted, and Informed (RASCI) matrix for site-specific tasks in Appendix A.

Table 2-1: Key positions and responsibilities associated with the administration of the WRTSF

Position	Organization	Responsibilities
Accountable Executive Officer, AEO	Pretivm	• Ensure appropriate and effective governance structure for the WRTSF. • Ensure appropriate and effective management system is in place that aligns with industry best practice. • Retain the services of qualified EOR. • Be aware of key outcomes of tailings facility risk assessments and how risks are being managed. • Report to Board on risks and performance of the waste and tailings management system.

Position	Organization	Responsibilities
General Manager	Pretivm	• Oversee overall operations implementation including waste rock and tailings deposition. • Budget control. • Overall on-site responsibility and oversight for all parties and activities. • Ensure implementation and maintenance of waste rock and tailings deposition SOPs and Emergency Response Plan (ERPs). • All site-wide responsibilities associated with the “Manger” per the HSR Code (MEMLI 2021)
WRTSF Responsible Person	Pretivm	• Overall on-site responsibility and oversight for all parties and activities. • Coordinate development of OMS with EOR and Department QPs; lead annual review and update. • Coordinate implementation of OMS; ensure Department QPs understand responsibilities per the OMS. • Accountable to ensure implementation and maintenance of waste rock and tailings deposition SOPs and ERPs. • Ensure the waste rock and tailings deposition area is operated in accordance with facility designs and mine permits. • Identify scope and budget required for waste rock and tailings management. • Manage the tailings facility including: o Establish and maintain relationship and ongoing communication with the EoR. o Ensure inspections are completed. o Implement an Independent Review process. o Coordinate and contribute to the development of life of mine (LOM) and annual deposition plans. o Report to the Mine Management, and AEO on performance of waste and tailings management. o Understand Code requirements and industry standards related to tailings management.
Tailings QP	Pretivm	• Oversee overall technical aspects and safety of the tailings production and distribution. • Direct and oversee the tailings production process and data records for tailings discharge rates and solids contents. • Ensure tailings-related surveillance is undertaken in accordance with design intent and performance objectives. • Ensure implementation and maintenance of tailings deposition SOPs and ERPs.
Waste Rock QP	Pretivm	• Provide technical and safety oversight. • Manage WRTSF geotechnical engineering activities on site. • Direct and oversee waste rock technical staff, including development of detailed work plans. • Communicate with EOR. • Prepare annual BC MEMLI reports. • Annually update SOPs in co-operation with the Health and Safety QP. • Provide site technical oversight of waste rock deposition SOP. • Ensure waste rock related surveillance is undertaken in accordance with design intent and performance objectives. • Maintain active database of waste rock settlement, survey, and volume tracking information. • Complete ongoing stability analysis and develop daily dump plan. • Ensure implementation and maintenance of waste rock deposition SOPs and ERPs.

Position	Organization	Responsibilities
		• Train waste rock deposition area operators, supervisors, and stakeholders in hazard recognition, deposition procedures, and reporting requirements. • Ensure EOR is up to date on all actions pertaining to the waste rock deposition area.
Environmental QP	Pretivm	• Overall responsibility and oversight for WRTSF environmental surveillance. • Lead Pretivm authorization/permitting processes related to the WRTSF operations. • Coordinate and compile annual report for BC MEMLI and BC Ministry of Environment and Climate Change Strategy. • Ensure implementation and maintenance of environmental SOPs and ERPs.
Health and Safety QP	Pretivm	• Monitor waste rock and tailings deposition SOPs and ensure safety compliance through audits every two weeks. • Develop, implement, and update SOPs and ERPs annually. • Ensure Emergency Response Team is trained to respond to WRTSF. • Maintain and test ERPs, or components of site-wide ERPs directly related to the WRTSF. • Ensure implementation and maintenance of waste rock and tailings deposition SOPs and ERPs.
Surface Operations QP	Pretivm	• Implement waste rock and tailings deposition SOP-related use of personal protective equipment (PPE). • Ensure implementation and maintenance of relevant waste rock and tailings deposition SOPs and ERPs. • Ensure the plans issued by Waste Rock QP and Tailings QP are executed safely and in a timely fashion.
Surface Maintenance QP		• Implement waste rock and tailings deposition SOP-related use of personal protective equipment (PPE). • Implement tailings distribution infrastructure surveillance. • Ensure tailings line preventative maintenance and corrective actions are performed as per schedule • Assist in repairs of tailings infrastructure as required in a timely fashion. • Ensure implementation and maintenance of relevant waste rock and tailings deposition SOPs and ERPs.
Engineer of Record (April 2021 to present) Jeffery Kwok P.Eng	Golder Associates Ltd.	• Design of waste rock and tailings deposition area (excluding deposition system, i.e., pipeline and pumping systems). • Evaluate design changes (technical). • Audit waste rock and tailings deposition progress. • Undertake annual geotechnical inspection of WRD.

Note: A “Qualified Person” (QP) means a person who, in the opinion of the manager, is:

(a) qualified because of the person’s knowledge, training and experience to design, organize, supervise and perform the duties for which the person is appointed,

(b) familiar with the provisions of this Act, the code, and the regulations that apply to the duties for which the person is appointed, and

(c) capable of identifying any potential or actual danger to health or safety in the workplace.

2.3 Competency and Training

The WRSTF Responsible Person must ensure that this OMS manual is kept current and that all personnel associated with waste rock and tailings management are familiar with its contents. Individuals who are assigned responsibilities for specific elements of the waste rock and tailings management, as defined in this OMS manual, have a duty to inform their immediate supervisors of any training requirements needed to fulfil those responsibilities as listed. Specific prerequisite competency and training associated with the responsibilities in Table 2-1 are listed in Table 2-2.

Table 2-2: Prerequisite competency and training for individuals responsible for WRTSF

Position	Core Competency and Training
WRTSF Responsible Person	Suitable level of experience as designated by Pretivm; a minimum of five years' experience around WRDs and tailings management.
Tailings QP	Extensive experience in industrial process management specifically in milling, dewatering, and tailings production.
Waste Rock QP	Professional Engineer registered in BC. Geotechnical engineer with at least five years' experience in mining and mine waste management, including tailings.
Environmental QP	Extensive experience in environmental incident responses and reporting, and in environmental monitoring and implementation of regulatory requirements, including environmental aspects of mine authorizations and the mine's Environmental Management Plans (EMPs). Thorough knowledge of site-specific and general permitting and other regulatory requirements; water quality requirements and required level of monitoring in BC; implementation.
Health and Safety QP	Extensive experience in mine health and safety planning and supervision and some experience with the operations of WRDs and tailings management.
Surface Operations QP	Five years' experience in managing operations projects and supervising personnel.
Surface Maintenance QP	Five years' experience in pipe maintenance, repairs, and wear surveillance
Engineer of Record	Professional Engineer registered in BC. Geotechnical engineer with at least 10 years' prior experience in mine waste management, including tailings.

2.4 Document Control

Pretivm is responsible for ensuring that all documents and records pertaining to waste rock and tailings management are current (with a history of changes and backups) and are available to individuals involved in waste rock and tailings management, as required. A document library with copies of, or electronic links to WRTSF documents and records will be maintained on the Brucejack J drive at a location accessible to employees with responsibilities associated with the WRTSF. A Microsoft Teams site will also be maintained as a central location for key documents and shared working files accessible to employees with responsibilities associated with the WRTSF.

3 Facility Description

This section summarizes physical site conditions relevant to this OMS manual and that provide the basis for design and operation of the WRTSF. Much of the information presented here is covered extensively in detailed baseline and background reports related to Brucejack Mine development and subsequent updates provided in the 2015 through 2019 annual reports for *Mines Act* Permit M-243, Effluent Permit 107835 and Air Permit 107025 (Pretivm 2015, 2016, 2017a, 2018, 2019, 2020a)

3.1 Location and Access

The Brucejack Mine is located in the headwaters of Brucejack Creek and consists of an approved underground mine and related production and ancillary infrastructure. The mine is located in northwestern BC approximately 65 km north-northwest of Stewart and 21 km south-southeast of the Eskay Creek Mine. The mine is located at approximately 1,370 m above sea level (masl) at Universal Transverse Mercator (UTM) 426,967E; 6,258,719N in Zone 9 on the North American (NAD) 83 grid (Figure 1)

Ground transportation to the site is by a 73 km long access road (Brucejack Access Road) west from approximately km 215 of Highway 37 North. Aerial access to site is by helicopter (usually from Stewart) or via fixed wing aircraft to the Bowser Aerodrome developed for the mine and located at km 50 of the Brucejack Access Road.

3.2 Site Terrain and Climate

The Brucejack Mine is situated in the BC coastal mountains, near the transition zone between the moderate coastal and interior continental climates. Mine Site infrastructure elevations are mainly between approximately 1,365 masl and 1,440 masl, with surrounding mountain peaks rising to 2,200 masl. Due to the elevation, the area has a subarctic climate and is dominated by non-vegetated or sparsely vegetated alpine ecosystems. Orographic effects by the mountainous topography and surrounding glaciers contribute to a high degree of spatial variability in air temperature and precipitation. Site-specific climatic data are limited, dating back primarily to 2009 (Pretivm 2015).

Mean daily winter and summer low temperatures at the VOK meteorological station west of the Mine Site range between 10°C and 4.4°C. Mean daily winter and summer high temperatures range between 4.7°C and 10°C. The absolute maximum daily temperature recorded at the VOK station was 24.6°C on July 30, 2018, and the absolute daily minimum was −30.4°C on February 2, 2019. The total annual adjusted precipitation recorded at the VOK station ranges from 1,252 to 2,019 mm, with monthly totals ranging from 19 to 400 mm. Precipitation is generally greater during the winter and fall. Approximately 60% of the annual precipitation falls as snow, accumulating between early October and mid-May.

Winds at the VOK meteorological station are predominantly from the east to east-southeast. Wind speeds above 6 m/s occur approximately 17% of the time during the year.

3.3 Regional Geology

The mine is located in the western Stikine terrane (Stikinia), the largest and westernmost terrane in the Intermontane Belt of the Canadian Cordillera. Stikinia is interpreted as an intra-oceanic island arc terrane formed between mid-Paleozoic to Middle Jurassic time. It was then strongly deformed during the Cretaceous accretion of the outboard insular belt terranes. The property is located on the eastern limb of the McTagg Anticlinorium, and as a result the rocks on the property are tilted and folded, generally younging progressively towards the east. The McTagg Anticlinorium is cut by a series of mid-Cretaceous thrusts and by a set of late-stage brittle faults, of probable Tertiary age, which includes the northerly trending Brucejack Fault.

Volcano-sedimentary rocks and related Early Jurassic plutons in the northwest part of Stikinia represent an exceptionally metal-rich tectonic assemblage in BC. This area includes volcanogenic massive sulfide deposits, alkaline porphyry copper-gold deposits, and transitional epithermal intrusion-related precious metal deposits like the Brucejack deposit. High-grade gold mineralization in the Valley of the Kings, the current focus of the mine, occurs in a series of west-northwest-trending sub-vertical corridors of structurally reoriented vein stockworks and breccias.

The Brucejack Fault separates two geological domains on the property: fine-grained and well-bedded siltstone and mudstone of the Triassic Stuhini Group are dominant west of the Brucejack Fault, and volcanic conglomerates and siltstones, hornblendes, and pyroclastic rocks of the Lower Jurassic Lower Hazelton Group outcrop to the east of the fault (Pretivm 2015).

3.4 Hydrological Conditions

Seasonal precipitation and snowmelt patterns lead to fluctuations in the elevation of the WRTSF water level. A lake elevation monitoring station was installed in July 2011 and collected data during the open water season until October 2018. The station was upgraded in October 2018 to include a telemetric satellite link and a freeze proof pressure transducer to record water levels year-round.

Water level elevations for the period of record between 2011 and 2019 ranged from 1,364.17 to 1,364.99 masl, with a mean elevation of 1,364.42 masl. Water level data may be affected by pressure build-up from ice, which typically occurs between late December and late April.

Median flows for the 2011 to 2019 period of record at the Brucejack gauging station (BJ 3.10) indicate a steady rise with the onset of freshet in late April to mid-May, followed by a decline until mid- to late September, when levels often rise again due to augmentation by episodic precipitation. After the fall, flows recede to base flow conditions by the end of November. Monitoring data for the period to 2015 are provided in the 2015 Application for *Mines Act* and *Environmental Management Act* Permits (Pretivm 2015). Monitoring data for the period 2015 through 2019 are available in the Annual Reports for *Mines Act* Permit M-243, Effluent Permit 107835 and Air Permit 107025 (Pretivm 2016, 2017a, 2018, 2019, 2020a).

3.5 Hydrogeological Conditions

Groundwater flow at and near the Mine Site was generally driven by topography prior to the commencement of underground mine dewatering, with groundwater discharging to Brucejack Creek

and Brucejack Lake. Continuous dewatering of the underground mine since August of 2012 has depressed the groundwater table in the vicinity of the mine and adjacent area. Strong downward vertical hydraulic gradients have developed at most monitoring well nests, driven by the underground mine dewatering. Groundwater levels are near ground surface along the shores of the WRTSF, and seasonally artesian along upper Brucejack Creek. Monitoring wells flanking the underground mine at higher elevations in the Valley of the Kings watershed indicate drawdown on the order of 100 m, although drawdown within the footprint of the underground mine workings is expected to be higher. Seasonal groundwater fluctuations range from less than 5 m to up to 55 m.

3.6 Water Quality

Deposition of waste rock and tailings in the WRTSF has the potential to change water quality downstream in Brucejack Creek. Flow is monitored continuously at the WRTSF outflow station (BJ 3.10), and during open water conditions in Brucejack Creek downstream of the outflow at station BJ 1.74. Surface water quality is monitored weekly at BJ 3.10 year-round, and monthly in Brucejack Creek at station BJ 2.62, which is located between monitoring sites BJ 3.10 and BJ 1.74.

Effluent Permit 107835 (amended December 14, 2018) specifies discharge limits at the WRTSF outflow (BJ 3.10). These limits are listed in Table 3-1 (Section 3.11.3).

3.7 Natural Hazards

3.7.1 Avalanche

The terrain and climate within the mine site area (mine development area within Pretivm's mining leases, west of upper Knipple Glacier) produce significant avalanche risks. A full-time team of avalanche technicians provides continuous year-round management of the risk of snow avalanches.

Avalanches are not expected to affect the WRTSF. Although one avalanche path identified in a study commissioned by Pretivm has the potential to reach the WRTSF, assessments indicate that the maximum size of an avalanche reaching the WRTSF from this area (along the south-central shore of the facility) will be Size 3 (less than 1,000 metric tonnes). Avalanche control combined with the construction of avalanche catchments and the installation of infrastructure impedes any avalanches from reaching the WRTSF.

3.7.2 Seismicity

The Brucejack property lies in the Saint Elias Region seismic zone, which is one of the most seismically active areas in Canada. The geometry of the boundary between the Pacific and North American plates is changing from transform to subduction, which results in rapid uplift rates of up to 30 mm/year and large earthquakes (NRC 2013). The 2010 National Building Code Seismic Hazard Calculation determined that Brucejack Lake is in an area with a peak ground acceleration value of 0.109 g, which corresponds to a probability of exceedance of 2% in 50 years or 1 in 2,475 years (NRC 2013).

3.8 WRTSF Bathymetry

Bathymetric surveys of Brucejack Lake prior to mine development indicated a shallow sloping shelf at the southeastern end of the lake. The lake bottom then dropped off quite steeply moving from the lakeshore towards the north. After the drop-off, the lake bottom generally sloped gently to the northeast. In the footprint of the present WRTSF waste rock and tailings deposition area, the lake reached a maximum depth of approximately 85 m. The pre-mine total volume of the lake was approximately 28.5 million cubic metres (Mm^3) (SRK 2015a).

Bathymetric surveys of the WRTSF are conducted at least annually per environmental surveillance program (see section 6.3).

3.9 WRTSF Foundation Conditions

No drilling has been conducted through the natural lake bed sediments lining the WRTSF; however, based on eight disturbed samples taken from the pre-development lake bottom, the in-situ sediments are characteristic of an alluvial depositional environment and are dominated by sand, silt, and clay particles. These sediments generally become finer moving away from the shorelines. The sandy silt material was found to have medium plasticity, while the clay material was found to have medium to high plasticity. Strength testing revealed a friction angle of 27° for the primarily fine-grained samples and a friction angle of 33° for the silty sand and sandy silt samples (BGC 2014).

A seismic refraction geophysical survey was completed in 2013 by Frontier Geosciences Inc. The survey interpreted the bedrock elevation from high compressional wave velocities over 4,000 m/s, in comparison to velocities through what was interpreted as sediments of under 1,500 m/s. Sediments range in thickness from 5 to 35 m within the footprint of the waste rock and tailings deposition area, with the thickest sediments occurring at the south end of the facility next to the shoreline (Frontier 2013).

Figure 4 shows the locations of samples taken from the bottom of Brucejack Lake before mine operations and the location of seismic refraction survey lines.

3.10 Waste Characteristics

3.10.1 Waste Rock

Physical Properties

The physical properties of the waste rock at the Brucejack Mine site vary according to the source of the material and the type of blasting employed. Limited geotechnical laboratory testing has been completed on the waste rock; its physical properties are therefore mostly deduced from observations. Waste rock is predominantly sourced from the underground mine operations.

Waste rock sourced from the underground mine is generally softer and finer than waste rock that is sourced from surface infrastructure, having particle sizes between 0.15 and 1.0 m. This is due in part that development of underground mine workings requires more closely spaced drilling, which creates finer waste rock. It is also due to orientation of the orebody being located in rock that has been highly altered with quartz-sericite-pyrite alteration; as a result, the rock breaks apart more

easily when blasted (Pretivm 2015). The underground waste rock generally has a higher moisture content than the waste rock previously produced from surface infrastructure during construction, as the majority of the mine is located below the water table (Pretivm 2015).

Waste rock previously sourced from the surface infrastructure works during the construction phase (mainly late 2015 through 2017) is harder, has a larger maximum particle size, is generally coarser, having a maximum particle size often greater than 1.0 m, and is drier than waste rock sourced underground. This is due to the larger spacing of previous surface blasting patterns compared to the underground pattern; also, the water table is likely deeper in the (former) surface infrastructure rock excavation locations than where it is being extracted from some areas (Pretivm 2015). The in situ and placed densities for all rock on site are assumed to be the same, at 2.78 t/m^3 and 2.06 t/m^3, respectively. Limited surface works are contemplated in the near future that would generate major waste rock volumes.

Geochemical Properties

As summarized in the 2015 Application for *Mines Act* and *Environmental Management Act* Permits (Pretivm 2015) and confirmed by subsequent monitoring in accordance with the requirements of Permit M-243 and the ML/ARD Management Plan, most of the Mine Site rock contains relatively high concentrations of sulfide minerals and variable but generally low proportions of acid-neutralizing carbonate minerals. A significant portion of the Mine Site rock is therefore classified as PAG. Waste rock is also classified as potentially posing metal-leaching concern, with elevated leachate concentrations of arsenic, cadmium, copper, lead, selenium, and zinc observed in humidity cell testing (Pretivm 2015).

Of the 160 surface development samples tested, 49% were characterized as PAG with enrichments (greater than 10x average continental crust) in silver, gold, manganese, antimony, and selenium (Pretivm 2016, 2017a). All surface waste rock excavated to develop the Mine Site infrastructure was placed subaqueously in the WRTSF. Saturated column tests indicate that subaqueous storage of surface waste rock will minimize any potential leaching and changes to WRTSF and Brucejack Creek water quality.

The three main units that comprise 83% of the waste rock coming from the underground mine (the Volcanic Sedimentary Facies, Fragmental, and Conglomerate units) contain between 76% and 85% PAG material. The data also show that many of the PAG samples with elevated sulfide content contain significant amounts of carbonate minerals (mostly calcite) that will neutralize acidity generated and prolong the onset of acid generation (Pretivm 2016). Humidity cell tests and field bin studies initiated to evaluate metal leaching behaviour indicate that cadmium, cobalt, copper, iron, lead, and zinc are parameters of potential concern (Pretivm 2015).

Confirmatory sampling programs have been developed to assess the geochemical characteristics of waste rock excavated from the Mine Site surface and the underground mine. The details of the sampling programs are outlined in the ML/ARD Management Plan, and the results are presented in the Annual Reclamation Reports (Pretivm 2016, 2017a, 2018, 2019, 2020a).

Volumes

Brucejack Mine operation generates waste rock and tailings. Depending on operational needs, Pretivm has production flexibility to either direct waste rock to the WRTSF for subaqueous deposition or to retain it in the underground mine, below the ultimate flooding elevation of the mine, as backfill. This operational flexibility allows Pretivm to deposit between 36% and 100% of all waste rock into the WRTSF. Based on the 2018 authorization to 3,800 tpd ore mining rate, this equates to approximate volumes of total deposited waste rock in the WRTSF between 1.9 Mt (0.92 Mm^3 at 2.06 t/m^3) and 5.3 Mt (2.6 Mm^3 at 2.06 t/m^3). However, Pretivm is currently seeking approval on a revised Mine Plan submitted July 2020, with associated volumes of total deposited waste rock in the WRTSF of between 2.1 Mt (1.03 Mm^3 at 2.06 t/m^3) and 5.9 Mt (2.85 Mm^3 at 2.06 t/m^3). Once approved within the M-243, these will be the new limits to work within.

3.10.2 Tailings

The Brucejack Mine is currently in operation and producing tailings. Mill commissioning, with limited tailings production, was initiated on May 16, 2017. Commercial production began in July 2017. Physical and geochemical properties of the tailings are summarized below.

Physical Properties

The particle size of Brucejack tailings inherently fluctuates; however, it has been measured to have a maximum particle size of approximately 0.3 mm, with about 65% fine particles passing a 0.074 mm sieve. The tailings have up to 40% clay content as measured during typical operations. Tailings are poorly graded, with a relatively small coefficient of uniformity, have little to no clay content, and are non-plastic. They can therefore be classified as poorly graded sand with silt or silty sand, depending on the fines content (Pretivm 2015).

Geochemical Properties

Ore samples tested in both humidity cells and subaqueous column tests did not generate acid drainage and are therefore classified as NPAG (Pretivm 2015). This is supported by confirmatory sampling results for tailings which yield neutralization potential ratios above the PAG/NPAG threshold value of 2 (Pretivm 2018, 2019).

Similar to Brucejack waste rock, the ore is found to have elevated concentrations of sulfate, arsenic, cadmium, copper, selenium, and silver (Pretivm 2015). Humidity cell and subaqueous column testing resulted in elevated concentrations of arsenic, antimony, molybdenum, and selenium in leachate solutions, meaning that the tailings are susceptible to neutral metal leaching.

Confirmatory sampling programs developed to assess the geochemical characteristics of both tailings and sludge are outlined in the ML/ARD Management Plan (Lorax 2020).

Volumes

The milling process at this mine produces two streams of tailings:

- Paste thickened tailings that are co-disposed underground with waste rock and cement binder as backfill
- Slurry tailings that are pumped and transported via pipeline and deposited in the WRTSF

Pretivm has production flexibility to direct tailings streams depending on operational needs. This operational flexibility allows Pretivm to deposit between 32% to 50% of tailings into the WRTSF over time. Based on the 2018 authorization to 3,800 tpd ore mining rate, this equates to between 5.5 Mt (3.46 Mm^3 at 1.59 t/m^3) and 8.7 Mt (5.47 Mm^3 at 1.59 t/m^3). However, Pretivm is currently seeking approval on a revised Mine Plan submitted July 2020, with associated volumes of total deposited tailings in the WRTSF of between 3.7 Mt (2.74 Mm^3 at 1.35 t/m^3) and 5.8 Mt (4.27 Mm^3 at 1.35 t/m^3). Once approved, these will be the new limits to work within.

3.11 Site Reference Data

3.11.1 Topographical Mapping and Grid System

The Brucejack Mine is situated approximately at Universal Transverse Mercator (UTM) 426,967E; 6,258,719N in Zone 9 on the North American (NAD) 83 grid. The site uses the NAD83 UTM coordinate system. LiDAR surveys, at precision greater than 1 m, were conducted in 2013, 2014, and 2019.

3.11.2 Datum and Benchmarks

Locations of permanent survey benchmarks and back sights are illustrated in Figure 3. The crest of the waste rock deposition area is regularly surveyed using portable survey monuments placed along the WRD crest as the crest advances; this allows tracking and observing settlement, aiding in planning and reporting.

The elevation of the WRTSF surface changes over the course of the year and is not used as a survey benchmark or reference. As described in Section 3.4, instead there is a water elevation gauge that records the change in surface elevation.

3.11.3 Monitoring and Regulatory Compliance Points

As described in Sections 3.4 and 3.6, flow rates and quality of surface water are monitored at the WRTSF outflow at station BJ 3.10, and downstream monitoring stations BJ 2.62 and BJ 1.74. Flow and water quality are also monitored at the influent and effluent locations of the mine WTP in accordance with PE-107835.

Monitoring site BJ 3.10 is the legal water quality compliance location for water discharge from the WRTSF (location at which legal discharge limits apply). Table 3-1 lists the PE-107835 discharge limits for this station. Condition 4.8 of PE-107835 also stipulates additional possible requirements if there are any exceedances of the BC Water Quality Guidelines for Freshwater Aquatic Life.

Table 3-1: Discharge Limits for Effluent Permit 107835 at Site BJ 3.10

Parameter	Maximum	Units
48 hr *Daphnia magna* single concentration toxicity test	50% survival in 100% concentration, minimum (see also PE-107835 Condition 4.3)	-
Algal Growth Inhibition Test (EPS 1/RM/25)	Less than 25% for 100% Lake Outlet Water (see also condition 4.3)	-
Total Suspended Solids	30 (maximum); 15 (monthly average)	mg/L
pH	6.5-8.5	-
Nitrite	240	µg/L as N
Nitrate	11.5	mg/L as N
Ammonia	4.0	mg/L as N
Total Antimony	28	µg/L
Total Arsenic	10	µg/L
Total Iron	1.7	mg/L
Total Silver	0.46	µg/L

3.12 Facility Components

3.12.1 Waste Rock Dump Working Surface

The deposition floor elevation is to be maintained a minimum of 0.3 to 1.0 m above the WRTSF surface water elevation, whereas the deposition crest elevation is to be maintained 1.5 to 2.0 m above the WRTSF surface water elevation. Due to natural seasonal fluctuations in water level, a constant water elevation of 1,364.5 masl was used in the design. Any variances must be reviewed on a case-by-case basis and approved by the EOR.

All waste rock placed at the surface must be submerged in the WRTSF to a minimum depth of 1 m within two years of placement, as required by *Mines Act* Permit M-243 Condition D.3(c). Therefore, the working surface of the waste rock deposition area initially consists of PAG waste rock. As initiated by Pretivm operations, this surface is excavated in sections to a depth of greater than 1 m below the water surface and ultimately replaced with either freshly excavated PAG waste rock, NPAG rock from the km 72 NPAG Quarry, or left ponded. Additional information is provided in Section 4.2.5.

All vehicles on the waste rock dump working surface are restricted to a maximum speed of 20 km/h for waste rock dump safety, including due to steep grades, limited visibility, and single-lane width areas in certain locations.

3.12.2 Tailings Discharge Pipelines

Thickened tailings are conveyed from the mill (process plant) to the WRTSF by pumping the slurry through either of two 8-inch (200 mm) internal diameter pipelines. Tailings disposal pumps draw the thickened tailings from a disposal surge tank to the disposal pipelines. Pipelines are partially buried, insulated, and heat traced from the process plant to the shoreline of the WRTSF.

The initial tailings discharge design consisted of two tailings pipelines: one (#1) positioned a short distance above the lake bed, and a second (#2) suspended from a cable extending between anchor points located on the south and north shores of the WRTSF. In October 2017, the section of the #1 tailings discharge pipeline within the ponded portion of the WRTSF was replaced with a second line suspended on a second cable support system to improve function, this line is no longer used and has been replaced by a line extending outward from the shoreline on the lakebed. The elevations of the suspended pipelines are adjustable such that their outfalls (discharge elevations) are less than the maximum of 7.5 m above the tailings bed as required by PE-107835. The original configuration was designed by AMEC-Foster Wheeler and illustrated in the selected design drawings referenced in Appendix E.

The vertical distance from the outfall elevations to the top of the deposited tailings is determined from the annual bathymetric surveys.

3.12.3 Reclaim Weir

The reclaim weir is a measuring system and a pump station for reclaiming water from the WRSTF back to the mill.

3.12.4 Turbidity curtains

There are four sediment curtains located in the WRTSF. The first curtain spans from the southwest corner of the WRD to the southeast corner of the waste dump and extends 30 m deep into the WRTSF, effectively confining the WRD. Three smaller curtains are located in parallel across the lake outlet, upstream of the low level weir (LLW). Condition 3.1 of PE-107835 specifies that waste rock and tailings disposal must not take place unless these three curtains, at a minimum, are in place. These curtains are assessed for damage annually and repaired/adjusted as required based on the annual assessment.

3.12.5 Water Rescue Equipment

Water rescue equipment and infrastructure are positioned for easy access within the working area to be used in the event of an emergency. Life rings are located immediately adjacent to the active working area on the crest of the deposition area. Life jackets and survival suits are located in an intermodal shipping container at the entrance to the active deposition area. Equipment operators and supervisors are also provided safety and equipment training for working near and around water.

3.13 Regulatory Requirements and Best Practice Guidelines

3.13.1 Regulatory

Planning and design of the WRTSF and this OMS manual and its associated supporting documents incorporate regulatory requirements of the Brucejack Mine's major authorizations, as well as Canadian federal and BC provincial regulatory requirements and guidelines relevant to this facility and its operations. These all prioritize worker safety and environmental protection, and include the following:

- Environmental Assessment Certificate #M15-01 and the BC *Environmental Assessment Act* (2018)
- Decision Statement Issued under Section 54 of the *Canadian Environmental Assessment Act, 2012*
- *Mines Act* Permit M-243 and related requirements under the:
  - BC *Mines Act* (1996)
  - Health, Safety and Reclamation Code for Mines in British Columbia (MEMLI 2021)
  - Ministry of Energy and Mines (2016). Health, Safety and Reclamation Code for Mines in British Columbia – Guidance Document. Version 1.0. Updated July 2016 (MEM 2016).
  - Part 10 of the Health, Safety and Reclamation Code for Mines in British Columbia, (MEMLI 2021)
- Effluent Permit 107835 and related requirements under the BC *Environmental Management Act* (2004)
- Metal and Diamond Mining Effluent Regulations SOR/2002-222 (last amended June 25, 2019), which are enabled under the Canadian federal *Fisheries Act* (R.S.C., 1985) (last amended August 28, 2019)

3.13.2 Best Practice Guidelines

- *Mined Rock and Overburden Piles, Investigation and Design Manual, Interim Guidelines* (British Columbia Mine Waste Rock Pile Research Committee 1991)
  - Note this guideline does not apply to subaqueous deposition; however, Pretivm adopted the guideline design values to provide a basis for defining acceptable safety factors to facilitate development of safe work procedures
- *Guidelines for Mine Waste Dump and Stockpile Design* (Hawley and Cunning 2017)
- *Global Industry Standard on Tailings Management* (Global Tailings Review 2020)
- *Developing an Operation, Maintenance and Surveillance Manual for Tailings and Water Management Facilities* (MAC 2021a)
- A guide to the Management of Tailings Facility Version 3.2 (MAC2021b)
- *Tailings Management: Good Practice Guide* (ICMM 2021a)
- C*onformance Protocols: Global Industry Standard on Tailings Management* (ICMM 2021b)

3.14 Design Principles

3.14.1 Waste Rock Deposition

The current design report that governs waste rock deposition was prepared by SRK Consulting (Canada) Inc. (SRK 2018). The main considerations in the development of the waste rock deposition plan are as follows:

- *Mines Act* Permit M-243 requires that a 1 m water cover be maintained over the deposited waste rock.
- The maximum time that waste rock may be left exposed above water is two years from the date of placement on the WRD. Three approved methods are employed to manage exposed waste rock exposed for longer than two years. These options are summarized in detail in Section 4.2.5.
- Three methods are used to deposit waste rock subaqueously into the WRTSF:
  - Remote operated dozer push: a remote operated dozer (no operator on-board equipment) is used to directly push run-of-mine waste muck and/or the coarse size fraction from active screening.
  - Telestacker conveyance: a telescoping radial conveyor stacker (Telestacker) is used to deposit waste rock into the WRTSF. An active screening system separates materials that can pass through a mechanical an 8-inch (200 mm) screen. The coarse rock is defined as screened material that is greater than 8-inch (200 mm) and fine material is defined as everything measuring less than 8-inch (200 mm). The smaller size fraction is deposited with a Telestacker.
  - Excavator bailing: a hydraulic excavator is utilized to place the coarse size fraction from active screening and/or run-of-mine waste muck. This method is referred to later in this document and related SOPs as “bailing.”
- The deposition of waste rock leads to rapid undrained loading of the foundation sediments at the bottom of the WRTSF. Because characteristics of foundation sediment vary across the waste rock deposition area (Figure 4), the magnitude of settlement are not consistent fixed values, but require continuous experiential judgment as applied by the senior site geotechnical engineers with support from the EOR as necessary.
- The senior site geotechnical engineers preparing the dump management plans ensure that observational settlement data meets the QPO before additional waste rock is deposited.
- Deposition planning is completed daily; lake bed profile near the waste rock slope, real-time survey monitoring and observational data are required to determine if dump settlement meets QPOs, and periodic bathymetric survey for the subaqueous waste rock slope profile will help the deposition planning.
- Sediment curtains are used to help manage and mitigate concentrations of total suspended solids discharged from the WRTSF.

- As deposition occurs, surficial failures of the waste rock slope and outer foundations occur. The deposition plan is designed to allow these to occur safely. The monitoring plan is designed to monitor and project for the development of any larger failures that could affect the safety of those working on or around the dump.
- Once the working surface of the deposition area is developed and provided that the geochemistry requirements are met, certain areas of the deposition area may be used for storage and/or stockpiling, should monitoring data confirm that settlement has slowed and the area is stable.

3.14.2 Tailings Deposition

The current process control designs were prepared by AMEC Foster Wheeler (2016). The design principles for tailings deposition at Brucejack Mine are summarized as follows:

- Thickened tailings are deposited into the WRTSF. The thickened slurry has a solids content (by weight) of 55% to 65%. Control of the tailings slurry water content is maintained by the dewatering equipment in the process plant.
- Thickened tailings are conveyed from the mill and processing infrastructure by pumping the slurry through one or both of two 8-inch (200 mm) internal diameter pipelines to the WRTSF. Tailings disposal pumps draw the thickened tailings from the tailings disposal surge tank.
- During periods when tailings are not conveyed to the WRTSF, the tailings lines are flushed with water to clear the pipelines of solids and to prevent sanding.
- During periods when the ambient air temperature is below freezing, a continuous flow of process water is required in both pipelines to prevent potential freezing. Water can be introduced into the tailings pipelines through a single injection point inside the mill building.
- Both pipelines are buried and insulated from the process plant to the shore of the WRTSF. In addition, approximately 100 m of pipeline, between the mill and the water's edge, is heat traced in addition to being insulated.
- There are two tailings pipelines, each suspended from a cable support system. The elevation of the outfalls above the underlying tailings mass is determined a minimum of annually via bathymetric survey, with the outfalls then raised during the open water season as necessary to maintain proper function while meeting the 7.5 m elevation restriction under Condition 1.3.2 of PE-107835.
- The pipelines and associated outfalls can be raised within the WRTSF by increasing the tension on the cable systems. The suspended pipelines are raised by pulling and shortening the cables. The backup anchor cable is pulled using a piece of heavy equipment such as a tracked bulldozer or an excavator. The main cable will be pulled, shortened, and reconnected to the anchor. Shortening the cable by 6 m will raise the outlet of the tailings discharge by 11 m. After the main cable is shortened, the backup anchor cable can then be shortened.
- The pipeline suspension cable system is designed for the cable to be raised to its ultimate elevation while fully operational.

4 Operation

4.1 Deposition Planning

4.1.1 Life of Mine

All waste rock and tailings produced at the Brucejack Mine that are not used as backfill are to be placed subaqueously in the WRTSF. Deposition of waste rock is to occur from the WRD located on the southwestern shore of the WRTSF. Over the life of mine (LOM), the WRD will advance outwards from the shore across multiple deposition zones as described in Section 4.2. At Closure, the WRD will occupy a portion of the natural basin that forms the WRTSF, with all PAG material remaining submerged below the water surface of the WRTSF. Thickened tailings produced in the mill are to be distributed to the lake via pipeline and deposited at depth, near the centre of the WRTSF as described in Section 4.3. The outfall of the distribution lines will be progressively raised over time, such that a submerged mound of tailings will gradually fill the natural basin that forms the WRTSF from the bottom up. At Closure, tailings will occupy a substantive portion of the deeper portion of the WRTSF; the top of tailings mound will remain submerged below the water surface of the WRTSF by several tens of metres.

The current authorized limits for total waste and tailings deposition is to a maximum 5.3 Mt (2.6 Mm^3 at 2.06 t/m^3) of waste rock and 8.7 Mt (5.47 Mm^3 at 1.59 t/m^3) of tailings, and total combined maximum waste deposition of 10.8 Mt (i.e., waste rock and tailings)as described in *3800 tpd Amendment Application for Permits M-243 and PE-107835* (Pretivm 2017b). The revised limit for total waste deposition (i.e., waste rock and tailings) to the WRTSF based on the 2020 mine plan (submitted July 2020; Pretivm 2020b) will be 9.6 Mt.

Deposition is also indirectly limited by water quality at the outlet of the WRTSF that is to remain within effluent discharge limits for several water quality parameters. Compliance with discharge limits is achieved through source control of inputs to the WRTSF. Waste rock and tailings constitute the predominant source of constituent loadings for several parameters for which there is a discharge limit. As such, the deposition rate and total deposition of waste rock and tailings consider actual and future predicted water quality of the WRTSF. Limitations on deposition may be necessary beyond the specific volume limits to maintain effluent quality compliance at the point of discharge.

The schedule of planned waste rock and tailings deposition in the WRTSF is shown in Figure 4-1 for current LOM plan (Pretivm 2020b). Figure 4-2 illustrates the associated progressive development of the WRD and subaqueous tailings mound. It must be noted that additional authorization is required to increase total allowable LOM deposition to accord with 2020 Mine Plan (Pretivm 2020b).

At a minimum, the LOM deposition plan is to be reviewed by the WRTSF RP and EoR each time the mine plan is updated to ensure accordance with total allowable deposition volumes, or to identify the need for changes to the deposition plan or authorized limits. Additional predictive water quality assessments may be required to understand potential implications to water quality compliance requirements as a result of an increase in total LOM deposition.

4.1.2 Annual

An annual deposition plan is to be prepared as part of the annual mine planning and budget process. The annual plan will provide a monthly schedule of waste rock and tailings deposition in the WRTSF based on:

- Mine development and production schedules
- Known deposition limitations related to:
  - Geotechnical risks
  - Equipment efficiencies
  - Seasonal environmental considerations (e.g., water column turnover, ice on/off periods)
- Other objectives (e.g., depletion of surface stockpiles)

There must be a clear understanding of accordance between the annual and LOM deposition plans. Planning over shorter time periods (e.g., monthly, weekly, daily) is described as relevant in Sections 4.2 and 4.3.

4.2 Waste Rock Management

4.2.1 Waste Rock Volumes and Schedules

Pretivm has operational flexibility to backfill waste rock in the underground mine or dispose of it in the WRTSF. With this flexibility, the volumes and schedules of waste rock transported and disposed of in the WRTSF will fluctuate. Based on waste rock haulage data tracked by Pretivm's geotechnical engineers, an average of 1,150 m^3 per day is transported to the WRTSF. However, due to operational flexibility, the actual rate of waste rock transported to the WRTSF is observed to deviate from the average, producing a range of volumes between 0 m^3 per day and 2,000 m^3 per day.

4.2.2 Waste Rock Dump Planning

The waste rock deposition system consists of placing waste rock into the WRTSF. Nine approved deposition zones define the active areas of WRD where waste rock can be placed into the WRTSF (Figure 5). Planning and engineering efforts determine which of the zones will accept waste rock for deposition. The activity of the zones is decided by Pretivm's geotechnical engineers based on settlement and stability of the WRD.

WRD planning is a daily activity to be carried out by site staff as dictated in Table 2-1 of this OMS manual. The specific elements of this planning are summarized as follows:

- The OMS manual and accompanying SOPs provide the principles for deposition planning.
- Pretivm's geotechnical engineers collect and review settlement data all year and collect bathymetry survey data during ice free conditions to support daily deposition planning.
- Pretivm's geotechnical engineers prepare daily deposition plans that are communicated to supervisors. Daily plans include the zone(s) where active deposition is to occur and the duration of deposition.
- The daily deposition plan is discussed with supervisors and operations staff at the start of each shift. Any deviation from the plan must be approved by Pretivm's geotechnical engineers.
- The deposition plan is flexible to accommodate changing weather conditions. For example: When poor visibility affects the operator's ability to see potential hazards, the operator is to cease the work and notify the supervisor immediately and the deposition plan can be discussed and revised.

For waste rock deposition with the remotely controlled dozer, frequent localized bathymetric surveys along the face of the WRD are required to monitor the underwater waste rock slope profile.

4.2.3 Waste Rock Deposition Procedure – Remote Controlled Dozer

Waste rock deposition procedures are outlined in detail in Appendix B2 and B3. A summary of Pretivm's SOP is as follows:

Step 1: Waste rock transported by trucks from the underground portals arrives on the WRD area.

Step 2: Pre-shift preparations include daily planning, checking monitoring data, remote control station setup, and snow clearing and ice breaking in the winter.

Step 3: A remote controlled dozer advances the waste rock into the WRTSF while maintaining the berm profile.

Key to the waste rock deposition with remote controlled dozer method, the following processes are focused on the overall safety of the workers and the stability of the WRD:

- A berm that has a minimum height of 1 m must be maintained along the waste dump crest at all time.
- A 10 m restriction zone from the waste dump crest must be delineated and be adhered to.
  - Outside of the active dozing zone for the day, markers must be in place at all times to delineate the “no-entry” zone, which is to be a minimum of 10 m from the crest.
  - No conventionally operated equipment may enter the 10 m restriction zone.
  - Only personnel with approval from the remote dozer operator and the engineer are permitted within the 10 m restriction zone in an active dozing area. Only personnel with approval from the engineer are permitted within the 10 m restriction zone in inactive dozing areas. Those permitted must wear PPE that includes a floatation device and a harness with lifeline, and must be accompanied by a spotter located outside of the 10 m restriction zone.
  - Haul trucks must end dump waste rock outside of the 10 m restriction zone in an approved location detailed in the daily deposition plan.
  - At no time is a dozer to operate with its tracks parallel to the dump face inside the 10 m zone.
  - At no time is any equipment to be parked, or materials stored, within the 10 m zone.
- The waste rock surface must be maintained at a minimum elevation of 0.3 to 0.5 m above the water surface as the crest advances away from the shoreline.
- During winter subaqueous deposition, waste rock must not be placed directly onto ice. A piece of long-reach equipment (long-reach excavator or crane) is to be parked outside of the 10 m restriction zone to break ice in front of the waste dump crest where remote dozer is planned to deposit waste rock into lake. Any snow accumulation greater than 0.5 m in depth must be removed from the top surface of the WRD 30 m east and west of the deposition area prior to the placement of additional rock.
- As the waste dump crest advances, the muck berm along the crest must be maintained with its dimension.
- The waste rock dump front crest scan will be conducted as per Pretivm’s geotechnical engineers’ requirement to help determine the active remote dozing zone.
- As the crest advances, a Tiltmeter beam and slide movement monitor is installed to provide continuous settlement monitoring.

- Pretivm's geotechnical engineers determine the commencement of further crest advancement. Zones that have been identified as High Risk by Pretivm engineers or the EOR must follow additional measures outlined in Table 6-3 (Section 6.4).
- Localized bathymetric survey may be requested by Pretivm's geotechnical engineer to monitor the underwater waste rock slope profile.
- Where stockpiles of waste rock and snow must be constructed, a minimum of 40 m between stockpile and the crest of the dump must be maintained. Placement locations and material types must be discussed with the EOR.

4.2.4 Waste Rock Deposition Procedure – Stacker / Bailing System

Waste rock dumping procedures are outlined in detail in Appendix B1. A summary of the Pretivm's SOP is as follows:

Step 1: Waste rock transported by trucks from the underground portals arrives on the WRD area.

Step 2: A mechanical vibrating screen with conveyor separates the waste rock into two size fractions: greater than 8 inches (200 mm) and less than 8 inches (200 mm) passing through the screen.

Step 3: A hydraulic excavator places all the coarse rock larger than 8 inches (200 mm) and the conveyor transfers waste rock that is smaller than 8 inches (200 mm) to a telescoping stacker conveyor.

Step 4: A telescoping conveyor stacker (TeleStacker) advances the waste rock that is less than 8 inches (200 mm) in size into the WRTSF.

Key to both waste rock deposition methods, the following processes are focused on the overall safety of the workers and the stability of the WRD:

- A berm that has a minimum height of 1 m and a crest width of 3 m must be maintained along the perimeter of the waste rock deposition area at all times.
- A 10 m setback from the WRD crest must be adhered to for equipment and personnel working on the WRD. This distance is informed by stability assessments of the WRD.
    - Markers must be in place at all times to delineate the "no-dumping" zone, which is to be a minimum of 10 m from the active crest.
    - At no time is a bulldozer or excavator to operate with its tracks parallel to the dump face or wheels of the stacker be placed inside the 10 m zone.
    - At no time is a piece of equipment to be working individually within the 10 m zone; an additional operator or person to act as a spotter is needed while the work is performed.
    - At no time is any equipment to be parked, or materials stored, within the 10 m zone.

- Trucks must end dump waste rock along the designated 10 m crest offset zone. The dump operators may direct the location of individual loads along the 10 m crest offset zone and stockpile locations near the screening equipment. A bulldozer or excavator then advances the loads to the edge of the WRTSF.

– The waste rock surface must be maintained at a minimum elevation of 0.3 to 0.5 m above the water surface as the crest advances away from the shoreline.

– Pretivm's conveyor and screen shutdown-and-lock-out policy must be followed when shutting down the equipment for maintenance and repair. The loading operator must accompany the maintenance personnel during maintenance and remain a safe distance from their work.

– During operation and before starting up the conveyor, all guards, fences, and safety shielding must be attached and operational.

– During winter subaqueous deposition, waste rock must not be placed directly onto ice. An excavator must be used to break and remove ice, if necessary, along the deposition area. Any snow accumulation greater than 0.5 m in depth must be removed from the top surface of the waste rock 30 m east and west of the deposition area prior to the placement of additional rock.

– As the crest advances, a berm must be constructed along the crest. Settlement monuments must be placed atop these berms immediately after they are constructed. Baseline surveys of the settlement monuments are required immediately after the berms are completed.

– Pretivm's geotechnical engineers determine the frequency of additional surveys and make the final decisions regarding the re-entry of recently deposited zones and commencement of further crest advancement. Zones that have been identified as High Risk by Pretivm engineers in collaboration with the TSF QP and EOR must follow additional measures outlined in Table 63 (Section 6.4).

– Where stockpiles of waste rock and snow must be constructed, the setback distance from the stockpile to the crest of the dump must be a minimum of 40 m. Placement locations and material types must be discussed with the EOR.

4.2.5 Waste Rock Management Plan

Mines Act Permit M-243 Conditions D.3(c) (iv) and (v) require that all waste rock deposited in the WRTSF be covered with a minimum of 1 m water cover and limit temporary storage of waste rock on surface to a maximum of two years. Waste rock temporarily stored above the permanent flooding elevation and nearing the end of the allowable exposure period is managed following three possible methods:

– Replace waste rock that is approaching the exposure time of two years, to a minimum depth of 1 m below water surface, with NPAG quarried rock from the km 72 NPAG Quarry. The excavated material is then deposited subaqueously following the procedures described above. This method is suitable for dump surface where it is far from the dump crest where settlement is minimal.

- Replace PAG waste rock that is approaching an exposure time of two years, to a minimum depth of 1 m below water surface, with freshly excavated waste rock from mine development areas. This method is suitable for the dump surface which is not far from the dump crest where active settlement occurs that frequent waste rock placement is required to maintain the elevation of the dump surface above water elevation.
- Sub-excavate PAG waste rock that is approaching an exposure time of two years to a minimum depth of 1 m below water surface and retain a temporary pond in the excavated area. Note: this method is temporary and seasonal and will not be used during the winter when temperatures are below freezing.

Appendix B4 contains the Pretivm SOP for WRD PAG material replacement, which addresses these three methods. The WRD is managed using a combination of these methods to address operational needs while addressing permit requirements. All three methods entail excavation and removal of "old" PAG material to the same elevation; therefore, the same SOP can address all three options.

Sub-excavation Procedure

- Pretivm's geotechnical engineer must issue a daily plan for sub-excavation tasks at the start of shift and discuss the plan with crews at the morning toolbox meeting.
- The sub-excavation procedures must include the following items:
  - Locations and sequencing of sub-excavation and replacement activities
  - Locations where temporary ponded excavations will occur and expected duration
  - Locations where institutional controls and safety measures are to be constructed
- Daily plans must be provided to surveyors for surveying and demarcating sub-excavation area with survey stakes.
- Designated waste rock is removed by heavy equipment and deposited into the ponded portion of the WRTSF in adherance to the normal WRD SOP.
- The entire sub-excavation must be excavated to a minimum depth of 1 m below the water level (at or below 1,363.5 masl).
- The geotechnical engineer measures and marks out the prescribed depth on the excavator bucket or staff gauge and asks the operator to test the depth of the sub-cut in a number of locations and photo-document where the excavation has been properly cut to 1 m below the water table.
- The perimeter of the open excavation must be guarded with a minimum 1 m high safety berm. The safety setback distance is 3 m imposed by the safety berm and applies to all sub-excavation areas.
- Once the sub-excavation is complete, the operator must inform the supervisor, who must inform Pretivm's geotechnical engineer that the excavation is complete. Pretivm's geotechnical engineer documents the progress of replacement excavations.

Working Surface Backfill Procedures

- Pretivm's geotechnical engineer determines the material types (PAG or NPAG) that may be backfilled into the sub-excavations and where these materials will be deposited.
- To complete backfilling, the haul truck operators must dump (PAG or NPAG) material from a specified origin, and the bulldozer operator pushes the material to backfill the excavated area.
- Haul trucks must dump waste rock a minimum 5 m from perimeter safety berm (i.e., a minimum of 8 m from the crest of the excavation).
- The completion date and location for each backfilled sub-excavation is recorded in digital drawing records.

Temporary Ponded Area

- Temporary ponded areas that result from leaving an open sub-excavation are intended to only be used during snow- and ice-free months. Pretivm's geotechnical engineer must identify where ponded areas are located on the operational maps and how long they are intended to be exposed.

Safe Work Procedure

- Safe Work Procedures for the waste rock replacement and deposition plan share the common safe practices as defined for work on the WRD. In addition to the common safe practices, the following procedures are defined:
  - There is a 3 m exclusion "Do Not Pass" set back area around the perimeter of an open excavation.
  - There is a 1 m high safety berm around the perimeter of an open excavation, set back 3 m from the excavation edge.
  - No worker is to enter an excavation.
  - Any changes to the excavation and deposition plan are to be communicated immediately to all staff working on the dumpsite.

4.2.6 Waste Rock Dump Emergency Evacuation and Re-entry Plan under Seismic Loading

Seismic loading of the WRD foundation results in undrained foundation conditions, which result in an unstable WRD. Therefore, Pretivm will evacuate the WRD during any triggered earthquake events, and only re-enter the area after it has been deemed safe by the EOR and authorized by the WRTSF RP and Health & Safety. Included below is a summary of the WRD Emergency Evacuation Plan for evacuating the WRD when a significant seismic event occurs. This plan is detailed in Appendix F.

- **Trigger** – Based on the Modified Mercalli Scale of 1931, a seismic trigger event is a ranked on a Mercalli Scale of II (equivalent peak ground acceleration of 0.0017 *g* to 0.005 *g*). Ground motion of this scale is typically felt indoors by a few people at rest, especially on upper floors of multi-story buildings. Birds and animals are disturbed, and trees, structures, liquids, and bodies of water may sway. Delicately suspended hanging objects may swing.

- **Announcement** – Pretivm dispatch operators must immediately announce a “STOP WORK ON THE WASTE DUMP” on the radio to all personnel on the WRD on the dispatch “All Call” Channel
- **Evacuation** – All Pretivm personnel and contractors must immediately:
  - De-energize equipment (put bulldozer blades and excavator buckets down and shut down all motors).
  - Leave their equipment, taking with them their radio, their floatation devices, and specialized PPE (weather-appropriate clothing).
  - Retreat from their equipment in a direction perpendicular from the dump crest and water’s edge, preferably walking directly towards the WRD access road.

  The Site Operations Supervisor must immediately barricade all access roads to the WRD and put up signage to prevent all access.
- **Muster** – All people on the WRD at the time of the evacuation order must muster at the warehouse building.
- **Engineering Assessments and Stability Review** – Following an earthquake:
  - The EOR must be contacted immediately after an evacuation order has been placed on the WRD due to a seismic event.
  - Pretivm geotechnical engineers must complete visual inspections of the WRD and a detailed survey of the settlement monuments and settlement data.
  - Subsequent surveys on monuments must inform that the WRD meets stability QPOs outlined in the OMS manual before personnel are approved to enter the WRD. Agreement for a re-entry permission must be reached between the EOR, Mine Site geotechnical engineers, and the mine manager, who will authorize re-entry to the WRD.
- **Re-entry to Waste Rock Dump** – Mine Manager’s authority.

4.3 Tailings Deposition Management

4.3.1 Tailings Volumes and Schedules

Tailings deposition is not a fixed flow system where a unit rate flow of tailings will enter the WRTSF on an hourly basis. A portion of tailings generated in the refinement process is also placed back into the underground mine as paste backfill. When there is an excess of tailings being generated, that excess volume is conveyed to the WRTSF for subaqueous deposition. Sludge generated from the WTP, amounting to up to 2% of the tailings, is mixed with the mine tailings to be deposited in the WRTSF. During the co-disposal of WTP sludge, the sludge is mixed with tailings in the thickening tank prior to entering the tailings pipeline.

4.3.2 Tailings Deposition Operations

The following summarizes tailings deposition monitoring and maintenance:

- The mill team is responsible for tailings pipeline operations, including tracking the deposition elevations of the tailings and the discharge pipes and supervising adjustment of the tailings support cables. The support cable adjustments are implemented by the surface operations team.
- Pretivm's engineering team is responsible for maintaining the pipeline support cables monitors and prescribing adjustments to the support cables and maintenance needs on the pipeline system.
- The tailings pipelines are inspected daily by or under the supervision of mill maintenance supervisors, with observations recorded in the maintenance forms.
- Routine maintenance shutdowns are planned based on equipment needs.
- Adjustments to the elevation of each tailings pipeline discharge are made based on digital measurements of the relative difference in elevation between the tailings surface and the discharge pipe. Bathymetric surveys are completed to determine when the elevation of suspended tailings discharge pipeline requires adjustment. The elevation difference between the pipe and tailings is required to be maintained at no more than 7.5 m.
- Each tailings pipeline must be inspected for obvious signs of damage, especially around pipe welds and flanges. Any areas of the ground that show any discoloration or signs of previous leakage could indicate pipe leakage.
- A breather shack houses the pipelines' air vent valves before the pipelines enter the WRTSF. This shack must be inspected for signs of excessive venting that may cause minor tailings leakage, and the air vent valves must also be checked and maintained to prevent plugging. The tailings pipelines are insulated and heat-traced and must be inspected for damage and proper operation. Pretivm Electrical is to be contacted if the indicator lights are not active on the heat trace.
- A tailings pipeline suspension cable suspends each tailings line above the bottom of the WRTSF. These cables are under high tension and must not be approached. If there is debris, snow, or ice hanging on the suspension cable, contact site services to handle, as the removal of ice/snow may cause the cable to snap back.
- During winter, the tailings lines are likely to be covered in snow. Look for areas of depressions in the snow that may indicate enhanced melting around the pipes. The tailings are generally warm (~10°C) and if there is a leak, the snow in the area will melt and become discoloured (grey).

4.3.3 Tailings Deposition Procedures

Tailings deposition procedures are summarized as follows:

Pre-operation Inspection

- Within the mill: discharge piping of tailing discharge pumps 3126-PU-005/006 to the interior wall of the mill building, located near the southern bay door near the gold room.
- Exterior of mill: exposed discharge piping just east of the heavy-duty mechanic shop, downhill to the intersection of the west zone access road and lakeshore drive.
- As the inspection continues beyond the warehouse, notify dispatch on Repeater 1 channel as follows: “Hello Dispatch, this is ‘Operator’ and ‘Supervisor’ travelling onto lakeshore drive to inspect the tailings pipe. We should only require 15 minutes and will check-in when complete.” Then wait for dispatch to acknowledge your radio communication and continue driving along lakeshore drive about 100 m east of the warehouse. At this point, turn left along the road that runs parallel with the eastern diversion ditch of the lake. The tailings and water discharge piping will now be on the right-hand side of the road as you are facing east.
- Exterior of mill: lakeshore drive (east of the warehouse) along the east diversion ditch to the shoreline of the WRTSF.
- When you return from the inspection, contact dispatch on Repeater 1 channel and ensure dispatch acknowledges your communication.
- Once the tailings lines have undergone a pre-operation inspection, notification is to be sent to the control room operator that the tailings lines are good for use. At this point, the control room operator can begin tailings discharge (see procedure below) and the inspection team is to verify there are no leaks from the pipework on their return trip to the mill.
- An inspection log sheet must be filled out and filed in the metallurgy office for each inspection.

Running Inspection and Operation

A summary of the procedure for tailings inspection and operation of the tailings disposal system includes the following:

- Verify tailings line status as stated in the pre-operation inspection procedure above.
- Determine in which line the tailings are to be conveyed to the WRTSF.
- Have the tailings dewatering operator verify the position of valves at the tailings disposal pumps.
- The control room operator should now direct the thickened tailings from the underflow pumps to the tailings disposal. The operator will also control the agitator inside the tailings disposal tank once the liquid level is above the agitator blades.
- The field operator must visually verify the automated and manual valve positions prior to operating the disposal pump.

- During tailings disposal, the pumps must be monitored for abnormal noise, current draw, and other mechanical abnormalities. Pump failure or mechanical faults must be reported to the maintenance department immediately, and the standby pump should be operated (once the suction/discharge valves are checked for proper positioning).
- The density of the thickened tailings must be a minimum of 55% solids. The maximum density target is 65% solids. If the thickened tailings underflow solids are lower than this, the reason must be determined and rectified.

Shutdown Procedure

In the event that tailings disposal to the WRTSF is stopped, the tailings disposal tank must be drained as best possible through the tailings disposal pumps, the disposal tank should be flushed (with fresh water), and the tailings line needs to be flushed (with fresh water). Shutdown procedures are summarized as follows:

- Stop thickened tailings flow to the disposal tank by directing the thickened tailings to the paste plant.
- The tailings disposal pump will slow down as the level in the tank approaches the bottom. At this point, the tank is to be filled with fresh water to flush any remaining solids out of the tank. It is required that the tank be filled three times, with the agitator on, to ensure the majority of solids are flushed from the tank.
- Continue filling the tailings disposal tank with fresh water and continue operating the tailings disposal pumps. The approximate volume of the tailings disposal pipe is 42 m^3 (1.3 km long, 8-inch diameter). To ensure no solids remain in the pipe, five times this volume or 210 m^3 must be flushed through at full speed of the pump.
- The disposal pump must operate at the maximum speed allowable for the volume of fresh water supplied to the disposal tank. As the thickened tailings are displaced from the pipe with water, the tailings solids will have a tendency to settle faster in the clean water. Running the pump at maximum speed will force the remaining solids to be flushed out from the pipe.
- After the flush is complete, shut the suction valves of the pumps and open the pump suction drain valves, and using a hose, flush the suction piping of the pumps. The air vent hand valves located on the discharge of the pumps should be opened to allow the majority of flush water to drain by gravity to the WRTSF discharge. Allow thirty minutes drainage time. Ensure the suction drain valves and air vent valves are closed after this process to allow for restart without delays.
- When the tailings disposal piping is not in use from October to June, there is the possibility of freezing. To ensure there is no possibility of residual water freezing in the pipe, a water flush is to be conducted every 6 hours using fresh water. This can be accomplished by filling the disposal tank with fresh water while operating one of the disposal pumps. Each line must be flushed continuously for five minutes.

4.4 Water Management

The Brucejack mine site area is characterized by high annual snowfall and rainfall. In this humid climate, water management is an important component of the mine plan. Water management infrastructure at the mine site includes the following:

- Two fresh water (non-contact) diversion channels divert non-contact water around the core mine site surface infrastructure area. The Johnson Creek (East) Diversion Channel drains into the WRTSF, while the Camp Creek (West) Diversion Channel discharges to Brucejack Creek.
- Domestic wastewater from the camp is directed to the STP, located near the mill building, with the treated effluent discharged to the WRTSF.
- Contact water from the contact water management area (encompasses the mill and camp pads and additional core infrastructure areas) is directed to the Contact Water Pond (CWP) by way of collection weirs, ditches, sumps, pumps and HDPE pipes.
- Contact water in the CWP is pumped to the WTP, located in the mill building. The effluent from the WTP is either used as makeup water for the mill or piped to the WRTSF for discharge.
- Water from dewatering of the underground mine is pumped to the WTP for treatment. The priority use for this treated water is the mill process. When there is a surplus of treated water after fulfilling mill process requirements, the excess is discharged to the WRTSF.
- Process water is required for the thickened tailings slurry to Brucejack Lake, the underground paste backfill, and the concentrate slurry. This water is sourced from the WTP treated effluent, reclaim from the WRTSF, and ore moisture.
- Tailings are either directed to the paste backfill plant or sent to the WRTSF as thickened tailings for disposal at depth, but never concurrently.
- If there is insufficient makeup water for process from the CWP and/or underground dewatering, fresh water is reclaimed from the lake outlet at the LLW.
- Potable water is obtained from a groundwater well, with subsequent filtration and disinfection treatment before piping to end users at the Brucejack Camp and other facilities.

The final discharge point from Brucejack Lake for Metal and Diamond Mining Effluent Regulations and PE-107835 compliance conditions is monitoring site BJ 3.10, which is located at the LLW.

4.5 Documentation and Reporting

4.5.1 Internal Reporting

Daily progress reports for waste rock deposition and tailings discharge must be completed by a competent person under the supervision of the Tailings RP and WR RP and submitted to the following individuals:

– WRTSF RP

- Engineer of Record (EOR)
- Health and Safety Manager

In addition, site inspection reports, safety audit forms, and daily deposition plans must be maintained in the deposition planning and inspection binder. Appendix D1 of this OMS manual provides a copy of the Daily Waste Rock Inspection Checklist and Appendix D2 contains a copy of the Weekly Waste Rock Deposition Audit Checklist.

The volume and density of the tailings must be tracked every shift. Mill Operations monitors two totalizers: one is a volumetric totalizer for tailings flow from the thickener to the disposal tank; the second is a wet tonnes mass totalizer for this same flow. These totalizers must be recorded each shift and information transferred to the metallurgy technician. The metallurgy technician will send these data to the environmental department for record keeping and reporting.

4.5.2 Regulatory Reporting

An annual waste deposition progress report is submitted to the BC Ministry of Energy, Mines and Petroleum Resources in accordance with M-243 Condition C.3(c). The progress report is included as part of the *Mines Act* and *Environmental Management Act* permits annual report submitted by March 31 of each year for the prior calendar year. It summarizes the progress of the waste rock and tailings deposition, placed volumes, and the stability and settlement experienced during deposition.

An annual review of the WRTSF must be conducted by a Professional Engineer and a report submitted to the Chief Inspector until 2021, after which the reporting frequency is reduced to once every five years (M-243 Condition C.3(d)).

As per Condition 3.5 of PE-107835, the tailings outfalls and discharge lines must be inspected once per year by a QP or certified tradesperson to ensure they and all associated piping are in good working condition, there are no major leaks or bends, and that the height of the tailings discharge is not more than 7.5 m above the lake bottom (i.e., the top of the natural lake bottom or deposited tailings, whichever is higher). These inspections may include a combination of bathymetric surveys, camera inspections, visual inspections, digital sonar surveys, etc. An inspection report must be submitted each year in the annual report unless concerns are noted, in which case an inspection report and associated mitigation plan must be submitted to the director within 45 days after the inspection date.

5 Maintenance

5.1 Objective and Procedures

The objective of the waste rock and tailings deposition maintenance program is to ensure that the WRSTF complies with design and performance criteria. The maintenance procedures are event driven and directed by the WRTSF QP in consultation with the EOR and Responsible Persons, with co-operation and support from Pretivm's geotechnical engineers and maintenance teams.

5.1.1 Waste Rock

Events that could result in maintenance above and beyond the regular operating procedures of the waste deposition areas include:

- Excessive settlement of the dump pad requiring additional waste rock placement to achieve the long-term height above water required (0.3 to 0.5 m).
- Localized lower spot and/or ponding of the dump pad due to truck loads or downward blading from dozers that requires levelling
- Heavy snowfall events that require snow and ice removal from the dump pad (to prevent slippery surfaces for equipment and enable observations of surficial signs of instability) before carrying out the daily deposition plan
- Cracking or sloughing that extends into the WRD past the crest berm, where restricted work and modified deposition plan is to be applied to stabilize the area

Any actionable maintenance tasks performed on the WRD outside of normal construction and deposition activities will be documented in the daily progress reports. Furthermore, maintenance of mechanized equipment that is employed at the dumpsite must follow the manufacturer's specifications.

5.1.2 Tailings

Events that could result in maintenance above and beyond the regular operating procedures of the tailings deposition include:

- Interference between the tailings deposition elevations and the elevations of the discharge pipelines that may cause the discharge pipelines to be damaged or buried. Annual bathymetric surveys are performed and tailings heights are adjusted.
- Damage to the tailings pipelines (including heat tracing and insulation) or to the pipeline cable supports. The pipes on surface are inspected daily in the summer months when there is no snow cover for any issues and damage is rectified by the surface maintenance crews. Any damage should not exceed 10% of minimum wall thickness of the pipe required for the pipeline operating pressure.

- Corrosion or any event that weakens the tailings cable support structure and anchors. The cables above the water are visually inspected regularly. Upon identifying corrosion or significant reduction of metal cross-section, a plan will be developed to address the issue and then executed.
- Blockages of pipelines.
- Rupture or leakage of pipelines. The tailings disposal will be switched over to the secondary line. The ruptured section will be repaired and made ready for service.

5.1.3 Reclaim Weir

The reclaim weir is a measuring system and a pump station for reclaiming water from the WRSTF back to the mill.

- The building and civil facilities are visually inspected annually in the spring and minor repairs carried out prior to the beginning of the winter season.
- Pump inspection occurs on a two-week frequency for mechanical issues.
- Pump motors are greased on a monthly cycle.
- Flow meter checks are performed intermittently or on request and in conjunction with the environmental monitoring department. If there are repairs, a work order is required.

5.1.4 Turbidity Curtains

Events that could result in turbidity curtain maintenance above and beyond the regular operating procedures include:

- A tear in the curtain or separation of two sections that may result in sediment from waste rock dumping activities migrating downstream towards the LLW rather than settling to the bottom of the WRTSF.
- One or more of the curtain anchor lines breaking, potentially allowing excess sediment to pass underneath of the curtain.

To limit the potential of the above from occurring, preventative maintenance (e.g., confirm curtain position is correct, check that seems between adjacent panels are tight and anchors remain in place) is performed at least once annually during the summer months when the curtains are accessible. Critical spares (e.g., curtain replacement panels of various lengths, anchors, rope, buoys) are stored on site, ready for install if required and replaced as necessary.

5.2 Instrumentation

Maintenance of instrumentation is important to ensure the instrumentation is in good working order and provides reliable readings. All instrumentation needs to be clearly marked, identified, and protected using cement blocks or some other distinguishable feature to delineate it for heavy equipment operators. Drawings and installation record information includes location; refer to the WRD daily plan for instrumentation locations. Survey prisms are to be maintained to enable collection of the data, and repair and replacement is to be carried out when needed.

5.3 Event-Driven Maintenance

Potential event-driven maintenance items arising from pipeline leaks or breaks, earthquakes, and floods are listed below.

5.3.1 Pipeline Leaks or Breaks

- Inspect entire pipeline.
- Repair or replace affected components.
- Repair any collateral damage caused by a leak or break.
- Collect any released tailings and place in the WRTSF.
- Reclaim any disturbed areas.

5.3.2 Earthquake Occurrence

- Measure freeboard for compliance with design requirements.

5.3.3 Flood Event

- Measure freeboard for compliance with design requirements.
- Inspect WRD pad for erosion and repair if required.

5.4 Maintenance Schedule and Spare Parts

All electrical and mechanical components are to be inspected and maintained as per manufacturer's recommendations. A spare parts inventory is to be maintained as recommended by equipment manufacturers and as required by Pretivm. This inventory is not listed in the OMS manual, as it is beyond the scope of this document.

5.5 Documentation and Maintenace reports

Maintenance records of each component are to include the following:

- Up-to-date logs of in-service equipment and facilities
- Maintenance schedules
- Maintenance history
- Inspection logs
- Repair reports including cost
- Frequency, cause of problems, and planned mitigation
- Inventory of spares parts, materials, tools, and equipment
- Calibration records, if applicable
- Critical spare parts list, if applicable

6 Surveillance

6.1 Objectives

Surveillance information is gathered through visual inspections, safety audits, and survey data collection. Regular review of observational data allows operations personnel to evaluate trends and take appropriate actions. The objectives of the surveillance program are to:

- Regularly monitor for settlement and stability of the WRD. Tailings conveyance systems should be regularly inspected for leaks, damage, and overall operation of pumping systems.
- Promptly record and report observations.
- Regularly inspect work areas and interview operators and maintenance personnel to ensure that the operation and deposition plans are understood and followed correctly.

6.2 Surveillance Parameters and Procedures

6.2.1 Waste Rock

The WRD surveillance procedures are summarized in Table 6-1, and tailings surveillance procedures are summarized in Table 6-2. Waste rock deposition parameters include the following:

- Waste rock settlement
- Subaqueous waste rock slope monitoring through Bathymetric survey.
- Surface cracking on the WRD and the tailings pipelines
- Overloading or load concentration of waste rock on lakebed
- Sloughing and/or slope movement
- Changes in the material consistency
- Surface deflection from equipment
- Lake bed profile

6.2.2 Tailings

Tailings deposition surveillance parameters include the following:

- Tailings consistency (% solids) and discharge rates
- Damage to tailings conveyance pipelines and support cables
- Damage or signs of failure of the anchor points of the tailings support cable
- Subaqueous elevations of the deposited tailings cone and the tailings deposition pipeline

6.2.3 Environmental

Environmental surveillance parameters include the following:

- Interaction of the tailings cone to the discharge pipeline and the WRD
- Damage to any of the four turbidity curtains
- Water quality parameters at the BJ 3.10 monitoring site showing unusual increases or nearing permit limits
- Continuous in-situ monitoring of physical characteristics of the lake's water column with periodic sample collection to assess water quality at various depths
- Full bathymetric survey of the lake conducted at least once annually

6.2.4 Health and Safety

Health and safety surveillance parameters include the following:

- Training on SOPs and ERPs and tracking of personnel training
- Personal protective equipment availability and use
- Hazard recognition.

Table 6-1: Surveillance procedures for waste rock deposition area

Procedure Components	Frequency	Critical Observation
01: Stability Analysis and Inspection	• Start of every new deposition area • After WRD evacuation due to earthquake	• Determine anticipated settlement of new crest advance.. • Assess factor of safety and setback distance of new crest advance. • Coupled with settlement results, assess for deformation as a result of an earthquake .
02: Settlement Surveys	• Real time survey through Tiltmeters setting up one per zone. • Immediately after WRD evacuation due to an earthquake • Frequency afterwards based on the site geotechnical engineer's requirements	• Capture the baseline crest elevation for comparison with subsequent settlement surveying. • Conduct ongoing settlement surveying until necessary settlement has been achieved. • Confirm compliance with QPOs in Table 6-3 row 03.
03: Geotechnical Engineer & Surface Supervisor Inspections	• At the start of every shift • After each break • At least every 4 hours if no breaks have occurred • At the start of a new work area • After every blast near the WRD • After an evacuation of the WRD due to an earthquake	• Inspect for signs of instability such as: - Cracking - Settlement - Slope movement - Changes in material type and moisture content - Surface deflection from equipment. • Inspect for delineators that mark the dump zones and restricted areas, and for proximity of safety equipment. • Review localized settlement monitoring data. • Inspect for safety equipment and PPE worn by operators. • .
04: Equipment Operators Inspection	• At the start of each shift and continually during normal WRD operations	• Inspect for signs of instability on working surface and dump face. • Be aware of equipment position, locations of egress points, and visibility. • Be aware of location of delineator cones, overhead lighting, and settlement monuments.
05: Health and Safety Audits	• Every two weeks	• Assess availability and use of safety supplies and PPE. • Assess adherence to deposition plan and SOPs. • Develop suggestions to improve WRD conditions and safety.
06: Engineer of Record Audits	• As deemed by the EOR	• Assess the deposition planning, tracking, and documentation being carried out on site. • Determine if procedures are being followed and if WRD is being operated and is performing as designed.
07: Event (earthquake near site or unexpected large rainfall event) driven inspection	• Event driven	• Monitor deformation and settlements immediately after an earthquake. • Inspection by EOR, assess the stability of the WRD areas. Documentation of assessment to be conducted. • Assessment of the waste rock deposition area below water level (bathymetry) may be required.

Table 6-2: Surveillance procedures for tailings deposition

Procedure Components	Frequency	Critical Observation
01: Exposed Tailings Discharge Pipeline	• Daily • Prior to starting tailings pumps • After tailings pumps are shut down • Any time the flow is switched between pipes • After an earthquake	• Determine if there is damage to the exposed pipelines and if they are in working order. • Determine if there are signs of leaking, cracking, and ice/tailings blockages.
02: Tailings Cable Anchor System	• As directed by the engineer • After an earthquake	• Determine if there is damage, fatigue, and oxidation of the cable anchor bolts and loop ends. • Determine if there is damage and cracking of the concrete foundations.
03: Pipeline Discharge Elevation	• Biannually, or more frequently at the discretion of the mill manager	• Measure elevations of the tailings discharge pipelines in relation to the depth of deposited tailings.
04: Deposited Tailings Elevation	• Biannually at the same time as the pipeline elevation measurements, or more frequently at the discretion of the engineer	• Measure elevation of the subaqueous tailings deposition at the point of the outflow of the tailings pipelines. • As a secondary observation, measure the elevation of the tailings deposition cone that is forming in the peripheral areas.

Table 6-3: Environmental surveillance procedures

Procedure Components	Frequency	Critical Observation
01: Turbidity Curtain Inspections	• At the start of each shift	• Before commencing waste rock or tailings disposal, ensure all of the turbidity curtains are in place and there is no apparent damage
02: Environmental Compliance Sampling	• Weekly	• Collect surface water samples at BJ 3.10 monitoring site to ensure water quality parameters are below permit maximums.
03: Lake Water Column Sampling	• At least monthly when lake surface conditions permit safe access (typically July – Sept and Feb/Mar – Apr/May)	• Collect water samples at specific depths (just below surface to near bottom) to assess water quality
04: Monitoring of physical water characteristics	• Continuous	• Ensure CTDs located at the LLW and attached to the lake mooring stations are functioning such that conductivity, temperature, and turbidity are being recorded
05: Bathymetric Surveys	• At least annually	• Conduct a bathymetric survey of the lake to determine the elevation profile of the lake bed, tailings deposition area, and subaqueous waste rock slope

6.3 Quantifiable Performance Objectives

Quantifiable performance objectives (QPOs) associated with performance monitoring as described in the OMS manual are summarized in Table 6-3 for the waste rock deposition with remotely controlled dozer, the stacker / bailing system, and tailings deposition.

Table 6-4: Quantifiable performance objectives for monitoring the WRTSF

ID and Description	QPO	Methodology	Responsibility	Frequency	Mitigation Actions
General Objectives					
01: Environmental Water Quality	• Water quality discharge limits at sampling location BJ 3.10 in accordance with PE-107835 • Water quality discharge limits are listed in Table 3-1, Section 3.11.3 of this OMS manual	• In accordance with standard industry best practice test methods as stipulated in PE-107835.	• Environmental Superintendent and Environmental Coordinator under the guidance of the Environment QP.	• As specified in Table 31 in Section 3.3.4 of this OMS manual.	• The Manager, Environment and Regulatory Affairs or delegate will prioritize lake profiling (access dependent); visual inspections of the sediment curtains; and site BJ 3.10 water quality to determine the source of any exceedances.
02: Waste Rock Deposition Exposure	• Waste rock is to be deposited into the WRTSF below a minimum of 1.0 m of water cover (1,363.5 masl) within a 2-year (24-month) allowable exposure period.	• Excavate exposed waste rock to a minimum of 1.0 m below the WRTSF water level of 1,364 m. • This excavation results in a minimum of 1.0 m of water cover over waste rock. All excavations are to be guarded by a 1 m tall and 3 m wide safety berm that is set back 3 m from the excavation. • Where needed, a trafficking layer of NPAG waste rock is placed over the excavated PAG waste rock. • Elevations are confirmed by engineering staff and recorded in a digital database.	• Waste Rock QP	• Actions to complete QPO are ongoing and a component of operations work. • Due to weather constraints, the majority of the PAG waste rock excavation will occur in the summer months.	• The on-site geotechnical engineers with the support of the surface operations team will prioritize the location of PAG waste rock excavation and develop construction schedules and survey records.
03: Evacuation of the Waste Rock Dump due to an Earthquake	• An evacuation of all personnel working on the WRD is initiated simultaneously with an evacuation of the underground mine.	• Seismic sensors that are used to determine the threshold for underground mine evacuation are applied as the indicator for the WRD.	• On-site geotechnical engineers, WRTSF RP, and support from EOR as necessary.	• If an earthquake is experienced that triggers the underground seismic detection system that warrants an evacuation of the underground mine.	• Continue monitoring until the threshold values are recorded on the seismic sensors.
Waste Rock - Deposition with Remote Controlled Dozer					
04: Waste Rock Deposition Settlement Rate	• Observational method of surveying settlement monuments and tiltmeter to track settlement. Results must show that settlement rates are less than 0.03 m/day over two consecutive days.	• Foundation characteristics, depth of the lake, and height of the waste rock vary continuously, and therefore settlement rate and magnitude are variable. • Monument prism survey. • Tiltmeter installed along the dump crest with real time monitoring. <u>Zones that meet the QPO:</u> • Will be denoted with a green settlement condition colour signifying that settlement currently meets the QPO. <u>Zones that do not meet the QPO:</u> • Will be denoted with a red settlement condition colour signifying that settlement has not yet reached the QPO value. • Settlement graphs will be included in the daily report for all red conditions until the settlement QPO is met and two days following. <u>Zones denoted as "High Risk" by the geotechnical engineer delegated by Waste Rock QP or EOR:</u> • Are zones where daily settlement surveys have not been completed or zones that have been assessed by the geotechnical engineer to have safety recommendations other than settlement QPO. (e.g., stability assessments, work zone access, snow build up, poor visibility). Recommendations may be from site inspections, annual EOR inspections, or stability assessments, or based on visual observations.	• On-site geotechnical engineers with support from Waste Rock QP and EOR as necessary.	• Twice a day monument prism survey. • Real time tiltmeter data monitoring (every 10 minutes data collection). • Ongoing daily review of settlement survey results. • EOR formally reviews database biannually.	• Continue monitoring until the threshold values are reached.
05: Waste Rock Dumpsite Monitoring & Inspections	• Site inspections to visually assess the stability of active and inactive deposition zones. • Site inspections are required to be documented. • Inspections can also include the observations of the equipment operators and supervisors. • The restriction zone is defined as a 10 m buffer from the dump crest. This restriction zone is maintained and delineated to ensure no person-operated equipment may enter. • Individual personnel are authorized to enter the 10 m restriction zone by the	• Sloughing and slope movement (including from equipment traffic) are expected and considered normal but should, nonetheless, remain within the constraints identified in the design reports and the conditions set here: • Visual inspections focusing on surface cracks or other signs of instability on the dump crest and proximal, freshly deposited areas of dump floor. • Observed cracks which form within the safety berm or on the dump surface must result in the stoppage of work (including egress of workers and equipment from the area) until an assessment by the engineer is completed. • A change in deflection magnitude resulting from equipment traffic must be addressed by the EOR. • A notable increase in ground settlement recorded by tiltmeter(s). • Bathymetric surveys indicating a bulged profile of the subaqueous waste rock slope.	• On-site geotechnical engineers with support from EOR as necessary.	• • Visual assessment of WRD stability every 4 hours by supervisors and two times per day by geotechnical engineer for active remote dozing zones, or "High Risk" zones. • If there is no waste rock deposition for over 24 hours, the supervisor will inspect WRD once per shift, while the geotechnical engineer will inspect the WRD once per day. • EOR formally reviews database biannually.	• • Cracks forming in the crest berm are immediately communicated to the geotechnical engineer. They are photo-documented in the daily reports and visually assessed during regular inspections. • Cracks/slumps forming in the safety berm or in the dump pad surface result in an immediate work stoppage on the entire dumpsite. All signs of instability are immediately communicated to the geotechnical engineer and the EOR and recorded in the daily reports. • The tiltmeter reading will be used to alert stakeholder when ground settlement is over QPO threshold. The geotechnical engineer will be informed and action plan will be developed.

ID and Description	QPO	Methodology	Responsibility	Frequency	Mitigation Actions
	engineer under the circumstances that monitoring data and remote visual inspection or physical inspection from outside the 10 m restriction zone support doing so. The person should have PPE as defined in the SOP and must have another person stationed outside the 10 m restriction zone as a spotter. •				
06: Waste Rock Stability	• Geodetic surveys are required a minimum of two times per day on all settlement monuments. Surveying frequency and timing must include: • Initial survey immediately after the fresh berm is constructed to establish a baseline. • An initial check survey within 6 to 12 hours of the baseline survey. • Subsequent surveys at 12-hour intervals until the geotechnical engineer specifies otherwise. In areas of active remote dozer deposition, real-time monitoring tiltmeters are required, and their data must be available remotely, in real time. • Bathymetric survey is required at geotechnical engineer's request to monitor the underwater waste rock slope profile.	• • The geotechnical engineer reviews settlement results and applies experiential judgment to determine when settlement magnitudes reach acceptable bounds and it is safe to deposit more waste rock. • As necessary, the geotechnical engineer will conduct stability analysis and settlement analysis to confirm their experiential judgment. • EOR to review any numerical modelling and determine if a zone should be categized as "High Risk" and make site-specific recommendations to mitigate concerns. <u>Zones denoted as "High Risk" by the Geotechnical engineer delegated by WR QPor EOR:</u> • Are zones where daily settlement surveys have not been completed or zones that have been assessed by the geotechnical engineer to have safety recommendations other than settlement QPO (e.g., stability assessments, work zone access, snow build up, visibility). Recommendations may be from site inspections, annual EOR inspections, or stability assessments, or based on visual observations. • Bathymetric survey to the underwater WRD slope profile is one of the tools to assist the slope stability analysis when lake is not covered with ice.	On-site geotechnical engineers with support from Waste Rock QP and EOR as necessary.	• Ongoing daily review of settlement survey results. • Ongoing daily review of the tiltmeter monitoring data. • Ongoing daily review of waste rock stability through stability analysis and settlement analysis as necessary. • Visual assessment of WRD stability every 4 hours by supervisors. • Active remote dozer deposition zones & "High Risk" zones will be assessed via a conjunction of real-time monitoring instrumentation & drone inspection. • Bathymetric survey will be done at the geotechnical engineer's request. • EOR formally reviews database biannually.	• The geotechnical engineer and the Manager of Technical Services must be contacted if the survey frequency cannot be completed to determine an action plan. • The geotechnical engineer must track the date when the survey(s) were attempted and report on the daily reports when future surveys will be attempted. • EOR and the geotechnical engineer can assign sections of the dump as "High Risk" and develop site-specific recommendations to mitigate stability concerns where needed. These may include, but are not limited to, no work zones, additional site clean up and clearing before work, or capturing additional survey data on a higher frequency.
07: Rate of Waste Rock Deposition and Crest Advance	• Waste rock deposition rates into the WRTSF are dependent on need for waste rock as backfill in the underground mine. • During operations, the expected volume of waste rock delivered to the WRTSF from the underground mine ranges between 0 and 2,000 m^3/day. • The geotechnical engineer prescribes the deposition zones that have met the requirements for further deposition in the daily deposition plan. • The WRD crest advance per shift should be less than 3 m.	• The rate of waste rock deposition is related to the rate of crest advancement. • The rate of waste rock deposition is related to the subaqueous waste rock slope profile as determined by bathymetric survey.	• On-site geotechnical engineers and Waste Rock QP with support from EOR as necessary.	• Ongoing daily activity.	• The rate of waste rock deposition is determined by the rate of construction of the berm advancement and by the rate of settlements during construction: it cannot be a fixed value. • The active deposition zone will be determined based on the monitoring and survey data to allow enough settlement time.
Waste Rock - Deposition with Stacker / Bailing System					
08: Waste Rock Deposition Settlement Rate	Observational method of surveying settlement monuments to track settlement. Results must show that settlement rates are less than 0.03 m/day over two consecutive days (green settlement condition). Settlement ≥0.03 m/day over 2 days is classified as red settlement condition.	• Foundation characteristics, depth of the lake, and height of the waste rock vary continuously and therefore settlement rate and magnitude are variable. • Settlement times are therefore also variable and cannot be prescribed. • Monument prism survey. <u>Zones that meet the QPO:</u> • Will be denoted with a green settlement condition colour signifying that settlement currently meets the QPO. <u>Zones that do not meet the QPO:</u> • Will be denoted with a red settlement condition colour signifying that settlement has not yet reached the QPO value.	• On-site geotechnical engineers with support from Waste Rock QP and EOR as necessary.	• Ongoing daily review of settlement survey results. • EOR formally reviews database biannually.	• Continue monitoring until the threshold values are reached.

ID and Description	QPO	Methodology	Responsibility	Frequency	Mitigation Actions
		• Settlement graphs will be included in the daily report for all red conditions until the settlement QPO is met and two days following <u>Zones denoted as "High Risk" by the Geotechnical engineer or EOR:</u> • Are zones where daily settlement surveys have not been completed or zones that have been assessed by the geotechnical engineer to have safety recommendations other than settlement QPO (e.g., stability assessments, work zone access, snow build up, poor visibility). Recommendations may be from site inspections, annual EOR inspections, or stability assessments, or based on visual observations.			
09: Waste Rock Stability	Geodetic surveys are required a minimum of two times per day on all settlement monuments. Surveying frequency and timing must include: • Initial survey immediately after the dump crest advance is completed with a berm to establish a baseline. • An initial check survey within 6 to 12 hours of the baseline survey. • Subsequent surveys at 12-hour intervals until the geotechnical engineer specifies otherwise	• The geotechnical engineer reviews settlement results and applies experiential judgment to determine when settlement rates are acceptable and when it is safe to deposit more waste rock. • As necessary, the geotechnical engineer will conduct stability analyses and settlement analyses to confirm their experiential judgment. • EOR to review any numerical modelling and determine if a zone should be categized as "High Risk" and make site-specific recommendations to mitigate concerns. <u>Zones denoted as "High Risk" by the Geotechnical engineer or EOR:</u> • Are zones where daily settlement surveys have not been completed or zones that have been assessed by the geotechnical engineer to have safety recommendations other than settlement QPO (e.g., stability assessments, work zone access, snow build up, visibility). Recommendations may be from site inspections, annual EOR inspections, or stability assessments, or based on visual observations.	• On-site geotechnical engineers with support from Waste Rock QP and EOR as necessary.	• Ongoing daily review of settlement survey results. • Ongoing daily review of waste rock stability through stability analysis and settlement analysis as necessary. • Visual assessment of WRD stability every 4 hours. • EOR formally reviews database biannually.	• The geotechnical engineer and the Manager of Technical Services must be contacted if the survey frequency cannot be completed to determine an action plan. • The geotechnical engineer must track the date when the survey(s) were attempted and report on the daily reports when future surveys will be attempted. • EOR and the geotechnical engineer can assign sections of the dump as "High Risk" and develop site-specific recommendations to mitigate stability concerns where needed. These may include, but are not limited to, no work zones, additional site clean up and clearing before work, or capturing additional survey data on a higher frequency.
10: Waste Rock Deposition Inspections	• Site inspections to visually assess the stability of active and inactive deposition zones. • Site inspections are required to be documented. • Inspections can also include the observations of the equipment operators and supervisors.	Sloughing and slope movement (including from equipment traffic) are expected and considered normal but should, nonetheless, remain within the constraints identified in the design reports and the conditions set here: • Visual inspections focusing on surface cracks or other signs of instability within the safety berm area. • Cracks which form within the safety berm or on the dump surface must result in the stoppage of work (including egress of workers and equipment from the area) until an assessment by the engineer is completed. • A change in deflection magnitude resulting from equipment traffic must be addressed by the EOR.	• On-site geotechnical engineers with support from Waste Rock QP and EOR as necessary.	• Visual assessment of WRD stability every 4 hours. • EOR formally reviews database biannually.	• Cracks forming in the safety berm are immediately communicated to the geotechnical engineer. They are photo-documented in the daily reports and visually assessed during regular inspections. • Cracks/slumps forming in the safety berm or in the dump pad surface result in an immediate work stoppage on the entire dumpsite. All signs of instability are immediately communicated to the geotechnical engineer and the EOR and recorded in the daily reports.
11: Rate of Waste Rock Deposition and Crest Advance	• Waste rock deposition rates into the WRTSF are dependent on need for waste rock as backfill in the underground mine. • During operations, between 0 and 2,000 m^3/day is the expected range of waste rock that is delivered to the WRD from the underground mine. • The geotechnical engineer prescribes the deposition zones that have met the settlement rate requirements in the daily deposition plan.	• The rate of waste rock deposition is related to the rate of crest advancement during the deposition process. • The rate of crest advancement is operationally limited to the reach of the hydraulic excavators and conveyor systems that are used to bail waste rock over the safety berm and the settlement time discussed above. • Typically, the safety berms are 6 m wide and the current equipment has an approximate reach of 12 m. With the excavator situated behind the 6 m wide safety berm, the effective reach of waste rock placement is 6 m into the lake, and therefore the rate of waste rock crest advance is 6 m per settlement cycle.	• Waste Rock QP with support from EOR as necessary.	• Ongoing daily activity.	• Rate of waste rock deposition is determined by the rate of construction of the safety berms and by the rate of settlements during loading of the lake bottom sediments—it cannot be a fixed value. • To decrease the rate of waste rock deposition, decrease the capacity of the equipment used to construct the safety berm. • To increase the rate of waste rock deposition, increase the capacity of the equipment used to construct the safety berms. However, the rate of waste rock deposition will be limited to the availability of rock and the time required to meet the settlement requirements.
Tailings Discharge					
12: Tailings Discharge Solids Content	• Tailings discharged from the dewatering plant is required to have a solids content of 55% to 65% by weight (green condition).	• Solids content of the discharge will be analyzed continuously at the process waste infrastructure using automated controls. • Manual measurements may be required for system calibration.	• Mill process technicians and managers under the supervision of the Tailings QP.	• Daily when discharge to the WRTSF occurs.	At less than 55% solids by weight: • Polymer addition rate may be increased. • Speed of the thickener underflow pump may be decreased to slow the withdrawal rate to allow solids to thicken. At greater than 65% solids by weight: • Polymer addition rate may be reduced. • Process water may be added to dilute the tailings slurry.

ID and Description	QPO	Methodology	Responsibility	Frequency	Mitigation Actions
					• Speed of the thickener underflow pump may be increased.
13: Tailings Discharge Rates	• Tailings discharge rates are expected to vary between 960 m^3 and 1,180 m^3 per day based on operational needs. • There are no geotechnical stability concerns with the tailings discharge rate, as there is no association between rate and stability. • Discharge rates are expected to be monitored and reported.	• Tailings discharge rates will be measured at the process waste infrastructure using automated controls.	• Mill process technicians and managers under the supervision of t Tailings QP.	• Daily when discharge to the WRTSF occurs.	• Mill process technicians and managers must track and report the tailings discharge rates. The mill superintendent must be contacted if the rates do not follow the targeted values. • Assessments of the course of action are to be made by the Mill Superintendent at this time to mitigate any issues with the process or the discharge system.
14: Tailings Deposition – Subaqueous to the WRTSF	• The pipeline discharge must be no more than 7.5 m above the tailings cone and not more than the ultimate elevation of 1,325 masl.	• Tailings deposition on the lake bottom will be monitored by tracking the surface elevation of the deposited tailings and the elevation of the submerged discharge pipe. • During the surveying of the tailings surface elevation, data captured should include the tailings elevation directly beneath the pipe discharge and at multiple points radiating away that can be used to estimate the slope and height of the growing tailings cone.	• Mill process technicians and managers under the supervision of the Tailings QP.	• Under the direction of the Mill Superintendent with a biannual minimum frequency.	• The depth of the tailings discharge pipeline will be measured by a cable incrementally marked every 2 m and affixed to a float on the surface. The depth of the discharge pipe is measured from the float marker. • The depth of the deposited tailings surface is measured by a sonar depth sounder. • The depth of the tailings discharge pipeline is adjusted by pulling on the backup anchor's cable loop affixed to the shoreline using heavy equipment (i.e., loader or a tracked bulldozer).

7 Emergency Response Plan

The objective of the ERP for the waste rock and tailings deposition area is to ensure timely and appropriate response to emergency situations and compliance with applicable laws, industry standards, and legal codes of practice. Implementing the maintenance and surveillance programs described in Sections 5 and 6 will identify potential issues and help minimize the potential of an emergency event at WRTSF waste deposition areas.

7.1 Emergency Situations

Emergency situations result in damage and loss of equipment, injury or death of workers, and environmental spills; causes include but are not limited to the following:

- Failure of the WRD within or exceeding the 10 m zone from the dump crest
- Rapid settlement of the dump crest or WRD surface area or floor
- Earthquake causing damage to the tailings support cable and pipelines, and rapid settlements and displacements of the WRD surface
- Major storm event or avalanche that results in flooding of the WRD surface or damage to the tailings pipelines and cable support system

7.2 Response to an Emergency Situation

Pretivm has prepared a site-specific ERP for rescuing and recovering someone who has become submerged in the WRTSF. A copy of the ERP is provided in Appendix C. For other emergencies, the following steps should be taken:

- STOP WORK Call “Code 1, Code 1, Code 1”and call dispatch on Channel 2, Repeater 1. Briefly describe the nature of the emergency. Call co-workers on Ladd 1, Channel 8 to evacuate the WRD.
- If an earthquake is experienced, immediately evacuate the WRD. For other emergencies, establish communication with everyone in and around the emergency area to warn them of the risks.
- Gather in a safe area or designated muster point.
- Barricade the hazardous area to prevent other people from entering.
- The surface supervisor of the WRD is to perform a head count to account for everyone who was working in the emergency area.
- Gather and record information relating to the emergency.
- The WRTSF RP is to immediately contact appropriate on-site and off-site personnel including the EOR, based on the severity of the situation.
- The WRTSF RP is to complete a brief status report (to be kept on file) describing the nature of the emergency and recommendations for immediate action.

– Any follow-up action deemed necessary by the EOR is to be taken immediately and documented.

7.3 Emergency Contact Information

Responsible, Accountable, Support, Consulted, and Informed (RASCI) matrix

RASCI Matrix: Waste Rock and Tailings Storage Facility (WRTSF), Brucejack Mine

Dated: 28 October 2023.

Rev.: C

RASCI Definitions:

- **A:** *Accountable*. The one ultimately answerable for the correct and thorough completion of the deliverable or task, the one who ensures the prerequisites of the task are met, and who delegates the work to those responsible. The accountable must sign off (approve) work that responsible provides. There must be only one accountable specified for each item.
- **R:** *Responsible*. Those doing the work to complete the item.
- **S:** *Support*. Resources allocated to responsible and who provide input to the work to complete the item.
- **C:** *Consulted*. Those whose opinions are sought, typically subject-matter experts, and with whom there is two-way communication.
- **I:** *Informed*. Those who are kept up to date on progress, often only on completion of the task or deliverable, and with whom there is just one-way communication.

Appendix B:
Standard Operating Procedures

Appendix B2:
Waste Rock Deposition with Remote Dozer

NEWCREST PRETIUM RESOURCES INC. A member of the Newcrest Group of companies		**BJ-ENG-SOP-011** **Waste Rock Disposal – Remote Dozer**	
Owner: Tech Services	**Approver**: Senior Geotechnical Engineer	**Revision Number**: 2.0	**Creation Date**: May 2021 **Revision Date**: October 2023

Objective

The objective of this procedure is to provide a safe and efficient process for the subaqueous disposal of Potentially Acid Generating (PAG) waste rock in the Brucejack Waste Rock and Tailings Storage Facility (WRTSF). The method of waste rock disposal detailed in this procedure is a remotely operated dozer push.

Scope

It has been determined that underwater disposal (subaqueous deposition) is, and will continue to be, the best management practice for the disposal of waste rock at the Brucejack Mine (the Mine) (i.e., for the waste rock that will not be used for underground backfill). As the Mine continues operation and production, waste rock mainly from the underground mine development is placed underwater within the WRTSF pond.

This procedure applies to all site personnel involved in subaqueous waste rock deposition at the Mine, including both Pretivm employees and independent contractors.

Health, Safety & Reclamation Code of BC

6.5.2(1)(2)(3) – Dump block

6.4.2 – Daily examination and report book

6.18.1 – Remote Control Operations

6.18.2 – Remote Control Operations

Definitions

PPE	Personal Protective Equipment.
Daily Deposition Plan	The Daily Dump Plan, or Deposition Plan, is a daily set of instructions which define the What, Where, and When of all tasks required over the next 24 hours at the waste rock dump, communicated via email, shared spreadsheet, and an annotated plan map attached to both.

Preparation

Hazards

Unplanned and/or uncontrolled activation of Dozer

Berm crest failure

Heavy equipment pedestrian interactions

High traffic area

Energized equipment

Stored energy

Unable to see settling materials

Slippery conditions

Sharp materials (rebar/fill fence)

Tools

- Remote Controlled Dozer
- Rock Truck
- Excavator
- Wheel Loader
- Personal Flotation Device
- Lock Out Locks and Tags
- Hand tools/power tools
- Long reach equipment for ice breaking (long arm excavator or crane that can park outside the 40 m restriction zone of the dump crest)
- GNSS instruments
- Tilt-beam instruments
- SlideMinder instruments
- Survey monument and prism

Requirements

- Operators, engineers, surveyors, and supervisors must review this SOP before commencing or participating in waste rock disposal with the remote-controlled dozer (RC Dozer).
- Operators, engineers, surveyors, and supervisors must review and understand the Waste Rock and Tailings Storage Facility Operations, Maintenance, and Surveillance manual (WRTSF OMS manual).
- Operators, engineers, surveyors, and supervisors must review and understand the Trigger Action Response Plan(s) (TARPs) appended to the WRTSF OMS.
- Operators and supervisors must review, be familiar with, and implement the associated SOP for remote dozer operation BJ-OPS-SOP-0020 Remote Dozer Operations before commencing waste rock disposal as described here.

Responsibilities

Mine Manager and Surface Operations Manager

The Mine Manager and Surface Operations Manager are responsible for:

- Ensuring this procedure is implemented and maintained.

Engineer

The Engineer is responsible for:

- Implementing this procedure.
- Developing a daily deposition plan, specific to remote dozer operation, and communicating this plan with all personnel working on the Waste Rock Dump.
- Maintaining and analyzing optical survey settlement data.
- Maintaining and analyzing GNSS settlement data.
- Maintaining and analyzing Tilt-Beam and/or SlideMinder data and observations when instruments are in-use.
- Assisting in operational management and supervision.
- Maintaining a waste rock dump geometry model.
- Training supervisors and other stakeholders in:
    - dump hazard recognition,
    - dumping procedures, and
    - reporting requirements.

Supervisors

Supervisors are responsible for:

- Implementing this procedure.
- Executing the daily deposition plan.
- Enforcing the use of dump site PPE.
- Training dump operators in hazard recognition and dumping procedures.
- Arranging for mentorship and coaching of newer operators by more experienced operators.
- Ensuring that dump safety features such as GNSS instruments, Tilt-Beams, berms, lighting, delineators, and barricades are constructed, installed, and maintained properly.
- Completing and recording dump inspections per the procedure. Completing inspections on active waste rock deposition areas.
- Ensuring that dump personnel understand their responsibilities, are trained, and are adhering to the procedures.

Health and Safety Manager

The Health and Safety Manager and their designate(s) are responsible for:

- Monitoring the implementation of this procedure.
- Maintaining training records.
- Maintaining emergency response and/or rescue SOPs and Management Plans.
- Performing bi-weekly audits of the dump site.

Dump Operations Personnel

Dump Operations Personnel are responsible for:

- Always adhering to this procedure.
- Safe remote operation of the dozer in conjunction with other equipment operated by conventional means.
- Performing visual dump inspections, equipment pre-shift inspections, and PPE inspections.
- Ensuring dumpsite PPE is always worn.
- Keeping all barricades and signage properly placed and maintained.
- Maintaining berm dimensions and profile as required.
- Stopping work, retreating to a safe area, and notifying supervisor(s), other personnel if conditions change.
- Immediately reporting any substandard dumpsite conditions to their supervisor.
- Asking for clarification from supervision if they have questions or concerns. Ensuring all snow and ice is removed from dump/ berms (Winter Months).
- Ensuring that ice immediately adjacent to the dump crest is cleared before waste rock deposition.

Personal Protective Equipment (PPE)

When settlement data and visual inspection indicate that the waste rock dump crest is stable, authorized personnel may enter the 40 m “remote only” exclusion zone on foot. Non-remote equipment is authorized to enter the 40 m exclusion zone only in specific, rare cases, as authorized by the Geotechnical Engineering team. In addition to standard PPE, any person within 40 m of the dump crest shall also use:

- A Personal Flotation Device (PFD), properly worn and buckled.
- A spotter with a radio standing outside the 40 m exclusion zone.

- Cold weather gear during winter.
- Personal lock (and tag(s)) for locking/tagging out any equipment with the potential for stored energy.

Monitoring and Inspections

Monitoring

GNSS settlement survey instruments are placed across the waste rock dump crest and report their positions hourly.

- Periodically, these instruments must be moved ahead to maintain proximity to the advancing dump crest. This work is authorized at the discretion of the Geotechnical team, following the performance objectives described in the WRTSF OMS TARP.
- If connectivity/network issues or power outages at the RC trailer compromise this system, troubleshooting and repair actions are initiated immediately.

Tilt-Beam system is to be placed across cracks or areas of concern observed on the waste rock dump crest or platform.

Bathymetric surveys are completed annually at a minimum; these surveys are interpreted to analyze the evolution of the underwater slope geometry.

Monitoring and Inspection Frequency

The Engineer must review the settlement monitoring data before issuing the daily plan. Periodic, ongoing review is also recommended.

The Engineer can request additional bathymetric surveys as required by waste rock deposition activities.

The dumpsite will be cleared of snow and ice and inspected prior to waste rock placement at the beginning of each shift.

The dump operators and supervisors shall complete an inspection of their active work areas prior to commencing or resuming work on the dump at the following intervals:

- At the start of every shift (day or night);
- After each break (i.e., coffee or lunch; day and nightshift); and
- Every time a new work area is started even if partway through the shift.

Except in rare cases where no geotechnical engineering personnel are on-site, an engineer must visit and inspect the dump every day that operations are occurring. Supervisors must visit and inspect the dump three times daily, including inactive work areas.

Inspection Procedure

When weather allows, a drone flight can be conducted to facilitate remote visual inspection. Otherwise, when inspecting the dump, the entire active area and 30 m to either side of that area will be inspected by foot from >40 m away from the dump crest and not from the cab of a vehicle.

Supervisors will inspect and monitor the active remote dozing areas of the dump, to be sure of the stability and finished work is satisfactory.

In cases where closer inspection is necessary, the geotechnical engineering team is authorized to enter the 40 m exclusion zone on foot, provided they adhere to the following conditions:

- Current settlement monitoring data indicates stability in the zones to be entered/inspected.
- Personnel entering the 40 m exclusion zone must wear the appropriate PPE (including Personal Floatation Device) and carry a functioning handheld radio.
- A spotter is nominated who will stay in a safe location with good visibility of the personnel entering the 40 m exclusion zone, and who will maintain visual and radio contact with the

inspection personnel until the inspection is complete and no personnel remain within the 40 m exclusion zone.

The person performing the physical inspection will pay particular attention to the dump floor and safety berm.

Signs of potential instability include:

Increased settlement rate (from GNSS, optical survey, and/or Tilt-Beam data).

Bulging waste rock slope profile (underwater) from bathymetric survey.

Cracking, or expanding crack aperture as measured by SlideMinder instrument(s).

Sloughing,

Changes in material type or moisture content, and

Surface deflection from equipment.

When signs of instability are observed, they will be noted, reported, and monitored. When these conditions are noted, all work will be stopped, and operators will retreat to a safe zone. The Mine Manager, Supervisor and Engineer will formulate a plan to work safely around the area, and/or to reduce the potential for more substantial slope failures.

For more information regarding indications of instability and standard response actions, please refer to the WRTSF Trigger Action Response Plan (TARP) table, found in the WRTSF Operations, Maintenance, and Surveillance manual (OMS manual).

Details of inspections recorded by supervisors will be filed for future reference.

Details of inspections recorded by engineers will be recorded and relevant observations reported in the Daily Dump Report.

Waste Rock Deposition Procedure

The Engineer will issue a daily dump plan, including the location and allowable volumes of deposition, in addition to any instructions related to atypical material specifications.

Plans for the daily deposition of materials will be communicated with the crews at the start of the shift. Any deviation from the plan must be approved by the Engineer.

During winter, it is critical to minimize or eliminate the incorporation of snow and ice into the waste rock slope:

Every effort must be made to clear accumulated snow from the dump floor and berm prior to commencing deposition activities:

- Snow found within the final dozer-length from the crest may not be recoverable; however, the rest of the exclusion zone can be cleared remotely by the RC dozer, with excavators and wheel loaders clearing the rest of the dump floor and stockpile as necessary.
- Depending on weather conditions, it’s possible that icebreaking is necessary to resume/sustain deposition.
    - Long-reach equipment (such as a long-reach excavator) can be employed to break ice from a safe distance.
    - Provided the ice thickness isn’t too great, the RC dozer can alternatively be used to break the ice by carefully advancing rock onto it. Additional operational experience is required to trial the effectiveness of this technique in different conditions, such as the presence of thicker, competent ice.

During operations, reflective markers or signage/delineators will be maintained to delineate the “40 m exclusion zone” distance from the dump crest.

Waste Rock Placement (Remote Dozer Operation)

As shown in Figure 1, the waste rock dump crest is divided into seven work zones (Zones 2, 3, 4, 5, 6, 7, and 8, respectively). These zones are demarcated in the field by signposts and signage, placed 40 m from the crest and periodically advanced to provide an accurate positioning aid for haul truck drivers to dump their loads.

The zones are approximately equal length. Their actual length is measured every time drone mapping is completed, and this measurement is used to calculate allowable daily deposition volumes per-zone:

A limit of 6.57 m3/m crest is prescribed for typical operations:

- On average, this cannot be exceeded; however, following deposition downtime or extended periods of reduced productivity, a “catch-up rate” can be applied for three days at a time to facilitate parity between average productivity and the deposition limit.

A limit of 9.00 m3/m crest is prescribed for 3-day catch-up periods:

- In cases where multiple catch-up periods are necessary, following two days of steady-state (6.57 m3/m) deposition during which settlement monitoring does not indicate accelerating trends or exceed the QPO, a second (or third, fourth, etc.) catch-up period can be initiated.

These limits can be modified based on physical, visual, and instrumentation observations: reduced deposition rates and/or barricading off portions of the dump crest have been shown to correct accelerating trends and QPO-exceeding settlement rates.

The remote dozer operator will aim to distribute the muck stockpiled in the active work zone throughout the crest length of that zone, working from one side to the other. When pushing muck, the dozer must maintain an orientation perpendicular to the dump crest.

A safety berm will always be maintained throughout this process: the dozer will push fresh muck into the existing safety berm, depositing the old safety berm into the WRTSF and replacing it with fresh muck.

Figure 1: Example Daily Deposition Plan

Weather Conditions

Dumping operations shall be reassessed if the operator's visibility is impaired by weather conditions.

When visibility is reduced enough to affect the operator's ability to see potential hazards, the operator must cease work, retreat to a safe location, and notify their supervisor of the deteriorating conditions. The supervisor will decide if conditions require "Restricted Work" on the dump, or "Stop Work" on the dump.

Under "Restricted Work", no personnel or equipment will operate within 40 m of the dump crest. Truck dumping operations may continue outside the 40 m exclusion zone.

Under a "Stop Work" designation, no work will take place on the dump until conditions improve.

Work will not resume until visibility improves and a dump inspection completed.

Appendix B3:
Remote Dozing Operation

NEWCREST BRUCEJACK		**BJM-OPS-SOP-0020** **Remote Dozer Operation**	
Department: **Surface Operations**	**Manager:** **John Sheehan**	**Revision Number:** **R1**	**Creation Date:** **August 28, 2021** **Revision Date:** **January 15, 2023**

Objective

This standard operating procedure (SOP) establishes the requirements for the safe operation of the remote-control dozing instrumentation on the Brucejack Waste Rock and Tailings Storage Facility (WRTSF) waste rock dump. This procedure was created to provide consistent and safe operating procedures for all employees and supervisors, and to comply with Brucejack's standards and relevant provincial mining regulations.

Scope

To provide a standard operating procedure for the safe operation of remote dozing of waste rock within the WRTSF. This SOP applies to all employees, including independent contractors working at the Brucejack Mine and designated sites.

Health, Safety & Reclamation Code for Mines in British Columbia

- 6.18.1, 6.18.2 remote control operations
- 6.19.1 Equipment operation
- 9.7.1 Terrain
- 10.5.6, 10.6.5 Major dumps

Definitions

- **Cat Command (Remote Dozer)** - Technology that allows an operator at a console to drive and operate remotely.
- **Cat Grade-** Technology that allows an operator to impute a daily grade plan into the dozer
- **Remote Operator-** A operator which operates a dozer from a mobile command center.
- **Remote Hot Zone-** The area defined as the controlled zone in which all Cat Command (remote dozing) activities are being carried out, and/or may impact surrounding waste disposal operations. This will be physically defined by the placement of the barricades.
- **Control room-** Mobile trailer which houses all the Cat Command controls and operators.
- **Remote all stop –** hand-held remote that is used to stop remote dozer activities in case of emergency.
- **WRTSF –** Waste rock tailings storage facility
- **WRD –** Waste rock dump
- **Avoidance Zone-** Digital fence on the Terrain Map system which will stop the RC dozer

- **Exclusion Zone –** There is an exclusion zone that is set by the geotechnical group that is an area of increased sloughing and is an indication of a potential slough. No one is to enter the exclusion zone unless approved by the Geotechnical group.

Roles and Responsibilities

The General Manager or Designate shall ensure that:

- A process is in place to develop, implement and use standard operating procedures (SOP)
- The resources, time, money, and technology available to support the safe operating procedures program.

The Health and Safety Manager or Designate shall ensure that:

- Provide advice and assistance in the development, implementation, and use of standard operating procedures (SOP)

The Area Manager or Designate shall ensure that:

- Ensure the implementation and use of standard operating procedures (SOP)
- Ensure that SOP is updated whenever there is a change to an existing process or equipment or an introduction of new processes or equipment
- Provide ongoing SOP training to all employees
- Inform all workers when a change occurs to the SOP
- Conduct the review of the standard operating procedures (SOP) within the required timeline specified in the document (3 years maximum) and make revisions as necessary due to changes in operating processes, industry best practices, or manufacturer recommendations

The Worker is responsible for:

- Adhering to the information supplied in this document
- Participating in the development and revision of standard operating procedures
- Annual standard operating procedure reviews

Preparation

Hazards

- Open water.
- Working near other heavy equipment/potential limited visibility.
- Any loss of communications from the remote dozer to the control room.
- Any interruptions to the remote dozer operator while operating the dozer.
- Any unexpected mechanical, electrical, or operational failure that impedes remote dozer activities in the hot zone that requires entry into the zone to retrieve or repair the remote dozer.
- Inadvertent entry to the Remote hot zone during remote dozer operations. which will be monitored by a camera.

Tools

- Spill Kit
- Remote All stops
- Light plant

Requirements

- WRD daily report
- Spotter required for manual retrieval within the exclusion zone
- Demarcation of the Exclusion zone
- Personal Protective Equipment (PPE) hard hat, safety glasses, hi vis vest, CSA certified boots and gloves
- In addition to standard PPE, operators working within 30m of the dump crest shall also use: Manually activated flotation vests
- Hard hats with chin straps must be worn while operating a dozer or excavator on the dump
- Cold weather gear during winter
- Seat belt DOES NOT HAVE TO BE WORN when working within the exclusion zone. But must be worn on other dump site work zones.
- Personal Lock (and Tags) for locking/tagging out potential energy equipment.
- In addition to standard PPE, personnel working within the exclusion zone must wear a flotation device.
- An **ALL STOP** is to be signed out if working within WRD RC dozer area.
- Test ALL STOP before use. To test press test and dozer will honk
- Operators shall have completed proper training and be deemed qualified by a trainer as per Brucejack's equipment training policy

Job Step

1. Only personnel trained and authorized in the use of a Remote Dozer shall be permitted to operate the Remote Dozer remotely. All other dozer operators may run the dozer manually for maintenance or transport only..
2. A safe location for the operator shall be provided in the Control room trailer within view of the dozer and work area.
3. Clean all camera lenses.
4. Conduct a manual pre-use inspection and servicing of the machine using the equipment logbook and FLHA.
5. Manually test all functions from the operator’s seat.
6. The work area **(Remote Hot Zone)** where any remote-controlled equipment is operating must have clearly marked signage. Signage shall state “Authorized personnel only".
7. The operator shall conduct a pre-inspection as per the operator's logbook. In addition, the operator shall test and inspect the remote dozer and remote operating unit consisting of the following
    a. Check antennas
    b. Check the condition of the transmitter
    c. Test for transmitter response
    d. Test the transmitter emergency stop button
    e. Test front and rear light functions
    f. Test throttle functions
    g. Test Blade and Ripper functions
    h. Test Park and service brake release functions
    i. Test steering function
    j. Test forward and reverse direction functions
    k. Test Shut Down

8. The manual controls in the cab must be locked out or gated to prevent accidental engagement during equipment movement.
9. Remote Dozer Operator and Rock truck operators will sign FLHAs and discuss Dump plan and hazards.
10. During waste rock dump crest inspections by engineers. Remote Dozer operation will Stop until inspection is complete. ALL STOP required within RC dozer area

NOTE: The operator will be located outside of the Remote Hot Zone to perform the above tests. If any of these tests are unsuccessful, immediately remove the Remote Dozer from service and Lockout. The supervisor and Heavy shop are to be notified immediately.
Once the above tests are complete operator will test the RC Dozer avoidance Zones. If Avoidance zone test fails, no remote work shall commence.

Control Room & Remote operator

11. The operator must be in the mobile control room trailer while remote dozing is active
12. No worker shall enter the remote dozer testing area without receiving permission from the remote dozer operator
13. Operator must follow a daily dump plan

End of shift

14. No maintenance work or servicing shall be performed on remote-controlled equipment unless the transmitter unit has been locked out.
15. Ensure the remote dozer tracks are cleaned and no muck or garbage is left in the dozer.
16. Post-operational inspection is to be completed and any deficiencies are to be reported immediately to the supervisor.

Appendix B4:
Waste Rock Dump PAG Material Replacement

NEWCREST BRUCEJACK		**BJM-OPS-SOP-1017** **NAG PAG Remove Replacement on Waste Rock Dump**	
Department **Surface Operations**	**Manager** **John Sheehan**	**Revision Number:**	**Creation Date:** **Feb 23, 2020**
			Revision Date: **Feb1, 2023**

Objective

As part of the requirements for the operations of the waste rock dump (WRD) at Brucejack Gold Mine, the potentially acid generating (PAG) rock used for the construction of the dump needs to be placed 1m below the Brucejack Lake water level. The removal of this material needs to be done in a safe and timely manner as the dump continues to be developed.

Scope

To provide a standard operating procedure for the safe and efficient removal of the potentially acid generating rock currently used to develop the waste rock dump. Once removed to 1m below Brucejack Lake level, the void is to be covered with non-acid generating (NAG) rock throughout the waste rock dump.

Health, Safety & Reclamation Code for Mines in British Columbia

- 4.17.1 - 4.17.15 Excavations.
- 10.1.15 Major Dumps
- 10.1.16 Metal Leeching and Acid Rock Drainage
- 10.5.5 – Permitting, Reclamation and Closure, Major Dumps.

Occupational Health & Safety (OHS) Regulation (WorkSafe BC)

- 16 Mobile Equipment

Definitions

- Acid generating – refers to the acidic water that is created when sulfide minerals are exposed to air and water and, through a natural chemical reaction, produce sulfuric acid and has the potential to introduce acidity and dissolved metals into water.
- PAG: Potentially Acid-Generating material.
- NAG: Non Acid-Generating material.
- PPE – personal protective equipment.

Roles and Responsibilities

The General Manager or Designate shall ensure that:

- A process is in place to develop, implement and use Standard Operating Procedures (SOP).
- The resources, time, money, and technology are available to support the Standard Operating Procedures program

The Health and Safety Manager or Designate shall ensure that:

- Provide advice and assistance in the development, implementation, and use of Standard Operating Procedures (SOP)

The Area Manager or Designate shall ensure that:

- Ensure the implementation and use of Standard Operating Procedures (SOP)
- Ensure that SOPs are updated whenever there is a change to an existing process or equipment, or an introduction of new processes or equipment;
- Provide ongoing SOP training to all employees.
- Inform all workers when a change occurs to SOP; and
- Conduct the review of the Standard Operating Procedures (SOP) within the required timeline specified inthe document (3 years maximum) and make revisions, as necessary, due to changes in Operating processes, industry best practices, manufacturer recommendations

The Supervisors are responsible for:

- Compliance to standard Operating Procedure guidelines for field work.
- Ensuring employees are properly trained on the equipment they have been designated to operate
- Providing the proper tools, equipment, information, support and guidance to the workers preforming the task.
- Verifying competency of the worker in the understanding of the Standard Operating Procedures

The Worker is responsible for:

- Comply with all Standard Operating Procedures (SOP)
- Participate in the development and revision of SOP
- Stop and refuse unsafe work

Preparation

Hazards

- Due to close quarters of the work visual and audible communications of equipment movement is essential. Establish positive communication prior to commencing any work.
- Excavation of the area to be removed is in the range of 1-2m deep. Berms (and delineators) will be in place to ensure no personnel wonder into the hole. Equipment operators are not to enter excavated area.

Requirements

- PPE: hard had safety, glasses, hi vis vests, CSA certified boots and gloves
- Personal Flotation Devices are to be worn inside 30m exclusion zone
- Equipment training and sign off

Tools

- Excavator.
- Dozer.
- Rock truck.
- Traffic delineators paint or stake markers to mark sub cut area

Job Step

1. Check to make sure the area to replace is outlined (paint or stakes) as per plan provided by Technical Services. If not, contact surveyors, supervisor or site engineer for clarification.
2. Check and mark depth of excavation as per following data (may need survey assistance to check on ultimate depth).
3. Place bucket flat at bottom of excavated area.
4. Apply mark on bucket or stick of excavator (spray paint / scribe mark) to ensure proper dig depth (repaint as necessary).
5. A photo of this setup should also be taken by the site engineer for record keeping.
6. Excavate area and PAG as per plan provided by Technical Services Engineer. Put PAG in truck and deliver to nearest active and/or available deposition zone. Please follow SOP - Waste Rock Disposal procedure for this part of the operation.
7. Preparing area may require use of a dozer's ripper claw to loosen up prior to excavating, as the ground may be very hard to penetrate with an excavator's bucket (even with a digging bucket).
8. Obtain permission from engineer prior to backfilling excavated area with NAG or PAG rock.
9. Push and level the NAG or PAG material using dozer into the recently excavated area. Ensure area is smoothed out after track-packing.
10. During excavation, a berm shall be maintained around the excavated area ¾ height of largest tire at all times when dig area is open. All four corners of the area should be delineated with cones, especially if left open w/o NAG or PAG backfilled.
11. Final survey pickup of the area shall be conducted after each area is backfilled with NAG or PAG and data provided to PVG Technical Services for documentation.

Appendix B5:
Waste Rock Haulage

NEWCREST BRUCEJACK		**BJM-OPS-SOP-1020** **Waste Rock Hauling**	
Department: Surface Operations	**Manager: John Sheehan**	**Revision Number:** **0**	**Creation Date:** **March 1 2018**
			Revision Date: **Nov 10, 2022**

Objective

To provide a standard operation for safe hauling of waste rock to the dumpsite.

Scope

This SOP applies to all employees including independent contractors, working at the Bruce Jack Project and designated sites.

Health, Safety & Reclamation Code for Mines in British Columbia

- HSRC1.9.1
- HSRC 2.2.1
- HSRC 6.10.1
- 16.34-16.43 OHS Regulations

Definitions

- PPE – Personal Protective Equipment
- Remote Dozer- Technology which allows an operator to operate dozer remotely from mobile command center.
- Remote Operator- An operator which operates a dozer from a mobile command center.
- Exclusion zones- Zones that are not to be entered
- FLHA- Field Level Hazard Assessment
- WRD – Waste Rock Dump

Roles and Responsibilities

The General Manager or Designate shall ensure that:

- A process is in place to develop, implement and use Standard Operating Procedures (SOP)
- The resources, time, money, and technology are available to support the Safe Operating Procedures Program.

The Health and Safety Manager or Designate shall ensure that:

- Provide advice and assistance in the development, implementation, and use of Standard Operating Procedures (SOP)

The Area Manager or Designate shall ensure that:

- Ensure the implementation and use of Standard Operating Procedures (SOP)
- Ensure that SOP are updated whenever there is a change to an existing process or equipment, or an introduction of new processes or equipment.
- Provide ongoing SOP training to all employees.
- Inform all workers when a change occurs to SOP; and
- Conduct the review of the Standard Operating Procedures (SOP) within the required timeline specified in the document (3 years maximum) and make revisions, as necessary, due to changes in Operating processes, industry best practices, manufacturer recommendations

The Worker are responsible for:

- Comply with all Standard Operating Procedures (SOP) and
- Participate in the development and revision of SOP
- All SOP are reviewed annually to maintain accurate and current directives.

Preparation

Hazards

- Light Vehicle interactions
- Steep Grades
- Extreme weather conditions
- Miscommunication
- Multiple radio channels
- Active work Area
- Mechanical failure
- Road conditions

Tools

- Pre-operational/ check lists
- Daily FLHA
- Spill Kits
- Radio
- Fire Extinguishers
- Chains in appropriate season
- PPE
- Training
- ALL STOP

Requirements

- Signed off on Remote Dozer SOP BJ-OPS-SOP-064
- Required training on haul truck.

Job Step

1. All operators must complete a thorough walk around and pre-operational check list prior to running any equipment on site to reduce the risk of mechanical failure on an active haul road.
2. Pre-operational/ post-operational check lists must be completed and handed in daily to ensure the safety of coworkers and the environment.
3. Operators are responsible for the operation and maintenance of equipment and follow all rules and policies. For operation of equipment on site.
4. Excavator/loader operators must complete radio check and sign FLHA with the haul trucks.
5. Excavator/Loader operators must maintain running surface surrounding muck bin to avoid side wall tire damage to underground/surface haul trucks.
6. Due to the steep grades and light vehicle interactions the operators loading any type of material into a haul truck for transport, must be diligent in their efforts to reduce spillage on an active haul road.
7. Any equipment on the west zone haul road or at VOK portal must have radio/visual confirmation with excavator/loader operator prior to passing the work zone.
8. Underground Haul trucks will be given the right of way due to separate underground channels and lack of visibility.
9. All underground/surface equipment must maintain a safe distance away from the excavator/ Loaders running surface/ swing zone prior to dumping or being loaded.
10. All operators must remain in the cab while being loaded, unless discussed with loader / excavator operator.
11. Loading significant oversized waste rock into a surface haul truck will require enough bedding waste rock to reduce the chance of damage to the equipment and load shift procurement.
12. All hauling of waste rock on surface will be subject to proper radio calls on the appropriate radio channels. Call at signage on the haul roads.
13. All haul truck operators must be compliant with the posted designated speeds throughout the Bruce Jack project. Under no circumstances will a haul truck exceed the speed of 30km/hour in any zone (Lakeshore Drive) throughout the Bruce Jack Project.
14. All haul truck operators / personnel must switch to radio channel to LAD 1 (Designated WRD channel) to announce entering and exiting WRD. Rock Truck drivers must radio check with RC dozer operator and Sign FLHA. Once clear of the WRD switch back to LAD 2
15. Rock truck drivers are required have an ALL STOP in their equipment and test prior to use.
16. Once haul truck operator has entered dump, remote dozer operator will instruct haul truck operator in which zone to start dumping waste.
17. In the event of extreme weather conditions or reduced visibility the haul truck operators are expected to reduce speeds to a maximum of 15km an hour and reduce efforts for hauling based on the "extreme weather conditions" hazard level.
18. No trucks shall enter the exclusion zone on the waste rock dump set by the Geotechnical team.
19. All operators are expected to complete a thorough post operational check list at the end of every shift as well as properly fill out and initial their FLHA end of shift check list

Appendix C:
Water and Ice Emergency Response and Rescue Plan

PRETIVM		BJ-OHS-SOP-034 Water / Ice Emergency Response & Rescue Plan	
Owner: Health & Safety	Approver: John Addy	Revision Number: 2	Creation Date: 13 Dec. 2015 Revision Date: 28 March 2020

Objective

The objective of this Operating Procedure is to provide a response plan to safely and effectively rescue a person that has entered Brucejack Lake or other lake/river on the Brucejack site.

Scope

This SOP applies to all employees, including independent contractors, working at the Brucejack Project and designated sites that potentially become submerged into Brucejack Lake or other lake/river on the Brucejack site.

Health, Safety & Reclamation Code of BC

- 3.2.2.1 – General Safety Rules

Definitions

- PPE – means Personal Protective Equipment for working around waterbodies such as floater suits, PFD's and other standard safety equipment.
- Workers – includes all Pretivm employees and contractors on site.

Responsibilities

Mine Manager or Designate is responsible for:
- Ensuring this SOP is implemented and maintained.

Health and Safety Manager is responsible for:
- Ensuring the implementation of this procedure is monitored;
- Conduct reviews and make amendments to the procedure as required; and,
- Ensuring on-site personnel have up-to-date information and appropriate training regarding this SOP.

ERT Coordinator is responsible for:
- Monitoring the implementation of this procedure; and,
- Maintain training records and certifications.

Surface Operations Supervisor is responsible for:
- Ensuring that all personnel who are involved in ice/water response/rescue understand this procedure; and,
- Ensuring that only trained and competent personnel are engaged in Ice/Water Rescue.

Dump Operation Personnel:
- Follow this SOP as outlined and directed by the content of this document; and,
- Ensure all Dump Operation Personnel are properly dressed, wear life vests, harness and or belt with a D-Ring.
- Be familiar with the safety seacan contents located at entrance of dump site.

Preparation

Hazards

- Personal Injury;
- Extreme cold, frostbite, hypothermia;
- Slippery conditions with personnel and vehicle interaction;
- Potential of additional dump failure;

- Potential of breaking through ice into open water;
- Rescue equipment out of reach or unavailable.

Work Preparation:

- During any outside rescue operation, it is imperative that all responders are properly
- dressed and protected from the outside elements.
- Ensure all rescue equipment is readily available and in in good working order.
- Rescue equipment is available at know location on the dump and includes safety rings,
- harness/ Belt with D-Ring, life vests, rescue rope.
- Conduct weekly inspections of the Safety Seacan located at the entrance of the waste dump

Job Steps

1. Upon an individual going through the ice into the water, initiate Code 1 protocol by calling Code 1 Code 1 Code 1 on Channel 2 Repeater 1.
2. Give dispatch the nature of the emergency, your name, and location.
3. Dispatch to call a Code 1 on all channels and contact the ERT Coordinator on channel 2 repeater 1.
4. ERT Coordinator to dispatch ambulance to arrange for pickup of site medic at clinic.
5. Before responding, ensure that the responders are properly dressed and protected from the outside elements.
6. Ensure that the responders are wearing a life vest and remains 10 m from the outside crest.
7. The responding person can toss a life ring and instruct the victim to grab it and insert their arm around the life ring. Pull the victim towards the shore.
8. Alternately, the rescuer can throw a rope bag to the victim and get them to grab the rope and pull them to shore.
9. If the victim is able, instruct them to get onto shore and walk away from the crest edge.
10. If the victim is not able to get onto shore or walk to safety, rescuers will be required to get ready to load for transport.
11. Should transportation from the crest edge / shore line be required (inside 10m from the crest) ensure that all responders are tied off, wearing rescue suits and that a basket stretcher is pre-rigged for transport.
12. As with all rescue operations, safety of the responders will be priority number 1. With that in mind, emphasis must be put on ensuring that the rescue is carried out quickly and efficiently and with the correct equipment.
13. The buddy system will be used to monitor rescuers for signs of exposure (frostbite, hypothermia etc.) and will take frequent warm-up breaks. The ability of all responders to function as a team and to be able to continue in rescue efforts started by other members will be imperative to the success of the rescue.
14. Outside resources may be contacted in the event that the situation is beyond our rescue capabilities or if this is deemed a recovery mission.

General Information

- Quick recognition and a quick response is vital to the survival of a person submerged in water. Providing the victim can stay above water, the average time for a person to go unconscious will be approximately 1 hour with a floatation device.

		Has waste rock berm been placed along the crest of deposition areas properly? *Comments:*
		Do supervisors wear a floatation device during inspections when they are within 40 m from the crest? *Comments:*
		Has monitoring instruments (GNSS, Tilt-Beam, and/or SlideMinder) been placed properly and have the monitoring data been collected/recorded on a regular basis? *Comments:*
		Have settlement monuments been placed along the crest of advanced areas and have they been surveyed routinely? *Comments:*

		Have truck counts been provided to the Engineer for volume tracking? *Comments:*
		Have daily photos of the waste dump been taken? *Comments:*
		Have daily toolbox safety meetings been recorded that communicate the daily deposition plan to equipment operators? *Comments:*
		Is the current Emergency Response Procedure on file, available for reference, and understood by the relevant personnel? *Comments:*
		Have the relevant personnel been trained on the Emergency Response Procedures and do they have the necessary tools outlined in the Procedures to carry out a rescue? *Comments:*

Audit Comments

Meets Expectation		Supervisor's Daily Inspections
YES	NO	
		Has an inspection been completed for the active zones reported by remote dozer operator and/or surface operation supervisor? *Comments:*
		Have geotechnical inspections been completed on a routine basis: *Comments:*
		Have inspections included the following information to a satisfactory level? • Reported the time, active deposition areas, and weather conditions; • Work areas are delineated and dumping limit identified; • Noticeable signs of settlement, deflection, slope movement, changes in material type or moisture content on the waste rock deposition pad and crest areas; • Any areas experiencing consistent/frequent or notable erosion or tension cracking (including an accurate location of these areas); *Comments:*
		Has signage been located in the proper locations to avoid unnecessary traffic on dump site? *Comments:*
Audit Comments		

Equipment Operator's Compliance Audit Checklist

Meets Expectation		Operator's Procedural Tasks
YES	NO	
		Is type and origin of deposition material known by operator? *Comments:*
		Do operators follow specific deposition procedures: ice and snow removal, waste material mixing, setting times, and waste rock berm? *Comments:*
		Are haul truck drivers being directed where to dump and dumping from outside the 40 m dump marker? *Comments:*
		Do the operators understand the signs of geotechnical instabilities which include: consistent/frequent or notable erosion, sink hole, tension cracking, and surface deformations? *Comments:*
		Do operators actively monitor and inspect their workspace for signs of instability? Do they maintain a clean workspace so that signs of instability are more evident? *Comments:*
		Do operators understand and follow the mandatory track orientation while working on the dump? *Comments:*
		Do operators understand the difference between "Stop Work" and "Restricted Work"? *Comments:*
		Do operators perform pre-shift inspections and PPE inspections?

		Comments:
Meets Expectation		**Operator's Safety Equipment Audit**
YES	**NO**	
		Do operators working within 40 m of the dump crest have the following job specific PPE in addition to the standard PPE: • Manually activated floatation vests; • Hard hats with chin straps that must be worn while operating a dozer or excavator on the dump; and • Cold weather gear during winter *Comments:*
		Do operators complete a pre-work site hazard risk assessment during tailgate meetings? *Comments:*
Audit Comments

PLAN
1:1000

NOTES:

1. FOR GENERAL NOTES SEE REF 1.
2. SUSPENSION CABLE LENGTH AS SHOWN ON PROFILE = 665m EACH. ALLOW ADDITIONAL 120m PER PIPE FOR BACKUP CABLES AND FOR POTENTIAL ADJUSTMENT IN LOCATION OF CABLE ANCHORS.
3. THE SUSPENSION CABLE SYSTEM IS DESIGNED FOR THE LINE RAISED TO ITS ULTIMATE ELEVATION AND IS FLOWING FULL OF TAILINGS. WHEN FULL OF WATER, THE TENSION IS REDUCED TO APPROX. 110KN (25,000 LBF) AT THE ULTIMATE ELEVATION. ELEVATIONS HIGHER THAN THE ULTIMATE CABLE ELEVATION AS SHOWN ARE UNSAFE AS THE RESULTING TENSION CAN EASILY EXCEED CABLE BREAKING STRENGTH (47 TONNES/51.5 TONS).
4. ADD COMPACTED 75mm MINUS GRANULAR BERM ON TOP OF PIPE TRENCH TO ENSURE MIN. 1.5m OF COVERAGE OVER PIPELINES IN BURIED SECTION.
5. THE PIPE LINES SHALL BE FIELD INSULATED AND HEAT TRACED TO A MINIMUM DISTANCE OF 8m BEYOND THE SHORELINE AND A DEPTH OF EL 1362.00. THE INSULATION SHALL BE A WATERPROOF CLOSED CELL PLASTIC FOAM AND THE JACKET MATERIAL SHALL BE HDPE OF 1.14mm MINIMUM THICKNESS. ALTERNATELY, HALF ROUND HDPE SHELLS MAY BE FIELD-APPLIED AND WRAPPED IN PIPELINE TAPE COATING IN ACCORDANCE WITH AWWA C209. A DOUBLE LAYER OF TAPE SHALL BE USED WITHIN 8m ABOVE AND BELOW THE SHORELINE. OPEN ENDS OF PIPE INSULATION SHALL BE SEALED TO BE WATERPROOF.
6. ENCASE CABLE IN 2" OR 3" HDPE PIPE IN ZONE WHERE IT PASSES THROUGH WATER BETWEEN ELEVATIONS 1365 TO 1360. WHERE PRACTICAL (LIKELY SOUTH SHORE) PLACE MIN. 2m THICK LAYER OF SAND AND GRAVEL AROUND ENCASED CABLE C/W OUTER LAYER OF 10kg RIPRAP TO PROTECT FROM ICE ACTION.

NOTES:

1. ALL DIMENSIONS AND ELEVATIONS ARE IN METRES UNO.
2. THE LOCATION OF THE CABLE ANCHOR CAN BE MOVED UP OR DOWN THE SLOPE, BUT MUST STAY IN ALIGNMENT WITH THE CABLE AMD THE ANCHOR ON THE FAR SIDE. THE
3. THE BACKUP ANCHOR CABLE IS TO BE USED TO TAKE LOAD OFF OF MAIN CABLE WHEN TAILINGS DISCHARGE PIPE IS TO BE RAISED. PIPELINE TO BE RAISED ONLY WHEN EMPTY OF TAILINGS AND FULL OF WATER. THIS WILL MINIMIZE TENSION ON LINE WHEN WORKING ON IT. ONCE LOAD IS OFF MAIN CABLE, IT CAN BE UNCLIPPED AND SHORTENED TO RAISE THE PIPELINE TO THE DESIRED HEIGHT ABOVE THE DEPOSITED TAILINGS.
4. DURING THE FINAL STAGES OF PIPE RAISING, THE DOWN SPOUT IS TO BE REMOVED TO LIMIT THE AMOUNT THAT THE CABLE NEEDS TO BE RAISED IN ORDER TO MEET DISCHARGE REQUIREMENT.
5. THE SUSPENSION CABLE SYSTEM IS DESIGNED FOR A MAXIMUM TENSION OF 310KN (70000 LBF). THIS FORCE OCCURS WHEN THE LINE IS RAISED TO ITS FINAL LOCATION FOR THE LAST STAGE OF TAILINGS DEPOSITION AND IS FLOWING FULL OF TAILINGS. WHEN FULL OF WATER, THE TENSION IS ONLY 110KN (25,000 LBF) UNDER THE SAME CONDITIONS.
6. ANCHOR ROD DETAILS:
   - 32T (32 ø) DYWIDAG TEMPCORE THREADED BAR (500MPa YIELD STRENGTH) ROCK ANCHOR
   - USE 9" BEVELLED WASHER + ANCHOR PLATE
7. ANCHORAGE DEPTH INTO SOUND ROCK SHALL BE DETERMINED BY A QUALIFIED GEOTECHNICAL ENGINEER. ANCHOR DEPTH SHALL BE SUFFICIENT TO DEVELOP THE FULL YIELD STRENGTH OF THE ANCHOR IN TENSION INCLUDING THE EFFECTS OF GROUP ACTION. TESTING OF INSTALLED ROCK ANCHORS SHALL BE AT THE DISCRETION OF THE GEOTECHNICAL ENGINEER. MINIMUM ANCHORAGE DEPTH TO BE 3.0m.
8. ROCK ANCHORS SHALL BE PLACED IN 89ø HOLES IN ROCK WITH CENTRALIZERS AT 1 METER SPACING AND GROUTED IN PLACE. INSTALL GROUT TO MANUFACTURER'S RECOMMENDATIONS USING GROUT PUMP AND GROUT TUBES.
   - SIKAGROUT ARCTIC 100 WHERE AMBIENT SUBSTRATE TEMPERATURE IS BETWEEN –10°C AND +4°C.
   - MASTER BUILDERS MASTERFLOW 928 WHERE AMBIENT SUBSTRATE TEMPERATURE IS +7°C AND ABOVE.
   - REPORT TO THE ENGINEER FOR CASES WHERE THE AMBIENT SUBSTRATE TEMPERATURE FALLS BELOW –10°C.

1.0 INTRODUCTION

Newcrest Mining Ltd. (Newcrest; formerly Pretium Resources Ltd. [Pretium]) retained Golder Associates Ltd. (Golder), now WSP Canada Inc. (WSP), to produce an issued for construction (IFC) level design for tailings transport pipeline A (Line A) and tailings transport pipeline B (Line B) at Brucejack Mine. These two lines begin at the mill building and extend to the waste rock tailings storage facility (WRTSF) discharge location. Lines A and B are expected to be installed in the summer of 2023.

The Brucejack site is an active underground gold and silver mine located near Stewart, BC, Canada. The site is mountainous and has temperatures ranging from -30°C to 25°C.

1.1 Project Background

Tailings are either discharged to the WRTSF or thickened and transported for backfilling the excavated stopes in the underground mine. According to the Ministry of Environment and Climate Change Strategy Permit 107835, Section 1.3.2, the tailings outfall to the WRTSF, must never be positioned more than 7.5 metres (m) above the lake bottom (i.e., top of natural lake bottom or the deposited tailings), whichever is higher (MECCS 2018). Because the WRTSF is approximately 80 m deep, subaqueous tailings deposition is required. The previous pipeline system used either a series of cables spanning the WRTSF to support the pipeline, or a weighted pipeline system with a float at the discharge outfall located 7.5 m above the lake bottom or the tailings surface.

Newcrest experienced several reliability and safety concerns with the tailings transport system between its installation and July 2021. The existing cable-supported pipelines (Tails Lines 1 and 2) posed a safety risk to personnel due to the highly tensioned cables used. Tails Line 1 was plugged with tailings, then disconnected and abandoned. Tails Line 2 is also not in use. There are three of four operable perimeter discharge bottom pipelines (Tails Lines 3, 4 [inoperable], 5, and 6). Tails Line 3 was disconnected in the fall of 2017 after plumes were observed during line operation. Tails Line 3 was reconnected in 2018 but remains unused. Tails Line 4, installed in October 2020, operated until 9 July 2021 when Tails Line 4 was noticed to be floating on the surface of the WRTSF. Tailings delivery through Tails Line 4 was later shutdown, resulting in Tails Line 4 sinking to the bottom of the WRTSF and becoming plugged. Tails Line 4 was subsequently disconnected, while new Tails Lines 5 and 6 were installed for redundancy in September 2021 and functioning well to date. Figure 1 shows the current pipeline arrangement at shore.

Figure 1: Current Aerial Photo of Shore

1.2 Design Cycle and Update of Lines A and B

Prior to Tails Lines 5 and 6 design, a review of the tailings transport system (Tails Lines 1, 2, 3, and 4) and an options analysis was required to develop a pathway forward with a more reliable system. An options analysis for the tailings distribution system was completed by Golder in October 2021. Option E2 (fixed perimeter and central floating subaqueous pipeline discharge) was the preferred option (Golder 2021a). The feasibility design of the selected option was completed on 7 December 2021 (Golder 2021b). Three lines were included in this design (A, B, and FL1), which aligns with the deposition plan presented in Golder 2022b.

Collection of additional operating data was a key recommendation from the feasibility design report (Golder 2021b). The hydraulic design was based on a limited sample of data. Golder developed an Excel workbook for Pretium to collect additional data that would help validate the hydraulic design of the tailings pipelines at Brucejack.

On 8 April 2022, Golder Issued the IFC design for Tails Line A (Golder 2022a) at an average production rate of 4,600 tpd (tonnes per day).

The original project authorized production rate was 1,387,000 tonnes per year (average 3,800 tpd). Newcrest upgraded the system in the past and is currently operating at an average of 4,600 tpd. Newcrest is considering an increase in production to an average of 5,000 tpd at 92% utilization; therefore, the daily throughput of the mill is 5,434 tpd or 226.4 tonnes per hour (tph).

This IFC design report advances the design of Line A and Line B for an average production rate of 5,000 tpd, and a maximum volumetric production rate of 303 m^3/h of tailings to be transported to the WRTSF.

The addition of two subaqueous perimeter discharge pipelines (Line A and Line B) will provide added capacity and reliability to the existing system. The discharge location of Lines A and B are limited in movement as they will be weighted to the bottom of the WRTSF (see Drawing 2 for site plan in Appendix A).

The objective of this pipeline design is to allow for the acquisition of pipeline system materials for construction in the summer of 2023.

Note: This report is focused on the operation of the surface to subaqueous tailings perimeter discharge system of Lines A and B from pumps in the mill to the WRTSF. Paste production and transport is beyond WSP’s current scope.

2.0 CURRENT SURFACE TAILINGS DISTRIBUTION OPERATION

The current tailings distribution system at Brucejack Mine begins at the tailings disposal surge tank (TDST) (3126-TK-001) located within the mill. Two horizontal centrifugal pumps are installed in parallel to transport tailings slurry to the WRTSF. These two pumps (3126-PU-005 and 3126-PU-006) are High Head millMAX 6X4-21-HH (FLS 2018) with design duty points of 212 m^3/h at 55 m total dynamic head (TDH), and 117 m^3/h at 51 m TDH. Each pump is driven by a 150-horsepower (hp) motor (FLS 2018) with a variable speed drive. When throughput to the WRTSF is high, both pumps are used at the same time to deliver the required flow rate. When the flow rate to the WRTSF is reduced, only one pump is on duty and controlled by the slurry level in the TDST (3126-TK-001).

WSP identified a risk of low flow / sanding due to the uncontrolled volume of slurry coming into the TDST during paste backfill operations. Corrective actions included adding pump discharge pressure monitoring (implemented). Low flow over-ride to add dilution water to the TDST via HV-6857 was suggested during the feasibility design and is planned to be implemented. Implementation of the addition of dilution water to the tailings would ensure reliable transport of tailings to the deposition points.

Two 6-inch extra strong (XS) carbon steel (CS) pipelines are routed in parallel from the tailings disposal pumps (3126-PU-005 and 3126-PU-006) to the wall of the mill building. At the mill building wall, the pipeline specification changes from 6-inch XS CS to 6-inch dimension ratio (DR) 9 high-density polyethylene (HDPE). At chainage 0+705 m, a valve cross-over station was installed so that flow from one of the pipelines can be directed to the other line if needed. Before the valve cross-over station, both pipelines (Mill Lines 1 and 2) transition to 6-inch DR7.3 HDPE. After this transition, the two pipelines (Tails Lines 5 and 6) continue with the same pipe type to the discharge location. The valve shack is located at chainage 0+935 m on the shoreline of the WRTSF. Figure 2 presents a piping schematic diagram of the existing piping at the shore.

Figure 2: Pipeline Naming Diagram

Air/vacuum valves have been strategically positioned to allow more air to exhaust from the pipelines. Locating these valves closer to shore, where slack flow occurs more frequently, allows a larger volume of air to be exhausted. Newcrest has observed large volumes of air being exhausted out of the new air/vacuum valves that were installed in September. In the valve shack, one 8-inch HDPE DR7.3 pipeline ties into each of the 6-inch DR7.3 lines. One of the 8-inch lines is suspended (Tails Line 2) while the other 8-inch line runs along the bottom of the WRTSF (Tails Line 3). Figure 3 shows a site aerial view and approximate land pipeline routing.

Figure 3: Waste Rock Tailings Storage Facility

Pipelines are routed along the WRTSF bottom with concrete weights, attached to counteract the buoyancy of the HDPE pipe, as well as floats to prevent the pipeline from becoming buried.

The tailings discharge pipelines are mostly buried from the mill to the shore. Approximately 36.5 m (120 feet) of heat tracing and insulation is used, with 18.23 m extending into the WRTSF for each line. When the line is not transporting tailings and ambient temperatures are below freezing, a continuous flow of process water is introduced to the pipelines through an injection point at the mill to prevent lines from freezing. When not in use, tailings lines are flushed with water to clear the pipelines of solids.

The existing tailings pipelines at Brucejack lack the redundancy necessary for reliable operation. The main operational issues experienced with the original tailings transport system are pipeline plugging occurrences and non-functioning air valves.

Shoreline access is limited, with several pipelines routed closely together (Figure 4).

Figure 4: Waste Rock Tailings Storage Facility Access Area for Tails Lines 2, 3, 5, and 6 (30 August 2022)

Figure 5 shows existing valve shack 1.

Note: Eastview towards the snow dump (30 August 2022).

3.0 STUDY GENERAL CONSIDERATIONS

3.1 Scope and Battery Limits

The new perimeter discharge bottom tailings pipelines (Line A and Line B) are expected to be installed in 2023. These pipelines will tie-in near the tailings disposal pump area at the mill and will run to the WRTSF. At the shoreline, the pipelines will transition to subaqueous routing and run along the bottom of the WRTSF.

The scope of work includes:

- system design criteria
- review of Newcrest's prepared piping and instrumentation diagrams beginning outside the mill to pipeline discharge
- general arrangement drawings (key facilities outside the mill)
- plan and profile of pipeline
- piping tie-in drawing
- piping detail drawings
- steady-state hydraulic analysis
- sizing of pipeline weights and floats
- pipeline flushing water requirements
- material take-offs

This IFC design has been based on the design basis technical memorandum (WSP 2023a). Key design criteria can be found in Section 3.4.

3.2 Assumptions

The following assumptions form part of the Line A and B design:

- Laboratory test work provided by Newcrest is assumed to be accurate and representative.
- Operating data (including flow rate, pressure, and slurry density measurements) provided by Newcrest is representative and accurate.
- Friction losses were calculated using the Colebrook-White equation with a calibrated contingency percentage based on operating data (5% for 49% solids and 16% for 61% solids).
- Slurry transition velocity has a 10% safety factor.
- Slurry deposition velocity has a 10% safety factor.
- The flow rates have a 1.15 design factor.
- Current solids content operating range will remain the same in the future (i.e., 49% to 61% solids).
- Mill utilization is assumed to be 92%.

- Motor power use has a 15% safety factor.
- Pump hydraulic efficiency is based on the existing pump curve provided by the vendor.
- All HDPE pipe considered shall be resin type 4710.
- Absolute roughness of used HDPE (slurry operation) is 0.0000457 m and new HDPE is 0.00002 m.
- Absolute roughness of CS is 0.0000508 m.
- Absolute roughness of pipe rubber liner is 0.000305 m.
- Density of polyurethane foam is 30 kg/m^3 (1.87 pounds per cubic foot [lb/ft^3]).
- Weight of 8-inch DR9 pipe is 10.03 pounds per foot (lb/ft).
- Weight of 8-inch DR9 with 2-inch-thick insulation is 11.5 lb/ft.
- Density of slurry at 61% solids is 102.01 lb/ft^3.
- Weights spaced to counteract buoyancy of HDPE pipe when full of air.
- Weight of cable, pipe clamps, and other accessories have been taken into consideration.
- WRTSF water current is assumed to have no impact on weights required for Line A and Line B.
- Heat tracing and insulation for Line A and Line B per client request.
- Concrete post bases are to be used for the pipeline weights as per client request. Each weight is to be 34 kg (75 lbs) or 166 kg (366 lbs).
- Use pipe clamps rather than concrete collars for the pipeline weighting system at the client's request.
- Pond elevation (1,365 m) will not rise significantly during life of mine.
- Water depth at discharge of Line A is 32.3 m (1,332.7 m elevation) and Line B is 29.4 m (1,335.6 m elevation), based on the deposition plan (WSP 2023b).

3.3 Exclusions

The following were excluded from the study:

- evaluation of impact of change on the backfill plant operation (if any)
- site surveying
- permitting
- scope already covered in WSP's geotechnical design scope of work
- design or costing for access roads / pipeline corridors to WRTSF
- mooring analysis
- capital cost estimate and operating expenses

- new pumps and control equipment
- pipe supports
- isometric drawings
- all in-plant equipment
- water pipeline from WRTSF

3.4 Design Criteria

Table 1 and Table 2 present the key design criteria. The mine waste production is based on 5,000 tpd throughput.

Table 1: Properties and Throughput of Tailings Slurry Pipeline

Criteria	Unit	Planning Value	Comment/Reference
Tailings pH	-	8.7	mill team (Chong T., 12 May 2021)
Tailings gradation	-	**Size (µm)** / **Cumulative% Passing (by dry mass)** 310 / 95 250 / 90 162.4 / 80 110 / 70 80 / 60 42.5 / 50 20 / 40 9.0 / 30 4.2 / 20 2.2 / 10	May 2020 tails (RMS 2020)
Tailings solids specific gravity	-	2.65 to 2.75 (2.67)	Norton (2021), RMS (2020)
Solids content of tailings discharged to WRTSF	%	range: 49 to 61	Laliberte (2023)
Slurry density to TSF	kg/m^3	nominal: 1,453 design: 1,617	calculated nominal based on 49% solids, design based on 61% solids
Tailings slurry yield stress	Pa	~1.05 to 12.18	values taken from tab D Tank-50 and D Tank-60 for 49% to 61% solids slurry (Newcrest 2023a)
Tailings slurry dynamic viscosity	Pa.s	~0.016 to 0.103	May 2020 tails for 49% to 61% solids slurry (RMS 2020)
Planned average (nominal) daily ore production	tpd	5,000	5,000 tpd at 92% availability (Laliberte 2023)
Availability	%	92%	Laliberte (2023)
Daily throughput of the mill	tpd	5,434	Laliberte (2023)
Hourly through put of the mill	tph	226.4	Laliberte (2023)
Portion of tailings directed to WRTSF	%	52% to 100%	Laliberte (2023)

Table 1: Properties and Throughput of Tailings Slurry Pipeline

Criteria	Unit	Planning Value	Comment/Reference
Tailings dry tonnage to TSF	tph	109 to 214	214 tph nominal maximum (24% bypass, no paste), 109 tph nominal minimum (no bypass, 48% tailings to paste) (Laliberte 2023)
Minimum design slurry flow to TSF	m^3/h	108	no bypass, with paste at 61% solids (Laliberte 2023); no design factor will be added to this minimum
Maximum design slurry flow to TSF	m^3/h	303	24% bypass, no paste at 49% solids (Laliberte 2023), a 1.1x design factor will be added to this value for contingency

Pa.s = pascal-second; tpd = tonnes per day; tph = tonnes per hour; TSF = tailings storage facility; WRTSF = waste rock tailings storage facility; - = N/A.

Table 2: Pipeline Discharge Criteria

Criteria	Unit	Planning Value	Comment/Reference
Maximum pipeline discharge distance above tailings surface or WRTSF bottom[(a)]	m	7.5	MECCS Permit 107835
Tails Line A discharge location	m	N: 427730.45 E: 6258818.47 Elev:1329.49	WSP (2023b)
Tails Line B discharge location	m	N: 427833.56 E: 6258786.00 Elev: 1334.95	WSP (2023b)

(a) Pending on outcome of deposition model, this may change during design optimization. Further discussion with Newcrest permitting team during design development and amendment to the permit may be required.

Elev = elevation; N = north; E = east; MECCS = Ministry of Environment and Climate Change Strategy; WRTSF = waste rock tailings storage facility.

WSP (2023a) provides the detailed design basis and criteria.

4.0 LINES A AND B – TAILINGS TRANSPORT DESIGN

Two existing 150-hp tailings disposal pumps are installed currently in the mill. WSP understands that one new pump will be added to the existing pump arrangement to provide additional capacity and contingency for the tailings disposal system. Only up to two pumps are to be operated at any one time, and the third pump will serve as a standby.

Figure 6 provides an overview of the tailings disposal system.

Figure 6:Tailings Pipeline Connection Schematic

Mill Line 1 (potential discharge through Line 5, 6, 3, or A): entirely existing and the only change to this system is the addition of a tie-in from Line A to Line 5. This system is mainly fed by existing pump PU-005 with 150-hp motor and utilizes existing piping. PU-005 can also feed Line A through a by-pass in mill.

Line A (potential discharge through Line 5, 6, 3, or A): fed by existing pump PU-006 with 150-hp motor and utilizes existing 6-inch XS CS in-plant piping. All outside of plant piping and equipment is new per WSP design.

Line B (potential discharge through Line 5, 6, 3, A, B): fed by a new pump to provide flow to Line B; all components of Line B will be new equipment.

4.1 Flow Range Reporting to the Waste Rock Tailings Storage Facility

An average of 5,000 tpd of tailings is the planned production rate. Lines A and B are expected to operate between 49% and 61% solids by weight (Laliberte 2023). The volumetric flow range required in the design criteria is based on a plant utilization of 92% and a 1.1 design factor. The flow rate will range between 108 to 331 m^3/h (Figure 7).

tph = tonnes per hour; m^3/hr = cubic metres per hour.

Figure 7: Operating Flow Range to the Waste Rock Tailings Storage Facility

The tailings flow range represents the tailings to be transported to the WRTSF without dilution water addition. It is possible to reduce the variability in volumetric throughput by adding dilution water to the tailings when tailings production is low. WSP understands that Newcrest is planning to supply dilution water from the WRTSF for such purposes.

4.2 System Operating Data

An Excel workbook was developed by WSP for Newcrest to collect additional tailings disposal operating data. Additional data aids WSP in customizing pipeline design to Newcrest's specific tailings material.

Tests were run on Tails Lines 5 and 6, which were installed in September 2021. Each pipeline was tested at 0% (water only), 45%, 50%, and 63% solids, while varying the flow rate at each solids concentration. Pressure data were collected at specified hold times for each operating condition to allow the pipeline time to fill with the intended material and allow pressure readings to stabilize.

The completed worksheet was sent to WSP by Chloe Redies on 17 February 2023 (Newcrest 2023c). WSP understands that no low density (45% solids) operating data was collected due to the capacity of the TDST. Adding dilution water to the volume of slurry reporting to the TDST during the test would have caused the TDST to overflow. Raw data from the distributed control system was also provided for reference over various operating ranges (Newcrest 2023b).

4.3 Hydraulic Analysis

Table 3 provides Lines A and B start and discharge elevations.

Table 3: Pipeline Length and Elevation Parameters

Pipeline	Length (m)	Start Elevation (masl)	Discharge Elevation (masl)	Elevation Differential (m)	Discharge Depth from Water Surface 1,365 (m)
Line A	1023	1408.4	1332.7	-75.7	32.3
Line B	1091	1408.4	1335.6	-72.8	29.4

masl = metres above sea level.

Figure 8 and Figure 9 provide elevation profiles for Line A and Line B pipeline routes.

WRTSF = waste rock tailings storage facility.

Figure 8: Line A Elevation Profile

WRTSF = waste rock tailings storage facility.

Figure 9: Line B Elevation Profile

Due to the steep sloping drop-off as the pipeline enters the WRTSF, open channel flow will frequently occur at the shore. Air/vacuum valves were included in the design to mitigate vacuum formation and air constriction of the flow path.

Hydraulic analysis was carried out to determine the appropriate pipe specifications and pumping requirements to meet the design criteria. The existing tailings transport pumps were considered in this analysis.

4.3.1 Calibration of Hydraulic Model Based on Operating Data

Slurry friction losses were calibrated using operating data (WSP 2023b,c) (Section 4.2). Head loss data were calibrated with the Colebrook-White equation for Newtonian fluid flow under each specific operating condition (percent of solids). The use of a calibrated Colebrook-White equation for specific flow conditions is appropriate for slurry flow in turbulent flow regime (design condition for the pipelines), based on WSP experience.

The purpose of calibrating the head loss equation is to determine the predicted head loss equation and apply this equation to the design of Lines A and B. Table 4 presents the results from the calibration analysis.

Table 4: Calibration Results

% Solids	Flow Rate from Data (m^3/h)	Pump Discharge Head from Data (m)	Calibration Factor on Colebrook
49%	130	17.92	+5%
61%	142	39.80	+16%

The calibration for the 49% solids head loss was based on the data point 130.1 m^3/h (17.92 m; circled in red in Figure 10). Calibration with this point resulted in a +5% calibration factor applied to the Colebrook equation to produce the same TDH as the operating data.

wt% = percent by weight; m^3/hr = cubic metres per hour.

Figure 10: Pump Discharge Head versus Flow Rate at 50 wt% to 55 wt% Solids

Figure 10 summarizes the operating data from the spreadsheet tailings test sheet.xlsx at 50% solids and spreadsheet tails correct data.xlsx from 50% to 55% solids.

Calibration for the 61% solids head loss was based on the data point 142.0 m^3/h (39.8 m; circled in red in Figure 11), which resulted in a +16% calibration factor applied to the Colebrook equation to produce the same TDH as the operating data.

wt% = percent by weight; m^3/hr = cubic metres per hour.

Figure 11: Pump Discharge Head versus Flow Rate at 60 wt% to 65 wt% Solids

Figure 11 summarizes the operating data from the spreadsheet tailings test sheet.xlsx at 63% solids and spread sheet tails correct data.xlsx from 60% to 65% solids.

The two points circled in red in Figure 10 and Figure 11 were selected for head loss calibration since they were collected at the high end of the flow range that was possible with the existing system and are closer to the desired operating points of the new lines.

For comparison, Table 5 shows the calculated unit head loss based on Colebrook with a 16% calibration factor and based on the WSP theory-based slurry model for each pipe specification for Line 6 calibration. By applying a 16% safety factor to the Colebrook equation, the resulting TDH matches the operating data of 39.8 m.

Table 5: Friction Loss Comparison at 61% Solids

Pipeline	% Solids	Flow Rate (m^3/h)	Unit Head Loss (m/km), Water (Colebrook+0%)	Unit Head Loss (m/km) Calibrated with Operating Data (Colebrook+16%)	Unit Head Loss (m/km), Theory-Based on Slurry Properties
6-inch XS	61	142	34.3	39.8	54.7
6-inch DR9	61	142	65.3	75.8	123
6-inch DR7.3	61	142	95.0	110	183
System TDH	61	142	28.3 m TDH	39.8 m TDH	93.7 m TDH

TDH = total dynamic head; XS = extra strong; DR = dimension ratio.

WSP selected to base the hydraulic analysis on operating data rather than the theoretical model based on slurry properties because the theoretical slurry head loss predictions far exceed the observed head losses reported on site.

The existing tailings disposal systems discharge pressure is set at an upper limit of 650 kilopascals (kPa); any pressure beyond that would blow out the existing packing (WSP understands that this is a gland water issue and can likely be fixed by using proper packing and water pressure). If operating the existing pumps above 650 kPa, an upgrade of the gland water system would be required.

The existing slurry pumps are each equipped with a 150-hp motor, which would limit the upper flow range of Lines 3 and A.

Table 6 and Table 7 present predicted TDH at 61% solids at various flow rates for Lines A and B, respectively.

Table 6: System Head (Total Dynamic Head) and Pressure Results for Line A

Pipeline A	% Solids	Flow Rate (m^3/h)	Line A, Slurry Head (m)	Lina A, Water Head (m) using HR[c]	Pressure (kPa)	Pressure (psi)	Assumed Pump Efficiency[a]	Power Draw[b] (hp)
Sizing for new pump	61	331	53.8	57.8	862	125	62.5%	196
Limited by 150-hp existing pump motor	61	313	43.7	47.0	701	102	62.5%	150
Limited by 650 kPa gland water pump packing	61	307	40.6	43.7	650	94	62.5%	137
Duty point	61	212	4.4	4.7	71	10	58.0%	11
Duty point	61	141	3.1	3.3	50	7	62.0%	4.8
Duty point	61	120	2.8	3.0	45	7	62.5%	3.65

a) Pump efficiencies are based on existing pump curve.

b) Power draw includes a 15% contingency.

c) Water head is consistently higher than slurry head as the density of water is less than the density of the slurry.

HR = head ratio; psi = pounds per square inch; kPa = kilopascal; hp = horsepower.

Table 7: System Head (Total Dynamic Head) and Pressure Results for Line B

Pipeline B	% Solids	Flow Rate (m^3/h)	Line B, Slurry Head (m)	Lina B, Water Head (m) using HR[c]	Pressure (kPa)	Pressure (psi)	Assumed Pump Efficiency[a]	Power Draw[b] (hp)
Sizing for new pump	61	331	55.5	59.7	890	129	62.5%	202
Limited by 150-hp existing pump motor	61	312	43.7	47.0	701	102	62.5%	150
Limited by 650 kPa gland water pump packing	61	307	40.6	43.7	650	94	62.5%	137
Duty point	61	276	24.7	26.0	396	57	61.0%	77
Duty point	61	141	2.7	2.9	43	6	62%	4

a) Pump efficiencies are based on existing pump curve.

b) Power draw includes a 15% contingency.

c) Water head is consistently higher than slurry head as the density of water is less than the density of the slurry.

HR = head ratio psi = pounds per square inch; kPa = kilopascal; hp = horsepower.

The maximum head that would occur within the design range is the pumping of 331 m^3/h of 61% solids slurry through one of the 8-inch pipelines. The pumping head estimate, at this point, is a slurry head of 56 m (890 kPa) with a power draw of 202 hp; assuming 62.5% pump efficiency. It would be the highest duty point required by the new pump; however, it is not recommended to pump the full flow through one line frequently as it could result in high wear. WSP recommends using this operating point to size the new pump for Line B so that the new pump does not become the bottleneck if design/operating conditions change in the future.

4.3.2 Pipe Selection and Expected Hydraulic Result

The design for Lines A and B is based on a model calibrated to the operating data.

Lines A and B would be used in combination with other operatable pipelines on site to deliver tailings from the mill to the WRTSF. Since the flow rate will vary widely (108 m^3/h to 331 m^3/h), operating pipelines will also vary depending on the flow rate delivered to the TDST.

The existing Tails Lines 5 and 6 are both 6-inch pipe diameter. Line 3 is mostly 6-inch pipe diameter with the discharge portion of the pipeline after valve shack 1 transitioning to 8-inch pipe diameter.

A pipe diameter of 8 inches was selected for the new sections of Lines A and Line B. This larger pipe diameter will provide operational flexibility in combination with the existing 6-inch pipelines.

WSP understands Newcrest would prefer the existing 6-inch XS CS in-plant piping for Line A. At the mill building exit, the pipeline would transition to 8-inch HDPE DR9 pipe and continue with this pipe type to the discharge point.

The new Line B would consist of 8-inch XS CS Grade B piping with a 0.375-inch rubber liner within the mill, then transition to 8-inch HDPE DR9 at the mill building exit and continue with this pipe specification to the discharge. Line B was specified as 8-inch to provide additional capacity with Tails Lines 5 and 6. Line A, Tails Line 5, and Tails Line 6 will have a consistent minimum flow rate to stay above deposition velocity. The deposition velocity of Line A is 1.61 m/s, and the deposition velocity of Line B is 1.64 m/s, set by the largest inner diameter section of the pipelines (8-inch DR9 and 8-inch XS CS with rubber liner for Lines A and B, respectively). Table 8 presents the deposition and transition velocities within each pipe type at various solids contents.

Table 8: Deposition and Transition Velocity

Solids	Pipe Type	Deposition (m/s)	Corresponding Flow (m^3/h)	Transition (m/s)	Corresponding Flow (m^3/h)
61%	8-inch XS CS with RL	1.63	141	2.84	245
	8-inch DR9	1.61	128	2.69	213
	6-inch XS CS	1.56	94	2.80	170
49%	8-inch XS CS with RL	1.64	141	0.77	66
	8-inch DR9	1.61	128	1.41	112
	6-inch XS CS	1.56	94	1.41	85

XS = extra strong; CS = carbon steel; DR = dimension ratio: RL = rubber liner.

The operating flow rate of Line A should not drop below 128 m^3/h, and the operating velocity of Line B should not drop below 141 m^3/h. If the flow rate of tailings reporting to the TDST drops below the deposition velocity of the operating line and a smaller diameter pipeline is not available, a low flow override via HV-6857 should activate the addition of dilution water to account for the difference. Implementation of this control would result in more reliable transport of tailings and reduce risks of plugging.

The transition velocity results show the relation between the solids content and the velocity required to maintain turbulent flow. The transition velocity increases at the higher solids content range.

When operating at higher solids contents, there is a risk of operating in laminar flow (below the transition velocity) and solids settling. Since the coarse fraction of material in Newcrest's tailings slurry is low, the fluid is likely operating in stable laminar flow. Stable laminar flow is an operating mode that could allow for some solids settling with the finer portion of the settled material being resuspended and dropped back to the bottom of the pipe over the length of the line. Since there is only a small fraction of coarse material remaining settled and dragged along the bottom of the pipe, it would not have a large impact on the head of the system in the short term. Sustained operation in this mode could result in solids accumulation and eventual blockage. WSP suggests operating at the upper range of the possible flow rates with frequent flushing to reduce the potential for solids accumulation in the pipeline. Discharge pressures should be monitored regularly. If flow is constant but discharge pressures are increasing, solids accumulation could be occurring. Mitigation of risks associated with operating below transition velocity is addressed in Section 4.3.3.

The expected hydraulic gradient was calibrated using the Colebrook-White equation assuming water fluid properties and a calibration factor of 16% for 61% solids, and calibration factor of 5% for 49% solids.

Figure 12 and Figure 13 show predicted operating range diagrams of Line A and Line B, respectively. The blue area represents operation below the deposition velocity where risk of solids accumulation at the bottom of the pipe is high. The red area was determined via hydraulic analysis, the pump curve, and the motor rating (existing pump curve in Appendix C). Operation in the red area represents operation exceeding the 150-hp capacity of the existing motors with a 15% safety factor on the motor power usage. The interface is slanted as more pumping power is required to pump a heavier specific gravity slurry than a lighter specific gravity slurry, resulting in higher flow rates being possible at lower solids contents.

The vertical dashed line shows the flow rate that corresponds with a flow velocity of 3.5 m/s. Slurry pipelines operating above 3.5 m/s for a sustained period could experience increased wear and high energy consumption. It is not recommended to operate above 3.5 m/s for sustained periods. The maximum flow rates to stay below 3.5 m/s is 212 m^3/h in Line A and 276 m^3/h in Line B.

tph = tonnes per hour; XS = extra strong; CS = carbon steel; Cw = weight concentration; m^3/hr = cubic metres per hour; HP = horsepower; kPa = kilopascal; " = inch.

Figure 12: Operating Range Diagram of Line A

Line A is expected to be able to operate with a maximum flow rate of 312.5 m^3/h at 61% solids. Hydraulic analysis shows that the TDH of slurry to pump tailings at the maximum flow rate is 43.7 m, and one pump at the mill would draw 150 hp under such conditions. At the maximum flow rate, the operating velocity of this line is 3.94 to 5.16 m/s.

tph = tonnes per hour; XS = extra strong; CS = carbon steel; Cw = weight concentration; m^3/hr = cubic metres per hour; HP = horsepower; kPa = kilopascal; " = inch.

Figure 13: Operating Range Diagram of Line B

Line B is expected to operate with a maximum flow rate of 312.5 m^3/h at 61% solids. Hydraulic analysis shows that the TDH of slurry to pump tailings at the maximum flow rate is 43.7 m, and one pump at the mill would draw 150 hp under such conditions. At the maximum flow rate, the operating velocity of this line is 3.62 to 3.94 m/s.

Figure 14 and Figure 15 show the expected slurry pump discharge heads at the key operating interfaces shown in Figure 12 and Figure 13.

m^3/hr = cubic metres per hour; Sol = solids; ; Expon. =exponential.

Figure 14: Pump Discharge Head versus Flow Rate at Line A

m^3/hr = cubic metres per hour; Sol = solids; ; Expon. = exponential.

Figure 15: Pump Discharge Head versus Flow Rate at Line B

4.3.3 Operating Strategy

The operating strategy shown in Table 9 is preliminary and adjustable as the field performance of the system is observed after installation and commissioning. The constraints on the operation of this system are the minimum velocity, maximum velocity, and pumping capacity.

Lines A and B lower operating range is set by the deposition velocity. The deposition velocity of Line A is 1.61 m/s which corresponds to 128 m^3/h. Line B has a deposition velocity of 1.64 m/s, which corresponds to 141 m^3/h.

The upper operating range of Lines A and B is set by the 3.5 m/s recommended maximum operating velocity, which corresponds to 212 m^3/h in Line A and 276 m^3/h in Line B. The 3.5 m/s operating limit is set to control pipeline wear.

Table 9 shows the recommended operating strategy of the tailings pipeline system.

Table 9: Recommended Operating Strategy

Tailings Flow Rate (m^3/h)	Pipelines Operated
120 and below	use one 6-inch line (existing Line 1 and discharge through 3 or 5)
120 to 141	use one 8-inch line (Line A)
141 to 212	use one 8-inch line (Line A or Line B)
212 to 276	use one 8-inch line (Line B)
276 and above	use two 8-inch lines, or one 8-inch and one 6-inch line (flow in each line would be 138 m^3/h or greater if divided equally)

The recommended operating strategy is intended to serve as a guideline for system operation. Operation outside the above flow ranges may be acceptable for limited durations.

If the flow rate of tailings drops below the deposition velocity and it is not possible to switch to a smaller diameter pipe (or it is inconvenient to do so in the case where flow rates are regularly fluctuating), dilution water can be added or a more regular flushing procedure can be implemented.

The required flush velocity of Lines A and B must be a minimum of 1.64 m/s in the 8-inch XS CS portion of the pipe, with a required flush duration of 35 minutes which equates to a flow rate of 141 m^3/h and should be performed weekly.

If pressures begin to rise unexpectedly, it could be an indication of a partial blockage and a flush or addition of dilution water should be performed as soon as it is practical. After flushing, when it is known that there is a clean pipe free of blockage, the discharge pressure (on water) should be noted for future reference. This pressure could be used as a baseline. If there is not a similar pressure after flushing, this indicates there may still be settlements in the pipe and the flush velocity should be increased.

4.3.4 Configuration – Fixed Perimeter Discharge

Lines A and B are subaqueous perimeter discharge pipelines. Discharge locations of Lines A and B have limited mobility since they will not be able to be relocated once sunk (see Drawing 2 for site plan and pipeline and layout in Appendix A).

Line A is connected to PU-005 and Line B is connected to the new pump within the mill. From the pump tie-ins, the pipelines are expected to be routed along the wall on the southeast side of the mill building. At a point determined by Newcrest, the pipeline will be directed downward, under the floor of the mill, and continue underground to the WRTSF. The in-plant pipeline routing is beyond WSP's scope of work and will be defined by Newcrest. Line A will tie-in to Line 5 outside the mill building just before valve shack 1. Line B runs independently from the mill exit to the discharge.

Line A and B are weighted with concrete blocks to counteract the buoyant forces of the HDPE pipe, insulation, and air that could fill the pipe in the subaqueous section. The concrete blocks rest on the lakebed sediments and are attached to the pipe with cables and riser pipe clamps; weights would be installed at the end of the pipeline to allow flotation to 7.5 m above the natural lakebed or tailings surface. The length of each cable is unique to provide a gradually sloping profile minimizing any peaks or troughs where air or solids could accumulate (Drawings 3, 4, 5, and 6 for pipeline profiles and weight tables in Appendix A). See drawings 7 and 8 for weight details in Appendix A. Table 10 provides specific weight details and spacing.

Table 10: Weight Spacing

Line	Pipe Type	Insulated	Weights	Weight Type	Spacing Every	Chainage from shore (m)	Comments
A	8-inch HDPE DR9	yes	166 kg (366 lbs)	Pipe clamp with concrete block	1.4 m	0 - 18.2	-
	8-inch HDPE DR9	no	2 at 34 kg (75 lbs)	Pipe clamp with concrete block	1.4 m	19.6 - 109.2	-
	8-inch HDPE DR9	no	2 at 166 kg (366 lbs)	Pipe clamp with concrete block	N/A	110.6	additional two 366-lbs weights to counteract each float
B	8-inch HDPE DR9	yes	166 kg (366 lbs)	Pipe clamp with concrete block	1.4 m	0 – 18.2	-
	8-inch HDPE DR9	no	2 at 34 kg (75 lbs)	Pipe clamp with concrete block	1.4 m	19.6 – 155.4	-
	8-inch HDPE DR9	no	2 at 166 kg (366 lbs)	Pipe clamp with concrete block	18.5m	117.6;135.8;154.0	additional two 366-lbs weights to counteract each float

DR = dimension ratio; HDPE = high-density polyethylene; - = not applicable; lbs = pounds; kg = kilograms.

A neoprene sponge sheet should be wrapped around the pipeline before application of pipeline clamps to prevent the clamps from slipping. In addition, during installation of the pipeline clamps, it is recommended to tie a 0.5-inch diameter polypropylene rope to each of the clamps to prevent the weights from slipping during the installation.

One float composed of 6.5-foot long, 8-inch HDPE DR9 pipe with 3-inch thick insulation and capped ends is connected to the end of Line A to serve as an underwater pipe float. Three of the same specified floats are needed for the floating section of Line B to prevent the end of the pipeline from becoming submerged in settled tailings that could clog the pipe end (Table 11 for float specifications). An additional two 366-pound weights are required to counteract the buoyancy of each float; total of two 366-pound weights at the end of Line A. A total of six 366-pound weights along the end of Line B.

Table 11: Float Specification

Line	Pipe Type	Insulated	Float	Floating Length (m)	Spacing	Comments
A	8-inch HDPE DR9	no	one 6.5-ft long, 8-inch DR9 pipe with 3-inch thick insulation	18.5	one at end of pipe	an additional two 166 kg (366-lbs) weights to counteract each float
B	8-inch HDPE DR9	no	three 6.5-ft long, 8-inch DR9 pipe with 3-inch thick insulation	51.7	three along floating section of pipe spaced ~18.5 m apart	an additional two 166 kg (366-lbs) to counteract each float

DR = dimension ratio; HDPE = high-density polyethylene; lbs = pounds; kg = kilograms; ft = feet.

To prevent the pipe outlet from plugging, open features (e.g., holes in the pipe) are included to aid continued discharge in the event the end is plugged or grounded out (Appendix A; Figure 6 for holes detail). A length of 310 m of heat tracing and insulation is included and extending 18.23 m under the water per previous design. It is recommended the pipe is buried at the shoreline to prevent any damage from ice or other objects in the WRTSF.

A new valve shack (valve shack 2) is required at chainage 0+912 m to protect the air/vacuum valve of Line A and Line B from ice and snow. The exact location of valve shack 2 may require adjustment as shoreline access is currently congested (Drawings 9 and 10 for valve shack 2 detail in Appendix A). A small enclosure (valve shack 3) would also be required upstream of valve shack 1 to protect the Line A tie-in valving (Drawing 11 for Line A tie-in detail in Appendix A).

Figure 16 shows Newcrest's proposed valve shack location.

Figure 16: Valve Shack Location

Appendix B provides the detailed material take-off of all the equipment required for Lines A and B outside the mill building.

5.0 RECOMMENDATIONS FOR FUTURE WORK

The following are general recommendations:

- Site visit: WSP recommends having a site visit to validate and test the functionality of the upgraded and recently installed WSP-designed pipeline systems. This site visit will help ensure nothing has been overlooked. Also, this is part of WSP's due diligence and will allow for more accurate as-built documentation of Lines 5 and 6.
- Subaqueous pipeline installation: WSP recommends Newcrest, or pipeline installation contractor, contact WSP's marine installation experts for any questions or installation guidance required.
- Commissioning: Test the newly installed system to ensure it is performing as expected. Modification to the system may be needed to increase functionality and reliability.

6.0 CLOSURE

The reader is referred to the Study Limitations section, which precedes the text and forms an integral part of this report.

We trust the above meets your present requirements. If you have any questions or comments, please contact the undersigned.

IF THIS MEASUREMENT DOES NOT MATCH WHAT IS SHOWN, THE SHEET SIZE HAS BEEN MODIFIED FROM: ANSI D
25 mm

TAILINGS LINE B - PROFILE STA 0+000 TO 0+550

HORIZONTAL SCALE 1:1000
VERTICAL SCALE 1:500

SCALE 1:10 m (1) DETAIL - TAILINGS LINE A & B DRILLED HDPE PIPE

SCALE 1:10 m (A) CROSS-SECTION - TAILINGS LINE A & B DRILLED HDPE PIPE

TAILINGS LINE B - PROFILE STA 0+550 TO 1+102

HORIZONTAL SCALE 1:1000
VERTICAL SCALE 1:500

LEGEND

- 2022 EXISTING GROUND (SEE REFERENCE 1)
- POND SURFACE ELEVATION (SEE REFERENCE 1)
- 2022 BATHYMETRY (SEE REFERENCE 2)
- TAILINGS LINE B
- 8" DR9 HDPE PIPE WITH 2" THICK INSULATION AND HEAT TRACING
- A/G | U/G — ABOVE GROUND / UNDERGROUND
- PIPE WEIGHT- 2 COUNT EACH 34 kg
- FLOAT WEIGHT - 2 COUNT EACH 166 kg
- PIPE FLOAT
- INSULATED PIPE WEIGHT - 1 COUNT EACH 166 kg

NOTES

1. ALL UNITS ARE IN METRES UNLESS OTHERWISE NOTED.
2. DRILLED PIPE INSTALLED AT END OF PIPE IN LAKE.
3. INSULATION AND HEAT TRACING BASED ON EXISTING PIPELINE DESIGN.
4. EACH FLOAT REQUIRES 2 WEIGHTS TO COUNTERACT BUOYANCY.

Material Take-Off

Piping Material Take-Off
Pretium
Brucejack : Line A&B Outside Mill - Preliminary MTO
Tailings Discharge System
Project No. 21507844

Area	Item	Description	Spec	Size (inch)	Quantity	Quantity (+10% SF if needed)	Unit	Comments
		Piping, Fittings and Valves						
	1	**Piping**						
Outside Mill	1.1	HDPE, PE4710 (SDR 9), Plain Ends	PE4710-DR9	8	1434	1578	m	Uninsulated pipe required for Line A&B
Outside Mill	1.2	HDPE, PE4710 (SDR 9), Plain Ends , 2" Thick Pre-insulated, with 2 heat channels	PE4710-DR9	8	620	682	m	Insulated pipe required for Line A&B
Valve Shack 2	1.3	Carbon Steel, Standard, ASTM A53 type B, butt weld, plain ends	CS XS GR. B	10	4	5	m	Line A&B for air vent in valve shack
Valve Shack 2	1.4	Carbon Steel, Standard, ASTM A53 type B, butt weld, plain ends	CS XS GR. B	8	2	3	m	Line A&B for air vent in valve shack
Outside Mill	1.5	HDPE, PE4710 (DR 7.3), plain ends, 2" Thick Pre-insulated, with 2 heat channels	PE4710 DR7.3	6	6	7	m	Line A tie-in to old Lines
Outside Mill	1.6	HDPE, PE 4710, 2" Thick Field joint insulation kits	PE4710 DR7.3	8	41	41	ea.	For Line A&B
Outside Mill	1.7	HDPE, PE 4710, 2" Thick Field joint insulation kits	PE4710 DR7.4	6	2	2	ea.	Line A tie-in to old Lines
	2	**Flanges**						
Valve Shack 2	2.1	High Density Polyethylene molded flange adapter - SDR9 c/w backing ring, ductile iron backup ring, bolt pattern conforming to ANSI Class 150, ANSI B16.5	Class 150	8	4	4	ea.	4 at vent shack, 2 for each line
Valve Shack 1, 2,3	2.2	High Density Polyethylene molded flange adapter - SDR9 c/w backing ring, ductile iron backup ring, bolt pattern conforming to ANSI Class 150, ANSI B16.5	Class 150	6	7	7	ea.	Line A lateral tie-in to old lines
Valve Shack 3	2.3	High Density Polyethylene molded flange adapter - SDR9 c/w backing ring, ductile iron backup ring, bolt pattern conforming to ANSI Class 150, ANSI B16.5	Class 150	3	2	2	ea.	For drain on Line A tie-in
Valve Shack 2	2.4	Slip on Flange, STD CS, bolt pattern conforming to ANSI Class 150, ANSI B16.5, ASTM A105	Class 150	8	4	4	ea.	2 for each air vent arrangement
Valve Shack 2	2.5	Blind Flange, Carbon Steel tapped 3" NPT outlet, ANSI Class 150, ASTM A105	Class 150	10	2	2	ea.	for 3 air valve connection at shack, one for each line
Valve Shack 2	2.6	Slip on Flange, STD CS, bolt pattern conforming to ANSI Class 150, ANSI B16.5, ASTM A105	Class 150	10	2	2	ea.	1 for each air vent arrangement
Valve Shack 2	2.7	3" Flat face flanged adapter nipple, Victaulic (No.45F)	Class 150	3	3	3	ea.	1 for each air vent arrangement, and one for drain on Line A tie-in
Valve Shack 2	2.8	3" Groove x male threaded nipple, Victaulic (N.40)	Class 150	3	2	2	ea.	for 3" air valve connection at shack, 1 for each line
	3	**Fittings**						
Valve Shack 2	3.1	Lateral Wye Molded, HDPE PE4710 (SDR 9), ends, 45 deg lateral	Class 150	8x8x8	1	1	ea.	Tie-in for line A to old pipelines, if procurement is difficult, switching to DR11 is allowed.
Valve Shack 3	3.2	Lateral Wye Molded, HDPE PE 4710 (SDR 7.3) 45 deg lateral	Class 150	6x6x6	1	1	ea.	Tie-in for line A to old pipelines, if procurement is difficult, DR9 will be a suitable substitution; DR 11 is allowed but will require two additional flange adaptor/backing ring assemblies
Valve Shack 3	3.3	Branch saddle reducing tee 6" x 3", HDPE PE 4710 (SDR 9)	Class 150	6 x 3	1	1	ea.	Tie-in to for Line A drain
Valve Shack 3	3.4	Adaptor Groove x female NPT threaded , ductile iron, (Victaulic No.80)	Class 150	3	1	1	ea.	Tie-in to for Line A drain
Valve Shack 3	3.5	Metal Cam-and-groove hose coupling for water, aluminum, threaded male NPT connection	Class 150	3	1	1	ea.	Tie-in to for Line A drain
Valve Shack 2	3.6	Electrofusion branch saddle 6" x 1", HDPE PE4710, Rated for 200-240 psi for water service or equivalent	Class 150	6 x 1	1	1	ea.	Tie-in to for Line A flush port
Valve Shack 2	3.7	Transition fitting, HDPE PE4710 to male NPT threaded metal	Class 150	1	1	1	ea.	Tie-in to for Line A flush port
Valve Shack 2	3.8	Spud with polymer seats, female NPSM X male NPT (Dixon Boss or equivalent) Stainless Steel	Class 150	1	1	1	ea.	Tie-in to for Line A flush port
Valve Shack 2	3.9	Concentric Reducer, HDPE PE4710 SDR9	Class 150	8x6	1	1	ea.	Tie-in for line A to old pipelines
Valve Shack 2	3.10	Eccentric Reducer, STD CS, ASTM A234, butt weld, plain ends	Class 150	10 x 8	4	4	ea.	Need 2 for each air vent
Valve Shack 2	3.11	Lateral Tee, STD CS, ASTM A234, butt weld, plain ends	Class 150	10 x 10 x 10	2	2	ea.	1 for each vent
	5	**Valves**						
Bypass	5.1	Knife gate, Ductile Iron Body, ASTM A536 or Cast Iron. Stainless steel gate and stem, EPDM Seal/seats, Rubber Lined , Open/Close(No Throttling) Lockout Required, Lug Style, Bottom Purging. Handwheel Operator, Class 150 Flanges, 250 psi rating of pipe	KGV	8	1	1	ea.	8" Valve for Line A bypass to old lines
Valve Shack 2, 3	5.2	Knife gate, Ductile Iron Body, ASTM A536 or Cast Iron. Stainless steel gate and stem, EPDM Seal/seats, Rubber Lined , Open/Close(No Throttling) Lockout Required, Lug Style, Bottom Purging. Handwheel Operator, Class 150 Flanges, 250 psi rating of pipe	KGV	6	3	3	ea.	6" Valve for Line A bypass to old lines
Valve Shack 2, 3	5.3	Knife gate, Ductile Iron Body, ASTM A536 or Cast Iron. Stainless steel gate and stem, EPDM Seal/seats, Rubber Lined ,Open/Close(No Throttling) Lockout Required, Lug Style, Bottom Purging. Handwheel Operator, Class 150 Flanges, 250 psi rating of pipe	KGV	3	3	3	ea.	3" Valves - In vent shack, and Line A tie-in
Valve Shack 2	5.4	Plug valve, female threaded NPT connection	PGV	1	1	1	ea.	Tie-in to for Line A flush port
Valve Shack 2	5.5	Air/ Vacuum Valve, Class 150 Flanges, 250 psi rating of pipe (EZ-VAC or similar), flanged connection	AV	3	2	2	ea.	3 " Air/ Vacuum valve - In vent shack Style and model number to be specified by Newcrest

Valve Shack 2	6.1	Studbolt, nut and washer, carbon steel hot dip galvanized package, standardized and tempered for 10" back-up ring, ASTM A193/194 (12 bolts)	Class 150	10	2	3	lot	For blind flange connection at vent shack
Valve Shack 2	6.2	Nitrile Gasket or approved equivalent, 1/8" thick, 150# Full Face	Class 150	10	2	3	ea.	For blind flange connection at vent shack
Valve Shack 2	6.3	Studbolt, nut and washer, carbon steel hot dip galvanized package, standardized and tempered for 8" back-up ring (SDR9, DI Backup-ring), ASTM A193/194 (8 bolts)	Class 150	8	5	6	lot	2 connections for each air valve arrangement, 1 for Line A tie-in to old line
Valve Shack 2	6.4	Nitrile Gasket or approved equivalent, 1/8" thick, 150# Full Face	Class 150	8	5	6	ea.	2 connections for each air valve arrangement, 1 for Line A tie-in to old line
Outside mill	6.5	Studbolt, nut and washer, carbon steel hot dip galvanized package, standardized and tempered for 6" back-up ring (SDR9, DI Backup-ring), ASTM A193/194 (8bolts)	Class 150	6	8	9	lot	4 for Line A tie-in to old line
Outside mill	6.6	Nitrile Gasket or approved equivalent, 1/8" thick, 150# Full Face	Class 150	6	8	9	ea.	4 for Line A tie-in to old line
Outside mill	6.7	Gasket and bolting kits 8" knife gate valve (item 5.1) with 8" DR9 flange with DI backing ring, 16 bolts	Class 150	8	1	2	lot	Stud bolts or hex bolts for both sides of valve
Valve Shack 2, 3	6.8	Gasket and bolting kits for 3" knife gate valve (item 5.3) , 8 bolts	Class 150	3	3	4	lot	Stud bolts or hex bolts for both sides of valve
Valve Shack 2	6.9	Victaulic Coupling (No. 07)	Class 150	3	3	4	lot	1 for each 3 " air valve connection at vent shack 2, and one for drain connection
	7	**Pipeline Weighting and Floatation**						
In lake	7.1	75 lbs (34 kg) concrete weight with tespar as per Wilson Concrete, rated for maximum load of 75 lbs or greater	-	400x160x230 mm	330	330	ea.	Two weights every 1.4 m on the uninsulated section of the pipe. 134 weights for line A and 196 weights for line B.
In lake	7.2	366 lbs (166 kg) concrete weight with telspar as per Wilson Concrete, rated for maximum load of 366 lbs or greater	-	470x300x460 mm	34	34	ea.	One weight every 1.4 m on the insulated section of the pipe plus weights to counteract the float. 13 (for insulated section)+ 2 (to counteract float) weights for line A and 13 (for non insulated section) + 6 (to counteract float) weights for line B.
In lake	7.3	Galvanized zinc plt 2 bolt riser pipe clamps (for 8" HDPE pipe) - fig 295H or equivalent, with bolts and nuts, rated for maximum load of 732 lbs or greater	-	8	169	186	m	For Line A&B - One clamp for each set (2 x 34 kg for the pipeline, and 2x166kg to counteract the float) of weights
In lake	7.4	Galvanized zinc plt 2 bolt riser pipe clamps (for 8" HDPE pipe with 2" insulation) - fig 295H or equivalent, with bolts and nuts, rated for maximum load of 732 lbs or greater		12	34	34	m	For Line A&B - One clamp for each weight on the insulated section of pipeline A & B
2 In lake	7.5	Wire rope cable (1/4") , 7x19 Galvanized aircraft cable reel, rated for maximum load of 732 lbs or greater	-	1/4	2377	2615	m	For Line A&B
In lake	7.6	Wire Rope Crosby clips (1/4")	-	1/4	1150	1265	ea.	4 for every 12" clamp, and 6 for every 8" clamp
In lake	7.7	Wire rope thimbles per (1/4")	-	1/4	575	633	ea.	2 for every 12" clamp and 3 for every 8" clamp
In lake	7.8	Shackle assemblies rated for maximum load of 732 lbs or greater, and compatible with 2.5" x 2.5" telspar and 0.5" pin hole	-	-	372	409	ea	1 for every 12" clamp and 2 for every 8" clamp to connect cables to telspar of concrete weight
In lake	7.9	Neoprene sponge padding, 3 mm thick, 250 mm minimum width of reel	-	0.003 m thick, 0.250 m width	602	662	m	to place between pipe and clamps
In lake	7.10	Rope, 0.5" thick Polypropylene	-	0.5 THK	290	319	m	to prevent clamps from slipping during installation for Line A and B
Float	7.11	High Density Polyethylene molded flange adapter - SDR9 c/w backing ring, ductile iron backup ring, bolt pattern conforming to ANSI Class 150, ANSI B16.5	PE4710-DR9	8	8	8	ea.	2 for each under water float
Float	7.12	8" blind flange HDPE DR9	PE4710-DR9	8	8	8	ea.	2 flanges for each under water float
Float	7.13	HDPE, PE4710 (SDR 9), Plain Ends , 3" Thick Pre-insulated	PE4710-DR9	8	8	8	m	6.5 ft length -1 for line A , and 3 for Line B
	8	**Enclosures**						
Valve Shack 2	8.1	Sea can, Heated Enclosure for Valves	-	6.1 m x 2.44 m x 2.59 m	1	1	ea.	Enclosure for valve shack 2 (8' x 20')
Valve Shack 2	8.2	Flat Top Concrete Square Blocks	-	24 x 24 x 24	6	6	ea.	To support sea can
At Shore	8.3	Regular Lock Blocks	-	30x30x60	4	4	ea.	For shore anchor (30"x30"x60")
Valve Shack 2	8.4	Ground Anchor Brackets, or equivalent	-	200 mm x 10 mm	10	10	ea.	To secure sea can on concrete blocks (200 mm x 10 mm or similar)
Valve Shack 2	8.5	3/4" Thick plywood sheets	-	6.1 m x 2.44 m	1	1	ea.	For floor of valve shack (3/4" thick)
Valve Shack 3	8.6	Treated base timber (4" x4")	-	4 x 4	1	1	lot	for valve shack 3
Valve Shack 3	8.7	Wood frame construction (2" x 4")	-	2 x 4	1	1	lot	for valve shack 3
Valve Shack 3	8.8	19 mm Exterior plywood cladding and roof	-	19 mm thick	1	1	lot	for valve shack 3
Valve Shack 3	8.9	50 mm thick Styrofoam insulation	-	50 mm thick	1	1	lot	for valve shack 3
Valve Shack 3	8.10	asphalt roll roofing	-	-	1	1	lot	for valve shack 3
Valve Shack 3	8.11	Minor hardware (hinges and screws)	-	-	1	1	lot	for valve shack 3

NOTES:
1. This MTO details items required for Line A&B that are outside the mill.
2. Items listed are best estimates at the time of issue of this MTO.
3. Metal plate reflectors should be added to pipeline to aid in bathymetric surveys.
4. Pipe supports have are not included in this scope of work.
5. Electrical items in valve shack have been excluded from this MTO (lighting, heater, fans), but should be considered by Newcrest.

Waste Rock Dump Area Emergency Evacuation and Re-entry Plan under Seismic Loading

PRETIVM
BRUCEJACK PROJECT

WASTE ROCK DUMP EMERGENCY EVACUATION AND RE-ENTRY PLAN UNDER SEISMIC LOADING

Revision: 0
Issue Date: October 11, 2018

1 Introduction

This document summarizes emergency evacuation procedures for Pretivm Resources Staff and Sub-contractors that are working on the waste rock dump (WRD). These procedures are to be followed if a seismic event occurs that is substantial in size, that has the potential to cause WRD instability.

The waste rock dump requires an emergency evacuation plan in the event of an earthquake because seismic forces may decrease the stability of the waste rock dump and cause a failure and impose a safety risk to personnel.

2 Waste Rock Dump Emergency Evacuation Plan

- **Trigger** – Based on the Modified Mercalli Scale of 1931, a seismic trigger event is a ranked on a Mercalli Scale of II (equivalent PGA of 0.0017 g to 0.005 g). Ground motion under this scale is typically felt indoors by a few people at rest, especially on upper floors of multi-story buildings. Birds and animals are disturbed, and trees, structures, liquids, and bodies of water may sway. Delicately suspended hanging objects may swing.

- **Announcement** – Pretivm dispatch operators must immediately announce a "STOP WORK ON THE WASTE DUMP" on the radio to all workers on the WRD.

- **Evacuation** – All Pretivm personnel and contractors must immediately:
    - De-energize equipment (put dozer blades and excavator buckets down and shut down all motors).
    - Leave their equipment with their radio and their floatation devices and specialized PPE (Spare Air tanks and floatation jackets).
    - Retreat from their equipment in a direction perpendicular from the dump crest and water's edge, preferably walking directly towards the WRD access road.
    - Site safety personnel must immediately barricade all access roads to the WRD and put up signage to prevent all access.

- **Muster** – All people on the WRD at the time of the evacuation order must muster at the warehouse building.

- **Engineering and Stability Assessments** – Following an earthquake:
    - The EOR must be contacted immediately after an evacuation order has been placed on the WRD due to a seismic event.
    - Pretivm Minesite Geotechnical Engineers must complete visual inspections of the WRD and a detailed survey of the settlement monuments and settlement data.
    - Subsequent surveys on monuments must inform that the WRD meets stability QPOs outlined in the OMS manual before personnel are approved to enter WRD. Agreement for

a re-entry permission must be agreed upon between the EOR, Minesite Geotechnical Engineers and the Mine Manager who will authorize re-entry to the WRD.

- **Re-Entry to Waste Rock Dump –** Mine Manager's Authority.

1 Introduction

The Brucejack Mine (Brucejack) is located approximately 65 km north-northwest of Stewart, BC in the Sulphurets District of the Iskut River Region (Figure 1-1). The mine consists of an underground mine workings with associated surface infrastructure, including two non-contact water diversion channels, a contact water pond (CWP) and a contact water management system.

This version of the OMS Manual (v. 008) was updated by SRK Consulting (Canada) Inc. (SRK) with contributions from Pretium Resources Inc. (Pretium) and replaces the previous version (v.007) as well as previous versions of the Brucejack Water Management Plan. The OMS Manual serves as a reference document for the operation of all surface water management facilities within the Mine Site.

The Water Management Plan component of this OMS Manual is a requirement of Environmental Assessment (EA) Certificate #M15-01, Mines Act Permit M-243 and Effluent Permit 107835. This OMS Manual has been prepared in general accordance with the latest guidelines titled "Developing an Operation, Maintenance and Surveillance Manual for Tailings and Water Management Facilities" prepared by the Mining Association of Canada (MAC 2021).

The primary objectives of this OMS Manual are to define and describe the following:

- Key components of the main Brucejack surface water management facilities;
- Roles and responsibilities of Pretium personnel assigned to these facilities;
- Procedures and processes for managing change;
- Procedures required to operate, monitor the performance of, and maintain the facilities to ensure that they function in accordance to design and meet regulatory and corporate policy obligations; and
- Requirements for analysis and documentation of the performance of the facilities.

The OMS Manual covers operations of main Mine Site surface water management infrastructure through the operations and closure phases at Brucejack. This infrastructure is shown in Figure 1-2 and includes:

- CWP and spillway;
- Contact water management system of ditches, sumps, pumps, weirs and pipelines;
- Non-contact diversion channels; and
- Low level weir (LLW) and reclaim system at the outflow of WRTSF.

This document has been prepared primarily for use by Brucejack Mine personnel who are responsible for the operation, maintenance and surveillance of the water management facilities. It contains information and instructions necessary to perform the above required activities.

Figure 1-2: Brucejack Mine site general arrangement – Water Management Plan.

2 OMS Manual Preparation

2.1 OMS Manual Development and Maintenance Responsibilities

The OMS Manual is intended to be a living document which incorporates the surface water management infrastructure within the Mine Site and conforms to the MAC (2021) guidelines as well as BC's Health, Safety and Reclamation Code (HSRC) (2022). Ownership and stewardship of this document are provided by Pretium's Mill Manager, who assumes overall responsibility for development, maintenance and implementation of this OMS Manual, delegating tasks related to maintenance and implementation as appropriate.

2.2 OMS Manual Objectives and Contents Summary

This Manual serves as the primary reference document for the operation, maintenance and surveillance of the CWP and other surface water management infrastructure within the Mine Site. Use of this Manual will contribute to consistency of operation, and maintenance and surveillance of the water management facilities. Where appropriate, references to additional relevant documentation are included throughout the Manual.

Table 2-1 lists engineering and environmental reports and documents appended to the OMS Manual that are relevant to the regulatory requirements, design, operation, monitoring, surveillance and performance of the water management facilities.

Table 2-1: Appendices to OMS Manual.

Appendix		Contents
A	Construction Record Drawings and Specifications	Construction Record drawings and specifications for CWP, East/West Weir, Low Level Weir (LLW), Non-Contact Diversion Channels
B	CWP Construction Records Report	BGC Engineering Inc. 2018. Brucejack Gold Mine – Contact Water Pond Construction Records Report.
C	Permits	*Mines Act* Permit M-243 (November 14, 2022) Effluent Permit #107835 (July 16, 2022) Conditional Water Licence #C500684 (November 26, 2018)

2.3 OMS Manual Control and Update

Updates to the OMS Manual are made by Pretium with assistance and review by SRK. All updates will be reviewed by SRK as the CWP/Water Management Engineer for the Mine Site. The Manual is reviewed a minimum of once annually in accordance with Permit M-243 Condition C.4 (e) and updated as appropriate based on the review. Updates are distributed as part of the combined *Mines Act / Environmental Management Act* Permits Annual Report that is submitted to MEMPR, MECCS, Nisga'a Nation, Tahltan Central Government and Skii km Lax Ha Nation, and others, by March 31st of each year for the previous calendar year. Section 3.3 outlines how the manual is updated, in accordance with relevant regulations.

Revisions to the Manual are tracked in the Record of Versions table at the front of this report.

3 Roles, Responsibilities, and Authorities

3.1 Organization, Structure, Individual Responsibilities

The Mill Manager has the primary overall responsibility for ongoing review, updating and implementation of the OMS Manual, drawing upon assistance from and delegating to others as appropriate in this regard. The Environmental Manager (Principal, Environment) has the primary responsibility to confirm that the Manual is being reviewed a minimum of once annually, and for distribution of updated OMS Manual versions to the applicable stakeholders and authorities. Figure 3-1 provides an organization chart for Pretium and Table 3-1 presents a summary of key personnel involved in the stewardship of the water management facilities, including their roles and responsibilities. Table 3-2 presents external consultants involved in the OMS, including their roles and responsibilities.

Figure 3-1: Brucejack organization chart for OMS Manual

Table 3-1: Pretium positions, roles and responsibilities for Mine Site Water Management Facilities OMS.

Position	Shift Schedule / Site Presence	Role	Responsibility	Authority
General Manager (GM)	Varies with a designate identified in their absence.	Corporate level operations oversight. Site-based oversight of water management stewardship.	Confirms that water management stewardship is in conformance with MAC guidelines, appropriate resources are in place to maintain conformance, and reports to the Vice President of Operations and Chief Executive Officer of Pretium on water management stewardship. Ensures that departments/groups involved in water management facilities stewardship are meeting assigned responsibilities. Confirms these personnel are interfacing as required, and that appropriate personnel/resources are in place to implement water management stewardship.	Overall operations authority. Direction of all senior site personnel and consultants. Allocation of personnel resources and budgets.
Mill Manager	2 weeks on, 2 weeks off with a designate in their absence.	Direction of water management facility operations, monitoring, and surveillance. Overall OMS responsibility.	Liaise with the Water Management Engineer over the CWP and any issues/anomalies with its monitored performance. Responsible for water level tracking in the CWP, including surveying of the operating pond. Ensure monitoring is carried out in accordance with approved protocols and frequency. Direct inspections of water management infrastructure for which the Mill Manager is directly responsible at appropriate frequencies, and report any unusual conditions/concerns to GM. The Mill Manager is directly responsible for the CWP and 'downstream' flows (piping from CWP to the mill and discharges from the mill/WTP), along with the reclaim water system. Owns and maintains the internal site water balance for the CWP and mill system related inputs/outputs. Review system water balance with Environmental Manager, Mill Maintenance and Mill Operations Superintendents. Ensure that flow data (pond volumes, reclaim water) are tracked, recorded, and provided to the Water Management Engineer to be incorporated into the site-wide water balance. Provide training to OMS Manual holders and operations personnel.	Liaise with the Engineer of Record over matters pertaining to operation of the water management facilities. Arrange for annual inspection of the water management facilities.
Principal, Environment	Full time, Brucejack	Lead and/or confirm the field implementation of environmental requirements related to water management and effluent discharge under all mine authorizations, including required site monitoring/sampling and implementation of required mitigations. Overall responsibility for review and leading updates to the EMS and applicable component plans.	Lead contact with MEMPR (excluding Health and Safety) MECCS, and MFLNRORD, and supporting contact with BC EAO and federal agencies related to regulatory requirements for water management, effluent discharge, and this OMS manual. Lead/coordinate technical consultant work, including work by the Water Management Engineer, ML/ARD, Water Quality, and Aquatic Biological Consultants. Responsible under major permits to lead annual reviews of this OMS manual as a component of the site EMS. Direct Environmental Superintendent/Coordinator in the implementation of site sampling, flow monitoring, and compliance monitoring programs, and in any compliance reporting. Lead ongoing confirmations, including via site personnel, that commitments under this OMS and permit/authorization requirements for water management and effluent discharge are implemented. This includes ensuring that applicable records are available for inspection upon request. Lead preparation and submission of provincial annual report and other submissions related to water management and effluent discharge pursuant to M-243 and PE-107835, including monthly reports.	Direct implementation of environmental and related compliance requirements pertaining to mine operations. Responsible and with the authority under Permit M-243 to implement remedial actions as may be necessary to ensure maintenance of environmental standards and permit requirements. Responsible under M-243 and PE-107835 to lead annual reviews of the EMS and ensure that annual reviews of component management plans (includes OMS) are completed, with plan updates as appropriate.
Principal, Health and Safety & Health and Safety Superintendents	2 weeks on, 2 weeks off, cross-shifting.	Site safety protocols, training, and monitoring.	Ensure that site safety protocols specific to water management facilities operations are established, enforced, and reviewed/improved as necessary.	Direction of safety requirements pertaining to mine operations.
Mill Operations Superintendent	2 weeks on, 2 weeks off, cross-shifting.	Oversight of operation and maintenance of tailings delivery and water reclaim systems.	Manage mill reclaim requirements. Report operational issues to Mill Manager, who in turn reports these to the General Manager as appropriate. Oversee and confirm that water management facilities are properly operated and maintained in accordance with SOPs. Advise CWP/Water Management Engineer, Mill Manager and Environmental Manager of any process changes with material effects on the water balance or process water quality or quantity. Confirm that CWP/Mill flow monitoring components of the water balance are being tracked, calibrated, and kept up to date and that required monitoring records are being kept for same. Review internal system water balance with Mill Manager and Environmental Superintendent/ Manager.	Direction of water management systems operation and maintenance.
Mill Maintenance Superintendent	2 weeks on, 2 weeks off, cross-shifting.	Responsible for the day to day maintenance of the CWP and other surface water management infrastructure.	Mill & Fixed Assets management & maintenance oversight. Oversee water management facilities under mill responsibility and confirm they are properly maintained in accordance with SOPs. Provision of personnel and resources necessary for the maintenance of the water pipeline distribution and reclaim/pumpback system consistent with the OMS Manual. Maintain records for maintenance and inspections pertinent to water management infrastructure and instrumentation.	Overall authority of Process Plant. Provision of personnel and resources/budgeting to support water management maintenance.

Position	Shift Schedule / Site Presence	Role	Responsibility	Authority
Mill Supervisors	2 weeks on, 2 weeks off, cross-shifting, variable day and night shifts.	Field operation of the water reclaim pumping/delivery systems.	Carry out the field operation of the CWP, other surface water management infrastructure 'downstream' of the CWP, the reclaim water system, and tailings discharge facilities, as defined by the Mill Operations Superintendent. Inspect water reclaim/pipelines no less frequently than once per shift. Fill out shift inspection reports and provide to Mill Operations Superintendent. Report any unusual conditions observed at surface water management infrastructure to Mill Operations Superintendent.	
Technical Services Manager / Chief Mining Engineer	2 weeks on, 2 weeks off, cross-shifting.	Site-based oversight. Direction of mine waste management planning and operations interfaces, and direction of mining engineering group.	Coordinate and manage mining engineering team with regards to any plans and/or actions pertinent to water management that may interface with mining activities.	Overall responsibility for mine planning, mine production, waste rock deposition, and stockpiles.
Maintenance Manager	2 weeks on, 2 weeks off with designate in his absence.	Oversight of mine site surface and underground maintenance, including electrical, excluding maintenance conducted by the Mill Department.	Coordinate and manage mine site maintenance team. The specific role of the Maintenance Department for this OMS is to support Surface Operations with maintenance of water management infrastructure 'upstream' (i.e. draining to) of the Contact Water Pond. This includes maintenance and related inspections of pumps, sumps/manholes, and pipelines.	Overall responsibility for surface and underground mine maintenance, excluding mill related maintenance.
Maintenance Superintendent	2 weeks on, 2 weeks off, cross-shifting.	Oversight of mine site surface and underground maintenance, including electrical, and excluding maintenance conducted by the Mill Department.	Supervise surface and underground maintenance personnel, excluding those for the mill. The specific role for this OMS is to direct and supervise maintenance of water management infrastructure 'upstream' of the Contact Water Pond.	Supervise implementation of maintenance work, excluding that conducted by the mill maintenance personnel.
Environmental Superintendent / Coordinator	2 weeks on, 2 weeks off, cross-shifting.	Site-based environmental compliance oversight.	Oversee water quality sampling and testing in accordance with approved protocols and following direction of technical consultants. Validate laboratory test results. Under the direction of the Environmental Manager, interpret environmental (facility water quality and flows) data in coordination with Mine and Mill Operation Superintendents and in consultation with the ML/ARD, Water Quality and Water Management Engineers. Oversee required monitoring of effluent discharges, and report non-compliance events or trends to the Environmental Manager, Mill Manager (if applicable to the discharge), the Mine Manager, and the General Manager. Confirm that CWP and site-wide water balance components are being tracked, calibrated, and kept up to date. Maintain on-site weather stations and plot/record/disseminate climate data.	Supervise site environmental personnel. Indicate water quality sampling locations, sample collection protocols and analytical parameters. Advise when CWP water quality is suitable for discharge or must be retained. Site lead responsible for confirming via monitoring/inspection that mining and milling activities comply with the requirements of the applicable authorizations and regulations governing the milling, tailings facilities.
Surface Operations Superintendent	2 weeks on, 2 weeks off, cross-shifting with the Surface Operations Supervisor.	Direction of mine fleet operators, and mine maintenance personnel.	Oversee maintenance of the non-contact diversion channels and water management facilities 'upstream' of the CWP, including contact water ditches, pipelines and related infrastructure draining to the CWP. In the event of an emergency or for operational support the Surface Operations Department can support the operations and maintenance of the CWP and other water management facilities. Snow management.	Responsible for operations of water management facilities draining to the CWP. Provide emergency and operational support for WP and other water management facilities.
Surface Operations Supervisor	2 weeks on, 2 weeks off, cross-shifting with the Surface Ops Superintendent.	Direction of mine fleet operators, and mine maintenance personnel.	Oversee maintenance of the non-contact diversion channels and water management facilities 'upstream' of the CWP, including contact water ditches, pipelines and related infrastructure draining to the CWP. In the event of an emergency or for operational support the Surface Operations Department can support the operations and maintenance of the CWP and other water management facilities. Snow management.	Responsible for operations of water management facilities draining to the CWP. Provide emergency and operational support for CWP and other water management facilities.

Table 3-2: External consultant's roles and responsibilities.

Position	Name and Contact Information	Role	Responsibility
CWP and Surface Water Management Engineer	SRK Consulting (Canada) Inc Technical Lead: Mauricio Herrera, PhD, PEng. Office: (604) 681-4196 Cell: (604) 764-1250 Email: mherrera@srk.com Technical Project Engineer: Stuart McPhee, PEng. Office: (604) 235-8549 Cell: (778) 879-4345 Email: smcphee@srk.com	External engineering support and inspection responsibilities for contact water management system design, monitoring, planning, and operations. OMS Manual oversight and review.	Liaise with appropriate Pretium personnel to remain well-informed and provide input to CWP operation. Review monitoring data, and report anomalies/concerns to Mill Operations Superintendent. Provide recommendations for revisions to monitoring requirements, as required. Provide input to OMS Manual and provide assistance in updates of the Manual as directed by Pretium. Review need for design modifications based on field conditions/monitoring data/Pretium suggestions and implement/document as appropriate. Contribute to closure planning. Provide assistance on surface water management.
ML/ARD Consultant	Lorax Environmental Services Ltd. Technical Lead: Alison Shaw, PhD, PGeo. Office: (604) 688-7173 (ext. 264) Email: alison.shaw@lorax.ca	Qualified Professional for ML/ARD Management Plan and geochemistry predictions, monitoring and assessment.	Provide ML/ARD consulting expertise as directed by the Environmental Manager
Water Quality Consultant	Lorax Environmental Services Ltd. Technical Lead: Alison Shaw, PhD, PGeo. Office: (604) 688-7173 (ext. 264) Email: alison.shaw@lorax.ca	Qualified Professionals for water quality/chemistry program.	Provide water quality/chemistry and water quality modeling consulting expertise and support as directed by the Environmental Manager.
Groundwater Consultant	Lorax Environmental Services Ltd. Technical Lead: Laura Findlater, PGeo. Office: (604) 688-7173 (ext. 230) Email: laura.findlater@lorax.ca	Qualified Professional for groundwater management.	Provide groundwater quality and quantity consulting expertise, including numerical groundwater modeling support, as directed by the Environmental Manager.
Hydro-Meteorological Consultant	Lorax Environmental Services Ltd. Technical Lead: Colin Fraser, PGeo. Office: (604)688-7173 (ext. 223) Email: colin.fraser@lorax.ca	Qualified Professional for hydro-meteorological modeling	Provide hydrological and meteorological consulting expertise, including site-wide water balance modeling support, as directed by the Environmental Manager.

3.2 Competency and Training

Training of personnel must be carried out to ensure the recommended minimum levels of knowledge set out in Table 3-3 are attained by personnel and positions involved in the operation, maintenance, and surveillance of the water management facilities. Training must consist of a review of this OMS Manual and/or a summary presentation.

Table 3-3: Knowledge and training requirements.

Position	Recommended Minimum Knowledge
General Manager	Review of the OMS Manual, with an understanding of the design, and operational requirements.
Mill Manager Mill Maintenance Superintendent Mill Operations Superintendent	Detailed understanding of the OMS Manual, with a complete understanding of the design, water balance, and operational requirements. Complete understanding of all related technical documents for design and operations. Detailed understanding of water management facilities surveillance (i.e. for CWP, reclaim water system, and infrastructure 'downstream' of the CWP) and visual indicators of unusual conditions. Detailed understanding of instrumentation surveillance, including monitoring requirements, action/threshold levels, and their significance.
Maintenance Manager Maintenance Superintendents	Understanding of the OMS Manual. Detailed understanding of the design, operational and maintenance requirements of water management infrastructure 'upstream' of the CWP. Detailed understanding of the visual surveillance and other inspection requirements for water management infrastructure 'upstream' of the CWP; this includes understanding of visual indicators of unusual conditions. Detailed understanding of applicable instrumentation surveillance, including monitoring requirements, action/threshold levels, and their significance.
Principal, Environment	Complete understanding of environmental compliance issues and monitoring requirements. Understanding of the OMS Manual, and the ongoing and future operational and water balance requirements. Knowledge of receiving environments adjacent to the Mine. Understanding of water management facilities, surveillance, and visual indicators of unusual conditions.
Mill Supervisors and Operators	Understanding of the OMS Manual. Detailed understanding of all operational elements within the facility and their operational and maintenance requirements, and for the CWP, reclaim water system, and infrastructure 'downstream' of the CWP. Detailed understanding of visual surveillance requirements.
Surface Operations Superintendent and Supervisor	Review of the OMS Manual, with an understanding of the design and operational requirements of infrastructure 'upstream' of the CWP. Understanding of all operational elements for water management and operational and maintenance requirements for infrastructure 'upstream' of the CWP. General knowledge of visual inspection requirements.

Position	Recommended Minimum Knowledge
Principal, Health and Safety	Review of the OMS Manual.
CWP/Water Management Engineer	Detailed understanding of the OMS Manual, and the water management facility design. Detailed and ongoing review of all monitoring and, inspections. Complete understanding of all related technical documents that support water management facility design and operation. Detailed understanding of operational and water balance management issues, and interfaces with design, operations, and planning.
ML/ARD Consultant	Understanding of design and interfaces with ML/ARD aspects.
Other external personnel (Designers and Contractors)	Varied levels of knowledge and understanding depending on involvement. The GM will determine levels of knowledge and instruct personnel.

3.3 Managing Change

3.3.1 Review and Update of the OMS Manual

Ownership and stewardship of this document is the responsibility of Pretium's Mill Manager. The Mill Manager ensures that the document is reviewed and updated on a regular basis and that the content is accurate. The Water Management Engineer is responsible to confirm that the OMS manual follows the guidelines published by MAC (2021) related to OMS Manuals for tailings and water management facilities.

The purpose of the OMS Manual is:

- To serve as the primary reference document for operational, maintenance and surveillance procedures for Pretium's Mine Site water management facilities.
- To adhere to established procedures over long periods of time, particularly during changes in operating and supervisory personnel.

This Manual will be reviewed on an annual basis, and updated if there are changes to any of the following:

- Changes to the organization, and/or shifting of roles and responsibilities between positions with regards to water management stewardship;
- Significant changes to any of the water management facilities (as approved);
- Significant variation of performance from design of the facilities;
- Addition of instrumentation, and/or adjustments to action/threshold levels established for instrumentation;

- Changes to operating procedures; and
- Regulatory changes/permit amendments.

3.3.2 Design and Operational Changes

Changes to the design and/or operations of the water management facilities may be necessary as a result of changes to the mine plan (resulting in an increase or decrease in required storage capacity in the CWP); in response to additional information acquired through site investigation; in response to changes in the performance of the water management facilities; or to take account of observed performance and lessons learned to improve the design.

Changes to OMS procedures may be necessary following design changes or changes in facility performance. Updates to the water management designs are undertaken under one or more of the following circumstances:

- Additional information is obtained through monitored (visual and instrumentation) performance which necessitate design changes; and/or
- Expansion of the CWP and construction of additional infrastructure.

Changes to design specifications and drawings are implemented via a system of approvals through the water management organization structure to ensure changes are consistent with operational needs, construction criteria, and design criteria. Ultimately any design change to the water management infrastructure requires authorization from the Mill Manager, in consultation with the General Manager and the Principal, Environment, and with technical support provided by the Water Management Engineer. Any design change also requires authorization under Permit M-243 and other mine authorizations as applicable, prior to implementation.

3.3.3 Succession/Planning Training

It is anticipated that the organizational chart for the mine will change over time. Succession training will be implemented to ensure continued operation of the water management facilities in the appropriate manner.

3.3.4 Regulatory Change

In the event of any regulatory change that impacts the design and/or operation of the water management facilities, it is the responsibility of the Principal, Environment to advise all Pretium staff identified in Table 3-1 and the Water Management Engineer of such change.

3.4 Documentation, Document Control and Reporting

Several documents are produced on a regular basis as part of operation of the water management facilities at Brucejack. Table 3-4 presents these documents in terms of their frequency of production, their purpose, filing requirements.

Table 3-4: Brucejack water management documentation – requirements.

Document	Purpose	Frequency of Issue	Issued By	Issued To	Distributed By	Filing Requirements
OMS Manual	To serve as the primary reference document for operational, maintenance and surveillance procedures for Pretium's Mine Site water management facilities. To adhere to established procedures over long periods of time, particularly during changes in operating and supervisory personnel.	Reviewed annually with updates issued if there are revisions	Pretium	Pretium, MEMPR, MECCS, SRK, external consultants (Table 3-2), and indigenous groups.	Pretium	Hard copies retained by Pretium and accessible by staff on-site. Digital copies are distributed externally.
Mines Act / EMA Permits Annual Report	Annual Report (due by March 31 of succeeding year).	Annually	Pretium	Various[1]	Pretium	Stored by Pretium.
Water Management Infrastructure Inspection	As per Section 2.6 of PE-107835: "All ponds, ditches, runoff or seepage collection, diversion works, flow monitoring weirs and gauges must be inspected at least twice per year, once in spring after freshet and once in fall before freeze-up. Records of inspections must be maintained, and any identified deficiencies in the work must be corrected immediately."	Twice a year	Pretium	Pretium	Pretium	Pretium retains files on-site.
Mill Operators Shift Inspection Report	Inspection form/checklist documenting CWP water levels and inspections (frequency season / facility dependent) contact water pipelines, water reclaim pipelines, and pumping operations (CWP).	Each shift (Day and Night)	Pretium (Mill Operators)	Pretium	Pretium	Pretium retains files on-site.
Daily Water Management Report	Seasonally when there is surface runoff, daily report of surface contact water management and related maintenance, including non-contact diversion channels, contact water ditches and pipelines 'upstream; of the CWP, East/West Weirs, and pumping operations.	Daily, day shift	Dewatering Coordinators	Pretium	Pretium	Pretium retains files.
Survey	Capture changes to CWP, new instrumentation, pond soundings, etc.	Ongoing, as required	Pretium	Pretium	Pretium	Files retained by Pretium. Incorporated into reporting summaries and updating site plans and as-built drawings for OMS Manual updates.

Notes:

[1]The annual report must be made available to MECCS, MEMPR, the Tsetsaut/Skii Km Lax Ha First Nation, the Tahltan Nation (as represented by the Tahltan Central Council), the Nisga'a Nation, through Nisga'a Lisims Government and the Alaska Department of Natural Resources.

4 Water Management Facility Description

4.1 Mine Description

Primary ore processing occurs in the mill building. Flotation tailings generated during processing are either deposited subaqueously in the WRTSF via a pipeline or thickened as a paste fill and used to backfill portions of the underground workings. Waste rock from underground mine development is also deposited subaqueously into the WRTSF or used as underground backfill.

Concentrate produced at the mine site is either refined into dore bars or hauled off-site by truck along the 74 km long access road that connects to Highway 37.

All runoff within the Mine Site contact water management system is collected in the CWP. The CWP is located near the southwest shore of the WRTSF (Figure 1-2). Contact water runoff is directed to the facility through a series of sump collection areas, ditches, pipes and pumps. From the CWP, contact water is pumped to the Operations Water Treatment Plant (WTP), located within the mill building. Treatment of collected surface contact water began part way through mine construction and will continue throughout the mine life. The CWP will be decommissioned during mine closure.

Construction of the mine started in September 2015, with production commencing in June 2017.

4.2 Site Conditions

4.2.1 Physical Setting

The Brucejack Mine is located within the Boundary Range of the Coast Mountain Physiographic Belt. The region is characterized by steep mountains and extensive glaciation. Elevations in the mine vicinity range from 400 meters above sea level (masl) at Bowser Lake to over 1,800 masl at the nearby highest peaks. The tree line is at approximately 1,200 masl elevation; therefore, the mine site (elevation ~1400 masl) is sparsely vegetated. Brucejack Creek has a watershed area of 6.6 km^2 at the outlet of the WRTSF (Figure 4-1). Approximately 6% of the watershed is covered in glaciers (mostly to the south of the camp site), while 9% is covered by the lake.

4.2.2 Climatic Setting

The climate at lower elevations in the mine vicinity is generally that of a temperate or northern coastal rainforest, with subarctic conditions at the high elevations where the Mine Site is located. In the winter (November to March), monthly mean air temperatures range from approximately -4°C to -20°C; and in the summer from 5°C to 20°C.

The hydrology of the mine site is characteristic of a snowmelt dominated regime supplemented by rainfall in the summer and early fall. The Mine Site experiences substantial precipitation with an estimated average annual precipitation of 2,200 mm. Most precipitation falls as snow from October to May.

Figure 4-1: Brucejack Creek watershed at station BJ 1.74.

Rainfall amounts at Brucejack for durations of 24 hours to 10 days and return periods of 2 to 200 years are summarized in Table 4-1 (BGC 2014). Frequency results for wet and dry annual precipitation are summarized in Table 4-2 while shorter duration rainfall totals are summarized in Table 4-3.

Table 4-1: Rainfall estimates for various return periods and durations at the WRTSF.

Return Period (years)	24-hr Rainfall (mm)	2-day Rainfall (mm)	3-Day Rainfall (mm)	5-Day Rainfall (mm)	10-day Rainfall (mm)
2	82	102	122	154	195
5	117	141	159	196	246
10	139	161	183	221	276
25	167	189	212	249	312
50	187	210	233	268	336
100	206	230	253	286	360
200	226	249	273	302	382

Table 4-2: Annual precipitation estimates for various return periods.

Return Period (years)	Annual Precipitation (mm)	
	Dry	Wet
2	2200	2200
5	2001	2450
10	1860	2580
100	1420	2840

Table 4-3: Rainfall intensity-duration-frequency data estimates for the WRTSF.

Duration	Rainfall (mm)						
	2-yr	5-yr	10-yr	25-yr	50-yr	100-yr	200-yr
5 min	2.7	4.3	5.1	6.2	7.0	7.8	8.8
10 min	4.0	5.4	6.2	7.3	8.1	8.9	9.8
15 min	4.7	6.0	7.0	8.1	8.9	9.7	10.7

1 hr	9.7	11.4	12.4	13.9	15.0	15.9	17.1
2 hr	15.8	18.9	21.1	23.7	25.8	27.7	30.0
6 hr	36	45	50	58	63	68	74
12 hr	59	74	84	96	105	114	125
24 hr	82	117	139	167	187	206	226

Estimated average monthly climate data for the Brucejack are summarized in Table 4-4. This table includes values for precipitation, temperature, PET and sublimation. Additional detailed information on the climatic and hydrologic setting of the Mine Site can be found in (BGC 2017b).

Table 4-4: Average monthly climate data.

Month	Average Temperature[1] (ºC)	Average Precipitation[2] (mm)	Average PET / Sublimation[3] (mm)
January	-7.1	269	2
February	-8.6	231	2
March	-5.9	196	2
April	-2.5	105	4
May	2.9	95	10
June	5.0	72	23
July	7.8	90	46
August	7.3	150	41
September	3.9	224	25
October	-1.6	267	8
November	-5.2	233	2
December	-8.3	267	2
Total/Mean	**-1**	**2,200**	**167**

Notes:

[1] Based on temperature data collected at the VOK meteorological station for 2014-2021 period.

[2] Using monthly precipitation distribution as observed at Unuk River Eskay Creek climate station (1989 to 2010).

[3] Estimated using climate data collected from the Brucejack meteorological station from 2010 to 2012 (BGC 2014).

4.2.3 Hydrologic Setting

Prior to start of Brucejack Mine construction in September 2015, WRTSF had an approximate volume of 30.4 Mm^3 and a maximum depth of 85 m. The watershed area at the outlet of the WRTSF has been estimated at 6.6 km^2, of which approximately 0.8 km^2 is covered by the water surface. Approximately 800 m downstream of the WRTSF outlet, streamflows have been monitored at hydrometric station BJ 1.74 since 2007. The drainage area at this station is approximately 8.5 km^2. Intervening tributaries between these two locations include Camp Creek (0.50 km^2), VOK Creek (0.45 km^2), and an Unnamed Creek (0.50 km^2) located north of Brucejack Creek and west of the WRTSF.

Groundwater flows from the historic West Zone mine adit previously discharged into Brucejack Creek immediately downstream of Camp Creek. However, the underground mine workings have been progressively dewatered since November 2011, initially to gain access to the historic West Zone workings and later to allow advanced exploration and subsequent active mining in the VOK Zone.

Between November 7, 2011 and February 4, 2012, underground dewatering with discharge from the West Zone adit occurred at an average rate of approximately 29 m^3/h (8 L/s). No dewatering occurred over the following six months. Dewatering resumed in September 2012 and has continued to date. Discharge from the underground dewatering continued via the West Zone adit

and ultimately to Brucejack Creek during the period from September 2012 until early 2016, when the construction phase WTP discharge was transitioned to the WRTSF. Two different water treatment plants were used during this period, with water piped out of the adit to the treatment plant, and post-treatment water discharged to Brucejack Creek. All underground mine water was pumped to the operations WTP located in the Mill beginning August 7, 2017, with this water then used in process and discharge of only the surplus.

The average dewatering rates were approximately 52 m^3/h (14.6 L/s) between September 2012 and October 2016; 41 m^3/h (11.4 L/s) from October 2016 to August 2017; and 61.8 m^3/h (17.2 L/s) from August 2017 through February 2020.

Streamflows have been monitored at the BJ 1.74[1] hydrometric station since mid-2007. Monthly average streamflow and unit runoff observed at this station is summarized in Table 4-5. Average annual runoff for the period of record is 2,207 mm – this record includes treated dewatering water pumped from underground. Streamflows are typically estimated for the November through May period due to the formation of ice on the creek and a deep snowpack, both of which hinder flow measurements.

4.2.4 Geology

The Brucejack Mine is located along the western margin of the Intermontaine Tectonic Belt and is underlain by Upper Triassic volcaniclastic and epiclastic sedimentary rocks of the Stuhini Group and Lower to Middle Jurassic volcanic, volcaniclastic, and sedimentary rocks of the Hazelton Group. The surficial materials in the local mine vicinity primarily consist of a veneer of well-graded glacial till over bedrock. However, thicker deposits of soils, including alluvium, have been encountered on the Mine Site.

Detailed information on the geology of the mine site can be found in the permitting documentation.

4.2.5 Geohazards

Avalanches are the primary geohazard within the Mine Site Area (infrastructure area west of the Knipple Glacier). Avalanche paths intersect the km 72 Non-Potentially Acid Generating (NPAG) Quarry located on the southeast side of the WRTSF, the gravel borrow area (currently undeveloped) east of the east end of the WRTSF, and parts of the Brucejack Access Road (BJAR) between the km 72 NPAG Quarry and the Mine Site. No geohazards have been identified that directly impact the CWP.

Detailed information on the geohazards within the Mine Site Area can be found in the 2015 *MA/EMA* Permits Application (Pretium 2015) and the Geohazards Management Plan (Pretium 2016).

[1] Prior to 2012, this station was referred to as BJL-H1 and was located at a slightly different site.

4.2.6 Geochemical Setting

Geochemical assessments indicate the majority of geological units on the mine site are classified as potentially acid generating (PAG) material.

Detailed geochemical characterization of the Brucejack site is provided in the 2015 *MA/EMA* Permits Application (Pretium 2015) and subsequent *MA/EMA* Annual Reports (Pretium 2016 to 2019). Management of PAG materials is governed by the applicable authorizations, particularly M-243 and PE-107835, and by the ML/ARD Management Plan, which is also reviewed annually and updated as appropriate based on review.

4.3 Site Reference Data

This section summarizes where reference data for the site can be found. These data include:

- Facility coordinate system and datum;
- Geotechnical site investigation data; and
- Baseline groundwater and surface water characteristics.

Table 4-5: Monitoring Site BJ 1.74 mean monthly discharge and Runoff from 2008 to 2021.

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Discharge (m^3/s)	0.114	0.086	0.082	0.121	0.924	1.555	1.266	0.861	0.718	0.496	0.273	0.158
Runoff (mm)	36	25	26	37	291	474	399	271	219	156	83	50

Note:

2009 is a partial year

4.3.1 Facility Coordinate System and Datum

The Brucejack survey control uses the Universal Transverse Mercator (UTM) coordinate system, and is based on the Zone 9 North projection, using the North American Datum 1983 (NAD 1983).

4.3.2 Geotechnical Site Investigation Data

Site investigations have been completed in support of the design of the CWP. Details regarding the site investigations, including drill hole and test pit logs, geophysical surveys, and laboratory testing can be found in the following reports:

- BGC Engineering Inc. 2013. Brucejack Project Feasibility Study, 2011/2012 Site Investigation Report. July 12, 2013;
- BGC Engineering Inc. 2015a. Brucejack Project, 2014 Site Investigation Report. January 14, 2015; and

- BGC Engineering Inc. 2015b. Brucejack Project, Geotechnical Design of the Contact Water Pond. January 21, 2015.

4.3.3 Baseline Groundwater and Surface Water Quality

Detailed information on baseline groundwater sampling and surface water quality for the Brucejack Mine is provided in Chapter 2 of the Pretium Resources Inc. 2015 MA/EMA Permits Application (Pretium 2015).

4.4 Contact Water Pond Design

Design criteria and bases for the CWP are outlined in Table 4-6. Design criteria have been adopted for design of the CWP based on Pretium's *Mines Act* Permit M-243.

Table 4-6: Design criteria for the CWP.

Design Criteria	Description/Comments
CWP Storage Requirements	Store the runoff from the 24-hour duration, 200-year return period rainfall plus snowmelt event. The 24-hour 200-year rainfall has been estimated at 226 mm while snowmelt potential has been estimated at 43 mm. The CWP is to store a minimum of 50,000 m^3 without discharges through the spillway.
Operating Pond	During the surface runoff season (typically May to November),
IDF	1/200 annual exceedance probability (AEP).
Freeboard	Greater of no overtopping by 95% of the water caused by the most critical wind with a frequency of: • 1/1,000 years when the reservoir is at its maximum normal elevation; or • 1/10 years when the reservoir is at is maximum extreme level during the passage of the IDF.
Spillway Capacity	Pass the IDF.

The CWP was constructed without a liner, as it has been excavated entirely within bedrock. A hydrogeological assessment of the unlined facility is provided in BGC (2017c). Construction record drawings for the CWP are provided in Appendix A. A construction records report, including record drawings, is included in Appendix B.

4.5 Regulatory Requirements and Authorizations

The following legislation and regulations are pertinent to this OMS manual:

- BC *Mines Act* (1996a). Provides guidance and approvals for all activities on the Brucejack Mine Site, including exploration, development, production, closure, and reclamation;
- Health, Safety, and Reclamation Code for Mines in BC (HSRC 2022). Under the *Mines Act* (1996a), requires the operator to:
  - ensure that a tailings storage facility has a water balance and water management plan for the permitted life of mine that is prepared by a qualified person (section 10.1.12); and,

  - after commencement of operations, the water balance and water management plans under section 10.1.12 of this code shall be reconciled annually and updated as required (Section 10.4.1).

- BC *Environmental Management Act* (SBC 2003). Relevant to water management at Brucejack, regulates the discharge of liquid effluent into the environment;
- Metal and Diamond Mining Effluent Regulations (MDMER 2019). Environmental monitoring and surveillance programs of effluent discharges are requirements of the Metal and Diamond Mining Effluent Regulations (SOR/2002-222) pursuant to the *Fisheries Act*; and
- *BC Water Sustainability Act* (B.C. Reg. 36/2016). Brought into force February 29, 2016, this Act is the principal law for managing the diversion and use of water resources in BC.

The following is a list of the major authorizations for the Brucejack Mine relevant to this OMS:

- BC Environmental Assessment Certificate (EAC) #M15-01, issued in March 2015;
- Federal approval for the Brucejack Project under the *Canadian Environmental Assessment Act,* issued in July 2015;
- *Mines Act* Permit M-243, issued on July 22, 2015 and most recently amended November 14, 2022;
- *Environmental Management Act* (EMA) Effluent Permit 107835, issued on August 31, 2015 and most recently amended on July 16, 2022; and
- Conditional Water Licenses C132076 and C132077 also authorize the non-contact diversion channels [Camp Creek (West) Diversion and Johnson Creek (East) Diversion].

This OMS, including its Water Management Plan components, is a requirement of EAC #M15-01, *Mines Act* Permit M-243 and Effluent Permit 107835. Geotechnical, health and safety, geochemistry, reclamation and other environmental aspects of the Mine Site water management system are regulated under M-243. Discharges to the WRTSF, including those from the CWP, WTP, and mill (tailings), are regulated under PE-107835, along with the discharge from the WRTSF via the LLW. Permits M-243 and PE-107835 are provided in Appendix C.

Requirements of Permits M-243 and PE-107835 that are specific to the water management facilities are summarized in the following sub-sections.

4.5.1 CWP Authorized Discharge

Effluent Permit 107835 allows for the direct discharge from the CWP to WRTSF under the following conditions (see Appendix C):

- The maximum authorized rate of discharge from the CWP to WRTSF varies;
- Should the water quality concentrations of the WTP and CWP discharge to WRTSF exceed the values in Table 4-7 the permittee must immediately, upon receipt of analytical results, recirculate effluent through the CWP and WTP until treated water does not exceed; and

- The water quality concentrations of the WTP and CWP discharge to WRTSF must not exceed the values summarized in Table 4-7.

Table 4-7: CWP and WTP authorized discharge water quality concentrations.

Parameter	CWP Maximum[1)]	WTP Maximum[1)]	Units
Total Suspended Solids (TSS)	25[2)] 150 NTU [3)]	25	mg/L
pH	6.5 – 8.5	6.5 – 8.5	pH
Total Aluminum	0.3	0.3	µg/L
Total Arsenic	10	10	µg/L
Total Cadmium	0.25	0.25	µg/L
Total Cobalt	10	10	µg/L
Total Chromium	20	20	µg/L
Total Copper	10	10	µg/L
Total Iron	1.0	1.0	mg/L
Total Lead	5	5	µg/L
Total Manganese	22	22	mg/L
Total Silver	0.1	0.1	µg/L
Total Zinc	20	20	µg/L

Notes:

1) Concentration in any grab sample that triggers the recirculation of effluent through the CWP and WTP.

2) When available CWP storage capacity is between 10,000 and 50,000 m^3.

3) When available CWP storage capacity is less than 10,000 m^3.

4.5.2 Conditional Water License

Conditional Water License (CWL) (#500684) was issued on November 26, 2018 by the BC Ministry of Forests, Lands and Natural Resource Operations and Rural Development (MFLNRORD). This license replaces a prior CWL and allows for the extraction of water from the WRTSF at the LLW as follows:

- Maximum pumping rate = 70 m^3/h (20 L/s).
- The period of the year during which the water may be withdrawn is the whole year.
- The conditions of CWL #500684 are suitable for an average ore throughput rate of 3800 tpd.

4.5.3 Inspection and Maintenance of Water Management Works

As per Section 2.1 of PE-107835:

“The permittee must regularly inspect the Authorized Works and maintain them in good working order. If components of the Authorized Works have a manufacturer's recommended schedule, then those components must, at a minimum, be maintained in accordance with that schedule.

The permittee must maintain a record of inspections and maintenance of the Authorized Works, and make the record available to an office upon request.

In the event of an emergency or other condition which prevents normal operation of the Authorized Works or leads to an unauthorized discharge, the permittee must take remedial action immediately to restore the normal operation of the Authorized Works and to prevent any unauthorized discharges. The permittee must immediately report the emergency or other condition and the remedial action that has and will be taken to the EnvironmentalCompliance@gov.bc.ca email address or as otherwise instructed by the director.

The director may require the permittee to reduce or suspend operations until the Authorized Works have been restored, and/or corrective steps have been taken to prevent unauthorized discharges."

4.5.4 Surface Water and Groundwater Monitoring

Surface water and groundwater monitoring requirements are specified in Appendices A and B of Permit PE-107835 (Appendix C).

4.5.5 Water Management Facility Compliance Reporting

The Mill Manager and Environmental Superintendent are responsible for monitoring the water management facilities operations for compliance with permits. Reporting pertinent to the mine surface water management facilities and required by *Mines Act* Permit M-243 and Effluent Permit 107835 includes:

- Condition C.4.(e) of M-243 requires that Pretium implement an OMS Manual for the Contact Water Pond that is reviewed annually and updated, as needed, to reflect changes in status as the facility develops.
- Condition C.4.(f) of M-243 requires that Pretium have a Professional Engineer complete an annual inspection of all surface water ponds, ditches, and diversion channels that compose the water management facilities on the mine site. The annual inspection shall be documented and inspection reports shall be maintained onsite and provided to any inspector upon request.
- Condition D.1.(a & b) of M-243 requires that Pretium maintain and implement an Environmental Management System (EMS) consisting of Environmental Management Plans (EMPs) and Standard Operating Procedures (SOPs). The EMS must reference relevant policies and establish proactive procedures to provide direction of effective operational management and monitoring on-site. The EMS must be audited annually, revised as soon as often as required, and be made available to a Mines Inspector at the mine site at all times. Pretium must ensure that mine site employees and contractors are knowledgeable and accountable to act consistently with the requirements of the EMPs and SOPs that form the EMS. This OMS manual is one of the EMPs that comprise the EMS.

- Condition E.2 of M-243 requires that Pretium submit an Annual Reclamation Report Submitted in a form and containing the information required by the Chief Inspector.
- PE-107835 provides discharge limits and rate requirements for effluents discharged into and from the WRTSF (refer to Sections 4.5.1 and 4.5.2 above); authorizes and requires inspection of the various discharge works; contains monitoring and testing requirements for effluents and various sites in the aquatic receiving environment; contains reporting and related procedural requirements in the event of discharge limit exceedance; and specifies annual and other reporting requirements (see Appendix C).

5 Water Management Plan

5.1 Purpose

The purpose of the Water Management Plan (WMP) is to guide water management through operations and closure such that:

- Infrastructure is appropriately designed and maintained to safely convey and withstand predicted flows;
- Sufficient water is available for environmental mitigation purposes and to support consumptive uses of water for mining related purposes;
- Discharges to the aquatic receiving environment occur in a manner that meets environmental and regulatory requirements from both flow and quality perspectives; and
- Flood preparedness

The WMP is focused on mine infrastructure located within the upper Brucejack Creek (including the WRTSF) catchment and is integrated with a water balance model developed for the site. The catchment includes most of the Mine Site Area, defined as the mine infrastructure area west of Knipple Glacier.

The WMP incorporates principles of adaptive management by providing a framework for ongoing review and improvement of water management practices. The document is intended to be used in conjunction with other Environmental Management Plans (EMPs) pertinent to the protection of the aquatic receiving environment, including plans from the MA/EMA Permits Application (Pretium 2015), and subsequent EMP updates such as the ML/ARD Management Plan, Tailings and Waste Rock Subaqueous Deposition Management Plan, Reclamation and Closure Plan, and the Aquatic Effects Monitoring Plan (AEMP).

The WMP focuses primarily on water flows, although the Brucejack water management has been planned such that water flows and quality are fully integrated with facility design and operations. The specifics of water quality mitigation planning and management, including geochemistry aspects and erosion prevention and sediment control, are addressed in the management plans referenced in the previous paragraph.

5.2 Performance Objectives

The WMP portion of the OMS Manual provides guidance for achieving the following performance objectives:

- Managing water to ensure ongoing compliance from a flow perspective with regulatory commitments, guidelines, and objectives;
- Implementing water management measures in a timely and effective manner;
- Integrating water management activities with other management and monitoring programs;
- Intercepting and diverting non-contact water (freshwater) away from work and development areas;
- Minimizing runoff over areas of surficial disturbance where feasible;
- Preventing potential adverse effects on the downstream aquatic receiving environment from a flow perspective;
- Maintaining an adequate supply of water for mine operations; and
- Minimizing the use of freshwater through water recycling whenever possible.

Specific measures implemented to achieve performance objectives are summarized in Table 5-1. This table also lists other applicable management plans for each performance objective.

5.3 Scope

The Water Management Plan component of this OMS Manual is applicable to the following mine facilities and activities, throughout mine life:

- Underground mine water management and dewatering, with water from the underground mine pumped to the WTP;
- Diversion of non-contact (fresh) water around the Mine Site;
- Collection and management of contact water within the Mine Site, and directing it to the CWP for either treatment in the WTP or direct discharge if required conditions are met;
- Water requirements for the process plant, thickened tailings slurry and paste backfill;
- The weir at the outlet of the WRTSF, which is used to monitor discharge rate from the WRTSF; and
- Surface runoff at the 72 km NPAG (non-potentially acid-generating) quarry.

5.4 Operations Water Management

5.4.1 Overview

Water management at the Mine Site includes the following facilities:

- Two fresh water (non-contact) diversion channels divert water around the core Mine Site surface infrastructure area. The Johnson Creek (East) Diversion Channel drains into the WRTSF, while the Camp Creek (West) Diversion Channel drains to Brucejack Creek.
- Wastewater from the camp is directed to a sewage treatment plant (STP) located near the mill building, with the treated effluent discharged to the WRTSF.
- Contact water from the contact water management area (includes the mill and camp pads and additional core infrastructure areas) is directed to the Contact Water Pond (CWP) by way of collection weirs, ditches, sumps and HDPE pipes.
- Contact water in the CWP is pumped to the WTP, located in the mill building. The effluent from the WTP is either used as makeup water for the mill or piped to the WRTSF for discharge.
- Water from dewatering of the underground mine is pumped to the WTP for treatment. The priority use for this treated water is the mill. When there is a surplus of treated water after fulfilling mill requirements, the excess is discharged to the WRTSF.
- Process water is required for the thickened tailings slurry to the WRTSF, the underground paste backfill, and the concentrate slurry. This water is sourced from the WTP treated effluent, reclaim from the WRTSF at the LLW, and ore moisture.
- Tailings are either directed to the paste backfill plant or sent to the WRTSF as thickened tailings for disposal at depth, but never concurrently.
- If there is insufficient make-up water for process from the CWP and/or underground dewatering, fresh water is reclaimed from the lake outlet at the LLW.
- Potable water is obtained from a groundwater well, with subsequent filtration and disinfection treatment before piping to end users at the Brucejack Camp and other facilities.

Water management practices, structures, and systems for the operations phase are described in more detail below, with an emphasis on environmental protection measures incorporated into system operations.

Table 5-1: Water management performance objectives and corresponding management measures.

Mine Phase	Activity or System	Performance Objectives	Management Measure	Other Applicable Management Plans
Operations	Site drainage and ditch operations	Reduction, elimination, or mitigation of erosion and sediment yield interception and diversion of non-contact water. Collecting and treating contact water.	Water management and sediment control structures and facilities are regularly inspected and maintained. Non-contact (freshwater) diversion channels that have been constructed around the operations camp, plant site, and laydown area continue to discharge to Brucejack Creek and the WRTSF. Surface contact water captured by the contact water management system drains into the CWP, and is pumped to the WTP for treatment prior to use in the process plant or discharge to the WRTSF when water is not needed for process.	Reclamation and Closure Plan, AEMP.
	WTP and CWP	Collecting and treating contact water.	Mine water and plant site contact water is treated in the WTP. Excess treated water beyond process requirement is discharged to the WRTSF.	ML/ARD Management Plan.
	Process water supply system	Maintaining an adequate supply of water for mine operations.	Water requirements for the process plant are met with treated underground seepage water, recycling process water and reclaim water sourced from the WRTSF at the LLW.	ML/ARD Management Plan.
	Tailings disposal	Maintaining an adequate supply of water for mine operations.	Tailings are either diverted to the paste plant to be backfilled underground or discharged to the bottom of the WRTSF as thickened tailings.	Tailings and Waste Rock Subaqueous Deposition Management Plan.
	Potable water supply system	Maintaining an adequate supply of potable water for mine operations.	Potable water for Brucejack Camp and mill building is supplied from a groundwater well.	Potable Water Management Plan.
Closure and Post-closure	Site closure and reclamation	Ongoing compliance with regulatory commitments, guidelines, and objectives[1]	Water management/erosion and sediment control structures will be dismantled and sites will be reclaimed to a stable condition for Post-closure. Underground workings will be flooded.	AEMP, Closure and Reclamation, and ML/ARD Management Plan.

Notes:

[1] Performance objective is applicable to all activities throughout all phases of mine.

5.4.2 Non-Contact Water Diversion Channels

Non-contact water from areas up-gradient of the Mine Site is intercepted by two diversion channels: Johnson Creek Diversion (East Diversion) and Camp Creek Diversion (West Diversion) (Figure 5-1).

The construction of both diversion channels was one of the first tasks completed on site. The channels are lined with riprap underlain with geotextile as needed for erosion protection. Both channels were designed for the 200-year return period peak instantaneous flow (Q_{i200}). IFC drawings for the non-contact diversion channels are included in Appendix A.

Johnson Creek Diversion (East Diversion)

The Johnson Creek Diversion (East Diversion) intercepts Johnson Creek and directs the flow eastward around the Mine Site to the WRTSF (Figure 5-1). This channel was specified with a bottom width of 2.5 m, 2H:1V sideslopes, a minimum depth of 1 m, and minimum gradient of 0.5%. Class 50 riprap[2] was specified for erosion protection with a geotextile under the liner. The design flows were estimated at 5.0 m^3/s.

Camp Creek Diversion (West Diversion)

The Camp Creek Diversion (West Diversion) intercepts Camp Creek and direct flows around the western perimeter of most of the Mine Site to Brucejack Creek (Figure 5-1). Camp Creek is culverted through the West Zone Portal Pad. This channel was specified with a bottom width of 2.5 m, 2H:1V sideslopes, a minimum depth of 1 m, and minimum gradient of 0.5%. Class 50 riprap was specified for erosion protection with a geotextile under the liner. The design flow was estimated at 5.3 m^3/s.

5.4.3 Contact Water Management System

Contact water within the core infrastructure area of the Mine Site, where the main excavations of surface bedrock occurred during construction to create building pads, is directed to the CWP. A catchment area of approximately 15 ha currently reports to the CWP. These areas are delineated as Areas A, B, E, F and G as shown in Figure 5-1. Because these areas include excavations in PAG rock, runoff from these areas is directed to the CWP by way of collection ditches and sumps. Similar to the non-contact water diversions, the collection ditches and pipelines are designed to convey the Q_{i200}.

Areas C, D and H do not contain PAG rock excavations from mine construction (Figure 5-1). Area C is largely undisturbed and contains water collection and pumping infrastructure to allow water from its western portion to be directed to the contact water management system as needed for sediment control. Drainage from the Diesel Power Station (DPS) drains to a sump for this facility and from there is pumped to the CWP. The rest of Area D remains outside of the contact water collection system as per the original pre-mine designs, plans and assessments. Area H drains to the WRTSF although runoff from part of the area may be directed to the contact water system as needed.

[2] This class of riprap has an average diameter (D_{50}) of 350 mm with 85% greater than 100 mm and 15% greater than 500 mm.

ID	Diameter	Notes
P1	510 mm	HDPE pipe with drain valve
P2	600 mm	CSP culvert from Sump to MH#2
P3	200 mm	HDPE pipe from West Weir to East Weir
P4	300 mm	HDPE pipe tie into 510 mm pipe from MH#2 to CWP
P5	150 mm	HDPE pipe from DPS Pond to East Weir
P6	1x1050 mm and 2x800 mm	3 culverts - Camp Creek West to Brucejack Creek
P7	510 mm	HDPE pipe gravity drain MH#1 to CWP
P8	800 mm	CSP culvert with HDPE lined ditch block
P9	300 mm	CSP culvert to roadside ditch
P10	200 mm	Pump and pipe system for Emergency Lake Discharge
P11	300 mm	HDPE Pipe multiple pumping rates CWP to Mill
P12	510 mm	HDPE Pipe multiple pumping rates Mill to CWP
P13	300 mm	HDPE Pipe VOK Portal to WTP
P14	200 mm	HDPE pipe with gas powered pump (Intermittent)
P15	4x1000 mm	CSP culverts through Lakeshore Drive roadway
P16	2x1100 mm	CSP culverts through Lakeshore Drive roadway
P17	3400 mm	CSP culvert through access road for WDC channel

Figure 5-1: Mine water management plan with drainage areas.

Area A: Phase 1 Camp Area

A portion of surface runoff from Area A is diverted northeast toward the CWP. Runoff is collected on the inside ditch of an internal road that leads from the Mill Pad to the Phase 1 Camp buildings where water is collected in a sump located to the immediate west of the VOK mine portal; from here flows are conveyed via a culvert and ditch towards the CWP. The remainder of the Phase 1 Camp area drains north and onto the Phase 2 Camp Pad, where it is ultimately captured by the pipeline from the Camp Pad to the CWP (see description of Area B). Figure 5-1 illustrates the water management infrastructure for Area A.

Area B: Phase 2 Camp Pad and West Portion of Mill Pad

Surface Runoff:

Water collected by perimeter ditches on the Phase 2 Camp Pad reports to a drainage manhole (MH#2) at the northwest end of the pad. Runoff reporting to MH#2 is conveyed by a 20” (510 mm) diameter HDPE pipe to the CWP. This 20” pipe initially runs down toward Area C before running along a ditch on the inside of Lakeshore Drive (Figure 5-1). To prevent ice build-up in the line during the winter months, a valve is in the vicinity of the Area C sump to allow for the 20” pipe to be drained prior to the onset of winter.

A sump at the northeast corner of the pad also collects runoff from the area between the camp building and the mill. A 600 mm diameter culvert conveys runoff from the sump to a drainage manhole (MH#1).

Subsurface Runoff:

Two concrete weirs (East and West) were built downgradient of the pads where water is collected, and from here conveyed through a pipe towards the CWP. Location of east and west weirs are illustrated in Figure 5-1. Figure 5-2 shows a photograph of the west weir.

The weirs are founded on bedrock and are designed to contain the Q_{200} without overtopping. IFC drawings of the weirs are attached in Appendix A. Seepage and surface runoff collected in the West Weir are routed by gravity via an 8” (200 mm) HDPE pipeline that discharges into the East Weir. Runoff collected in the East Weir discharges to a 12” (300 mm) HDPE pipeline, which ties into the 20” line that runs from MH#2 to the CWP. In addition, flows from the DPS pond are pumped into the East Weir (Figure 5-1).

Figure 5-2: Overview of West Weir. SRK photograph of August 20, 2019.

Contact Water Ditches:

To minimize potential leakages on the camp and mill pad perimeter collection ditches, the permit-level WMP indicated that an HDPE geomembrane liner was to be placed under sections of the collection ditches founded either in high hydraulic conductivity (K) soil (i.e., soil with less than 20% of material passing No. 200 based on field classification) or fractured bedrock based on field observations. However, any seepage from these collection ditches is expected to report to the East Weir or the West Weir. As runoff and seepage collected in these areas is conveyed by gravity drainage or pumping to the CWP, the ditches have not been lined.

Area C: North Slope West Zone Access Road

Drainage from the northern portion of Area C is collected and directed to the CWP via a pumping system as needed to manage water along this section of Lakeshore Drive, including to prevent excessive wetting of the roadbed materials. A sump, east of the DPS Pad collects runoff from a gully located directly upslope, as well as ditch drainage to the east. Any runoff reporting to the sump is pumped to the CWP (Figure 5-1).

Area D: West Zone

The West Zone pad area includes the West Zone Portal and adjacent pad, the DPS Pad, and the DPS Sump (Figure 5-1). The Camp Creek (West) Diversion is culverted through this area with flows conveyed through three culverts (1 x 1050 mm and 2 x 800 mm). Surface runoff from this area reports to Brucejack Creek, with an approximate 1 m high armored berm providing separation between Brucejack Creek and mine infrastructure..

The Diesel Power Station (DPS) Pond is a lined facility that was constructed in 2016. Portions of the DPS Pad that contain diesel generators and fuel tanks are also lined. Runoff from lined areas

reports to an oil water separation system, prior to discharge to the DPS Sump. Runoff collecting in the DPS Sump overflows through a vertical standpipe to an adjacent sump, from where it is pumped to the East Weir for conveyance to the CWP (refer to pipeline label P5 in Figure 5-1).

Area E: East Portion of Mill Pad Area

Runoff from Area E includes the east half of the Mill Pad. Runoff within the mill footprint reports to a buried perimeter drainage system, which is tied into Manhole #1 (MH#1). Runoff reporting to MH#1 drains by gravity into the CWP via a 20” line.

Area F: Bunkhouse 6 Laydown

The Area F collection ditch and Area A/E/G collection ditch discharge to a common sump, before draining northwest to the CWP.

Area G: Contact Water Pond

Area G includes the footprint of the CWP, as well as upslope areas (Figure 5-1). Surface runoff from this area reports to the CWP, either directly as sheet runoff, or is through a ditch system. Contact water runoff from Zone A discharges into a ditch located on the upslope side of the access road. This ditch also intercepts contact water runoff from the mine portal area. In addition, surface contact runoff from Area F discharges into this ditch, upstream of the access road crossing.

The combined runoff is intercepted and conveyed across the access road through an 800 mm diameter CSP culvert. Downslope of the culvert, flows are conveyed in an HDPE-lined ditch in a northwest direction to the CWP.

The CWP spillway consists of a concrete control section, a channel excavated down to bedrock (with riprapped side slopes), and a culverted crossing (4 x 1,000 mm) of Lakeshore Drive.

Management of pond volumes can be divided into five categories: normal operating conditions, upset conditions in the WTP, pumped discharge (suitable water quality), pumped discharge (emergency conditions), and emergency discharge. Management practices for each operating condition are summarized in Table 5-2. Trigger levels for these various scenarios are discussed in Section 5.7.6.

Area H:

Area H includes the footprint of the Truck Shop (Figure 5-1). Surface runoff from this area reports to the CWP, either as runoff or through a perimeter ditch system. Water collected in the perimeter ditch is collected into a sump (on the west side) and then pumped into the CWP. Peak flow estimates and pump sizing analyses are presented in Appendix E.

Table 5-2: CWP operating conditions and management practices

CWP Operating Conditions	Management Practice
Normal Operating Condition	During normal operating conditions, water levels in the CWP fluctuate below 80% (water level at elevation 1374.8 masl, storing ~40,000 m^3) of the maximum storage capacity. The CWP has been designed to store 50,000 m^3 of contact water without discharge through the spillway. The CWP reclaim water system is operated as needed to manage the CWP. As-built drawings for the CWP reclaim system[3] are provided in Appendix B. A total of four submersible pumps are used to dewater the pond. Two large pumps, each with a capacity of 220 m^3/h, are connected to 6" hoses. Two smaller pumps, each with a capacity of 65 m^3/h, are connected to 4" hoses. Water is pumped from the CWP to the WTP in a 12" line that is heat traced and insulated. Any combination of these pumps can be operated to supply a range of flows to the WTP (or for emergency discharge to the WRTSF), depending upon the CWP pond level and WTP minimum flow requirements.
Upset Conditions in WTP	In the event of upset conditions or maintenance requirements that require temporary shutdown of the WTP, the CWP will be passively managed allowing pond volumes to increase up to 95% of the maximum storage capacity (water level at elevation 1376.1 masl, storing ~47,500 m^3).
Pumped Discharge (Suitable Water Quality)	CWP water quality must meet the discharge characteristics in PE-107835 Subsection 1.2.3 prior to direct discharge to the WRTSF. Direct discharge to the WRTSF may occur at any time that the CWP available storage capacity is between 10,000 and 50,000 m^3 provided that the water quality characteristics of Subsection 1.2.3 are met prior to discharge. This discharge would occur via the 8" (200 mm) direct discharge pipeline to the WRTSF.
Pumped Discharge (Emergency Conditions)	When pond levels reach the spillway invert, a controlled but unintended release of contact water will occur into the WRTSF. To minimize potential impacts to the water quality, it is preferable that any release of contact water occur at depth, rather than discharging to the surface as would occur from the spillway discharge. Therefore, when pond volumes reach 95% of the CWP storage capacity and dependent upon circumstances (e.g. if significant additional rainfall is forecast), direct discharge to the WRTSF via the 8" (200 mm) direct discharge pipeline may be initiated on an emergency basis. This pipeline can discharge up to 600 m^3/h with two pumps operating. This pipeline would operate as long as pond volumes remained above the 95% level. If the CWP water quality does not meet the discharge characteristics in PE-107835 Subsection 1.2.3 prior to this discharge occurring, non-compliance provisions of PE-107835 would take effect (PE-107835 Subsections 5.3 and 5.4, and reporting to MEMPR, the Tsetsaut/Skii km Lax Ha First Nation, the Tahltan Nation (as represented by the Tahltan Central Government), Nisga'a Nation, through Nisga'a Lisims Government, the Alaska Department of Natural Resources, and to federal agencies if applicable.)
Emergency Discharge	Emergency discharge will occur through the spillway when pond levels reach the spillway invert. This controlled release of water would report to the WRTSF. If the CWP water quality does not meet the discharge characteristics in PE-107835 prior to this discharge occurring, requirements outlined for Pumped Discharge, Emergency Conditions, would apply.

[3] Electric power is supplied to the mine site from a 69 kV transmission line. A 4.16 kV overhead distribution system is utilized to provide power to the major infrastructure around site and a 600 v feed for the CWP pumping system

The CWP is required to have a minimum storage capacity of 50,000 m^3, which is achieved at a maximum pond elevation of 1,376.5 m (i.e., the invert elevation of the spillway inlet). This elevation is the maximum operating and storage level of the CWP. Refer to CWP Record Drawings contained in Appendix B ("Contact Water Pond Construction Records Report" by BGC (2018), see Appendix A). Figure 5-3 illustrates the stage storage curve for the CWP.

Figure 5-3: Storage capacity of the CWP

Environmental Protection

Regulatory requirements pertinent to the Mine Site water management system are described in Section 4.5. *Mines Act* Permit M-243 and Effluent Permit 107835 (both included in Appendix C for reference). Effluent Permit 107835 provides discharge limits for mine effluent (Section 1.0 of the permit); specific requirements for surface and groundwater flow and quality, and aquatic biological, sediment monitoring and toxicity testing requirements (refer to Section 4.0 and the related appendices in the Permit).

As discussed in Section 4.4, the CWP was constructed without a liner, as it has been excavated entirely within bedrock. The following monitoring is conducted to check for any seepage that could warrant geotechnical assessment:

- Quarterly monitoring of groundwater levels (including datalogger downloads of water level) and groundwater quality in BJ-GW16-5A/B, installed northwest of the CWP, and BJ-GW18-23A/B, installed northeast of the CWP, following the methodologies and parameters of the permitted (PE-107835 and M-243) groundwater monitoring network.
- Inspecting the area between the CWP and the WRTSF for evidence of seepage from the CWP once a year during the snow-free period for pond levels less than 30,000 m^3 capacity (elevation = 1373 masl), and once a month for higher pond levels, until it can be established that seepage breakout is not a concern for the normal operating range of the pond. If seepage breakout is observed to be a concern, this inspection will be augmented by mapping of any larger, persistent discontinuities that daylight in the northeast wall and if/when possible the floor of the CWP. Mapping of the northeast wall will be accomplished using photogrammetry when pond levels are low.
- Recording water levels in the CWP on at least a daily frequency.

Figure 5-4. View of CWP spillway concrete control section. SRK photograph of August 20, 2019.

5.4.4 Waste Rock Stockpiles

Waste rock from the underground mine is stockpiled temporarily at the WRD prior to sorting and subaqueous deposition. These temporary stockpiles are situated either on or slightly up-gradient of the WRTSF; in both cases rainfall and snowmelt infiltrates and eventually reports to the WRTSF.

5.4.5 Underground Mine

Dewatering of the underground mine will continue throughout mine operations. Water pumped from the underground mine workings is directed to the WTP, where it is treated prior to use in the process plant or discharge to the WRTSF. Modeling studies undertaken in 2015 predicted monthly average dewatering rates reaching a maximum of 5,300 m^3/d. Preliminary results from ongoing updates to both the numerical groundwater model and site wide water balance model indicate that the 2015 reported values are reasonably conservative and that underground dewatering rates are expected to stabilize in the last four years of mining.

5.4.6 Operations Water Treatment Plant

Water from the underground mine and contact water collected from the Mine Site contact water management area is treated by the WTP. Treated water is used in process, with the excess discharged to the WRTSF and to the CWP. The WTP has a maximum treatment capacity of approximately 417 m^3/h (10,000 m^3/day). Water pumped to the WTP is initially fed through a clarifier to remove most of the TSS. The clarified water is then sent to the primary treatment train and WTP sludge is discharged to the WRTSF with the tailings slurry within the proportion authorized by Permit M-243. Magnetic flow meters are used to track flow rates and associated volumes. Additional details of the WTP are provided in Section 7.1 of the 2015 *MA/EMA* Permits Application by Pretium (2015) and subsequent Annual *MA/EMA* reports (Pretium 2016 to 2019). The WTP will be used throughout the operations and closure phases until it is no longer required for water treatment.

The WTP requires a minimum feed of 175 m^3/h to operate at peak efficiency. Whenever this input rate is not met from the underground mine and process water, water from the CWP is recycled to the WTP to meet this minimum demand.

In the event of upset conditions or maintenance requiring temporary shutdown of the WTP, contact water from the underground mine can be temporarily diverted and stored in the CWP.

5.4.7 Process Water Supply System

Process water is required for:

- Mill processing;
- The thickened tailings slurry to the WRTSF;
- The underground paste backfill;

- The filtered and bagged concentrate; and
- Mine supply water for underground dust control and drilling.

The balance of the process water is supplied from the WTP, which treats water from the mine (underground water), CWP; and a portion of the CWP water. Process water is also sourced from ore moisture and a reclaim system installed at the low-level weir at the lake outlet.

5.4.8 Freshwater Supply System

Freshwater is held in a fresh/fire water storage tank. The tank is equipped with a suction pipe mounted at approximately 2/3 of tank height, which ensures that the tank always contains at least a two-hour supply of water for firefighting. Water is supplied to the freshwater tank from the LLW and WTP treated water. Freshwater from this tank is primarily used for:

- Fire water for emergency use;
- Gland water for the slurry pumps;
- Reagent make-up;
- Mine supply;
- Process water make-up;
- Mill process spray nozzles;
- Gravity concentrator fluidization water; and
- Gold Room Scrubber.

In addition to freshwater usage, the overflow supernatants of the tailings thickener is reused in the process circuit.

5.4.9 Tailings Disposal

Flotation tailings are either used in paste backfill in the underground workings or deposited in the WRTSF. The Brucejack Mine has a common thickener and filtration system for tailings dewatering prior to deposition in WRTSF and underground paste backfill. The thickened tailings deposited in WRTSF are pumped in a slurry consisting of a targeted 55 to 65% solids by weight, while the paste backfill has a slightly higher target percentage of solids (63 to 65%).

5.4.10 WRTSF Outlet Weir

The low level weir (LLW) is a weir is located across Brucejack Creek at the outlet of the WRTSF. Site location of the LLW is provided in Figure 5-1 and a photo of the location is included as Figure 5-5. The purpose of the LLW is to provide flow monitoring of the effluent stream from the WRTSF at a level of accuracy that meets regulatory requirements. The facility is also used as a platform to pump reclaim water to the mill.

Figure 5-5: View looking upstream to constructed low level weir. SRK photograph of August 20, 2019.

The LLW consists of a compound cross-section: concrete broad-crested structure with a low level opening to pass average annual flows and an overflow crest to pass peak flows (up to 200-year return period events). The LLW is enclosed in a concrete chamber founded on bedrock with a grating floor and heated superstructure above it. This configuration keeps the weir ice free during the winter period. This weir is illustrated in the conceptual design drawing in Figure 5-6 and Figure 5-7.

Water enters the upstream chamber through an underflow baffle, passes over the weir, and exits the downstream chamber through another underflow baffle. The reclaim water pumps are mounted on the floor above the upstream chamber. The water passes through the dividing wall into a secondary chamber through two openings, which are offset to either side of the pump intakes to minimize turbulence upstream of the weir. The weir and the flow monitoring instrumentation are located in the secondary chamber.

The underflow baffles at the inlet and outlet keep ice outside of the weir and promote flow mixing. The turbulence caused as water flows over the weir crest also creates flow mixing. This design is intended to ensure a proper reading for average TSS and other water quality parameters, which are monitored by sampling of water at the downstream end of the weir chamber.

Figure 5-6: Low level weir profile looking upstream.

Figure 5-7: Section through low level weir.

Automated instrumentation is in operation to continuously measure water level, which is converted to a flow rate using an equation for a rectangular broad-crested weir (hydrometric station BJ 3.10). IFC drawings for the LLW are attached in Appendix A.

5.4.11 Pipelines and Pumps

Installed pipelines and pumps are summarized in Table 5-3.

Table 5-3: Summary of pipelines and pumps.

From	To	Pipeline Diameter (inches)	Pump Rate
West Weir	East Weir	8	gravity
East Weir	20” line	12	gravity
MH#2	CWP	20	gravity
DPS Sump	East Weir	8	60 m^3/h

From	To	Pipeline Diameter (inches)	Pump Rate
Area C sump	CWP	6” lay-flat hose	225 m^3/h
Area H Sump	HDPE-lined ditch/CWP	4” lay-flat hose	685 m^3/h
Underground	WTP	6” + 8”	6” only + single pump train: 150 m^3/h 8” only + single pump train: 180 m^3/h 6” and 8” + two pump trains: 385 m^3/h
LLW	Mill	6	80 m^3/h
CWP	Mill	12	2 x 65 m^3/h, 2 x 220 m^3/h
CWP	WRTSF	8	2 x 65 m^3/h, 2 x 220 m^3/h – close valve to Mill and open valve to 8” line to WRTSF
Mill/WTP	CWP	20	gravity
MH#1	CWP	20	gravity
Potable Well	Site	2	8 – 9 m^3/h

5.4.12 Closure and Post-Closure Water Management

Closure will involve the removal of all structures and equipment, closure of the portals, flooding of the underground mine workings, and site rehabilitation. The primary goal of water management activities during the closure and post-closure phases will be to minimize the long-term effects on the environment and return the site to as close to its pre-disturbance condition as possible.

Reclamation and closure activities that will occur during the Closure phase are described in the Reclamation and Closure Plan -MA/EMA Permits Application, Chapter 5 (Pretium 2015) and the subsequent annual reports by Pretium (2016 to 2021); this was updated in the 5 Year Mine Plan and Reclamation Program due July 31, 2020. The description that follows highlights reclamation and closure activities pertinent to water management as described in 2015.

When Mine Site Area roads are no longer required, they will be deactivated following the standards of the Health, Safety and Reclamation Code for Mines in BC These standards include, but are not limited to:

- Removal of the LLW, all culverts and bridges;
- Contouring potentially unstable road shoulders;
- Installing water bars (interceptor dikes);
- Ripping the road surface; and
- Revegetation.

At final closure, the two non-contact water diversion channels will remain in place.

The underground workings will be progressively backfilled with tailings (i.e., paste) and waste rock throughout mine operations and, once mining is completed, the remaining underground voids will be allowed to flood. The ventilation shafts and West Zone underground portal will be sealed with concrete plugs, and the new portals will be closed. Some seepage may occur from the West Zone Portal or adjacent rock face on a seasonal basis; any seepage flows from the West Zone Portal will be monitored in accordance with the monitoring plan.

The CWP will be decommissioned by backfilling and reclaiming it during the Closure phase.

5.5 Adaptive Management

Effective water management requires an integrated, adaptive approach. Water management activities emphasize best management practices (BMPs) to minimize disturbance to vegetation, soil, and natural drainages during operations. BMPs are discussed in the following sections. Measures that will apply throughout mine Operations and Closure incorporate adaptive management as part of the WMP.

5.5.1 General Approach

The general adaptive management approach for the WMP is describe below:

- Adaptive management is a process for continually improving management practices by learning from the outcomes of operational approaches (e.g., Holling 1978; Taylor et al. 1997). To be effectively implemented, it requires a prompt response to field observations of changing environmental conditions and limitations or deficiencies in existing water management structures.
- When properly implemented, adaptive management enables a cost and time-effective hierarchical response to potential water management issues. BMPs and a corresponding inspection, maintenance, and monitoring program constitute the basis of water management planning.
- The adaptive management approach promotes proactive measures, with the caveat that contingency plans and materials should be in place prior to the initiation of work so that additional measures can be quickly implemented if needed.
- Communication is essential in the implementation of adaptive management strategies of the WMP. Relevant site personnel are advised about the WMP's goals and purpose, and their responsibilities to implement the WMP successfully. Personnel are informed of changes in a timely manner. Appropriate training and field supervision are important elements of the WMP. It is important that personnel understand why water management measures are needed and how to implement them correctly.
- Adaptive management options that may be employed for the Mine Site include:
  - Increasing monitoring and sampling frequency;
  - Adding or relocating monitoring locations;

- Developing new contingency plans, operating procedures or analytical methods;
- Updating conceptual and numerical models developed for the site; and
- Adopting mitigation strategies.

5.5.2 Surface and Groundwater Adaptive Management Approach

If any issues, such as a non-compliance, are identified in any of the surface water or groundwater quantity or quality results through interpretation of instrumentation data and visual inspections of conditions on site, a review of the sampling frequency, parameters of interest, and sampling locations will be completed. A summary of adaptive management strategies for surface water infrastructure are presented in Table 5-4 . A summary of the main components of the groundwater monitoring program related to adaptive management are provided in Table 5-5. For sampling details and locations refer to PE-107835.

Table 5-4: Surface water adaptive management strategies.

Component	Objective	Management Approach
Non-Contact water diversion structures	Evaluate performance of infrastructure during freshet	Current winterization strategies and functioning during freshet is working well, however, if icing conditions worsen, additional ice control strategies will be implemented as appropriate, such as culvert steaming.
Contact Water Weirs	Evaluate seepage downstream of weirs	If monitoring of downstream seepage indicates an increase in flows, consideration will be given to for additional collection and pumping capacity

Table 5-5: Groundwater monitoring program components managed adaptively.

Component	Objective	Management Approach
Groundwater inflow pathways to the underground	Evaluate the accuracy of predicted groundwater inflow rates to the underground versus actual rates	Predicted inflow rates are considered conservative however rates will be monitored and additional management will be implemented as appropriate if rates are greater than predicted
Underground dewatering response	Evaluate the effects of underground dewatering on groundwater levels and hydraulic gradients	Monitoring results will be used to evaluate the effect of underground dewatering
Leakage rates from WRTSF and Brucejack Creek	Confirm and quantify leakage rates from WRTSF and Brucejack Creek	Leakage rates are assumed to be negligible however gradients from the lake to the underground will be monitored
Groundwater flow paths during operations	Evaluate changes in groundwater flow system and quality in	Monitoring results will be used to update conceptual and numerical models developed for the mine

Component	Objective	Management Approach
	response to mining activities	
Seepage from adit plugs at closure	Inspect adit plugs and if necessary, quantify seepage rates from the adit plugs that will be placed at the West Zone adit at closure and confirm that rates are negligible	Groundwater levels recovery in the underground will be monitored during closure and into post closure. If groundwater levels rise above adit plugs or seals, seepage around the plugs is possible. In this event, mine seals and caps will be inspected for seepage. Seepage rates are assumed to be negligible however contingency plans for monitoring the seepage rate and quality will be developed if seepage is observed. Results of the seepage monitoring will inform decision making as to the need for pressure grouting, or other repair, around plugs and seals is necessary. Failure of the plug would result in leakage to Brucejack Creek, requiring corrective mitigation measures.
Underground filling	Evaluate time to fill the underground workings at closure	Monitoring results will be used to update conceptual and numerical models developed for the mine
Groundwater flow paths at closure	Evaluate long-term predictions of groundwater elevations at closure	Conceptual and numerical models developed for the mine will be updated. New contingency plans will be developed if groundwater elevations do not trend as predicted.

5.5.3 Instrumentation

The adaptive management approach relies on the monitoring, analysis and interpretation of data collected by instrumentation installed on site to adapt to changing surface water and groundwater conditions. Data will be collected, processed and interpreted with the following considerations for application to the adaptive management program:

- Collecting data related to surface water quantity and groundwater quality and quantity according to the specified locations and frequency outlined in PE-107835;
- Processing and summarizing the data into an appropriate format;
- Reviewing instrumentation readings and comparing with baseline and predicted conditions;
- Identifying significant changes along with possible erratic readings or malfunctioning instrumentation;
- Ensuring that data is recorded and processed;
- Increasing the frequency of measurements if significant changes in the readings are observed or readings are significantly different from predicted conditions;
- Noting any malfunctioning, damaged or destroyed instruments and providing for maintenance where feasible and/or replacement where necessary; and,

- Informing the appropriate site personnel of readings that exceed threshold values and conditions and taking appropriate actions to manage changing conditions on site.

5.5.4 Seasonality

Seasonal climatic influences will be managed adaptively as outlined in Table 5-6.

Table 5-6: Seasonal climatic influences managed adaptively.

Season	Climate Considerations	Operating Considerations	Procedure
Winter (Nov – Mar)	• Runoff flows are negligible. • Lake, ditches, and channels freeze. • Freeze-thaw cycles impacts ground conditions. • Snow accumulation.	• Potential freezing and frost-heaving of discharge lines. • Impact of snow accumulation on access roads/ buildings/ geohazards.	• Inspections of water management structures. • Snow/ ice removal. • Review snow survey data from VOK station.
Spring (Apr – June)	• Breakup of ice at lake outlet. • Snowmelt contributes additional flows. • Freeze-thaw cycles contributing flows.	• Potential for ice jams and unsafe ice conditions. • High runoff/ erosion potential. • Large amount of surface runoff may cause erosion on the slopes of the landforms.	• Inspection of water management structures for potential impacts from increased runoff and seepage. • Monitoring of water levels and water quality at lake outlet. • Standby of emergency pumps if CWP water levels reach above a trigger (see Section 8.5).
Summer (July – Aug)	• Potential for single large precipitation event. • Large event results in increased runoff. • Potential for high wind speeds.	• High runoff/ erosion potential. • Increased infiltration rates may result in elevated groundwater levels or seepage rates.	• Inspection of water management structures for potential impacts from increased runoff and seepage. • Standby of emergency pumps if CWP water levels reach above a trigger.
Fall (Sept – Oct)	• Potential for single large precipitation event including rain-on-snow. • Large event results in increased runoff. • Freeze-thaw cycles. • Snow accumulation.	• High runoff/ erosion potential.	• Inspection of water management structures. • Standby of emergency pumps if CWP water levels reach above a trigger.

5.6 Water Management Facilities Maintenance

This section provides guidance and performance criteria for proper maintenance of water management facility components. Pretium has identified essential facility procedures and parameters to ensure that maintenance is conducted in accordance with applicable regulatory requirements and generally accepted operating practices. Maintenance activities required for the continued safe operation of the water management facilities include inspection, maintenance and repair of the following components:

- Contact water collection and delivery to the CWP (including contact water collection ditches, East/West Weir, culverts, sumps/manholes, pipelines and pumps)
- Non-contact water diversion channels
- LLW reclaim system
- CWP reclaim system to the WTP
- Underground pump system to the WTP
- Supply of maintenance tools
- CWP spillway and emergency line discharge
- Winterization

Maintenance records must be retained by the department performing the work. Timing of maintenance actions for unusual conditions should be based on specific recommendations from inspection/surveillance findings. Time frames for routine maintenance of pumping components should be based on manufacturer's recommendations when available.

5.6.1 Maintenance Parameters

Maintenance is performed on a regular basis for all the main factors that would reduce the quality, functionality and/or capacity of the water management facilities. Monitored parameters are completed daily and indicate if maintenance attention is required. Common parameters include, but not limited to:

- Pipeline wear and thickness;
- Pump temperature, the presence of cavitation;
- Excessive equipment sound emissions;
- Diversion channel and culvert capacity;
- Functionality of flow meters;
- Physical integrity and functionality of the CWP emergency spillway;
- Integrity of the CWP cut slopes; and

- Water flow rate.

5.6.2 Routine and Predictive Maintenance

Pretium has developed a preventive maintenance system that involves the Mill Maintenance/Operators, Surface Operations and Environment departments. Pretium operators are trained on the equipment and infrastructure within their workplace and can early identify odd situations or unusual equipment behavior. Their work scope includes checks to ensure optimal performance of the various systems in place. If something should require the maintenance department to take action, the operator will write a work order or request immediate attention, as needed.

CWP and Diversion Ditches

The following are examples of specific maintenance activities:

- Regularly check non-contact and contact water ditches and culverts for accumulation of debris or sediment, or any other form of blockage and remove if required;
- Visually inspect contact water ditches for cracking, bulging, slumping, and any other indications of slope movement;
- Remove accumulated sediment from the CWP pump sump; and
- Repair erosion gullies, local slumps or slides in the diversion ditches or spillway channel.

Water Delivery and Reclaim System

Regular maintenance of the water reclaim and delivery system will include:

- Checking the pump anchor system;
- Carry out maintenance as recommended by fitting and valve suppliers;
- Regularly inspect major wear components;
- Replace worn parts as recommended by manufacturers;
- Perform regular performance tests on the various pumps;
- Preventative maintenance of pumping systems; and
- Maintain system instrumentation.

5.6.3 Event-Driven Maintenance

Any unplanned maintenance events will be addressed in order of priority by Pretium staff. Incidents classified as an emergency will be assessed and dealt with in the appropriate manner depending on the situation. Such situations will involve impacts to personnel safety, the environment, or ensuring compliance with relevant permit requirements and may require drawing

resources from all areas of the mine and possibly outside personnel. All reasonable efforts will be made to mitigate the emergency condition as quickly and safely as possible.

Those unplanned events that are not considered an emergency will be documented and mitigated according to operating schedules and event priority.

5.6.4 Maintenance Documentation

Operation of the various water management facilities will be consistent with all the documentation used in the mill department. The correct management of the facilities, and associated equipment, requires detailed accounts of all pertinent information and any modifications thereto. The recording of maintenance documents enables Pretium to develop new strategies for optimal preservation of equipment and facilities and may include:

- Order requests;
- Log books;
- Audiovisual documentation;
- Frequency and cause of problems;
- Scheduled maintenance;
- Inspection reports;
- Equipment manuals;
- Spare list;
- Modification history; and
- Operations report.

5.6.5 Maintenance Reporting

The maintenance reporting at the Brucejack Mine is document-centered, and used for prevention, forecasting, tracking, and learning of any failure in the equipment or facilities. The final purpose of maintenance reporting is to improve equipment/ facility performance, minimize downtimes, and diminish maintenance expenses. These documents are used internally within the different departments and will be stored as digital copies.

The operators check sheets will record all operational and wear condition of relevant equipment. For instance, there is a project management program in the JD Edwards System (mine accounting system) for all mill equipment. This includes equipment for the water management facilities, as well as Bill of Materials (BOMs), which lists the location and availability of spare parts.

When the equipment or facility needs maintenance attention, a document designated as a "work order" will be made by the operator and delivered to the corresponding department. If any

equipment or facility needs urgent attention, the operator will follow the contingency protocols specified in the respective standard operation procedure document, requesting urgent attention, and thereafter record the event in the log book when the emergency is satisfactorily resolved.

5.6.6 Winterization

Seasonal climatic influences are managed adaptively, and proactive measures are exercised prior to winter to maintain the water management infrastructure systems around Brucejack mine site. Due to potential freezing and frost heaving of discharge lines, impact of snow accumulation on access roads, ditching, and buildings, the following preventative measures are performed by Mill Maintenance, Surface Operations, and Surface Maintenance accordingly.

Mill Maintenance

The mill water treatment plant operator (WTP) inspects the reclaim weir and contact water pond (CWP) once per 2-week shift in the winter time. The operator checks the CWP for cracks, deformation of the rock wall, depressions in the snow, and leaks in the piping. As part of the CWP and weir inspection, the mill verifies that the heat trace light is on within the reclaim pumphouse and inside the CWP valve sea can. Mill Maintenance is also responsible for regular Preventative Maintenance (PM) on the compressor building and ensuring the bubbler system in the CWP is operational prior to and during winter months, and this is also included on a CWP checklist. The bubbler system is a visual inspection to ensure that the system is functioning.

Surface Operations

Surface Operations have preseason meetings with the Environmental Department, De-watering Coordinator and Surface Maintenance to ensure that ditches are clear, all mechanical checks on pumps are completed, and lines are drained and properly stored. Surface operations is also responsible for removing the snow and ice from around critical areas, to gain access for inspection; such as pipelines, ditches, access roads and rooflines. During temperature fluctuations, ditches and pipes are monitored. Drill steel rods have been put in place to protect surface piping and ditching during winter months. Rock scaling with excavators is completed in areas where geo-hazards are present.

Surface Maintenance

Surface Maintenance are responsible for daily checks on the current electrical draw and heat trace on all piping. These are especially important in the fall of each year. Insulation damage is also checked when inspecting the heat trace. Surface Maintenance are also responsible to drain the 20” contact water line and other contact water pipes so they do not freeze before winter. Surface Maintenance are also responsible to steam the 20” pipeline and other pipelines before spring freshet to ensure they are functioning.

5.7 Water Management Facility Surveillance

5.7.1 Surveillance Objectives

Surveillance of the water management facilities is required to determine if the facilities are operating within expected parameters. Deviations from expected performance may require adjustments to operation, maintenance or design to facilitate ongoing safe and efficient operation of the facilities.

The conceptual procedure for surveillance is shown in Figure 5-8. Surveillance is undertaken by two primary methods – visual inspection and reading of instruments. Results of these qualitative and quantitative observations are compared to the expected performance of the facilities. If observations are within the expected range or performance, the results of the surveillance are simply recorded. If observations are outside the expected range, the results of the surveillance are recorded, and further evaluation is completed to determine if remedial action is necessary. If remedial action is needed it may range from a minor adjustment to operational procedures to initiation of emergency response, depending on the severity and nature of the deviation from expected performance. Authorization from the Mill Manager is required for any change to any operational procedure not covered in this Manual.

5.7.2 Surveillance Parameters

Signs of potential or actual hazards can be identified by a combination of visual inspection and instrumentation readings before hazards become significant. Using the CWP as an example, Pretium personnel can identify the need for maintenance if changes to the cut slopes, CWP berm and surrounding areas such as erosion, cracking, bulging, or seeps are observed. Additionally, changes in instrumentation readings (i.e., rapid rise in water levels) can also indicate potential hazards. Key qualitative and quantitative parameters for CWP surveillance are outlined below:

- pond levels
- reclaim pipeline flow
- crest stability (cracking, slumping, erosion, bulging, sinkholes)
- excessive seepage on downstream crest
- instability of bedrock cut slopes (slumping, sliding, etc.).

Several potential failure modes exist for the CWP and other water management facilities. These potential failure modes, along with alert triggers and observable visual and instrumentation indications of the failure mode, are presented in Table 5-7. Table 5-8 summarizes the expected behavior of the various CWP elements as well as behaviors that are indicative of potential failure mechanisms.

Figure 5-8: Conceptual surveillance procedure (MAC 2011).

Table 5-7: Potential failure modes, triggers and observable effects.

Failure Mode	Possible Causes (Triggers)	Visual Effects	Instrumentation Effects
CWP overtopping	Extreme precipitation, landslide generated wave, blockage of the spillway	Instability of cut slopes – slumping, sliding etc., breach of crest	Pond levels Reclaim pipeline flow
Channel Avulsion	Blocked culvert, mobilized riprap, reduced channel capacity	Ponded water at culvert inlet, debris accumulation, displaced riprap	n/a
CWP Cut Slope Failure	Adverse geological structures, changes to pore water pressure acting on the geological structures, earthquake induced	Dilation or sliding of blocks or slabs of rock defined by the geological structures	n/a
East or West Weir overtopping	Extreme precipitation, blockage of piping, blockage of storage basin	Water level of pond retained by the weir is within 0.5 m of the crest of the weir	n/a

Table 5-8: Visual observations – expected and unexpected behaviors.

Facility Element	Expected/Normal Behaviour	Unexpected Behaviour
CWP Berm crest	No changes to crest geometry	Cracking, slumping, erosion, bulging; sinkholes
CWP cut slopes (downstream and upstream)	No changes to slope geometry	Dilation of geological structures, cracking, slumping, bulging, erosion
Seepage from CWP	Minor seepage from geological structures.	Significantly fluctuating seepage rates, seepage appearing in new locations down gradient of CWP
East or West Weir	No change from geometry. Storage basin of the weirs is free of equipment and debris	Cracking, slumping, erosion. Degradation of concrete. Seepage through the weir. Water level of pond retained by the weir is within 0.5 m of the crest of the weir.
Inlet of Camp Creek Culverts under West Pad	Free flow into the culverts	Sediment and/or debris blockage
Inlet of Johnson Creek Culverts under Access Road	Free flow into the culverts	Sediment and/or debris blockage

5.7.3 Surveillance Procedures

Routine visual surveillance of the water management facilities is summarized in Table 5-9. The mine has also implemented an instrumentation and process control design that allows for continuous monitoring of CWP water levels and reclaim flows, as discussed in Section 5.7.4. These parameters are monitored at the mill control room.

Visual surveillance requirements after unusual events are outlined in Table 5-10.

5.7.4 Instrumentation

Flow instrumentation directly applicable to the CWP includes:

- Water levels in the CWP are monitored on a continuous basis (SCADA system with an alert system) by a level transmitter, which is strapped to one of the pump lines.
- Runoff collecting in the CWP will be pumped up to the WTP in one of four dedicated lines (2 x 4”, 2 x 6”). Each line is fitted with a magnetic flowmeter for continuous monitoring of flows.
- Non-spec effluent from the WTP will also be discharged to the CWP periodically. These flows are measured with a magnetic flowmeter in the plant site.
- As summarized in Table 5-3, an 8” pipeline allows for pumped CWP flows to be directly discharged to the WRTSF. This pipeline would be used if the CWP water quality met standards or an emergency discharge was required due to rising water levels. The 8” pipeline is tied into the four pumps that convey water to the WTP.
- Groundwater quality sampling is required on a quarterly basis from CWP well nest G..

5.7.5 Collation and Analysis of Data

Instrumentation readings are sent to Pretium’s Mill Operations Superintendent on a daily basis. The CWP/Water Management Engineer will review the instrumentation data on an annual basis (or more frequently if requested by Pretium), and, if applicable, provide recommendations to Pretium for additional actions.

Table 5-9: Routine visual surveillance.

Responsible Person	Activity	Frequency	Structure
Mill Operators	Visual inspection of mill-associated water management structures. Visual review of the CWP crest, cut slopes, and spillway. Check pumping system and pipelines from CWP to WTP and the direct lake discharge system. Focus on CWP and 'downstream'. Obtain maintenance support if/as needed.	Once per shift, with weather-related limitations during winter months	CWP, water management structures 'downstream' of CWP, and reclaim water system: • CWP • Pipelines from CWP to mill and WRTSF • Discharge pipelines from mill to WRTSF • LLW and reclaim system
Waste Management and De-Watering Coordinators	Inspection of non-contact water diversion channels and all aspects of the contact water management system 'upstream' of the CWP. Obtain maintenance support if/as needed.	Once per shift in non-frozen conditions, generally late April to late October. Major inspections pre- and post-freshet and pre-freeze-up in the fall	Surface contact water management facilities feeding into the CWP, and the non-contact water diversion channels: • Contact water ditches, pipelines, pumps, and manholes • East and West weirs • Manholes and sumps • Non-contact diversion channels
Environmental Scientists	Visual inspections of CWP crest, cut slopes, and spillway. Accompany Surface Ops in 3 times annual inspections of contact water management system upstream of CWP, and non-contact diversion channels, documenting findings. Accompany Mill Operators at least twice annually on CWP and pipeline/pumping inspections.	Major inspections pre- and post-freshet and pre-freeze-up in the fall. Checks/ observations of CWP and LLW each time water quality samples are collected at these locations	CWP, LLW coincidental with water quality sample collection
All Pretium employees working on/around the water management facilities	Visual inspections checking for any unusual conditions/conditions of concern as listed in Table 5-10. Includes instrumentation confirmation of observations.	As applicable	All water management facilities
CWP/Water Management Engineer - Technical Lead or Senior Engineer	Annual Inspection Report.	Annual Intermittent	CWP, all contact water management infrastructure and non-contact water diversion channels

Notes:
1) Requisite levels of training and familiarity with OMS Manual as outlined in Table 3-3
2) Refer Table 3-1, roles and responsibility matrix, outlining visual surveillance responsibilities listed above.

Table 5-10: Unusual event driven surveillance.

Unusual Event	Post-Event Inspection/Surveillance
Earthquakes	• Carry out a detailed walkover of all CWP structures, including crest, cut slopes and spillway, looking for signs of cracks, dilation, bulging, settlement and/or other deformations. • Look for and note any changes in seepage, particularly with respect to the rate of seepage flows along the cut slopes. • Read all groundwater wells adjacent to the CWP. • Inspect all pump stations, manholes and pipelines. • Inspect non-contact water diversions and contact water collection ditches, including culverts and the East Weir and West Weir. • Discuss findings with the Mill Manager and CWP/Water Management Engineer.
Rapid snowmelt and/or heavy rainstorms	• Inspect the (visible) slopes and the crest of the CWP looking for areas of concentrated runoff and erosion. • Examine cut slopes for indications of localized dilation/instability. • Inspect all pump stations, manholes and pipelines. • Inspect non-contact water diversions and contact water collection ditches, including culverts and the East Weir and West Weir. • Check the water levels in the CWP against the critical levels and keep checking these levels until the pond/reservoir inflows subside. • Discuss findings with Mill Manager and CWP/Water Management Engineer. • Check piezometric levels if instructed by CWP/Water Management Engineer.
Extreme snow pack	• Check the water levels in the CWP against the critical levels and keep checking these levels until the spring freshet is over. • Check the capacity of the diversion channels and collection ditches. Remove snow, if required. • Evaluate the situation in terms of possible snowmelt scenarios. Make predictions as to the expected storage capacity available in the CWP.
Deformation at berm crest, cut slope or toe area	• Record the current CWP level. • If deemed necessary, divert water from the CWP. • Contact the Mill Manager and CWP/Water Management Engineer.
Necessity to store more than typical amount of water in CWP (any reason)	• Record the current CWP level. • Contact the Mill Manager, Environmental Manager and CWP/Water Management Engineer.
Other events/observations.	• Notify Mill Maintenance and Mill Operations Superintendents as appropriate to the area/circumstance of the observation.

5.7.6 Trigger Levels – Management of CWP Inventory

During the non-winter months, the CWP inventory is primarily managed by pumping water up to the WTP from where it is either used in process or released to the environment. Various trigger levels for the CWP are summarized in Table 5-11 and the following bullets. A stage storage curve of the CWP is provided in Figure 5-3.

Table 5-11: Trigger levels for management of CWP water levels.

Water Elevation (m asl)	OWTP Operational	Water Quality	Action
< 1367.4 [1]	-	-	No pumping. Minimum water depth for pumping not achieved.
> 1367.4 [2]	✓	✓	Pump to the WTP
>1374.8 [3]	-	✓	Use of the 8” discharge line for deep lake disposal.
> 1376.1	-	✓	Emergency use of the 8” discharge line for deep lake disposal.

Notes:

[1] The reclaim pumps require a minimum water depth of 1.4 m to operate. Thus, the pumps will not operate when pond levels are below elevation 1367.4 masl.

[2] At pond levels in excess of 1367.4 masl, water will be reclaimed to the WTP for use in process or released to the environment (as per Permit 107835). The rate of reclaim will depend on process needs and climatic conditions. Water will not be reclaimed if the WTP is not operational.

[3] CWP levels can be drawn down via direct discharge (i.e., the 8-inch diameter pipeline) to a deep lake outfall in WRTSF subject to the following conditions:

- The most recent water quality results for the CWP meet all the limits specified in Section 1.2.3 of EMA Permit 107835.
- There has not been any diversion of untreated mine water to the CWP since the most recent CWP sample was taken.

If the above conditions are met, direct discharge could occur at any water level in excess of 1367.4 masl. Any direct discharge shall be coordinated with the Environmental and Mill departments.

Based on Effluent Permit 107835, Pretium can discharge water from the CWP to WRTSF provided water quality guidelines are met for the following two scenarios:

- When available CWP storage capacity is between 10,000 and 50,000 m^3 (Maximum TSS of 25 mg/L)
- When available CWP storage capacity is less than 10,000 m^3 (Maximum turbidity of 150NTU)
- When pond levels reach the spillway invert of 1376.5 m asl, a controlled but unintended release of contact water will occur into the WRTSF. To minimize potential impacts to the lake water quality, it is preferable that any release of contact water to the lake occur at depth, rather than discharging to the lake surface. Therefore, when pond volumes reach 95% of the CWP storage capacity (elevation = 1376.1 m asl) and additional rainfall is forecast, Pretium staff will start to operate both 8” pipelines with direct discharge to the lake

at depth. These pipelines would operate as long as pond volumes remained above the 95% level.

5.7.7 Periodic Inspection and Review by the Water Management Engineer

The frequency of inspections by the CWP/Water Management Engineer is as outlined in Table 5-9. Instrumentation monitoring data will be reviewed as it is provided by Pretium, and the CWP/Water Management Engineer will review the data on an annual basis (at minimum) and provide commentary and recommendations as required.

5.7.8 Documentation

Documentation is as discussed in the preceding sections. Hardcopy and electronic files are retained by Pretium on site and available to an inspector upon request.

5.7.9 Reporting

CWP instrumentation readings will be sent to Pretium's Mill Operations Superintendent on a daily basis.

The CWP/Water Management Engineer will issue a comprehensive annual review report that addresses any requirements for design changes, and/or changes to operation, maintenance, and surveillance that arise from the surveillance activities.

6 Emergency Preparedness and Response

There is no permanent population that is at risk from the CWP, and mine personnel are only temporarily in the spillway zone of the facility. Therefore, an ERP or EPP has not been prepared for the CWP.

6.1.1 Flood Preparedness

Hydraulic modeling of the West Zone pad drainage system area (SRK 2021) indicated that there is potential risk of flooding during the passage of the 200-year storm event. The modeling included the inflow from Camp Creek, the culverts that traverse the pad, and concurrent flows at Brucejack Creek. As a short-term flood mitigation measure it was recommended that an AquaDam was procured by Pretium and maintained nearby to be deployed when needed. To support the installation, an AquaDam SOP was developed (BJ-ENV-SOP-067 – AquaDam Deployment) to provide instructions related to deployment and installation around the West Zone Portal entrance with relatively short during high flow conditions.

7 Safety and Security

The Brucejack Mine is controlled under 24-hour security personnel that screen every person entering and leaving the site. The access road is gated near its intersection with Highway 37 and all persons who are not permanent employees require permission of the Mine Manager to proceed beyond the gate. All personnel working at the Brucejack Mine are also required to go through a health, safety and environmental orientation.

NOTES:

1. ALL DIMENSIONS ARE IN METRES UNLESS NOTED OTHERWISE.
2. TOPOGRAPHIC DATA IS BASED ON LIDAR SURVEY PROVIDED BY ALLNORTH, DATED OCTOBER 24, 2014. CONTOUR INTERVAL IS 1 m.
3. GROUND PROFILE IS BASED ON LIDAR SURVEY THAT CAPTURED THE WATER SURFACE, NOT THE BOTTOM OF THE CHANNEL.
4. ALL COORDINATES, CONTOURS AND ELEVATIONS ARE IN METRES AND REFER TO GEODETIC DATUM IN UTM NAD83, ZONE 9.
5. ROCK ANCHOR INSTALLATION TO BE APPROVED BY GEOTECHNICAL ENGINEER.

KEY PLAN
SCALE: 1:200

NOTES:

1.0 GENERAL

1.1 All elevations in m, all dimensions in mm.

1.2 Check all dimensions prior to commencing work. Notify Engineer of any conflicting or erroneous information.

1.3 Do not scale dimensions from the drawings.

2.0 DESIGN CRITERIA

2.1 Codes and Standards

(Do work in accordance with the current revision of the following standards except where specified otherwise.)

- British Columbia Building Code
- CSA A23.3 Design of Concrete Structures
- CSA S16 Limit States Design of Steel Structures
- Canadian Dam Association (2007), Technical Bulletin: Structural Considerations for Dam Safety

2.2 Design Loads

2.2.1 Ice loads: 150 kN/m @ 0.3m below water level

2.2.4 Seismic loads:

- Peak ground acceleration PGA = 0.08 g
- Normal importance factor Ie = 1.5
- Site classification Site class A (Assumed)
- Spectral parameters

Period, T	0.2s	0.5s	1.0s	2.0s
S(T)	0.16	0.07	0.05	0.03

2.2.5 Soil and Rock parameters:

- Foundation Condition: R3.5 porphyry, slightly weathered, slightly fractured rock
- Uniaxial Compressive Strength of the rock : 50 MPa
- Factored Bearing Resistance for foundation on rock : 1 MPa
- Rock/Grout Bond Stess for rock dowels : 1 MPa

	Unit Weight	Friction Angle
- Sediment	20 kN/m3	34°
- Rock	27 kN/m3	45°

2.2.6 Hydraulic parameters:

Peak instantaneous Design Flow: West Catchment Weir: 46 L/sec
East Catcment Weir: 127 L/sec

- Normal Operation Level: Static Head @ Inlet 1 m
- Emergency Operation level: Overtopping 0.3 m

3.0 CONCRETE

3.1 Materials

3.1.1 Concrete
-Cement: To CSA A3001 Type GU.
-Aggregates: To CSA A23.1
-Admixtures: CSA A23.3, ASTM C260, ASTM C494 and ASTM C1017. Calcium chloride admixtures not permitted.
-Exposure Class: CSA A23.1, F-1 (Exposed to freeze-thaw in a saturated condition but no chlorides)

3.1.2 Specified concrete cylinder strength at 28 days:
-Mix C30
-Compressive Strength f'c = 30 MPa

3.2 Do not add additional water to the concrete after batching and mixing in accordance with the mix design. The Engineer may reject any concrete to which additional water was added without further cause.

3.3 Do not place concrete without prior inspection and approval by the Engineer.

3.4 Location of construction joints shall be reviewed by the Engineer. Do not make construction joints within 2 m of the inlet pipe

3.5 Do not remove forms before the concrete achieves a cylinder strength of at least 70% of the specified compressive strength or twice the maximum stress present in the concrete after form removal.

3.6 Commence with curing of all surfaces immediately after stripping of forms.

3.7 Roughen all vertical and horizontal construction joints to minimum 5 mm amplitude by means of air/water jet blasting or bush-hamering to remove laitance and expose coarse aggregate. Simple roughening of freshly cast surface is not adequate.

4.0 REINFORCEMENT

4.1 Materials

4.1.1 Deformed bar reinforcement for structural concrete: CSA G30.18, Grade 400 W.

4.1.2 Minimum yield strengths for deformed reinforcement: fy = 400 MPa

4.2 Minimum Concrete Cover:
- 75 mm (Cast Against Rock)
- 60 mm (Contact with Water)
- 50 mm (Contact With Air or Soil)

4.3 Splices

All splice lengths not indicated explicitly on drawings are Type B, as defined by Clause 12.15.1 of CSA A23.3. Unless noted otherwise, minimum splice lengths are:

Bar (mm)	Top Bar (mm)	Other
10M	500	400
15M	700	550
20M	850	650
25M	1350	1050

Top bars have 300 mm or more of concrete cast below them.

5.0 EMBEDMENTS

5.1 Rock dowels: to CSA G30.18, grade 500W threaded bars w/ grout

5.2 Grout: Basalite Microsil Anchor Grout installed per manufacturer's recommendations or pre-approved alternate
fy (28 days) = 60 MPa (min)

5.3 Installation:

-After drilling, thoroughly clean borehole with a pressurized air/water lance.
-Introduce grout into the borehole first, using a tremie pipe to ensure grout fills the hole from the bottom up.
-Insert the rock dowel, with centralizers, into the grout-filled borehole, displacing the grout.
-Maintain dowel plumb, using wood wedges, for atleast 24 hours.

6.0 STRUCTURAL STEEL

6.1 Steel Pipe to ASTM A252 Grade 2 (GALV) fy = 240 MPa

6.2 Steel Flanges to AWWA Class B, Material to ASTM A105 (GALV)

6.3 Flange Bolts to ASTM A307 Grade B (GALV) 2

6.4 Welds

6.4.1 Welding: to CSA W59 E49XX unless noted otherwise.

6.4.2 Perform all welding using welders certified in accordance with the requirements of CSA W47.1.

6.4.3 Unless noted otherwise, welds are 6 mm continuous fillet welds.

7.0 FOUNDATION PREPARATION

7.1 Excavations shall be carried out to the lines and grades shown on the drawings or as directed by the Engineer.

7.2 Acceptable foundation shall be bedrock free of vegetation, organics, snow or ice and pockets, seams or layers of soft material.

7.3 All finished foundations shall be approved by the Owner's Engineer prior to placing concrete.

7.4 The Contractor shall take precautions to prevent disturbance of the foundation during excavation.

7.5 Bedrock surfaces may require slush grouting and/or dental concrete and shall be treated as follows:

- Remove loose or weathered rock
- Clean bedrock surface with air/water jets as appropriate
- Clean infill from cracks and joints to a depth of atleast twice the joint opening and backfill with slush grout
- Shape the bedrock surface with dental concrete as directed by the Engineer
- Dampen the bedrock surfaces before placing concrete

CHECKED:	A. GYGAX	DATE:	19 AUGUST 2016
APPROVED:	A.GYGAX	DATE:	23 AUGUST 2016

DRAWING NO: 16021.621- S-12 0

GENERAL NOTES FOR ROUGH GRADING DRAWINGS:

1. ALL EARTHWORKS, BLASTING, AND MATERIALS FOR ROUGH GRADING SHALL CONFORM TO THE FOLLOWING SPECIFICATIONS:

   ROCK EXCAVATION: 177421-0000-DD10-SPC-0001
   EXCAVATION FILL & COMPACTION: 177421-0000-DD10-SPC-0002
   EXPLOSIVES & BLASTING SAFETY: 177421-0000-DD10-SPC-0004

2. REMOVE OVERBURDEN AND RIPPABLE ROCK FROM SURFACES TO BE BLASTED, PLACE OVERBURDEN MATERIAL IN SEPARATE STOCKPILES IN A DESIGNATED AREA, IN ACCORDANCE WITH THE SPECIFICATIONS. HAUL RIPPABLE ROCK TO LAKE FOR DISPOSAL.

3. THIS IS A COMPACT AND CONGESTED SITE. EXERCISE EXTREME CAUTION, ESPECIALLY WHEN BLASTING IN THE AREAS ABOVE THE GENERATOR/FUEL TANK PAD, AND ADJACENT TO THE EXISTING CAMP, THE MECHANICS SHOP, THE NEW PERMANENT CAMP AND OTHER FACILITIES.

4. ALL ROCK ON THE SITE IS CONSIDERED PAG (POTENTIALLY ACID GENERATING) AND SHALL BE DISPOSED OF IN BRUCEJACK LAKE. PAG ROCK SHALL NOT BE USED AS FILL UNLESS THE CONTRACTOR IS SPECIFICALLY DIRECTED TO DO SO BY THE ENGINEER.

5. LAKE DISPOSAL OF PAG ROCK SHALL BE BY OTHERS. CONTRACTOR SHALL COORDINATE DUMPING OF WASTE ROCK WITH OTHERS PERFORMING DISPOSAL PROCEDURE.

6. ALL FILL MATERIALS SHALL BE PRODUCED FROM NON-PAG ROCK ORIGINATING FROM THE QUARRY.

7. BEFORE ANY FILL MATERIALS ARE PLACED ON OVERBURDEN SOIL, THE SURFACE SHALL BE STRIPPED OF INCOMPETENT OR EXCESSIVELY WET SOIL AND INSPECTED AND APPROVED BY THE ENGINEER.

8. LARGE EMBANKMENTS SHALL BE CONSTRUCTED OF RUN-OF-QUARRY ROCK FILL PLACED AND COMPACTED IN ACCORDANCE WITH SPECIFICATION 177421-0000-DD10-SPC-0002. EMBANKMENT FILL UNDER STRUCTURES AND FOUNDATIONS SHALL BE 300 MINUS CRUSHED ROCK FILL OVERLAIN BY A MINIMUM OF 1m of 75 MINUS STRUCTURAL FILL. (1)

9. FILL EMBANKMENTS LESS THAN 1m IN DEPTH SHALL BE CONSTRUCTED ENTIRELY OF 75mm MINUS ROAD SUBBASE MATERIAL.

10. THE MILL PAD AREAS SHALL BE FINISHED WITH A 150mm LAYER (HALF OF THE DESIGN THICKNESS) OF BASE COURSE MATERIAL BY CONTRACT # CB002. PLACEMENT OF THE REMAINING HALF OF THE BASE COURSE LAYER AND GRADING SHALL BE PERFORMED BY OTHERS AT THE END OF THE PROJECT.

11. ALL DIMENSIONS ARE IN METRES UNO. ALL COORDINATES, CONTOURS AND SPOT ELEVATIONS ARE IN METRES AND REFER TO GEODETIC DATUM IN UTM NAD83, ZONE 9. TO COMPUTE HORIZONTAL GROUND-LEVEL DISTANCES FROM UTM COORDINATES, DIVIDE UTM GRID DISTANCES BY THE AVERAGE COMBINED FACTOR OF 0.999444.

12. CONTRACTOR SHALL CONFIRM THAT IN WORKING AREAS ALL EXISTING UTILITIES/SERVICE PIPES AND LINES HAVE BEEN RELOCATED BY OTHERS BEFORE COMMENCING SITE WORKS.

13. FOR GEOTECHNICAL INFORMATION, SEE "UPDATED GEOTECHNICAL ANALYSIS AND DESIGN OF THE PLANT SITE FOUNDATION", BJ-2014-21, BGC ENGINEERING INC., JAN 14, 2015.

PLAN
SCALE 1:125

SECTION A
1:100

NOTES:

1. SEE GENERAL NOTES FOR ROUGH GRADING DRAWING IN 177421-1110-DD10-GRD-0100.
2. CONTRACT CB002 IS TO COMPLETE THE ENERGY DISSIPATION HEADWALL, CULVERT AND MANHOLE, PRIOR TO CONSTRUCTION OF THE DPS COLLECTION POND BY OTHERS.
3. ALL DIMENSIONS ARE IN MILLIMETRES AND ALL ELEVATIONS ARE IN METRES UNO.
4. LOCATIONS OF TWO EXISTING 800ø CULVERT INLETS ARE APPROX AND MUST BE VERIFIED, IN ORDER TO DETERMINE THE LENGTHS FOR THE NEW CULVERT EXTENSIONS.

SECTION B
1:75

SECTION C
1:75

LEGEND:

EXISTING:

- 1350 MAJOR CONTOUR
- MINOR CONTOUR
- CREEK
- CREEK TO BE REMOVED
- ROAD
- CULVERT
- AVALANCHE ZONE
- SANITARY SEWER
- ELECTRICAL CABLES
- FRESH WATER
- BUILDING OUTLINE

PROPOSED:

- SLOPE SYMBOL
- BUILDING OUTLINE
- YFP YARD FIRE HYDRANT
- WFP WALL FIRE HYDRANT
- ROAD/PAD EDGE
- DITCH
- ELECTRICAL CABLE TRENCH
- E ELECTRICAL CABLES
- DSA SANITARY – GRAVITY
- DSF SANITARY – PUMPED
- MANHOLE
- WF FRESH WATER
- WFP FIRE WATER
- WPT POTABLE WATER
- WPR PROCESS WATER
- DST STORM
- WET TREATED EFFLUENT
- CULVERT

NOTES:

1. ALL DIMENSIONS ARE IN METRES UNLESS OTHERWISE NOTED.
2. THIS DRAWING IS TO BE READ IN CONJUNCTION WITH ACCOMPANYING DRAWINGS AND SPECIFICATIONS. THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE ENGINEER SHOULD UNCERTAINTIES ARISE WITH THE DRAWINGS, SCOPE, AND/OR TECHNICAL SPECIFICATIONS.
3. BASE TOPOGRAPHIC DATA BASED ON "CWP AND MILL PAD AS BUILT" PROVIDED BY ALLNORTH CONSULTANTS LTD., DATED JUNE 10, 2016. CONTOUR INTERVAL IS 1 m.
4. PROJECTION IS UTM NAD 83 ZONE 9N.
5. THE STORAGE CAPACITY OF THE COMPLETED CONTACT WATER POND TO EL 1375.5 m IS APPROXIMATELY 51,800 m³.
6. CONSTRUCTION OF THE CONTACT WATER POND REQUIRES AN EXCAVATION VOLUME OF APPROXIMATELY 42,100 m³.
7. THE FINAL CUT SLOPES OF THE CONTACT WATER POND SHOULD BE DEVELOPED UTILIZING PRE-SHEAR BLASTING TECHNIQUES.
8. THE FINAL CUT SLOPES OF THE CONTACT WATER POND SHOULD BE SCALED TO REMOVE ALL LOOSE MATERIAL.
9. THE FINAL CUT SLOPES OF THE CONTACT WATER POND SHOULD BE REVIEWED BY THE GEOTECHNICAL ENGINEER. SLOPE SUPPORT, SUCH AS ROCK BOLTS AND MESH, MAY BE REQUIRED AS DETERMINED BY THE GEOTECHNICAL ENGINEER.
10. REFER TO AMEC FOSTER WHEELER DRAWINGS 177421-3230-DD10-GRD-0172 THROUGH -0179 FOR PLANS, CROSS SECTIONS, AND DETAILS. THE LAYOUT OF THE CONTACT WATER POND HAS BEEN REVISED SINCE THESE DRAWINGS WERE DEVELOPED. AS SUCH, DRAWINGS 177421-3230-DD10-GRD-0172 THROUGH -0179 SHALL BE USED AS APPLICABLE WITH FIELD MODIFICATIONS TO WORK WITH THE LAYOUT OF THE CONTACT WATER POND SHOWN ON DRAWING 1008-CWP-001. ANY DEVIATIONS FROM THE DESIGNS REQUIRED TO WORK WITH THE LAYOUT SHALL BE AGREED TO BY THE OWNER PRIOR TO PROCEEDING WITH CONSTRUCTION.
11. THE SITE WATER MANAGEMENT PLAN WILL NEED TO BE UPDATED TO DESIGN DITCHING TO AND FROM INLET #1. THE FINAL LOCATION OF INLET #1 TO BE DETERMINED BASED ON DESIGN OF DITCHING.
12. UNLESS BGC AGREES OTHERWISE IN WRITING, THIS DRAWING SHALL NOT BE MODIFIED OR USED FOR ANY PURPOSE OTHER THAN THE PURPOSE FOR WHICH BGC GENERATED IT. BGC SHALL HAVE NO LIABILITY FOR ANY DAMAGES OR LOSS ARISING IN ANY WAY FROM ANY USE OR MODIFICATION OF THIS DOCUMENT NOT AUTHORIZED BY BGC. ANY USE OF OR RELIANCE UPON THIS DOCUMENT OR ITS CONTENT BY THIRD PARTIES SHALL BE AT SUCH THIRD PARTIES' SOLE RISK.

Appendix C – Permits

PROVINCE OF BRITISH COLUMBIA
MINISTRY OF ENERGY, MINES AND LOW CARBON INNOVATION

PERMIT

APPROVING MINE PLAN AND RECLAMATION PROGRAM

(Issued pursuant to section 10 of the *Mines Act* R.S.B.C. 1996, c. 293)

Permit: **M-243** Mine No: **0100270**

Issued to: **Pretium Resources Inc.**
Suite 2300, Four Bentall Centre
1055 Dunsmuir Street
PO Box 49334
Vancouver, BC
V7X 1L4

for work located at the:

Brucejack Mine

Issue Date	**Permit**
July 22, 2015	Approving Mine Plan and Reclamation Program

This permit supersedes and amends all previous versions of Permit M-243 issued pursuant to Part 10 of the Mines Act. All previously approved works systems are hereby transferred under this permit.

Amended at Victoria, British Columbia this 14th day of November in the year 2022.

J. Lowell Constable
Deputy Chief Permitting Officer
Major Mines Office

(This page is left intentionally blank)

PREAMBLE

The Mines Act Permit application, and applications for changes to approved works and conditions to Permit M-74, have been submitted to the Chief Permitting Officer, in accordance with Section 10(1) and/or 10(6) of the *Mines Act*, and Sections 10.1.2 and 10.1.18 of *the Health, Safety and Reclamation Code for Mines in British Columbia* (Code).

Where more than one version of information exists in the application, the most recent version must be considered the approved version unless otherwise stated or determined by the Chief Permitting Officer.

1. Approving Mine Plan and Reclamation Program (Issued July 22, 2015)

1.1 Application entitled "*Brucejack Gold Mine: Application for Mines Act and Environmental Management Act Permits*", dated May 2015.

1.2 Report entitled, "*Brucejack Gold Mine Project: Metal Leaching and Acid Rock Drainage Management Plan*", prepared by Pretium Resources Inc., dated June 30, 2015.

1.3 Memorandum entitled, "*Brucejack Project MA/EMA Permitting Phase – Responses to Information Requests from MEM & MOE – Groundwater Quality and Quantity Monitoring Plan*", prepared by BGC Engineering Inc., dated June 19, 2015.

1.4 Memorandum entitled, "*Brucejack Project MA/EMA Permitting Phase – Responses to Information Requests from MEM & MOE – Part 1 of 2*", prepared by BGC Engineering Inc., dated June 19, 2015.

1.5 Memorandum entitled, "*Brucejack Project MA/EMA Permitting Phase – Responses to Information Requests from MEM & MOE – Part 2 of 2*", prepared by BGC Engineering Inc., dated June 19, 2015.

1.6 Report entitled, "*Groundwater Monitoring and Sampling Protocol – Brucejack Mine; Revision 3*", prepared by Pretium Resources Inc., dated June 2015.

1.7 Letter entitled, "*Response to BC Ministry of Energy and Mines 'Information Requirements' and 'Clarifications' regarding underground geotechnical aspects of the Brucejack Project's Application for Mines Act and Environmental Management Act Permits*", prepared by BGC Engineering, dated June 18, 2015.

1.8 Report entitled, "*Brucejack Gold Mine Project - Invasive Plants Management Plan*", prepared by Pretium Resources Inc., dated July 2015.

1.9 Confidential Memorandum entitled, "*Brucejack Mine Project Mines Act Permit Application – Reclamation Cost Estimate*", prepared by ERM dated June 22, 2015.

1.10 Report entitled, "*Brucejack Gold Mine Project Wildlife Management Plan*", prepared by ERM dated July, 2015.

Application Received: March 12, 2015.
Gazette: BC Gazette June 4, 2015.
Referred: March 12, 2015.

Mine Review Committee Meetings: May 13, 2015; May 25, 2015.

2. Approving Groundwater Monitoring Plan (Issued August 26, 2015)

2.1 Report entitled "*Brucejack Gold Mine Project – Location, purpose, timing and monitoring schedule for monitoring wells to be installed to augment the Water Management Plan per Mines Act Permit M-243 Section D Part 4(c) – REV 1*", dated August 21, 2015.

Application Received: July 31, 2015.

3. Approving Updated Brucejack ML/ARD Management Plan (Issued September 9, 2015)

3.1 Report entitled "*Brucejack Gold Mine Project – Metal Leaching and Acid Rock Drainage Management Plan*", dated September 8, 2015.

Application Received: September 8, 2015.

4. Approving Temporary PAG Waste Rock Stockpile and Non-PAG Quarry (Issued March 17, 2016)

4.1 Application entitled "*Request for Authorization of Temporary Surface PAG Waste Rock Stockpile, Mines Act Permit M-243, Brucejack Mine*", dated October 18, 2015.
4.2 Application entitled "*Application for Modification of Km 72 NPAG Quarry, Permit M-243, Brucejack Mine*", dated November 3, 2015.

Application Received: November 3, 2015; November 16, 2015.
EAC M15-01 Amendment: March 10, 2016.

5. Approving Changes for Disturbance Area and Construction Water Treatment Plant (Issued August 4, 2016)

5.1 Application entitled "*Proposed Changes to Approved Disturbance Area, Mines Act Permit M-243, Brucejack Gold Mine – Amendment Application #2*", dated April 11, 2016.
5.2 Application entitled "*Application for Approval of Mine Water Treatment Plant Process Change for Nitrite Treatment*", dated April 25, 2016.
5.3 Report entitled "*Brucejack Gold Mine 2016 Freshet Water Management Plan*", dated March 2016.

Application Received: April 11, 2016.

6. Approving PAG Waste Rock Exposure Extension, Sludge Deposition with Tailings In Brucejack Lake and Chromium Management Plan (Issued April 3, 2017)

6.1 Report entitled "*Brucejack Mine: Proposed Extension for Waste Rock Storage on Surface*" dated November 10, 2016.
6.2 Report entitled "*Brucejack Gold Mine: Assessment of Long-Term Sludge Stability for In-Lake and Underground Deposition*" dated December 19, 2016.
6.3 Report entitled "*Chromium Management Plan*" dated February 23, 2017.
6.4 Report entitled "*Metal Leaching and Acid Rock Drainage Management Plan*" dated March, 2017.
6.5 Report entitled "*Operation, Maintenance and Surveillance Manual: Brucejack Gold Mine Subaqueous Waste Rock and Tailings Deposition; VERSION 04*" dated March, 2017.

Application Received: November, 2016; December, 2016 and September, 2016

7. Approving Mine Plan and Reclamation Program for Increased Production Rate and Waste Management (Issued December 14, 2018)

7.1 Application entitled "*3800 tpd Amendment Application for Permits M-243 and PE-107835*", prepared by Pretium Resources Inc., dated December 2017.
7.2 Report entitled "*Brucejack Gold Mine: Updated Subaqueous Waste Rock Dump Design*", prepared by SRK Consulting,dated October 2018.
7.3 Letter entitled "*Brucejack Gold Mine, Mine No. 0100270 MA Permit M-243 Section D.1 (d)*" dated March 8, 2018.

Application Received: April 13, 2018
Mine Development Review Committee Meetings: January 16, 2018; May 2, 2018; July 5, 2018

8. Approving West Zone Ramp, Additional Stope Development, and Underground Exploration (Issued December 18, 2020)

8.1 Application entitled "*Mines Act Permit M-243 Amendment Application: Permit Boundary Amendment*", prepared by ERM Worldwide Group Ltd., dated August 2020.

8.2 Report entitled "*OMS Manual - Water Management Plan*" prepard by SRK Consulting Inc., dated March 2020.

8.3 Report entitled "*Brucejack Gold Mine: 2020 Groundwater Model Review and Update*" prepared by Lorax Environmental, dated July 20, 2020.

8.4 Report entitled "*Brucejack Gold Mine Ground Control Management Plan – Version 7*", prepared by Pretium Resources Inc., dated October 2020.

8.5 Report entitled "*Production Ventilation Plan Brucejack Gold Mine*", prepared by Pretium Resources Inc., dated July 10, 2020.

Application Received: August 19, 2020

9. Approving Permitted Mine Area (PMA) Expansion for Future Access Road Realignment km 72 Ramp (Issued November 14, 2022)

9.1 Application entitled "*Permit M-243 Brucejack Mine – Amendment Application to Increase Permitted Mine Area for Future Brucejack Access Road km 72 Ramp Realignments*", prepared by Pretium Resources Inc., dated December 2, 2021.

9.2 Document entitled "*Geohazards Management Plan Revision 1*" prepared by Pretium Resources Inc., dated December 2016.

9.3 Report entitled "*Brucejack Access Road 72 km Glacier Ramp Design Basis*" prepared by Onsite Engineering Ltd., dated August 19, 2022.

Application Received: December 12, 2021

This permit contains the requirements of the Ministry of Energy, Mines and Low Carbon Innovation (EMLI). It also is compatible, to the extent possible, with the requirements of other provincial ministries. However, nothing in this permit limits the authority of other provincial ministries to set other conditions, or to act independently, under their respective permits and legislation.

The mine is located within the consultative territory of Tsetsaut /Skii-km Lax Ha and portions of the mine permitted area are located in the Nass Area as defined in the Nisga'a Final Agreement. Tsetsaut/ Skii-km Lax Ha, Nisga'a Lisims Government and Tahltan Central Government have been consulted with respect to this permit and have expressed their interests regarding potential concerns to their asserted or established rights.

CONDITIONS

The Chief Permitting Officer hereby approves the Mine Plan and Reclamation Program as submitted in the applications, subject to compliance with the following conditions:

A. General

1. Compliance with *Mines Act* and Code

The Permittee must ensure all work is in compliance with all sections and parts of the *Mines Act* and the Health, Safety and Reclamation Code for Mines in B.C. (Code), and the owner, agent or manager (Permittee) must obey all orders issued by the Chief Inspector or their delegate.

2. Departure from Approval

The Permittee must notify the Chief Inspector of Mines (Chief Inspector) in writing of any intention to depart from the approved Application(s) and this *Mines Act* permit (M-243) to any substantial degree, and must not proceed to implement the proposed changes without the written authorization of the Chief Inspector.

3. Permit Approval

(a) Development, including surface disturbance and works, management buffers associated with 19 km of the Transmission Line extending southward from the Mine Site, and contingency buffers for mine infrastructure, encompassing approximately 659.3 ha (Figure 1a and Figure 1b), is authorized under this permit.

(b) Ore production rate must not exceed an average annual 1,387,000 tonnes on a calendar year basis.

4. Permit

This Permit is not transferable or assignable.

5. Maintenance of Mine

The Permittee must maintain mine facilities and infrastructure in a manner to meet design objectives and environmental protection and reclamation requirements.

6. Reports to be signed by a Qualified Professional

Unless otherwise specified in permit conditions, all reports required to be submitted under this permit the Permittee must ensure are reviewed and signed by a Qualified Professional with applicable experience and registered in the province of British Columbia.

7. Responsibility to Reclaim

Any outstanding reclamation associated with Reclamation Permit MX-1-842 that exists within the permitted mine area for the Brucejack Gold Mine defined in Figure 1a and Figure 1b is the responsibility of the Permittee under the terms and conditions of this permit.

8. First Nations Reporting Requirements

Unless otherwise requested, the Permittee must provide to the Tsetsaut/Skii-km Lax Ha, Nisga'a Lisims Government and Tahltan Central Council Government all material reports and plans relevant to this permit, including annual monitoring reports and material changes to the approved Reclamation and Closure Plan.

9. Compliance Status Report

The Permittee must track compliance status of all permit conditions, inspection orders or advisories in a form acceptable to the Chief Inspector. The Permittee must maintain a tracking table on site, and ensure it is revised when compliance changes or as required by the Chief Inspector. The Permittee must ensure that the tracking table is available at the mine site at all times and to a Mines Inspector upon request. An annual Compliance Status report must be submitted to the Chief Inspector by March 31st and must include a summary of outstanding non-compliance issues and an action plan, to the satisfaction of the Chief Inspector, for meeting compliance.

B. Health and Safety

1. Mine Emergency Response Plan (MERP)

(a) The Permittee must update the Mine Emergency Response Plan (MERP) The Permittee must keep the MERP up to date and file updates with the Chief Inspector, and make the updated MERP available at the mine site at all times.

(b) The Permittee must ensure that mine site employees and contractors are knowledgeable and accountable for fulfilling the actions of the MERP.

C. Geotechnical

1. General

(a) The Permittee must ensure that all geotechnical/designs, specifications, work plans, monitoring requirements and reports required to be prepared under section (C) are signed by a Professional Engineer and are submitted to the Chief Inspector.

(b) The Permittee must ensure that all geotechnical/designs, specifications, work plans, monitoring requirements and reports required to be prepared under section (C) are maintained on site and made available to any Inspector of Mines upon request.

(c) The Permittee must ensure all construction is completed under the supervision of a Professional Engineer and that sufficient field reviews have been conducted to ensure that all construction and facilities are built in conformance with the design, accepted engineering practices and the Code.

(d) The Permittee must ensure that recommendations by a Professional Engineer relating to health and safety, geotechnical stability or environmental protection are followed unless a suitable alternative course of action is approved in writing by a Professional Engineer.

(e) The Permittee must submit an Advice of Geotechnical Incident form to the Chief Inspector for any geotechnical incident that is classified as a dangerous occurrence or any other incident as described in the current EMLI Advice of Geotechnical Incident form.

2. Underground Mine

(a) The Permittee must maintain an up-to-date mine design that includes computer models, drawings, calculations, specifications, and written descriptions of:

(i) The geometry of all existing and proposed excavations,
(ii) The geologic, hydrogeologic and geotechnical conditions affecting the mine, and
(iii) Excavation design and ground support design that considers stress, structure and rockmass conditions.

(b) The mine design must be periodically, at a minimum of annually, updated to reflect site experience and the actual geological, hydrological and geotechnical conditions encountered.

(c) The Permittee must ensure the dimensions of all excavations and pillars are within nominal tolerances per the recommendation of a Professional Engineer.

(d) Ground Control Management Plan

The Permittee must implement the Ground Control Management Plan (GCMP). The GCMP must be reviewed annually by a Professional Engineer and updated as required. The Permittee must submit the updated GCMP to the Chief Inspector within 60 days of being issued, and it must include (but is not limited to) the following components:

(i) Ground control program roles, responsibilities, accountabilities, implementation, records and communications,
(ii) Design basis information and assumptions used to develop the mine design and the ground control program,
(iii) Geological model for the mine,
(iv) Hydrogeological model for the mine,
(v) Geotechnical (rock mechanics) model for the mine including stress, structure and rockmass,
(vi) Historical experience,
(vii) Mine design including mining methods, and excavation dimensions, pillar dimensions, stope sequencing, etc.; and criteria used in dimensioning of excavations and pillars,
(viii) Water control measures including specific precautions to be taken where bodies of water, water bearing structures, overburden, tailings etc., may inundate the mine workings,
(ix) Ground support systems and materials to be employed,
(x) Criteria used in selection, dimensioning, spacing and extent of ground support,
(xi) Standards and procedures to ensure worker safety including,
(xii) Minimum ground support standards to be employed at Mine,
(xiii) Blasting methods,
(xiv) Employee procedures and training,
(xv) Monitoring program to verify acceptable performance, detect early signs of instability, and confirm design basis information and assumptions,
(xvi) QA/QC program,
(xvii) Risk management, and
(xviii) Ground Control Management Plan reviews, audits, and scheduled update program.

(e) The Permittee must install ground support in new and rehabilitated excavations in accordance with the recommendations of a Professional Engineer.

(f) Mining-Backfill Standard Operating Procedure (SOP)

The Permittee must implement and maintain a Mining-Backfill Standard Operating Procedure (SOP). The Permittee must ensure the Mining Backfill SOP be reviewed annually by a Professional Engineer and updated as required. The Mining Backfill SOP must consider (but is not limited to) the following components:

(i) Barricade and berm design for anticipated loading conditions;
(ii) Procedures for determining suitable barricade location;
(iii) QA/QC procedures for constructed barricades;
(iv) Design rationale for minimum strength requirements for operating beside and underneath backfill at the design dimensions;
(v) Prescribed fill rates within stopes;
(vi) Paste line flushing procedures;
(vii) Procedures to ensure tight backfill has occurred,
(viii) Safe filling procedures that include safe worker setback distance from active paste pours, and
(ix) QA/QC backfill testing requirements.

(g) The Permittee must ensure that no placement of paste backfill into a mined void proceeds unless the fill retention barricades constructed for the placed paste backfill are inspected and approved by a Professional Engineer.

(h) Monitoring

(i) The Permittee must maintain a geotechnical model of the underground openings that record the stress conditions, structure and rock mass in all headings and stopes.

(ii) The Permittee must conduct performance testing on installed ground support to ensure performance is in accordance with design values. The Permittee must ensure quantifiable performance objectives provide triggers for when rehabilitation of ground support is required.

(i) The Permittee must maintain a Ground Control Log Book that must be available at any time at the mine site to any Mines Inspector and includes, but is not limited to, the following information:

(i) Records of damaged, loaded, or failed support;
(ii) Areas of ground support non-conformance to design;
(iii) Records of working ground such as cracks, noise, movement, or other signs of instability;
(iv) Records of uncontrolled falls of ground;

(v) Unusual or unexpected geological, hydrogeological and geotechnical conditions;

(vi) Identification of ground control concerns, coupled with a plan for mitigation/remediation and prioritization,

(vii) A record of the implementation of the mitigation/remediation to address the concern in C.2(i)(vi).

(j) The Permittee must monitor the strength of the paste backfill through laboratory or in-situ testing methods and ensure that no mining occur in areas below or adjacent to where low strength fill is encountered.

(k) The Permittee must ensure that the Ground Control Log Book is read and signed each day by the shift boss and the Mine Manager, or a mine engineer designated by the Mine Manager.

(l) The Permittee must ensure that in the event of mining induced seismicity, all mining must immediately cease until an observation, management and surveillance plan specific to mining in a mining induced seismically active area is submitted to the Chief Inspector and approved. The plan must provide measures to monitor micro seismicity and mitigate rock burst potential.

(m) Reporting

(i) The Permittee must ensure an annual review of the underground workings is undertaken by a Professional Engineer, and observations and recommendations made during the review are summarized in a report and submitted to the Chief Inspector by March 31 of the year following the inspection.

(ii) Starting in 2018, and every four years thereafter, or at the discretion of the Chief Inspector, the Permittee must ensure third party audits of the Ground Control Management Plan be conducted by a Professional Engineer and that they include a review of the instrumentation/monitoring program, QA/QC testing, stress management and pillar performance, and performance of installed ground support.

(iii) Starting in 2021, and every four years thereafter, or at the discretion of the Chief Inspector, the Permittee must ensure third party audits of the paste backfill operations be conducted by a Professional Engineer and that they include plant operations, paste reticulation system and paste placement procedures.

3. Subaqueous Waste Rock and Tailings Storage Facility (WRTSF)

(a) Operations

(i) The Permittee must implement the Subaqueous Waste Rock and Tailings Storage Facility Operation, Maintenance, and Surveillance Manual (OMS Manual; Document 6.5). The Permittee must ensure the OMS manual is reviewed annually and updated, as needed, to reflect changes in status as the facility develops.

(ii) The Permittee must ensure all employees and contractors involved in the operation of the WRTSF are trained in the implementation of the OMS Manual and that records of the training be maintained on site.

(iii) The Permittee must ensure that all subaqueous placement of tailings is to be performed under the guidance of a Professional Engineer.

(iv) The Permittee must assign a qualified person to monitor dumping and to provide a daily work schedule that shows the locations and quantities of waste rock to dump. No dumping of material must occur unless approved by the qualified person.

(v) The Permittee must ensure that no weak, cohesive materials or snow be dumped within the ultimate design limits of the subaqueous waste rock dump area, with the exception that high fines (cohesive) materials may be placed under the direction of the qualified person in areas approved by the Engineer of Record. The Permittee must ensure the locations, total volume and percentage (with respect to total placed) material of the high fines content is documented and included in the semi-annual and annual reports.

(vi) The Permittee must ensure any weak, cohesive materials or snow that is dumped outside the ultimate design limits of the WRTSF, be documented (locations and quantities) and included in the applicable semi-annual and annual reports.

(vii) The Permittee may, following standard operating procedures set in the OMS manual, and as outlined in Document 7.2, use a conveyor, excavator, or remotely operated vehicle to place waste rock into the ponded portion of the WRTSF.

(viii) The Permittee must develop an operational setback and delineation of high risk zone, including the following:

(a) The operational setback distance at the crest is defined with a Factor of Safety FoS > 1.1 for short term analysis of deep seated failures and areas with less than a FoS of 1.1 are identifiable as a high-risk zone;
(b) The zone must be clearly marked at all times;
(c) No personnel must work alone within this zone at any time;
(d) A clear, unobstructed escape route for equipment working within this zone must be maintained;
(e) Personal protective equipment, rescue equipment, communication equipment must be present at the location of work for all personnel working within the zone;
(f) At minimum a 10m operational setback distance must be maintained, and
(g) Prior to work occurring within the high risk zone, the area must be inspected and deemed safe by a Qualified Professional following all recommendations of the Engineer of Record

(ix) The Permittee must implement an earthquake monitoring system with an alarm to trigger evacuation of personnel from the dump in the event of an earthquake.

(b) Monitoring and Reporting

(i) The Permittee must monitor dump crest movement and implement a failure alert procedure on all active waste dumps and closed high consequence dumps.

(ii) The Permittee must install instrumentation to monitor the rate of settlement of the subaqueous waste rock dump. Reports of the settlement rates are to be made available to the Mine Inspector upon request.

(iii) The Permittee must install a water level gauge or other suitable pond level monitoring system to monitor Brucejack Lake water level.

(c) Annual Construction Progress Report

The Permittee must submit an annual construction progress report to the Chief Inspector by March 31 of that year, on the construction and monitoring of the WRTSF. The Permittee must ensure the report includes:

(i) A review of construction documentation,
(ii) Rock deposition advancement,
(iii) A discussion detailing any potential amendments to original design based on field observations,

(iv) Recommendations for the placement of material in all weather conditions, and
(v) Confirmation the report was reviewed by the Engineer of Record.

(d) Annual Review of WRTSF

(i) The Permittee must ensure that an annual review of the WRTSF is conducted by a Professional Engineer and a report submitted to the Chief Inspector until 2021.

(ii) Starting in 2022, and every five (5) years thereafter, the Permittee must ensure that a review of the WRTSF is conducted by a Professional Engineer and a report submitted to the Chief Inspector.

4. Surface Water Ponds, Ditches and Diversion

(a) The Permittee must not commence construction of surface water ponds and ditches that carry mine-influenced water or diversion channels until issued for construction (IFC) drawings, signed by a Professional Engineer, are submitted to the Chief Inspector. This condition does not apply to temporary diversion channels required to facilitate construction.

(b) The Permittee must ensure that water surface ponds, ditches and diversion channels are designed to convey the design flood without overtopping or side slope failure, and with adequate armour or lining to prevent significant erosion.

(c) Ponds must be designed with a minimum 0.5 m freeboard under the design flood. The design flood must be chosen with consideration of the consequence of failure, and duty life of the ponds, but must be no less than the 1:200 year peak flow event.

(d) The Permittee must submit an "As-Built" report to the Chief Inspector for all surface water ponds, ditches and diversion channels. The Permittee must ensure that the report certifies that each facility has been constructed in accordance with the design and the applicable guidelines.

(e) The Permittee must implement the Operations Maintenance and Surveillance Manual for the Contact Water Pond. The Permittee must ensure the OMS manual is reviewed annually and updated, as needed, to reflect changes in status as the facility develops.

(e) The Permittee must include all surface water ponds, ditches and diversion channels in an annual inspection by a Professional Engineer of water management facilities on the mine site. The annual inspections must be documented and inspection reports must be maintained onsite and provided to any inspector upon request.

5. Temporary Soil, Overburden, Rock, and Organic Material Stockpiles

The Permittee must ensure that the temporary soil, overburden, rock, and organic materials stockpiles are designed by a Professional Engineer and builtin accordance with the designs.

6. Borrow and Quarry Excavations

The Permittee must ensure that borrow and quarry excavations are designed by a Professional Engineer and developed in accordance with the designs.

7. Mine Site Roads

(a) The Permittee must ensure that all new mine roads are constructed in accordance with the designs and recommendations prepared by a Qualified Professional.

(b) The Permittee must ensure that all new roads with cut or fill slopes exceeding 6 m in height or located on terrain that can be classified as moderate (or higher) likelihood of initiating a landslide are designed by a Professional Engineer.

(c) The Permittee must ensure that all roads are reviewed at least every five years by a Qualified Professional. The Permittee must document the review and any recommendations and maintain a copy on site and provide it to an Inspector of Mines upon request.

(d) The Permittee must ensure that all roads are operated, maintained, and inspected in accordance with acceptable industry standards and guidelines.

8. Mine Site, Plant, Shop, and Other Infrastructure Foundations

(a) The Permittee must ensure that all building foundation designs address bearing capacity, potential settlement, and any necessary foundation preparation or treatment.

(b) The Permittee must ensure an inspection of the prepared excavation prior to the placement of permanent foundations is completed.

9. Geohazards Assessment

(a) The Permittee must develop and implement a Geohazards Management Plan. The Permittee must ensure that the plan is developed by a Qualified Professional. The Permittee must manage the geohazards associated with surface works in accordance with the plan. The plan must include mapping, an assessment of potential geohazards, and identification of risks prior to construction of the associated surface works.

(b) The Permittee must ensure a Qualified Professional conducts an annual review of the geohazard management practices being implemented by mine personnel at the mine site. The Permittee must provide the results of this inspection in an annual report to the Chief Inspector by March 31 of the year following the inspection.

D. Protection of Land and Watercourses

1. Environmental Management System

(a) The Permittee must maintain and implement an Environmental Management System (EMS) consisting of Environmental Management Plans (EMPs) and Standard Operating Procedures (SOPs). The EMS must reference relevant policies and establish proactive procedures to provide direction for effective operational management and monitoring on-site.

(b) The Permittee must audit the EMS annually, revise it as soon and as often as required, and make it available to a Mines Inspector at the mine site at all times. The findings of the annual audit of the EMS must be reported in the Annual Reclamation Report.

(c) The Permittee must ensure that mine site employees and contractors are knowledgeable and accountable to act consistently with the requirements of the EMPs and SOPs that form the EMS.

2. Environmental Manager

(a) The Permittee must ensure that an Environmental Manager is assigned.

(b) The Environmental Manager must have the authority to implement remedial actions as may be necessary to ensure maintenance of environmental standards and permit requirements. If suspension of construction or operations occurs due to environmental concerns, the Permittee or Environmental Manager must immediately notify the Chief Inspector.

3. Metal Leaching (ML) and Acid Rock Drainage (ARD)

(a) General

(i) The Permittee must ensure all materials with the potential to generate ML/ARD are placed in a manner that minimizes the production and release of metals and contaminants to levels that assure protection of environmental quality.

(ii) Unless otherwise approved, The Permittee must ensure all plans for the prediction, and if necessary, the prevention, mitigation and management of metal leaching and acid rock drainage are prepared in accordance with the *Guidelines for Metal Leaching and Acid Rock Drainage at Minesites in British Columbia* (1998).

(iii) The Permittee must ensure no changes are made to the criteria for ML/ARD definition, waste handling procedures, mitigation strategies, or materials monitoring program without the approval of the Chief Inspector.

(b) Definition of Potentially ARD Generating (PAG) and Metal Leaching (ML) Materials

All waste rock, quarry rock, borrow materials and tailings must be considered PAG if NP/AP is < 2, where AP is calculated from total sulphur and NP is calculated from total carbon.

(c) Mine Materials Handling and ML/ARD Mitigation

(i) The Permittee must ensure only non-PAG materials are used for construction purposes.

(ii) Prior to their use, the Permittee must ensure representative samples of quarry and borrow materials used for construction are tested and characterized in accordance with the ML/ARD Management Plan for their potential to generate ML/ARD.

(iii) The Permittee must ensure all waste rock generated from surface or underground development is backfilled in the underground workings, below the ultimate flood limit of the workings, or deposited in Brucejack Lake.

(iv) The Permittee must ensure all PAG waste rock deposited in Brucejack Lake is covered with a minimum 1 m water cover.

(v) The Permittee must ensure waste rock stored temporarily on surface, within the mine contact water collection system, for no longer than 2 years. Permanent disposal of waste rock on surface is not permitted.

(vi) The Permittee must ensure all tailings are either backfilled underground or deposited in Brucejack Lake.

(vii) The Permittee must ensure sludge generated from the Operations Water Treatment Plant is comingled with tailings and deposited in Brucejack Lake at a mixing ratio not to exceed 2% sludge by dry weight.

(viii) Underground co-disposal of Operations Water Treatment Plant sludge with cemented paste tailings is not permitted until such time as the Permittee can demonstrate the long term stability of these materials and an updated ML/ARD Management Plan and Subaqueous Waste Rock and Tailings Deposition OMS Manual is provided to the Chief Inspector for review and approval.

(ix) The placement of sludge from the Operations Water Treatment Plant in the underground workings is prohibited until such time the Permittee can demonstrate the long-term geochemical stability is demonstrated and an updated ML/ARD Management Plan and Subaqueous Waste Rock and Tailings Deposition OMS are provided to the Chief Inspector for review and approval.

(d) ML/ARD Operational Monitoring

(i) The ML/ARD Management Plan is approved and must be implemented. The Permittee must ensure no changes are made to the plan without the approval of the Chief Inspector.

(ii) The Permittee must ensure all personnel involved in waste rock and tailings generation and handling are trained and kept up to date on the content and implementation requirements of the ML/ARD Management Plan and the Subaqueous Waste Rock and Tailings Deposition OMS.

(iii) The Permittee must maintain an inventory of waste rock, quarry rock, borrow materials, exposed rock units in the underground workings, tailings products and water treatment plant sludge generated, including (as appropriate) information on source, composition, quantity of material, disposal location, elevation (meters), depth of water cover, and date of placement. This inventory must be kept on site and be made available to any Mines Inspector upon request.

(iv) Concurrent with mine development and operations, the Permittee must characterize excavated materials produced and mine surfaces exposed, including waste rock, quarry rock, borrow materials, exposed rock units in the underground, tailings products and generated water treatment plant sludge to determine ML/ARD generating potential, validate pre-mining predictions, guide material management decisions, confirm effectiveness of waste handling procedures, and determine the need for mitigation and contingency measures that ensure environmental protection.

(v) The Permittee must maintain a record of waste rock placed within the platform and active face areas of the waste rock dump. The record must include information on the type, amount and exposure time (in months) of waste rock prior to submergence in Brucejack Lake. The record must be kept on site and be made available to any Mines Inspector upon request. The record must be reported in the Annual Reclamation Report.

(e) Analytical Requirements

(i) The Permittee must present analytical QA/QC results in the Annual Reclamation Report.

(f) ML/ARD Reporting

The Permittee must report results of the ML/ARD analytical testwork (including raw data, sample descriptions, analytical QA/QC, and materials inventory) and underground geologic mapping in the Annual Reclamation Report. Any significant changes or trends must be discussed, and implications for materials handling must be identified.

4. Water Management and Monitoring

(a) Water Management

(i) The Permittee must obtain any necessary permits and licenses for water diversion and discharge.

(ii) The Permittee must ensure water from the underground workings is collected and directed to water treatment.

(iii) The Permittee must ensure that water from the Contact Water Pond is collected and either directed to water treatment or to Brucejack Lake through the direct discharge line, as per the Contact Water Pond OMS manual required as a condition of this permit.

(b) Groundwater

(i) The Permittee must ensure the Operation, Maintenance and Surveillance Manual: Mine Site Surface Water Management Facilities is kept up to date, reviewed annually, revised as soon and as often as required and is made available to an Inspector at the mine site at all times. Updated versions of the manual must be submitted to the Chief Inspector.

(ii) The Permittee must ensure updates to the post-closure groundwater elevation predictions be provided with each Five Year Mine Plan Update, commencing July 31, 2020. Any changes to predicted post-closure groundwater levels must be used to revise the ML/ARD Management Plan and the Water Management Plan, as required.

(c) Chromium Management Plan

(i) The Permittee must implement the Chromium Management Plan (Document 6.3).

(ii) The Permittee ensure the Chromium Management Plan is kept up to date, reviewed annually, revised as soon and as often as required and made available to an Inspector at the mine site at all times. The findings of any investigations undertaken and any significant changes to the plan must be reported in the Annual Reclamation Report.

(iii) The Permittee must ensure that mine site employees and contractors are knowledgeable and accountable to act consistently with the requirements of the Chromium Management Plan.

(d) Monitoring and Reporting

(i) The Permittee must monitor and track changes to mine site surface water and groundwater quality and quantity from the underground workings (including pumping rate of water into and out of the underground workings), groundwater monitoring wells, Contact Water Pond, and tailings supernatant. The Permittee must ensure the program is capable of providing early warning about the onset of ARD or an increase in contaminant loading and provide refined predictions regarding the post-closure groundwater elevation.

(ii) The Permittee must ensure detection limits are sufficient to compare to provincial water quality guidelines and permit requirements established by the British Columbia Ministry of Environment.

(iii) The Permittee must ensure an effective QA/QC program for mine site contact water is implemented.

(iv) The Permittee must ensure monitoring results of water quality and water quantity, including interpretation of the results, are kept up to date in a dedicated database available for review by a Mines Inspector and reported in the Annual Reclamation Report.

(v) The Permittee must ensure that the Annual Reclamation Report includes a table comparing relevant monitoring and testwork data to source term concentrations used in water quality predictions. The Permittee must ensure implications of the results for source term refinement, water quality mitigation and adaptive management is discussed in the report.

(e) Water Quality Predictions

During operations, the Permittee must track water quality and flow monitoring data to enable validation and refinement of water quality predictions based on site-specific monitoring information. The Permittee must ensure water quality model updates is provided in every 5 Year Mine Plan update thereafter, or more frequently as necessary to inform mine planning and mitigation design and engineering.

5. Closure Underground Water Quality Adaptive Management Plan

The Permittee must implement an appropriate monitoring program with water quality triggers and management actions that will be used to ensure the groundwater discharging from the underground workings during post-closure is protective of receiving environment water quality.

6. Water Treatment

(a) Operations

(i) The Permittee must ensure the Operations Water Treatment Plant Operations and Maintenance Manual (OWTP OMS) is kept up to date, reviewed annually, revised as soon and as often as required and be made available to an Inspector at the mine site at all times. The Permittee must submit updated versions of the OWTP OMS to the Chief Inspector.

(ii) The Permittee must ensure no substantive changes are made to the operations phase water treatment processes without the approval of the Chief Inspector.

(b) Monitoring and Reporting

(i) The Permittee must monitor, track and report in the Annual Reclamation Report on the performance of the Water Treatment Facility. The Permittee must report information on system performance, volume and quality of contact water influent and effluent of the water treatment system, volumes of reagents used, volumes and characteristics of waste generated, and information on any process changes.

(ii) The Permittee must ensure the Annual Reclamation Report includes a breakdown of all annual costs associated with operation of the Operations Water Treatment Facility, including labour, electricity, waste handling and storage and all delivered costs for diesel, reagents, etc.

7. Sediment and Erosion Control

(a) The Permittee must ensure that the Erosion and Sediment Control Management Plan is implemented. This plan must be reviewed at least annually and updated to reflect results of effectiveness monitoring and potential contingency requirements, changing site conditions, and site-specific freshet-related considerations. The Permittee must ensure substantive changes are provided to the Chief Inspector prior to implementation, and annual updates are reported in the Annual Reclamation Report.

(b) The Permittee must ensure that erosion and sediment control prescriptions, and associated effectiveness monitoring programs, are developed based on site-specific assessments of risk and consequence prior to construction of individual mine and water management components.

(c) The Permittee must ensure that unauthorized release of sediment-laden water released from the authorized water management system must be characterized and reported to the Chief Inspector, with recommendations for improvement to the water management system if required.

(d) The Permittee must initiate progressive reclamation where practicable to control erosion around the mine area.

8. Soil Salvage and Storage

(a) The Permittee must salvage and stockpile topsoil, overburden, and organic material to the greatest extent possible for use in reclamation.

(b) The Permittee must ensure a Qualified Professional monitor and direct sampling, soil salvage, stockpiling activities on-site.

(c) The Permittee must ensure an inventory of salvaged and stockpiled soil, including the locations, origins, and quantities of material, is documented and reported in the Annual Reclamation Report.

(d) The Permittee must protect stockpiles from erosion, degradation, and contamination using appropriate best management practices, and monitor them as appropriate to ensure effective controls are maintained. The Permittee must ensure stockpile protection activities and monitoring results are documented and reported in the Annual Reclamation Report.

(e) The Permittee must ensure soil stockpiles are located in areas that minimize handling requirements during site preparation and mine operations, provide adequate accessibility for reclamation activities, and optimize sediment control options.

(f) The Permittee must ensure soil stockpiles are clearly marked to ensure that they are protected during construction and mine operations.

(g) The Permittee must ensure stockpiled soil suitable for use in reclamation is not used as fill.

9. Vegetation Management

(a) The Permittee must ensure that the Vegetation Management Plan is implemented.

(b) The Permittee must limit disturbance to vegetation to those areas approved by this permit (Figure 1a and Figure 1b) and ensure that disturbance limits are clearly communicated and adhered to on-site. Where only minimal vegetation removal is proposed, the Permittee must ensure efforts are made to limit ground disturbance to minimize soil erosion and maximize the regeneration potential of the site.

(c) The Permittee must ensure that the Invasive Plants Management Plan, dated July 2015 is implemented.

(d) The Permittee must prevent the establishment of invasive plants on-site, manage and control weeds that do establish on the site, and take reasonable efforts to ensure that weeds do not move from the site to adjacent areas. The Permittee must ensure that seed used on-site is certified weed free and consider using non-toxic means for weed control.

(e) The Permittee must salvage and stockpile woody debris, including stumps, roots, limbs and rotting logs, that is generated during clearing and grubbing operations. The Permittee must keep an inventory of salvaged and stockpiled woody debris, including the locations, origins, and quantities of material, and report in the Annual Reclamation Report.

(f) The Permittee must avoid chipping or burning of woody debris suitable for use in reclamation.

10. Wildlife Protection

(a) The Permittee will implement the Wildlife Management Plan (REF 1.10), to prevent and mitigate impacts to wildlife, with the monitoring results provided in the Annual Reclamation Report.

(b) The Permittee must ensure that strategies, designed by a Qualified Professional with suitable experience, to prevent human-wildlife interactions are included in the Waste Management Plan and implemented.

(c) The Permittee must ensure that where exclusion fencing is installed that it is maintained in effective working order at all times that people are present on site.

(d) The Permittee must conduct monitoring and/or track incidental observations of bats in the underground throughout mine life. If bats are observed to be present the Permittee must:

(i) Develop, and submit to the Chief Inspector within 3 months of bat observations, an operational management plan to minimize risk to bats, particularly with respect to direct mortality and spread of white nose syndrome and

(ii) Conduct a bat survey and take all reasonable efforts to move bats out of the underground, prior to securing the underground openings.

(e) The Permittee must avoid wildlife sensitive periods and/or adhere to timing windows for construction activities. Where this is not practicable, the Permittee must adhere to mitigation measures outlined in the Wildlife Management Plan.

(f) Pursuant to Part 1.6.9 of the Code, the Mine Manager must incorporate in the mine safety program a no hunting and shooting policy, for the mine permit area (Figure 1a and Figure 1b).

(g) The Permittee must implement a policy of no fishing and hunting for all employees and contractors while on company business or while commuting to and from the mine on the Brucejack Access Road west of Highway 37.

11. Archaeological Resources

If archaeological materials or cultural features are encountered during construction or related activities, the Permittee must implement procedures as set out in the Heritage Management Plan.

12. Ongoing Reclamation Research

(a) The Permittee must by July 31, 2020, submit to the Chief Inspector a Reclamation Research Program that includes details for achieving the research requirements outlined in this permit with a schedule for implementation and description for how results will be utilized and reported.

(b) The Permittee must ensure a summary of all research being conducted under this section is provided in the Annual Reclamation Report and a detailed summary of results is provided in the Five Year Mine Plan and Reclamation Program updates.

(c) The Permittee must ensure research is conducted to explore opportunities for enhancement of both habitat and surface drainage control on the Mine Site, particularly with respect to design of the surface topography predicted to remain once infrastructure is decommissioned at closure. The scope of this research must include evaluation of options to optimize remaining concrete foundations.

(d) The Permittee must ensure research is conducted to evaluate opportunities for amending soil that is to be used for reclamation purposes to enhance the soil suitability, if necessary, based on soil analyses.

(e) The Permittee must ensure testwork is conducted to determine soil replacement depths and locations required to achieve the designed surface topography and end land use objectives.

(f) The Permittee must ensure research is conducted to determine the viability of revegetation with native plant species, including culturally important species.

(g) The Permittee must ensure research is conducted to assess decompaction methodologies to ensure that the severity of compaction that exists prior to commencing reclamation activities is effectively addressed in a manner intended to achieve end land use objectives and erosion control. The scope of this research must include mine access roads and mine site pads.

(h) The Permittee must develop a reclamation success monitoring program designed to evaluate the success of revegetation, landscape design, and erosion control that specifies sampling parameters and performance criteria.

(i) The Permittee must develop a monitoring program for evaluating metal uptake in exposed terrestrial and aquatic ecosystems, which specifies sampling requirements and performance criteria and targets areas where potential pathways for metal uptake via (e.g., dust, growth medium, or contact water). Where harmful levels are found, the Permittee must take any corrective action necessary to mitigate to ensure levels are safe for plant and animal life.

13. Subsidence Monitoring

The Permittee must develop a Subsidence Monitoring and Management Plan and submit it to the Chief Inspector as part of the 5 Year Mine Plan and Reclamation Program update. The plan must be designed to evaluate the effectiveness of subsidence controls, provide early warning of surface expression that may result in changes to terrestrial or aquatic values and include an adaptive management approach to ensure that appropriate mitigation and/or closure plans are developed as needed.

E. Reclamation and Closure Program

1. Reclamation Security

(a) The Permittee must maintain a total security for this permit of Thirty One Million Seven Hundred Thousand ($31,700,000.00) dollars. The security will be held by the Minister of Finance for the proper performance of the approved program and all the conditions of this permit in a manner satisfactory to the Chief Inspector.

(b) Notwithstanding the security posted as a condition of this Permit, the Permittee remains responsible for covering all closure and reclamation costs associated with reclamation and environmental protection.

2. Annual Reclamation Report

By March 31 of each year, starting in 2016, the Permittee must submit an Annual Reclamation Report in a form containing the information required by the Chief Inspector.

3. Land Use

The Permittee must reclaim the land with the intent of re-establishing average pre-mining capability to the following end land use objective: wildlife habitat, particularly matrix habitat for mountain goat, grizzly bear and hoary marmot on the mine site and high elevation sections of the Transmission Line, and moose and grizzly bear habitat at lower elevations of the Transmission Line. Achieving land capability objectives and habitat enhancement must guide the reclamation program.

4. Revegetation

(a) The Permittee must, where vegetation is a necessary component of fulfilling the approved end land use objective, ensure the land is revegetated to a self-sustaining state using appropriate and or native plant species including culturally important native species.

(b) The Permittee must ensure revegetation programs are designed to restore wildlife habitat where practicable.

(c) The Permittee must ensure revegetation practices are conducted to provide appropriate species and densities that are similar to naturally occurring ecosites at similar elevations, aspects, and climatic conditions.

(d) The Permittee must develop details of the proposed revegetation programs, including species and densities prescribed for specific areas, based on input from the reclamation research program required as a condition of this permit.

5. Growth Medium

(a) Where replacement of salvaged soil will occur, the Permittee must ensure surface preparation is done in a manner that controls erosion and achieves end land use objectives.

(b) The Permittee must monitor soil replacement to ensure the minimum depths are achieved and a confirmation sampling plan must be implemented to ensure quality of soil used for reclamation purposes will achieve end land use objectives. The Permittee must present the results in the Annual Reclamation Report.

(c) With the exception of areas where closure plans require compaction prior to placement of growth medium in order to reduce infiltration and contact water, the Permittee must ensure all areas are reclaimed and decompacted to the minimum depth required to adequately address the severity of compaction prior to placement of soil and or vegetation, in a manner intended to achieve end land use objectives and erosion control.

6. Contaminated Sites Assessment

The Permittee must develop and implement risk-based monitoring programs designed to ensure all potential sources of contamination have been addressed in order to satisfy reclamation success objectives and water quality requirements.

7. Erosion Control

The Permittee must ensure that long term erosion potential is minimized through landform configuration, appropriate surface preparation, development of maintenance-free vegetation covers, where applicable, and self-sustaining drainage control features and watercourses.

8. Surface Water Management Ponds and Channels

(a) The Permittee must ensure all surface water management ponds and water diversions are reclaimed to satisfy stability and erosion control requirements and the approved end land use once no longer required.

(b) At least 3 months prior to decommissioning water treatment facilities, the Permittee must develop and submit to the Chief Inspector for approval, a Closure Plan that addresses all non-contact and contact water management features that will no longer be required.

9. Transmission Line

At least 3 months prior to decommissioning the Transmission Line, the Permittee must develop and submit to the Chief Inspector for approval, a Reclamation and Closure Plan to satisfy the approved end land use objectives.

10. Borrows and Quarries

The Permittee must ensure borrow pits and quarries are reclaimed to satisfy stability and erosion control requirements and the approved end land use, once no longer required.

11. Mine Roads

(a) The Permittee must ensure all mine roads are reclaimed, in accordance with recommendations of a Qualified Professional, to satisfy the approved end land use objectives, including all reasonable effort to fully re-configure to conform to adjacent landscape where long-term stability is not compromised, unless permanent access is required.

(b) Individual mine roads may be exempted from the requirement for total reclamation pursuant to this permit if either:

(i) the Permittee can demonstrate that an agency of the Crown has explicitly accepted responsibility for the operation, maintenance and ultimate deactivation and abandonment of the road or

(ii) the Permittee can demonstrate that another private party has explicitly agreed to accept responsibility for the operation, maintenance and ultimate deactivation and abandonment of the road and has, in this regard, agreed to comply with all the terms and conditions, including bonding provisions, of this reclamation permit, and to comply with all other relevant provincial government (and federal government) regulatory requirements.

(c) The Permittee must ensure all access roads are effectively blocked to prevent inadvertent vehicular access to surface areas of the mine that may be dangerous.

12. Structures and Equipment

Prior to abandonment, the Permittee must, unless the Chief Inspector has made a ruling with respect to heritage project status or industrial use:

(a) Remove all machinery, equipment and building superstructures, unless the Permittee can demonstrate that another private party has explicitly agreed to accept responsibility for its operation and maintenance;

(b) Remove all synthetic sediment control structures, such as turbidity curtains, ditch liners, and soil covers not required after closure and where practical ,disposed of in the underground prior to flooding or buried in place where sufficient cover materials exist;

(c) Remove all concrete foundations, or covered with sufficient growth medium and re-vegetated, or otherwise reclaimed to fulfill approved end land use objectives based on input from the reclamation research program required as a condition of this permit; and

(d) Remove all scrap material and dispose of in an approved facility.

13. Temporary Shutdown

(a) If the mine ceases production, including for seasonal closure, within one month the Permittee must submit a Care and Maintenance Plan which describes, documents, and tracks key aspects of the ongoing mitigation, monitoring, and maintenance requirements for the care and maintenance of the site. The Permittee must ensure the manual documents the outstanding reclamation activities and closure requirements for the site, and develop a trigger action response plan that will be implemented to activate closure activities based on monitoring results and site conditions. This document must be a living document with updates submitted to the Chief Inspector whenever material changes occur.

14. Mine Plan and Reclamation Program Update

On or before July 31, 2020, and every 5 years thereafter, the Permittee must submit an updated Mine Plan and Reclamation Program, providing, but not limited to, the following:

(a) The current status of the mine plan and reclamation obligations;
(b) A compilation and interpretation of all monitoring including ML/ARD prediction, water quality and quantity, and post-closure groundwater elevation prediction updates;
(c) Closure and maintenance activities;
(d) Any changes to the reclamation program that affect long-term mitigation;

(e) Reclamation research program;
(f) Contingency plans;
(g) Schedule for completion of reclamation works and
(h) A breakdown of outstanding liabilities and associated costs.

15. Closure Plan

(a) Twelve months prior to final closure, the Permittee must submit a Closure Plan providing, but not limited to, the following:

(i) Closure objectives and criteria for each mine component;
(ii) Provide the current status of the mine plan and reclamation obligations;
(iii) A compilation and interpretation of all monitoring including ML/ARD prediction, water quality and quantity;
(iv) Closure and maintenance activities;
(v) Any changes to the reclamation program that affect long-term mitigation;
(vi) Reclamation research program;
(vii) Contingency plans;
(viii) Schedule for completion of reclamation works and
(ix) A breakdown of outstanding liabilities and associated costs.

(b) Concurrent with the final Closure Plan, the Permittee must submit a Closure Management Manual which describes and documents key aspects of the operational surveillance and monitoring requirements used to track important changes that could affect long-term mitigation performance, monitoring and maintenance requirements. This document must be a living document with updates submitted to the Chief Inspector, at least every five years while the permit remains active, and when material changes occur.

PO BOX 49334 1055 Dunsmuir Street
Vancouver, BC V7X1L4

Dear Permittee:

Enclosed is Amended Permit 107835 issued under the provisions of the *Environmental Management Act*. Your attention is respectfully directed to the terms and conditions outlined in the permit. An annual fee will be determined according to the Permit Fees Regulation.

This permit does not authorize entry upon, crossing over, or use for any purpose of private or Crown lands or works, unless and except as authorized by the owner of such lands or works. The responsibility for obtaining such authority rests with the permittee. This permit is issued pursuant to the provisions of the *Environmental Management Act* to ensure compliance with Section 120(3) of that statute, which makes it an offence to discharge waste, from a prescribed industry or activity, without proper authorization. It is also the responsibility of the permittee to ensure that all activities conducted under this authorization are carried out with regard to the rights of third parties, and comply with other applicable legislation that may be in force.

This decision may be appealed to the Environmental Appeal Board in accordance with Part 8 of the *Environmental Management Act*. An appeal must be delivered within 30 days from the date that notice of this decision is given. For further information, please contact the Environmental Appeal Board at (250) 387-3464.

Administration of this permit will be carried out by staff from the Environmental Protection Division's Regional Operations Branch. Plans, data and reports pertinent to the permit are to be submitted by email or electronic transfer to the Director, designated Officer, or as further instructed.

Yours truly,

for Director, *Environmental Management Act*

MINISTRY OF ENVIRONMENT AND CLIMATE CHANGE STRATEGY

PERMIT

107835

Under the Provisions of the Environmental Management Act

Suite 2300, Four Bentall Centre
PO BOX 49334 1055 Dunsmuir Street
Vancouver, BC V7X1L4

Is authorized to discharge mine related contaminants and effluent to Brucejack Lake and Brucejack Creek, from the Brucejack Mine located approximately 60 km North of Stewart, British Columbia, subject to the requirements listed below.

Contravention of any of these requirements is a violation of the *Environmental Management Act* and may lead to prosecution.

This authorization supersedes and replaces all previous versions of Permit 107835 issued under Section 14 of the *Environmental Management Act*.

Where this authorization provides that the director may require an action to be carried out, the permittee must carry out the action in accordance with the requirements of the director.

1. AUTHORIZED DISCHARGES

1.1 Brucejack Lake Final Discharge Point

The permittee must manage the operations and authorized discharges in Sections 1.2, 1.3, 1.4, and 1.5, such that water quality at the outlet of Brucejack Lake (monitoring site BJ 3.10) does not exceed the maximum concentrations specified in Section 1.1.1. The site reference number and final point of compliance for this discharge is E298312.

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

1.1.1 The characteristics of the Brucejack Lake Outlet (BJ3.10) water quality must not exceed the following:

Parameter	Maximum (1)	Units
48 hr Daphnia magna single concentration toxicity test	50% Survival in 100% Concentration, Minimum **(2)**	Not applicable
Algal Growth Inhibition Test (EPS 1/RM/25)	Growth Inhibition must be less than 25% for 100% Lake Outlet Water **(2)**	Not applicable
Total Suspended Solids	30 (maximum) 15 (monthly average)	mg/L mg/L
pH	6.5- 8.5	
Nitrite	240	µg/L as N
Nitrate	11.5	mg/L as N
Ammonia	4.0	mg/L as N
Total Antimony	28	µg/L
Total Arsenic	10	µg/L
Total Iron	1.7	mg/L
Total Silver	0.46	µg/L

(1) Maximum allowable concentration in any grab sample.
(2) Refer to Section 4.3.

1.1.2 The annual average authorized discharge rate from Brucejack Lake is 50,000 m^3/day. The average authorized discharge volume has been set to enable the calculation of discharge fees as required by the Permit and Approval Fees and Charges Regulation.

1.1.3 The discharge is authorized from Authorized Works, which are various discharge lines and outfalls from treatment works, collection works, ditches, oil/water separator, pipes, sumps, pumps, flow monitoring and water sampling devices, a low level weir, and Brucejack Lake.

1.1.4 The location of the facilities from which the discharge is authorized to originate and the point where the discharge is authorized to occur is Mining Lease 1038598. The Authorized Works and various points of discharge are as shown in attached Site Plan A.

Date issued: August 31, 2015
Date amended: June 16, 2022

Mining Authorizations

1.2 Water Treatment Plant and Contact Water Pond Effluent

This section applies to the discharge of effluent from the Water Treatment Plant (WTP) and the Contact Water Pond (CWP) to Brucejack Lake and/or for use as process water within the mill building. The site reference number for the WTP discharge is E302957. The site reference number for the CWP direct discharge is E306114.

1.2.1 The maximum authorized rate of discharge from the WTP to Brucejack Lake is 10,000 m^3/day.

1.2.2 The maximum authorized rate of discharge from the CWP to Brucejack Lake is indeterminate.

1.2.3 Subject to subsection 1.2.4, the characteristics of the WTP and CWP discharge to Brucejack Lake must not exceed the following:

Parameter	CWP Maximum (1)	WTP Maximum (1)	Units
Total Suspended Solids (TSS)	25 (2) 150 NTU (3)	25	mg/L
pH	6.5 – 8.5	6.5 – 8.5	pH
Total Aluminum	0.3	0.3	mg/L
Total Arsenic	10	10	µg/L
Total Cadmium	0.25	0.25	µg/L
Total Cobalt	10	10	µg/L
Total Chromium (see Section 3.4)	20	20	µg/L
Total Copper	10	10	µg/l
Total Iron	1.0	1.0	mg/L
Total Lead	5	5	µg/L
Total Manganese	22	22	mg/L
Total Silver	0.1	0.1	µg/L
Total Zinc	20	20	µg/L

(1) Concentration in any grab sample that triggers requirements in subsection 1.2.4
(2) When available CWP storage capacity is between 10,000 and 50,000 m^3
(3) When available CWP storage capacity is less than 10,000 m^3.

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

1.2.4 Should the concentrations in Section 1.2.3 be exceeded for the WTP or CWP discharge to Brucejack Lake, the permittee must immediately upon receipt of analytical results recirculate effluent through the CWP and WTP until treated water quality does not exceed the discharge characteristics specified in Section 1.2.3.

1.2.5 **Water Treatment Plant Authorized Works**
The discharge is authorized from Authorized Works, which are Brucejack Lake, and the WTP that utilizes pH adjustment for metals precipitation using hydrated lime and, if necessary, sodium sulphide; coagulation using ferric sulphate; and flocculation using anionic polymer and microsand for removal of TSS; clarification using lamella plates and disc filter; sludge dewatering using centrifuge and cationic polymer; and pH neutralization using sulfuric acid and calcium hydroxide.

1.2.6 **Contact Water Pond Authorized Works**
The discharge is authorized from Authorized Works, which are Brucejack Lake and a CWP with a minimum storage capacity of 50,000 m^3. Related appurtenances include a permanent emergency spillway for events exceeding the design capacity as well as a drawdown pump and pipeline system to a deep lake outfall.

1.2.7 The location of the WTP and the deep lake discharge line are as shown on Site Plan B. The sources of the WTP influent are mine water, process water and the CWP.

1.2.8 The location of the CWP and the direct discharge line are as shown on Site Plan B. The sources of the CWP influent are various surface water collection works surrounding the mine site, Diesel Power Station (DPS) pond effluent, WTP effluent, as well as emergency storage of untreated Mine Water.

1.3 Thickened Tailings Slurry

This section applies to the discharge of Thickened Tailings Slurry via the tailings discharge lines to Brucejack Lake. The site reference number for this discharge is E302910.

1.3.1 The annual average authorized rate of discharge is 3,800 tonnes per day.

1.3.2 The tailings outfall must never be positioned more than 7.5 m above the lake bottom (i.e., the top of the natural lake bottom or deposited tailings, whichever is higher) unless approved by the director.

1.3.3 The discharge is authorized from Authorized Works, which are Brucejack Lake, tailings discharge lines to Brucejack Lake, and thickening processes and related appurtenances approximately located as shown on Site Plan B.

1.4 Water Treatment Plant Sludge

This section applies to co-deposition of the WTP Sludge with tailings via the tailings discharge lines to Brucejack Lake. The site reference number for this discharge is E302910.

1.4.1 The maximum rate of sludge deposition is indeterminate.

1.4.2 The mixing ratio of WTP Sludge to tailings must not exceed 2% sludge by dry weight.

1.4.3 The discharge is authorized from Authorized Works, which are Brucejack Lake, tailings discharge lines to Brucejack Lake, tailings thickening processes and related appurtenances approximately located as shown on Site Plan B.

1.5 Treated Domestic Wastewater

This section applies to the discharge of Treated Domestic Wastewater from the mine operations and camp infrastructure to Brucejack Lake. The site reference number for this discharge is E302911.

1.5.1 The maximum authorized rate of discharge is 175 m^3/day, 365 days/year.

1.5.2 The characteristics of the treated effluent must not exceed:

45 mg/L for Total Suspended Solids, and
45 mg/L for 5 day Biological Oxygen Demand.

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

1.5.3 The discharge is authorized from Authorized Works, which are Brucejack Lake and three Filterboxx C75 treatment units, or an equivalent unit(s) approved by the director, and related appurtenances including a deep lake outfall.

1.5.4 The location of the Domestic Wastewater Treatment plant and the deep lake outfall discharge line are as shown on Site Plans A and B.

2. GENERAL CONDITIONS

2.1 Maintenance of Works and Emergency Procedures

The permittee must regularly inspect the Authorized Works and maintain them in good working order. If components of the Authorized Works have a manufacturer's recommended schedule, then those components must, at a minimum, be maintained in accordance with that schedule.

The permittee must maintain a record of inspections and maintenance of the Authorized Works, and make the record available to an officer upon request.

In the event of an emergency or other condition which prevents normal operation of the Authorized Works or leads to an unauthorized discharge, the permittee must take remedial action immediately to restore the normal operation of the Authorized Works and to prevent any unauthorized discharges. The permittee must immediately report the emergency or other condition and the remedial action that has and will be taken to the EnvironmentalCompliance@gov.bc.ca email address or as otherwise instructed by the director.

The director may require the permittee to reduce or suspend operations until the Authorized Works have been restored, and/or corrective steps have been taken to prevent unauthorized discharges.

2.2 Construction of Water Management and Pollution Control Works

The permittee must ensure the plans and specifications for the various phases of the WTP, the Domestic Wastewater Treatment Plant and other associated works authorized under Sections 1.2. 1.3, 1.4, and 1.5 are certified by a Qualified Professional and retained on site for inspection prior to the commencing any of the discharges from either sources. The permittee must cause the Qualified Professional to certify that the works have been constructed in accordance with such plans and specifications before discharge commences under this authorization, and a maximum of 45 days following completion of construction.

2.3 Controlled Bypasses

The permittee must not allow any discharge authorized by this authorization to bypass the Authorized Works, except with the prior written approval of the director.

2.4 Temporary Shutdown

In the event of a temporary shutdown in construction and mining activities at the site, the permittee must notify the director in writing and must ensure all permit conditions continue to be met.

2.5 Glossary

Capitalized terms referred to in this Authorization are defined in the attached Glossary. Other terms used in this Authorization have the same meaning as those defined in the Environmental Management Act and applicable regulations.

2.6 Licence to Publish Documents

Licence to Publish Documents a) Subject to paragraph b, the permittee authorizes the Province to publish on the Ministry of Environment and Climate Change Strategy website the entirety of any Regulatory Document. b) The Province will not publish any information that could not, if it were subject to a request under section 5 of the Freedom of Information and Protection of Privacy Act, be disclosed under that Act.

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

3. OPERATIONAL REQUIREMENTS

3.1 Turbidity Curtains

Waste Rock and Tailings disposal must not proceed unless a minimum of three turbidity curtains are in place across the lake outlet approximately as shown on Site Plan B.

3.2 Source Control of Nitrite and Nitrogen

The permittee must maintain an up to date version of the Nitrogen Management Plan (NMP) on site for inspection by Environmental Protection staff.

The permittee must implement the most current version of the NMP. The NMP describes source control measures, monitoring, auditing and reporting activities that are undertaken to ensure nitrogen sources are controlled and minimized, and that the discharge standards in Section 1.1 are met.

The permittee must maintain records of the activities described in the NMP available for inspection at the request of Environmental Protection staff.

3.3 Closure Underground Water Quality Adaptive Management Plan

The permittee must develop a post closure management plan with the intent of limiting all impacts within Brucejack Creek to levels acceptable to the director.

The Plan must assess all available management options including but not limited to: directing mine pool water on closure to the CWP to allow for attenuation there, continuing to use the WTP and/or discharging the water where it would have minimal impact. In addition, the plan must include appropriate monitoring, water quality triggers, and management actions to maintain water quality throughout closure and post closure.

The Plan must include all available and updated hydrology, hydrogeology and geochemistry results and propose further work necessary to better define closure and post closure Water Quantity and Quality predictions.

An initial Plan submission is due by July 31, 2020. Subsequent updates with respect to ongoing findings and management options are required every five (5) years or as requested by the director. The final report must be submitted 2 years prior to closure for the approval of the director.

3.4 **Chromium Management Plan**

The permittee must maintain an up to date Chromium Management Plan (CMP) on site for inspection by Environmental Protection staff.

The permittee must implement the most current version of the CMP to manage, monitor and mitigate the release of hexavalent chromium from cement in the underground workings, and ensure that the BC Water Quality guidelines for Cr(III) and Cr(VI) are not exceeded at Brucejack Lake outlet (BJ 3.10).

The permittee shall implement the monitoring program and mitigations described in the most current version of the CMP if either of the following occurs:

1) dissolved Chromium levels prior to treatment in the WTP exceed the trigger level of 10 µg/L,

2) dissolved Chromium levels at BJ 3.10 exceed 1 µg/L.

3.5 **Outfall Inspection**

The permittee must cause the outfall(s) and discharge lines to be inspected once every year by a Qualified Professional or certified tradesperson to ensure they and all associated piping are in good working condition, there are no leaks, no major bends which would erode due to the flow of the tailings slurry, and the height of tailings discharge is in compliance with Section 1.1.3 of this permit. Inspections may include a combination of the following: bathymetric surveys, camera inspections, visual inspections, digital sonar surveys, etc. The permittee must submit an inspection report as part of each annual report unless concerns are noted. In the latter instances, the permittee must submit an inspection report accompanied by a mitigation plan to the director with 45 days after the inspection date.

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

3.6 Water Treatment Plant Sludge

The permittee must implement the WTP sludge monitoring and management program outlined in the most current version of the Metal Leaching and Acid Rock Drainage (ML/ARD) Management Plan. Co-subaqueous deposition of WTP Sludge in Brucejack Lake with tailings is permitted as described in Condition 1.4. On-site sub-aerial storage of the WTP Sludge must not exceed twelve (12) months, unless approved by the director.

Disposal of the WTP Sludge does not require approval if it is disposed off-site at a licensed facility.

3.7 Reagents

The permittee must maintain records of reagents types, volumes and usage rates for various water treatment and ore concentration process.

When commissioning any specific process and or adding/changing reagent(s) the permittee must compile and submit documentation to the director 15 days prior to their usage.

3.8 Diesel Power Station (DPS) Oil/Water Separator

The permittee must develop and implement a preventative maintenance, monitoring and inspection program for the DPS separator system and DPS pond by January 31, 2019.

The permittee must maintain records of inspections, cleanouts, accidental discharges, and a site plan, available for inspection at the request of Environmental Protection staff.

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

4. MONITORING REQUIREMENTS

Locations of all monitoring sites are depicted in Site Plans C and D. Appendices A and B specify the monitoring periods and frequencies, and monitoring parameters for the surface water and groundwater monitoring sites.

The groundwater monitoring frequencies will be as per Appendix B unless the permittee documents specific safety conditions present at a given well, or other condition such as lack of recovery, frozen or dry wells, that justify missing a specific sampling event. The director may approve revisions to the Groundwater Monitoring Program subject to the permittee submitting a review and recommendations by a Qualified Professional.

4.1 Benthic Invertebrates

The permittee must implement the benthic invertebrate program as specified in Appendix A using personnel or Qualified Professionals trained in the Environment Canada CABIN protocol.

The benthic invertebrate monitoring frequencies at BJ 2.62 and BJ 1.74 will be annually, as per Appendix A, for 3 years (i.e., 2019, 2020 and 2021) after which time the permittee may request a reduction of the monitoring frequency to once every 3 years.

4.2 Sediment Sampling

The permittee must implement the sediment program as specified in Appendix A using personnel or Qualified Professionals trained in the procedures.

The Program must analyze biologically relevant fine sediments less the 63 µm in size.

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

4.3 Toxicity Sampling Requirements for the Outlet of Brucejack Lake (BJ 3.10)

As per Section 1.1, the discharge at the outlet of Brucejack Lake must not be acutely toxic to aquatic organisms or inhibit algal growth. The required test methods are:

1) Acute/ Lethal Toxicity - 48 hr Daphnia magna single concentration toxicity test (EPS 1/RM/14 2nd edition, December 2000), and
2) Growth Inhibition Test Using a Freshwater Alga (EPS 1/RM/25).

A lethal toxicity test failure is defined as undiluted effluent that results in >50% mortality of Daphnia magna in 48 hours.

A Growth Inhibition test failure is defined as whenever the growth inhibition in 100% lake outlet effluent is determined to be greater than 25%.

In the event of failures, the Ministry must be notified (as per section 5.3 "Non-compliance Notification) and the specific test must be immediately repeated. For Acute Toxicity, the follow-up test must use multiple concentrations to determine the 48 hr LC50 for Daphnia magna.

Test results must be validated and results must be reported as described in approved Environment Canada biological test methods as referred to above.

4.4 Long Term Trend Analysis Toxicity Sampling

A test for survival and growth using larvae of freshwater midges (*Chironomus dilutus*) (water only) (test method EPS1/RM/32) must be conducted on 100% lake outlet effluent. Results must be included in the Annual Report. Trends in survival and growth must be plotted, including all available data from previous tests. The summary must include a description of the results in the context of ecological effects in the receiving environment.

4.5 Aquatic Effects Monitoring Program (AEMP)

The permittee must implement the most current version of the AEMP, approved by the director.

The permittee must submit results of the AEMP, prepared by a Qualified Professional, to the director by March 31st of the year after the studies are conducted in accordance with Section 5.5. Based on the results of this monitoring program, the monitoring requirements may be extended or altered by the director.

Changes to the AEMP must be approved by the director in writing regardless of any language in the approved program indicating otherwise. Recommendations for changes to the monitoring program must be prepared by a Qualified Professional and submitted to the director.

4.6 Sampling and Analytical Procedures

The permittee must carry out sampling in accordance with the procedures described in the "British Columbia Field Sampling Manual for Continuous Monitoring and the Collection of Air, Air-Emission, Water, Wastewater, Soil, Sediment, and Biological Samples (2013 Edition)" or most recent edition, or by alternative procedures as authorized by the director.

A copy of the above manual is available on the Ministry web page at: https://www2.gov.bc.ca/gov/content/environment/research-monitoring-reporting/monitoring/laboratory-standards-quality-assurance/bc-field-sampling-manual

The permittee must carry out analyses in accordance with procedures described in the "British Columbia Environmental Laboratory Manual (2015 Permittee Edition)", or the most recent edition, or by alternative procedures as authorized by the director.

A copy of the above manual is available on the Ministry web page at: https://www2.gov.bc.ca/gov/content/environment/research-monitoring-reporting/monitoring/laboratory-standards-quality-assurance/bc-environmental-laboratory-manual

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

4.7 Quality Assurance Quality Control (QA/QC)

The permittee must obtain from the analytical laboratory(ies) their precision, accuracy and blank data for each sample set submitted by the permittee and an evaluation of the data acceptability, based on criteria set by such laboratory.

The permittee must submit samples to analytical laboratory(ies) that meet the definition of a qualified laboratory under the Environmental Data Quality Assurance Regulation.

4.8 Exceedance of Guidelines at BJ 3.10

In the event that water quality parameters measured at BJ 3.10 exceed their respective "British Columbia Water Quality Guidelines" or discharge standards in Section 1.1, the director may require the following:

a) Additional sampling and monitoring;
b) Risk assessment that incorporates the loadings and concentrations considering biological sensitivity of the area;
c) Submission of an **Environmental Management Plan** in accordance with the following section for each parameter of concern; and
d) Submission of any other information the director considers necessary to assess environmental impact or to protect the environment.

An **Environmental Management Plan** must be to the satisfaction of the director and include but not be limited to:

a) Remedial and mitigation measures for the parameters(s) of concern;
b) An attainment schedule, whereby the permittee must specify actions and interim targets with associated timelines for reducing the amount of contaminants discharged into the environment, with the goal of attainment of water quality guidelines or other criteria as specified by the director;
c) Revised modelling predictions for the parameter of concern based on monitoring data and refinements to source term information; and,
d) Periodic review of the activities to date, and the implementation of future strategies as required by the director. The review will include but not be limited to performance and progress report on control and reduction programs and also provide an opportunity for adjustments to the monitoring program in light of new scientific knowledge and other related technical advances.

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

5. REPORTING REQUIREMENTS

5.1 Spill Reporting

The permittee must immediately report all spills to the environment (as defined in the Spill Reporting Regulation) in accordance with the Spill Reporting Regulation. Notification must be via the Provincial Emergency Program at 1-800-663-3456.

5.2 Reporting of Monitoring Results

The permittee must submit field and laboratory monitoring results, including a summary of non-compliances and corrective actions taken, by email to the Ministry via the Routine Environmental Reporting Submission Mailbox (RERSM) at EnvironmentalReporting@gov.bc.ca within 30 days of the end of the month in which the monitoring occurred. The permittee must submit such data and information in a form that is tabulated, graphically represented and interpreted to the satisfaction of the director.

For guidelines on how to properly name the files and email subject lines or for more information visit the Ministry website:

https://www2.gov.bc.ca/gov/content/environment/waste-management/waste-discharge-authorization/data-and-report-submissions/routine-environmental-reporting-submission-mailbox

5.3 Non-Compliance Notification

The permittee must immediately notify the director or designate by email at EnvironmentalCompliance@gov.bc.ca, or as otherwise instructed by the director of any non-compliance with the requirements of this authorization by the permittee and take remedial action to remedy any effects of such non-compliance.

The permittee must provide the director with written confirmation of all such non-compliance events, including available test results within 24 hours of the original notification unless otherwise instructed by the director.

Date issued: August 31, 2015
Date amended: June 16, 2022
(most recent)

Neil Bailey, P.Eng.
for Director, *Environmental Management Act*
Mining Authorizations

Non-compliance notification must also be provided to the Tsetsaut/Skii Km Lax Ha First Nation, the Tahltan Nation (as represented by the Tahltan Central Government), the Nisga'a Nation, through Nisga'a Lisims Government and the Alaska Department of Natural Resources.

Exceedances of the WTP discharge characteristics specified in Section 1.2.3 are not non-compliance events. A non-compliance event would be not complying with requirements in Section 1.2.4, which are triggered in the event of discharge characteristics in Section 1.2.3 being exceeded.

5.4 Non-Compliance Reporting

If the permittee fails to comply with any of the requirements of this authorization, the permittee must, within 30 days of such non-compliance, submit to the director a written report that is satisfactory to the director and includes, but is not necessarily limited to, the following:

a) All relevant test results obtained by the permittee related to the non-compliance,
b) An explanation of the most probable cause(s) of the non-compliance, and
c) A description of remedial action planned and/or taken by the permittee to prevent similar non-compliance(s) in the future.

The permittee must submit all non-compliance reporting required to be submitted under this section by email to the Ministry's Compliance Reporting Submission Mailbox (CRSM) at EnvironmentalCompliance@gov.bc.ca or as otherwise instructed by the director. For guidelines on how to report a non-compliance or for more information visit the Ministry website:

http://www2.gov.bc.ca/gov/content/environment/waste-management/waste-discharge-authorization/data-and-report-submissions/non-compliance-reporting-mailbox

Non-compliance follow up reports must also be provided to the Tsetsaut/Skii Km Lax Ha First Nation, the Tahltan Nation (as represented by the Tahltan Central Government), the Nisga'a Nation, through Nisga'a Lisims Government and the Alaska Department of Natural Resources.

5.5 Annual Reporting

The permittee must submit to the director a comprehensive Annual Report by March 31st of each year, in a report format that follows directions of the "Technical Guidance 4 – Annual Reporting under the *Environmental Management Act* (2016)", or the most recent edition. The Annual Report must be submitted to the Ministry via the Routine Environmental Reporting Submission Mailbox (see Section 5.2). Copies of the annual report must also be made available to the Ministry of Energy, Mines, and Petroleum Resources.

The Annual Report must include but not be limited to:

1. an evaluation of the impacts of the discharge on the receiving environment, adequacy of monitoring and recommendations;
2. spills and other environmental incidents;
3. a comparison of monitoring data, including acute and chronic toxicity results, with Permit standards, BC Water Quality guidelines, and water quality modelling predictions;
4. results of long term toxicity sampling including plots of all data, trends in survival and growth, and a description of the results in the context of ecological effects in the receiving environment;
5. an interpretation (including graphs) of upward trending parameters monitored and/or predicted to potentially exceed BC Water Quality guidelines, or Permit standards;
6. results of water treatment operation and removal efficiency for all contaminants of potential concern;
7. a summary of all non-compliances submitted in an Annual Status Form, mitigation and continuous improvement efforts employed by the mine;
8. a summary of all surface water and groundwater quality, and hydrometric and groundwater levels for the previous year, including tables and graphs where appropriate to indicate trends in key water quality parameters, and including an assessment of relevant quality assurance data;
9. flow measurements and discharge rates data for all authorized discharges, estimates of the amount and type of chemical additions (flocculants and chemicals used in the WTP and mill for ore processing and tailings thickening process);

10. results and interpretations of receiving environment aquatic effects program monitoring, including: results and interpretations of acute and chronic toxicity testing, sediment and biological monitoring; analyses of key water quality trends; environmental effects; and assessment of the protectiveness of the discharge limits;
11. results of any additional hydrogeological investigation and assessment work and updates to the groundwater model for the site;
12. results and analyses of ongoing review of the site water quality predictions and source terms, water balance and water management at the site; and
13. results of ongoing ML/ARD chemistry studies.

The annual report must also be provided to the Tsetsaut/Skii Km Lax Ha First Nation, the Tahltan Nation (as represented by the Tahltan Central Government), the Nisga'a Nation, through Nisga'a Lisims Government and the Alaska Department of Natural Resources.

5.6 Mine Data and Water Quality Modelling Review

Every five years during the operating life of the mine, or as required by the director in the event of significant changes with respect to monitoring results, production rates and or other factors, the permittee must conduct a review of the environmental monitoring required under this permit and reassess the predictive modelling with respect to the environmental impacts.

The permittee must ensure that the review be conducted by independent, third party Qualified Professionals. The permittee must cause the Qualified Professional to consider all the available data and any other information available to the permittee or Ministry of Environment staff. Each review will recommend what actions or permit amendments, if any, are advisable to limit impacts from the current or future activities at the mine site on the receiving environment and to ensure compliance with permit requirements.

The director shall consider these recommendations and may make amendments to the permit and/or the environmental monitoring plan that the director considers necessary for the protection of the environment.

A report summarizing the results of a five-year review must be submitted to the director and the Tsetsaut/Skii Km Lax Ha First Nation, the Tahltan Nation (as represented by the Tahltan Central Government), and the Nisga'a Nation,

through Nisga'a Lisims Government by July 31st of the year in which the review is required. The first five-year review report is due on July 31, 2020.

5.7 Electronic Submission of Data into EMS

The permittee must cause a private laboratory or certified third party to electronically submit all the water quality data collected under this permit into the Environmental Management System (EMS) database on their behalf. For instructions on the electronic submission process or for more information visit the Ministry website:

https://www2.gov.bc.ca/gov/content/environment/research-monitoring-reporting/monitoring/environmental-monitoring-system

6. GLOSSARY

Capitalized terms referred to in this authorization are defined in the attached Glossary. Other terms used in this authorization have the same meaning as those defined in the *Environmental Management Act* and applicable regulations.

6.1 "Authorized Works"

"Authorized Works" means Brucejack Lake, low level weir, contact water pond, emergency spillway, contact water pond direct discharge line and outfall, tailings discharge line and outfall, water treatment plant, domestic wastewater treatment plant, water treatment plant and domestic wastewater treatment plant effluent discharge line and outfall, collection works, ditches, pipelines, sumps, pumps, flow monitoring, water sampling, and related appurtenances at stated in Sections 1.1.3, 1.2.5, 1.2.6, 1.3.3, 1.4.3, and 1.5.3.

6.2 "Province"

"Province" means Her Majesty the Queen in right of British Columbia.

6.3 **"Regulatory Document"**

"Regulatory Document" means any document that the permittee is required to provide to the Director or the Province pursuant to:
(i) this Authorization;

(ii) any regulation made under the *Environmental Management Act* that regulates the facility described in this Authorization or the discharge of waste from that facility; or

(iii) any order issued under the *Environmental Management Act* directed against the permittee that is related to the facility described in this Authorization or the discharge of waste from that facility.

6.4 **"Qualified Professional"**

"Qualified Professional" means an applied scientist or technologist specializing in an applied science or technology applicable to the duty or function, including, if applicable and without limiting this, agrology, biology, chemistry, engineering, geology or hydrogeology and who:

(i) is registered with the appropriate professional organization, is acting under that organization's code of ethics and is subject to disciplinary action by that organization, and

(ii) through suitable education, experience, accreditation and/or knowledge, may be reasonably relied on to provide advice within their area of expertise.

All documents submitted to the Director by a Qualified Professional must be signed by the author(s).

Closure - Submit installation plan 2 years prior to closure
2020 - Install timing to be assessed during 2020 Five Year Mine Plan update

Metals & General* - Appendices A & B

Metals refers to:

1. Low level ICP or equivalent analysis of Total and Dissolved Metals including: Aluminum, Antimony, Arsenic, Barium, Beryllium, Bismuth, Cadmium, Chromium, Cobalt, Copper, Iron, lead, Lithium, Manganese, Molybdenum, Nickel, Selenium, Silver, Strontium, Thallium, Tin, Uranium, Vanadium and Zinc; and
2. Mercury analysis which are to be included at the Brucejack Lake outlet (BJ 3.10), the WTP effluent, the tailings supernatant; Site BJ 2.62, SCO, BJ 1.74, on a sQuarterly basis. The mercury sampling frequency at Site L3 outflow must be during freshet and fall.

General Parameters are defined as:

1. Laboratory analysis: pH, Specific Conductivity, Hardness, Alkalinity, Sulphate, Chloride, Fluoride, Calcium, Magnesium, Sodium, Ammonia, Nitrate, Nitrite, Total & Ortho Phosphorous, Total Organic Carbon, Total Suspended & Total Dissolved Solids, and Turbidity;
2. Field measurements: Turbidity, pH, Conductivity and Temperature;
3. Dissolved Phosphorous and Dissolved Organic Carbon which are to be included as part of the General Parameters at Sites BJ 3.10 & BJ 2.62 at a frequency of 3x/ ice free period, and 1x mid-winter;
4. General groundwater monitoring does not need to include Total and Dissolved Organic Carbon;
5. Total Extractable Hydrocarbon analysis which is to be included at the CWP prior to direct discharge to Brucejack Lake and prior to treatment at the WTP; at a frequency of once for each event that DPS pond effluent is pumped to the CWP.

Appendix D – Flood Preparedness

PRETIVM		BJ-ENV-SOP-067 AquaDam Deployment	
Owner: Environmental Department	Approver: Torence Sandhals / Jason Gabora	Revision Number:	Creation Date: May 1, 2021 Revision Date:

Objective

This document provides a step-by-step procedure for how to install a 3' x 150' AquaDam to prevent flooding of the West Zone Portal in case of a 1 in 200-year storm event.

Scope

This standard operating procedure (SOP) provides guidance on how to transport, deploy, monitor, deflate and re-roll the AquaDam. Personnel involved in any part of this process should read and understand this SOP.

Health, Safety & Reclamation Code for Mines in British Columbia

- 1.11.1 Training
- 1.8.2 to 1.8.5 Personal Protective Equipment
- 3.3.3 Drowning Hazard

Definitions

- **AquaDam:** a portable dam consisting of an outer tube made of heavy-duty polypropylene geotextile, and two inner tubes which are filled with water on site to cofferdam, contain, or divert the flow of water.
- **Personal Floatation Device (PFD):** a piece of equipment designated to assist the wearer to keep afloat in water. Unlike a lifejacket, the PFD will not keep the wearer's head out of the water.
- **SOP:** standard operating procedure

Roles and Responsibilities

The Mine Manager or Designate is responsible for:

- Ensuring this procedure is implemented and followed.

The Health and Safety Manager or Designate is responsible for:

- Ensuring this procedure complies with H&S regulations.

The Area Manager or Designate is responsible for:

- Ensuring all departments involved with the installation of the AquaDam are aware of this procedure and understand their responsibilities related to this procedure in the event of a 1 in 200-year flood.

The Worker is responsible for:

- Ensuring this procedure is followed.

Preparation

Hazards

- Slips, trips, and falls
- Working near water
- Extreme weather and/or temperatures
- Hidden / submerged hazards

- Floating debris
- Hypothermia
- Contact with contaminated water

Tools

- One 3' x 150' AquaDam
- Water source
- Two 2" or 3" trash pumps, capable of providing a total flow rate of at least 200gpm
- Two 2" or 3" x 20ft suction hoses
- Four 2" or 3" x 100ft discharge hoses
- Duct tape (1-2 rolls)
- AquaDam repair kit
- Utility knives (1 per person)
- Scissors (1 pair)
- Shovels (2)
- Wood boards – Approx. 2" x 6" (20)
- Sandbags (10)
- PFD (1 per person)
- Lifebuoy or throw rope (1)
- Standard PPE (high-vis vest, steel toed boots, CSA approved hard hat)

Requirements

- Understanding of this SOP
- ERT members who have Swift Water Rescue training and a valid First Aid certificate must be on standby in case of an emergency

Job Step

- **AquaDam installation requires 2-4 labourers.**

Preparing for WestZone Portal Closure

1. As soon as the decision is made to deploy the WestZone Portal AquaDam, the Environmental Superintendent or designate shall inform the Mine Captain that access / egress to the mine will be via the VOK Portal only.
2. The Mine Captain or designate will place signage ahead of the WestZone Portal doors underground, informing workers that access is restricted.
3. The Surface Operations Superintendent or designate shall inform Dispatch that flood protection works are commencing on surface near the WestZone Portal, and that traffic to the area should be restricted.
4. Dispatch will broadcast closure of the WestZone Portal on all radio channels, stating that surface traffic to the WestZone is restricted to persons helping implement flood mitigation measures only.

Transporting Equipment to the WestZone

5. Collect the AquaDam and associated installation equipment from the white sea-can near the incinerator.
    - The AquaDam will be stored rolled up like a carpet and can be transported in the back of an empty pick-up truck.
    - If the AquaDam is to be moved with heavy equipment, secure straps around the AquaDam and connect the straps to the heavy equipment for transportation.
    - Be very careful not to drag the AquaDam during transport.

- Pumps and hoses to fill the AquaDam will be stored in the white sea-can near the incinerator.

Laying out the AquaDam

- **This process assumes that the AquaDam will be installed on dry land prior to flood waters reaching the WestZone.**

1. Place the AquaDam at the starting point of the intended installation path such that the open end is at an elevation at least 3ft greater than the lowest point on the installation path.
   - It may be necessary to use sandbags to prop up the end of the AquaDam if the natural berm is not sufficiently elevated.
2. Unwrap the roll, using scissors to remove any shrink wrap and/or rope that may be securing the AquaDam. Be careful not to accidentally cut the AquaDam.
3. Visually survey the intended installation path, remove any obstructions, or sharp objects, and pad any immovable objects.
   - The installation path should avoid low points and cross-slopes if possible, ideally keeping to level high ground.
4. Unroll the AquaDam along the chosen path. (Figures 1 & 2).

Figure 1: *Place the self-supporting (open) end of the AquaDam at a high point and unroll the AquaDam along the chosen path.*

Figure 2: *Unroll the AquaDam, avoiding low points and cross-slopes, if possible.*

- When turning the AquaDam, ensure there is a wrinkle pulled back from inside the turn to prevent kinking of the tube. (Figure 3)
- Try to create turns that are no more than 45° each. (Figure 4)

Figure 3: *Pull back a wrinkle when turning corners.*

Figure 4: *If you need to turn a sharp corner, make two 45° turns rather than a single 90° turn.*

5. If installation along a cross-slope is unavoidable, install wooden boards, sandbags, or supersacks filled with dirt to brace the AquaDam against the slope. (Figure 5)

Figure 5: *Use wooden boards or sandbags to brace against cross-slopes.*

- **See Appendix A** for the ideal AquaDam installation path to prevent flooding of the WestZone Portal.

Filling the AquaDam

1. Attach the suction and discharge hoses to the pumps. Do not forget to attach a strainer to the suction hose.
2. Insert the discharge hoses 6-8 feet into the inner fill tubes.
   - If the ends of the discharge hoses have any sharp edges, wrap them with duct tape to prevent puncturing the inner tubes.
3. Gather up any loose tubing around the hoses and secure with duct tape, if necessary.
4. Insert the suction hose into a nearby water source and start pumping water into both inner tubes at the same time.

- It is important that the tubes be filled rapidly (minimum 100 gpm into each tube) and at the same rate.

5. While one person controls the pump(s), the other labourers will need to walk alongside the AquaDam as it fills, ensuring any air pockets are pushed out towards the fill tubes. The inner tubes may also need to be adjusted periodically to prevent kinking.
    - **It is important that each labourer carry a utility knife.** The knife can be used to cut the AquaDam and release the water in case of an emergency (such as a person becoming pinned to the ground if the AquaDam rolls).
6. Once the AquaDam is full, stop the pump(s), remove the discharge hoses, and wrap duct tape tightly around the fill tubes to restrict them to a manageable size. Fold the fill tubes back onto each other, and tape together in an upright position. (Figure 6)
    - **Note:** The AquaDam is full once it has reached a height of 3ft at the lowest point along the installation path (Figure 7). DO NOT overfill the AquaDam.
    - The AquaDam will have an inflated width of approximately 7ft.

Figure 6: *Fold the fill tubes back onto each other, and tape them together in an upright position.*

Figure 7: *The AquaDam is full once it has reached a height of 3ft at the lowest point along the path.*

Monitoring and Maintaining the Installed AquaDam

1. The installed AquaDam will need to be monitored regularly for leaks and rolling.
    - If you notice a leak in the AquaDam, patch it with repair tape.
    - If a leak occurs, you may need to add more water.
2. Monitor flood levels and place bracing (wooden boards or sandbags) behind the AquaDam in case of increased water levels. (Figure 8)
    - It is unlikely that this step will be required based on predicted flood levels at the WestZone Portal, but important to be aware of.

Figure 8: *Wooden boards or sandbags can be used if water levels approach the top of the AquaDam.*

Removing the AquaDam

1. Remove duct tape from the fill hoses and pump water out of the AquaDam.
2. After the AquaDam has been drained, place the wooden beam (which the AquaDam was originally wrapped around) at the closed end of the AquaDam.
3. Re-roll the AquaDam around the beam.
4. Tie off the rolled up AquaDam with rope and return it to storage.

Appendix E – Truck Shop Flow Estimates

MEMORANDUM

To	Ali Farah, Rick Yokome
CC	Robin McCall, Sylvia Van Zalingen, Brett DeHay Turner
From	Xavier Pinto
Date	June 17, 2022
Subject	**Mean Annual Flow Estimates for Pump Sizing at New Heavy Shop**

Purpose

This memorandum provides mean annual flow (MAF) estimates for the drainage area of interest (DAI) where the new heavy shop building will be constructed (Figure 1). The estimates will be used as guidance for sizing of pumps located along drainage ditches surrounding the building. This guidance applies to the hydrology estimates only. Other engineering risks associated with the design of the pumps are outside the scope of this memorandum.

Methods

Synthetic Dataset

The drainage area of interest lacks hydrometric monitoring data; therefore, a synthetic daily discharge dataset was generated using available discharge data from the monitoring station BJ 3.10 located along Brucejack Creek, for the period 2010-2021.

The synthetic dataset for the drainage area of interest was scaled from available BJ 3.10 daily discharge data using the following equation:

$$Daily\ Discharge_{DAI\ (\frac{M3}{s})} = Daily\ DischargeDaily\ Discharge_{BJ\ 3.10} \times \frac{DA_{DAI}\ (km2)}{DA_{BJ\ 3.10}\ (km2)}$$

Where:

DA_{DAI} is the drainage area of interest (0.13 km^2)

$DA_{BJ\ 3.10}$ is the drainage area of Brucejack Creek at BJ 3.10 (6.7 km^2)

Climate Change Considerations

Uncertainties associated with precipitation increases caused by climate change were assessed. To account for possible future variations to the estimated MAF, safety factors were incorporated. These climate change factors were produced with the Design Value Explorer (DVE), a web-based interface from the Pacific Climate Impacts Consortium used to access historical climatic variables across Canada.

The DVE provides estimates for several climate change scenarios and the RCP8.5 scenario, which provides the most severe case, was selected.

Results

Annual statistics for the synthetic record for the drainage area of interest are shown in Figure 2. The estimated MAF (m^3/s) is 0.0084 m^3/s or 31 m^3/hr. To account for the effects of climate change the MAF estimates were adjusted by 9% resulting in a MAF of 0.0092 m^3/s or 33 m^3/hr (Table 1). The latter values are more conservative and are suggested to be used for the pump design.

Table 1. Mean Annual Flow Estimates for the Drainage Area of Interest

Parameter	m^3/s	m^3/hr
MAF Base Case	0.0084	31
MAF with Climate Change Scenario[1]	0.0092	33

[1] Assumes 2°C temperature and 9% precipitation increase, projected to 2059 by the climate scenario RCP8.5

Figure 1. Drainage area of interest for the proposed Heavy Shop building

Figure 2. Annual discharge statistics for the drainage area of interest (Period 2010 -2021)

Re: Instantaneous Peakflow Event Estimation for Proposed Heavy Shop Diversion Works

---

Purpose

The purpose of this memo is to summarize the methods and the results for the estimated instantaneous peak flow for the delineated drainage basin around the new proposed heavy shop facility.

Methods

Instantaneous peakflow values for 1-in-100-year and 1-in-200-year return periods were calculated using the rational equation. This method was chosen because it is generally accepted for drainage areas smaller than 1 km^2.

The drainage basin was delineated in Global Mapper (v.23) using a Digital Elevation Model (DEM) generated with the latest LIDAR survey data (2019). The drainage basin was determined at 0.13 km^2 and is shown in Figure 1.

Peakflow Estimation

Instantaneous peakflow rates (m^3/s) for the 1-in-100-year and 1-in-200-year return periods were estimated using rainfall intensity values generated for the area of interest using the IDF-CC Tool v6.0. The tool provides rainfall intensity values for normal case and climate change scenarios. The climate change scenario used was the RCP 8.5 because this is the most severe scenario calculated by the tool and provided the most conservative results. Parameters used in the calculations of the peakflow estimates are provided in Table 1. Peakflow estimates are provided in Table 2.

Table 1 – Parameters used for peakflow estimation

Parameter	Value	Units
Drainage Area	0.13	km^2
Time of Concentration[a]	0.39	hr
Runoff Coefficient[b]	0.95	Dimensionless

[a]-Using Hathaway equation, assuming a roughness factor of 0.3 for rough bare soil; [b]-Value assumed from empirical tables (Coulson 1991) and uses a correction factor of 0.2 to account for a recurrence interval greater than 25 years and snowmelt.

Table 2. Instantaneous peakflow estimates

	Instantaneous Peakflow (m^3/s)	
Return Period	**Base Case**	**Climate Change Scenario**
1-in-100	0.82	0.99
1-in-200	1.05	1.29

Figure 1 – Delineated Drainage Basin

The estimated instantaneous peakflow values should assist in the design of water diversion structures around the proposed heavy shop facilities.

If you have further questions, please do not hesitate to contact me.

GLOSSARY AND ABBREVIATIONS

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

BC	British Columbia
BC MF	British Columbia Ministry of Forests
BC MECCS	British Columbia Ministry of Environment & Climate Change Strategy
BC MEMLCI	British Columbia Ministry of Energy, Mines and Low Carbon Innovation
BC *Wildlife Act* (1996)	The main provincial law for protecting wildlife, endangered species, and wildlife habitat. The Act has several provisions for protecting, managing, and purchasing habitat areas as well as protecting endangered and threatened species. The Act is administered by the British Columbia Ministry of Environment and Climate Change Strategy
BJAR	Brucejack Access Road
BMP	Best Management Practice
EAC	Environmental Assessment Certificate
IWMS	Identified Wildlife Management Strategy: an initiative of the British Columbia Ministry of Environment and Climate Change Strategy in partnership with the British Columbia Ministry of Forests The IWMS provides direction, policy, procedures, and guidelines for managing Identified Wildlife. The goals of the Strategy are to minimize the effects of forest and range practices on Identified Wildlife situated on Crown land and to maintain their limiting habitats throughout their current ranges and, where appropriate, their historic ranges.
***Migratory Birds Convention Act* (1994)**	A federal government commitment established in 1917 to protect most migrating birds found in Canada. The Act fulfilled the terms of the Migratory Birds Convention of 1916 between Canada and the USA. The Canadian government has the authority to pass and enforce regulations to protect those species of migratory birds which are included in the Convention.
Mine	Brucejack Mine
NMMP	Nass Moose Management Program
Pretivm	Pretium Resources Inc.
ROW	right-of-way

Species at Risk Act (2002)	A Canadian federal statute which is designed to meet one of Canada's commitments under the International Convention on Biological Diversity. The goal of the Act is to protect endangered or threatened organisms and their habitats. It also manages species which are not yet threatened, but whose existence or habitat is in jeopardy.
SRMP	Sustainable Resource Management Plan
UWR	Ungulate Winter Range
VC	Valued Component
WHA	Wildlife Habitat Area: mapped areas that are necessary to meet the habitat requirements of an Identified Wildlife species under the Identified Wildlife Management Strategy. WHAs designate habitats in which activities are managed to minimize their effect on the Identified Wildlife for which the area was established.
WMP	Wildlife Management Plan

1 PURPOSE

The purpose of the Wildlife Management Plan (WMP) is to minimize potential effects on wildlife and wildlife habitat from mine-related activities at Brucejack Mine (the Mine) during the Construction, Operations (including potential temporary closure), Closure, and Post-closure phases, while considering operational requirements and the safety of mine personnel. The plan has taken into consideration the Cassiar Iskut-Stikine Land and Resource Management Plan (BC ILLR 2000), the Nass South Sustainable Resource Management Plan (SRMP; MFLNRO 2012), relevant provincial and federal legislated requirements for wildlife and wildlife habitat management, and current best management practices (BMPs).

The WMP targets the following wildlife included as Valued Components (VCs) in the Application for an Environmental Assessment Certificate (EAC) / Environmental Impact Statement:

- moose;
- mountain goat;
- grizzly bear and black bear;
- furbearers (wolverine, fisher, American marten);
- hoary marmot;
- bats;
- migratory birds (waterbirds and land birds);
- raptors; and
- western toad.

2 PERFORMANCE OBJECTIVES

The overall performance objectives of the WMP are to:

- minimize wildlife mortality as a direct or indirect consequence of the Mine; and
- avoid and/or minimize adverse effects on wildlife with special attention to their habitats, breeding activities, and feeding activities.

Specific actions related to achieving the objectives are to:

- review and meet legislation requirements regarding active or inactive bird nests (including raptors), mammal dens, and potential mortality of animals directly attributable to the Mine, particularly for species of conservation concern;
- minimize loss of high-quality habitat (Surface Erosion Prevention and Sediment Control Management Plan and Vegetation Management Plan);
- minimize disruption of wildlife movement;
- minimize disturbance of mountain goats within Ungulate Winter Range (UWR) during restricted periods;
- minimize disturbance to moose within winter habitat areas; and
- prevent disturbance within candidate grizzly bear Wildlife Habitat Areas (WHAs) during periods of greatest sensitivity: October 31 to April 30 (Section 5.1).

3 SCOPE

This WMP pertains to the VC's described in Section 1 and is applicable to Operations, Closure, and Post-closure phase activities at all mine facilities requiring site-specific mitigation and monitoring (Table 3.1-1).

Table 3.1-1. Mitigation and Monitoring during all remaining Phases of the Mine

Mine Phase	Site-specific Mitigation and Monitoring
Operations	Traffic, aircraft, access, and waste management plans, and personnel education and training
Closure	Traffic, aircraft, access, and waste management plans and personnel education and training
Post-closure	Access management

4 LEGISLATION, REGULATIONS, AND EAC CONDITIONS

4.1 LEGISLATION AND REGULATIONS

The following legislation applies to wildlife and wildlife habitat:

- British Columbia (BC) *Wildlife Act* (1996): Legal designation as Endangered or Threatened under the Act increases the penalties for harming a species, and also enables the protection of habitat in a Critical Wildlife Management Area. Moose, mountain goats, bears (black and grizzly), American marten, fisher, wolverine, bats, and western toads are protected legislatively by the provincial Act. The Act also protects some bird species, including raptors, active bird nests, and some inactive raptor nests.
- *Species at Risk Act* (SC 2002, c. 29): Federal legislation that aims to protect species at risk from becoming extinct. Certain species are also protected under the *Species at Risk Act* as part of wildlife habitat and in accordance with the Canadian Biodiversity Strategy.
- *Migratory Birds Convention Act* (1994): Federal protection of avian species that migrate between countries. It is the responsibility of Environment and Climate Change Canada to develop and implement policies and regulations for the protection of migratory birds, their eggs, and their nests.
- *Forest and Range Practices Act (2021)* (2004): Provides the legal authority to develop management measures and spatial areas for UWRs and WHAs. The Identified Wildlife Management Strategy (BC MWLAP 2004) of the *Forest and Range Practices Act* also provides management objectives and procedures for integrating fisher conservation with industrial development.
- BC *Environmental Assessment Act* (2002a, updated in 2018): The legal framework for the province's environmental assessment process for proposed major projects. The Act is supported by several regulations, including the Reviewable Projects Regulation (B.C. Reg. 243/2019), as well as a variety of policy, procedure, and technical guidelines. The environmental assessment guidelines in BC provide an outline of the best practices for the selection of wildlife VCs and the assessment of potential effects.

4.2 ENVIRONMENTAL ASSESSMENT CERTIFICATE CONDITIONS

Pretivm was granted an EAC (#M15-01) on March 26, 2015, that included conditions of certification. This management plan fulfills Condition #2, in relation to a Component Plan for wildlife management, Condition #14 and Condition #15 presented within Schedule B of the Certificate and copied below.

<u>Condition #2</u>

> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*

Component Plans, at minimum, must include the following information:

- *Purpose of Component Plan;*
- *Performance objectives;*
- *Effects mitigation measures;*
- *Monitoring programs;*
- *Monitoring schedules; and*
- *Reporting requirements.*

The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.

The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."

Condition #14

"The Holder must prepare a Wildlife Management Plan (WMP) that applies to the Mine Site and Ancillary Infrastructure in consultation with, and to the satisfaction of, FLNRO and MEM. The WMP must meet the Component Plan requirements set out in Condition 2. The WMP must include a Wildlife Collision Protocol (WCP). The Holder must implement the WCP."

Condition #15

"Before the start of Construction, the Holder must enter into a contribution agreement with the Province as represented by the Minister of Forests that will set out the terms of the Holder's participation in a program of activities that supports the recovery, conservation and management of the Nass moose population (NMMP). The Holder must abide by the terms of the Contribution Agreement.

The NMMP may include any measures that support the recovery, conservation, and management of moose population in the Nass Valley, and, without limitation, may include:

a) The development and implementation of population, habitat and access management measures that support the conservation and recovery of Nass moose;

b) Education and communication, inventory, monitoring, collection of harvest data, signage, and programs to increase knowledge of human interactions with moose; and

c) Administration of such activities.

The Contribution Agreement will require the Holder to contribute up to the following amounts to the province's costs of implementing the NMMP:

a) $7,500 payable as early as the date (the "Brucejack Access Road Start Date") of any physical alteration, including site preparation, to the Brucejack Access Road right of way made for the purpose of improving the Access Road; and

b) an amount ("Annual Contribution") consisting of $3,000, plus adjustments for inflation and Project Vehicle Wildlife Incidents referred to below, payable as early as on the first and every subsequent anniversary of the Access Road Start Date until FLNR determines that the Holder has commenced permanent closure and decommissioning of the Project.

Where the Province has not incurred expenses in implementing the NWWP and invoiced the Holder at the earliest payable date set out above, the Contribution Agreement will allow those amounts that have not been invoiced, together with interest accruing on them, to be carried over and invoiced later in addition to the Annual Contribution for a particular year.

The Annual Contribution will be adjusted by an inflation factor based on the increase in the British Columbia Consumer Price Index from the date of the issuance of the Environmental Assessment Certificate (EAC).

Five years after the first shipment of concentrate from the ore processing complex, and every five years after that date, the Annual Contribution will be adjusted by an amount determined by the province to reflect any increase or decrease in moose accidents caused by vehicles along the Brucejack Access Road ("Project Vehicle Wildlife Incidents"). However, in no circumstance shall the Annual Contribution be less than $3,000 plus any adjustment for inflation and BC Consumer Price Index as described above.

The Contribution Agreement may require the Holder to review, prepare, comment on, or otherwise participate in the preparation and presentation of draft plans, final plans, and reports regarding the NMMP."

5 MITIGATION AND BEST MANAGEMENT PRACTICES

This section identifies proposed mitigation measures to eliminate or reduce potential mine-related effects on wildlife. Environmental management concerning wildlife will take an adaptive approach. Management measures implemented are reviewed periodically and updated based upon initial outcomes, current best management practices (BMPs and methods, and the results of environmental monitoring.

Potential mine-related effects on wildlife could include:

- habitat loss and alteration;
- sensory disturbance;
- disruption of wildlife movement patterns;
- direct mortality;
- indirect mortality;
- attraction to the Mine due to attractants; and
- health effects due to chemical hazards.

Mitigation measures to address these potential effects are outlined in the following sections.

Maps were prepared, showing sensitive environmental features for wildlife, fish, vegetation, soils (risk of erosion), and archaeological sites. The maps include a summary of mitigation activities from relevant management plans. The completion of mitigation activities will be noted by the responsible persons qualified to identify wildlife features and summarized in the compliance reporting delivered to appropriate regulators and the Wildlife Advisory Committee.

5.1 VEGETATION CLEARING MANAGEMENT

Vegetation clearing activities that may disturb wildlife are avoided during sensitive periods (Table 5.1-1), where feasible. This includes modifications of design to avoid sensitive habitats and legislated UWRs or WHAs where feasible. If avoidance is not possible, pre-clearing surveys are conducted to identify features that must be avoided and protected with appropriate buffers. These surveys are described in more detail for each VC in Section 6.1.1 (Vegetation Clearing Monitoring).

Timing windows and pre-clearing surveys were designed to be site-appropriate, informed by the standard provincial guidelines, *A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia* (BC FLNRO 2014).

Table 5.1-1. Timing and Mitigation Activities for Vegetation Clearing

Valued Component	Sensitive Period	Habitat	Summary of Mitigation Measures	Legislation, Standards and Guidelines
Moose winter	January 1 to April 30	Late Winter High Quality and UWR	Applies to high-quality late winter habitat and provincial UWR. Avoid working in these areas during the sensitive period. If construction or critical works must occur during the sensitive later winter period, then pre-clearing ground surveys and construction monitoring will be conducted by an environmental monitor at least 300 m ahead of the activity. Include a mitigation strategy to minimize disturbance. If moose are observed within 100 m of clearing activities, work will be halted until moose are beyond 100 m.	Nass South SRMP (MFLNRO 2012). A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (BC FLNRO 2014)
Moose calving	Late April to early June	All habitats	Surveys will be completed by an environmental monitor ahead of clearing, ground based surveys are preferred over aerial surveys which can result in unnecessary disturbance. If female moose with newborn calf is observed within 100 m of clearing activities, a break will be called until the moose move out of a 500 m range. Sightings will be reported to the environmental department.	Nass South SRMP (MFLNRO 2012). A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (BC FLNRO 2014)
Mountain goat	November 1 to July 15	UWRs, Kidding period, known mineral licks and access trails	Avoid activities in, and within 500 m of, mountain goat UWRs and kidding habitat during the sensitive wintering and kidding periods from October 31 to July 15th and any known mineral licks and their access trail. If project critical work needs to occur in these areas, then conduct pre-clearing surveys and include a mitigation strategy to minimise disturbance. Maintain known and potential mineral licks in a natural state and verify ungulates have access to them during the season when they are used the most (April to October). If goats are observed within 500 m of UWR or kidding habitat, then pause work until goats have moved away. Avoid flying within 400 vertical meters and 2000 horizontal meters of all the mountain goat winter range areas. Track helicopter paths and document avoidance as well as an explanation or rationale as to why avoidance is not practicable. This monitoring data should	UWR U-6-002 Order, sections 9(2) and 12(1) of Government Actions Regulation (BC MOE 2008; BC Reg. 582/2004), unless an exemption is granted. Management Plan for Mountain Goat in BC (BC MOE 2010). Nass South SRMP (MFLNRO 2012). A Compendium of Wildlife Guidelines for Industrial Development Projects in the

Valued Component	Sensitive Period	Habitat	Summary of Mitigation Measures	Legislation, Standards and Guidelines
			be summarized and included in annual reporting and applied as an adaptive system to identify areas and instances of non-compliance and areas where mitigation may be required because compliance is not possible due to safety requirements.	North Area, British Columbia (BC FLNRO 2014)
Bears	October 31 to April 30	High Quality Denning Habitat	Avoid clearing in high-quality black bear denning habitat (e.g., riparian and old large old growth stands) and grizzly bear denning habitat (e.g., high elevation) during winter, whenever possible. Detailed level plans for road upgrades and maintenance will identify if high-quality habitat will be impacted by clearing activities. If work is planned in these areas during winter, then conduct pre-clearing surveys prior to snowfall or other mitigation may be required based on discussions with BC Ministry of Forests (BC MF). If active dens are detected, set a minimum of 60-m buffer (BC FLNRO 2014) where only limited work may occur (e.g., moving machinery through the area and conducting Project critical clearing or movement).	British Columbia Environmental Assessment Guidelines for Grizzly Bears and Black Bears (MacHutchon 2001). A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (BC FLNRO 2014)
Hoary marmot	Annual	Colony Habitat	Conduct pre-construction surveys in previously identified marmot habitat if excavation activities are scheduled to occur. If marmots are identified within the excavation area, contact BC MF for direction on how to proceed.	
Furbearers (fisher, American marten, wolverine)	February 1 to September 30	Denning	Avoid clearing in high-quality denning habitat for furbearers during the winter. Detailed level plans for road upgrades and maintenance will identify if high-quality denning habitat will be impacted by clearing activities. If work must be conducted in these areas during winter, then conduct pre-clearing surveys for dens prior to snowfall or other mitigation may be required based on discussions with BC MF. If an active den is found, set a 50-m buffer where only unavoidable work may occur. Wolverines for example generally den in the subalpine in proximity to the treeline. The dens are constructed in boulders, under deadfall or in snow tunnels at higher elevations. This contrasts with fisher that rear their offspring during April to June in large, declining black cottonwood, trembling aspen, or balsam poplar trees. Marten have a similar home range as Fisher but prefer mature coniferous	A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (FLNRO 2014)

Valued Component	Sensitive Period	Habitat	Summary of Mitigation Measures	Legislation, Standards and Guidelines
			forests that provide the greatest winter cover. Old-growth trees and dead trees within these sites are often used for dens and resting.	
Furbearers (fisher, American marten, wolverine)	Annual	Maintain Connectivity	If clearing for right of ways (e.g., transmission line) occurs in suitable furbearer habitat, retain natural accumulations of coarse woody debris using machine-free zones or create piles of coarse woody debris using machinery. Manmade piles should generally be larger than 20 m³. Structural attributes, such as tall stumps should be left in place (or promoted in instances were clearing has removed screening vegetation) across openings to provide cover and connectivity at regular (< 500 m) intervals or less (100 m) in confirmed fisher habitat. Minimize the width of any clearing activity. In the case of wolverines, that have very large ranges, an all-encompassing, and more complex view is needed in terms of minimizing the impact to them.	
Bats	May 15 to September 30	High-quality Maternal Roosting Habitat	Avoid clearing during the spring and summer period in old growth forested habitat. If clearing needs to occur, conduct pre-clearing surveys in conjunction with bird surveys. If maternity roosts are identified, maintain a buffer of 50 to 125 m radius core around the roost. If the tree, or buffer, is in a Project-critical area the environmental staff will contact BC MF and determine a possible course of action for moving the bats out of the roost tree. To offset potential effects of removing bat roosts during vegetation clearing, bat boxes will be installed along the access road in areas of old growth forest where suitable roosting trees are removed with a goal to install approximately two roost boxes per hectare of cleared old growth and mature conifer forest.	A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (BC FLNRO 2014)
Bats	October 1 to May 31	Hibernacula	The Project is not anticipated to interact with bat hibernacula but if discovered, bat hibernacula will not be disturbed or destroyed. Should a suspected hibernacula be identified, Project activities will be halted until a pre-disturbance survey can be completed by a qualified environmental profession to provide confirmation.	*Species at Risk Act* (2002) A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (BC FLNRO 2014)

Valued Component	Sensitive Period	Habitat	Summary of Mitigation Measures	Legislation, Standards and Guidelines
			If an active bat hibernaculum is identified, a core area within a minimum 100-m radius of the hibernacula, and a special management zone within a 1-km radius of the core area, will be established (BC MOE 2016). If Project activities must occur within the buffer, the relevant regulating body (e.g., BC MF) will be consulted to develop additional mitigation strategies, if necessary.	
Migratory birds (waterbirds and landbirds	May 1 to July 31	Nesting Habitat (wetlands, rivers, forests)	Schedule vegetation clearing activities outside of the sensitive period where possible.	*Migratory Bird Convention Act* (1994) A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (BC FLNRO 2014)
Migratory birds (waterbirds and landbirds	May 1 to July 31	Nesting Habitat (wetlands, rivers, forests)	If clearing must be completed during the breeding period, conduct pre-clearing surveys to identify active nests. Pre-clearing surveys will occur at least 100 m ahead of the activity and include the area to be cleared. If an active nest is found, the tree is protected under Section 34 of the *BC Wildlife Act* (1996). Establish a 50-m buffer where no work is conducted, with exceptions for critical project activities. Once the nest is inactive, vegetation clearing can occur.	*BC Wildlife Act* Section 34 (1996) A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (BC FLNRO 2014)
Raptors	Varies for different raptor species, generally between mid-March and end of August	Nesting Habitat (forests and trees with stick nests)	Schedule vegetation clearing outside of raptor nesting timing in forested areas. If clearing is planned in these areas during the raptor nesting season, conduct pre-clearing surveys for nests in trees. If a nest is found, the tree is protected under Section 34 of the *BC Wildlife Act* (1996). Establish a 200 m to 500 m no disturbance buffer (depending on species as identified in BC FLNRO 2013) and a 100 m to 300 m forested buffer around active nests where no work is conducted, with exceptions for critical Project activities. Active nests will be monitored regularly until raptors and fledglings leave the nest	*BC Wildlife Act* Section 34 (1996): protects active raptor nests, and protects the nests of eagles, peregrine falcons, gyrfalcons and ospreys year-round. Guidelines for Raptor Conservation during Urban and Rural Land Development in British Columbia (MFLNRO 2013).

Valued Component	Sensitive Period	Habitat	Summary of Mitigation Measures	Legislation, Standards and Guidelines
			Any goshawk surveys will follow guidelines in the Nass South SRMP. Callback surveys are only required from February 15 to August 15. Once the nest is inactive, consult with BC MF on the possibility of removing or moving the nest if it is within the Project footprint.	A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (BC FLNRO 2014)
Western toad	May through October	Breeding Ponds	Avoid construction activities in areas adjacent to potentially high-quality western toad breeding habitat from May through October. If this is not possible, conduct pre-clearing surveys and if breeding ponds are observed, establish a buffer zone of at least 30 m, or, if this is not possible, contact BC MF regarding alternative mitigation. If clearing does happen, level the ground, and fill any deep ruts left by machinery because the unintentional creation of ephemeral, shallow, pond-like habitats created by machinery, where large puddles or ruts hold water for prolonged periods of time attract breeding amphibians. When they breed in such, the eggs are exposed to predators and dry up over the season; these sites can be population sinks. Trenches and steep-sided holes with water in them can also attract western toads, which may become trapped	A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia (BC FLNRO 2014)

5.2 ROAD AND TRAFFIC MANAGEMENT

The Brucejack Access Road (BJAR) is managed to minimize the following potential effects:

- direct mortality from wildlife-vehicle interactions; and
- disruption of movement or mortality due to presence of BJAR, attraction to BJAR, or wildlife use of BJAR.

Management protocols for the BJAR are outlined below.

5.2.1 Traffic Management

Wildlife-vehicle interactions can be minimized by modifying driver behaviour. This includes adhering to speed limits, giving wildlife the right-of-way (ROW), and communicating wildlife sightings (described below and in Section 6.1.2). When travelling outside of daylight it is recognised that crepuscular hours (i.e., dawn and dusk) and night tend to be the periods of highest wildlife activity.

The following mitigation measures are being implemented:

- Speed limits are posted along the BJAR. Mine also adhere to open road speed limits for Highways 37 and 37A. Other types of road signs (e.g., wildlife ahead, toad crossing) will be maintained along the BJAR to alert drivers to speed limits and wildlife-sensitive areas. Speed limits are enforced by surface operations supervisors along the BJAR and can also be monitored by listening to the km marker calls. Radar speed signs are also used in areas where speeding is more likely to occur (e.g., KM 41-44 area).
- Drivers are informed that wildlife have the ROW along BJAR and the highway (included in orientation to all site employees and the Traffic and Access Management Plan).
- Tunnels will be maintained at pre-determined locations to allow safe passage under the road for western toads.
- Locations along the BJAR identified as having a higher likelihood for vehicle collisions with wildlife are being managed adaptively (e.g., signage, education, speed limits).

5.2.2 Wildlife Collision Protocol

- Collisions between Mine vehicles and wildlife are documented and include information on the location of the collisions. Mine personnel are instructed to report any wildlife-vehicle collision to Pretivm environmental staff.
- Records/reports include all wildlife sightings.
- Information on collisions is reported annually to the Wildlife Accident Reporting System maintained by the BC Ministry of Transportation and Infrastructure either through the BC Ministry of Forests, Lands and Natural Resources Operations or to the BC Ministry of Transportation and Infrastructure.
- The Principal, Environment is responsible for training, providing a reporting system, and reporting collisions to appropriate government officials.

5.2.3 Management to Minimize Wildlife Use of Roads

To minimize wildlife use of the BJAR, the following mitigation measures are being implemented:

- Use of road salts for winter road management has not been used along km 0 to 58 of the BJAR to reduce the potential of attracting ungulates to the road. Use of sand or stone chippings is the preferred approach to provide winter traction.
- Vegetation management is implemented to reduce site attractiveness to wildlife and, when appropriate, roadway edges are cleared to increase visibility of wildlife to drivers (e.g., a cleared buffer zone of appropriate size). Clearing will be site-specific to provide a balance between low vegetation and maintaining high-value and sensitive habitat. Vegetation maintenance activities (e.g., brush-cutting) is conducted as appropriate to reduce herbivore use of vegetation within corridor areas where concerns exist for wildlife-vehicle collisions and high-quality browse is present (e.g., willow, birch). These activities may be conducted on a different schedule if local conditions warrant, in the early summer months of June and July, to minimize attractiveness to herbivores such as moose (Rea et al. 2010). Pre-clearing surveys for bird nests are conducted during appropriate times of the year prior to brush cutting.
- To minimize potential wildlife-vehicle collisions along the lower (km 0 to 58) BJAR, the verge (i.e., the vegetated strip adjacent to the roadway) was seeded with a mix that has low or no clover content, which is less attractive forage to wildlife, especially to moose, mountain goats, and black bears. In locations where erosion control is the main objective of seeding, ground cover is the overriding factor in seed choices.
- Refuge areas are ploughed along the road during winter; gaps in snowbanks on roads are prepared to allow for egress of wildlife. Egress for moose is provided by creating gaps or 'push-outs' where feasible (i.e., as topography allows) on the outside of bends and/or corners and approximately every 0.5 km (one side/alternate) for extended straight sections of the BJAR (Heatherington et al. 1989).
- Ditches and culverts are designed and installed to minimize pooling of water. Free-draining roadside ditches help prevent pools that may form toad breeding areas.
- Carrion is removed from the BJAR to minimize attracting wildlife to the road, thereby reducing the risk of conflicts between vehicles and wildlife.
- Fugitive dust emissions generated by vehicles on BJAR and camp areas are managed through enforced speed limits, application of water as a dust suppressant, and the use of a Mg/Cl brine as a dust suppressant. Procedures are guided by the Air Quality Management Plan, Section 5.1.5.

5.3 ACCESS MANAGEMENT

The Brucejack Transmission Line is managed to minimize potential access to and along the transmission line ROW by all-terrain vehicles (ATVs) and snowmobiles. In areas where tree felling was required, the trees were left in place to act as barriers and discourage access. Additionally, the naturally steep terrain along the transmission route further deters access. Creation of points of entry to the transmission line ROW was minimized because the transmission line is constructed and maintained via helicopter. Therefore, no new roads were constructed to access the ROW during the Construction phase, nor will

there be an access trail constructed alongside the transmission line to support access and maintenance during the Operations phase.

The BJAR is managed to minimize the potential for indirect mortality to wildlife (e.g., hunting) through access management. To mitigate for the potential effects of increased access to the Mine and consequent increase in hunting of wildlife, the following mitigation measures were implemented:

- A security screening building at km 1 of the BJAR was installed to prohibit entry of non-authorized vehicles.
- Control access to the BJAR and the surrounding areas west of the Bell-Irving River by prohibiting access to recreational vehicles and deactivating all non-essential roads if long-term post-closure monitoring access is not required.
- Pretium No Hunting or Fishing Policy and Wildlife Attraction Zero Tolerance Policy prohibits the possession of personal firearms, other hunting weapons, and including fishing gear by personnel and contractors within the Mine area. Security checks are conducted for these items during the screening process and entry is denied if in possession.
- Deactivate all non-essential roads if long-term Post-closure monitoring access is not required.
- Limit use of personal vehicles to and at the Mine site as much as possible by transporting personnel via buses, aircraft, or designated company transport vehicles from communities or central collection sites at the start and end of each rotation.

5.4 AIRCRAFT MANAGEMENT

To minimize disturbance to sensitive wildlife species such as mountain goats, aerial support, including helicopter access, is directed along controlled routes or flight paths. Specific flight paths are followed unless weather or safety require pilots to fly within wildlife buffers. Locations of these flight paths and the reasons they must be used are communicated to workers involved in aviation support. Pilots are required to follow flight paths wherever feasible, and a member of the Environmental Dept. communicates and reviews with the pilots annually (or in orientation for new pilots) the location of environmentally sensitive areas.

The Province of BC provides guidance on helicopter activities in and near goat habitat in the *Management Plan for the Mountain Goat (Oreamnos americanus) in British Columbia* (BC MOE 2010). Mountain goat mitigation measures related to aircraft and helicopters from November 1 through July 15 include using helicopters that produce less punctuated noise (e.g., the 3-bladed Eurocopter A-star instead of 2-bladed Bell 206 Long Ranger), where possible.

There is a general set of helicopter “behaviours” which, if followed, can significantly reduce the potential for mountain ungulates to be disturbed by helicopters. Goats typically have little defence against predators, except fleeing to escape terrain and they likely perceive helicopters as a predation risk. Thus, it is important to understand and have the helicopter “behave” in a way that does not startle or trigger this predation response. General recommendations for pilots include:

- Avoid overflights of occupied goat habitat whenever possible (below suggested elevations of 500 m), including avoiding “flightseeing”.

- If flying a helicopter that produces a heavy “blade slap” noise, avoid inducing this noise when overflying or adjacent to occupied goat habitat.
- If a pilot is aware that goats are on the opposite side of a ridge or mountain, avoid surprising goats by flying low over the ridge and suddenly appearing above them.
- Avoid triggering a goat’s “chase response” by avoiding flying directly at goats. Helicopters flying tangentially to goats are perceived less as potential predators.
- Goats can become habituated to helicopters if the helicopters operate in a predictable and nonthreatening manner. Wherever possible, use the same routes and elevations to and from camps and drills and other destinations.
- Use topographic barriers to separate helicopters from mountain goats.
- Keep helicopters below mountain goats if feasible.
- Helicopters can drop off specialized work crews in goat habitat, but only when goats are not present within 500 m.

In the balance between operability and reducing disturbance to goats, for aircraft activities pilots are instructed to maintain the largest separation feasible from mountain goats. The ideal situation is >2 km. In some cases, it may not be possible to maintain >2 km separation with goats given that valleys may be less than 2 km wide, and seasonal low clouds may force helicopters into the bottom of valleys.

5.5 Building and Waste Management

Buildings are designed and maintained to exclude wildlife ingress wherever possible, such as:

- covering vents with mesh to prevent bats, birds, and furbearers (e.g., American marten) from entering;
- skirting buildings to deter wildlife from entering under buildings; and
- constructing additional structures (e.g., electric fencing) to exclude wildlife from areas that may be attractants to wildlife, such as waste management facilities and lower road camps.

Wildlife species, particularly grizzly bear and furbearers may be attracted to specific sites (e.g., kitchen, waste handling areas) if the waste products processed at these areas are not properly managed. Mitigation and monitoring to minimize attractants include the following measures:

- Incinerate kitchen wastes in a timely manner.
- Store recyclable wastes and chemicals in wildlife-proof containers / facilities.
- Store attractants and wastes (garbage, food waste) at permanent site infrastructure in bear-proof storage containers. Bear-proof containers are tightly secured when not in use.
- Conduct regular road and camp cleanups to remove hazardous substances, wires, or loose materials that could endanger wildlife, and arrange proper storage and disposal of hazardous wastes.

- Remove waste from collection sites regularly, incinerate in an approved incinerator or store in wildlife-proof areas and wildlife-proof buildings until incineration or transportation off site.
- Dispose of waste which cannot be incinerated at an approved disposal site such as the Regional District of Kitimat-Stikine Meziadin landfill for controlled and uncontrolled waste and Environmental 360 Solutions Ltd. in Prince George for hazardous waste.
- Prevent wildlife from entering incinerators and sewage treatment facilities, where possible, using appropriate wildlife exclusion techniques.
- Follow Chemical and Materials Storage and Handling Management Plan, Spill Response Management Plan and Waste Management Plan.

To help limit unnecessary wildlife attractants on site, a Wildlife Attractant Zero Tolerance Policy (Appendix B) has been developed and implemented at the Mine. The Policy requires that all personnel follow the specified rules on reducing wildlife attractants (e.g., no littering including disposal of cigarette butts on the ground and dumping coffee, keeping access to buildings and vehicles closed when not in use, placing food waste in appropriate designated receptacles, immediately cleaning up a spill, etc.) where failure to do so can result in disciplinary action, hence the use of “Zero Tolerance” in the title of the Policy.

Consideration for management of the mine ventilation and portal to exclude bats was evaluated; however, the high elevation of the site, cold environmental conditions during the growing season, and absence of bat observations or evidence of use of the adit after remaining open for 15 years suggests that it is unlikely to provide roosting habitat for bats. The adit will be sealed with doors to prevent access; no bat directed mitigation is deemed necessary for the portal and ventilation.

As per Section 6.1.6, Incidental Wildlife and Wildlife Incident Monitoring, observations of wildlife at or near Mine infrastructure are recorded and delivered to the Principal, Environment. If this monitoring program records observations of bears repeatedly in or near the camps, then a response plan will be prepared to limit bear access to the site, including all Mine camps (Brucejack, Wildfire, and the Knipple Transfer Area). In order of preference, this response plan may include (but is not limited to) the following options for management activities:

- Evaluate if waste management activities are successful, and update if necessary;
- Evaluate if building exclusion measures (e.g., skirting, electric fencing, etc.) are successful and update if necessary; and
- Conduct an audit of waste and attractant management (i.e., evaluate adherence to Wildlife Attractant Zero Tolerance Policy) and increase education and enforcement measures, if warranted.

If the observations of bears continue despite these measures, then additional measures may be required, as per the site audit. These measures may include additional fencing or measures to exclude bears from the kitchens, accommodations blocks, and other facilities that may attract bears at the Brucejack, Knipple and Wildfire Camps.

5.6 LIGHT MANAGEMENT

To avoid over-lighting, the level of illumination required for safe completion of tasks is minimized where possible. The potential effects of sensory disturbance on wildlife by exposure to light is mitigated through infrastructure design and by applying applicable measures as present in various guidelines such as *Develop with Care: Environmental Guidelines for Urban and Rural Land Development in British Columbia; Migratory Birds Environmental Assessment Guideline* (BC MOE 2006).

Lighting at the Mine was designed to minimize potential effects on wildlife while ensuring safe operational conditions and included the following considerations:

- optimize the level of illumination required for the task to avoid over-lighting;
- use directed lighting rather than broad area lighting wherever possible;
- shield lighting and direct it downwards wherever possible; and
- switch on lighting only when it is necessary for safe mine site operation.

Lighting may be managed adaptively if observations suggest wildlife interactions with infrastructure are influenced by lights.

5.7 PERSONNEL EDUCATION AND TRAINING

An education program for personnel promotes stewardship and seeks to avoid human-wildlife conflicts. This program is supported by relevant Policies (e.g., No Hunting or Fishing Policy, Wildlife Attractant Zero Tolerance Policy), presentations at formal meetings (including the initial orientation), standard operating procedures, standard reporting forms, information sheets, posters, and signage. The education program places emphasis on:

- personnel awareness of wildlife-sensitive times of year;
- waste management/wildlife attractant protocols;
- not feeding or intentionally attracting wild animals;
- policies banning firearms, hunting, and fishing;
- bear awareness training;
- legal obligations and corporate commitments concerning working near mountain goats and UWRs and bird nests;
- responsibilities for pilots to use designated flight paths and maintain appropriate distances from wildlife and occupied wildlife habitat (e.g., UWR);
- operating protocols for the roads; and
- wildlife reporting and response procedures.

The effectiveness of the education program training is continually reviewed and amended as required.

6 ENVIRONMENTAL MONITORING

6.1 PERFORMANCE MONITORING

6.1.1 Vegetation Clearing Monitoring

If construction activities occur during sensitive timing windows for wildlife VCs (Table 5.1-1), a member of the Environmental Department, reporting to the Principal, Environment, will identify sensitive wildlife features and implement measures to avoid or minimize potential adverse effects to wildlife. For each wildlife VC, there are times when wildlife will be more sensitive to disturbance (e.g., breeding). Table 5.1-1 summarizes key sensitive periods for wildlife VCs applicable to the Mine, and highlights legislation or BMPs relevant to each VC. Any identified salt licks for wildlife are included as sensitive features. The identified salt lick for mountain goats on the north side of Knipple glacier is addressed in the Mountain Goat Management Plan.

6.1.2 Road and Traffic Monitoring

As per the Traffic and Access Management Plan, drivers are required to report wildlife collisions/mortalities along the BJAR and Highway 37. The location along the road and species is recorded and monthly mortalities are summarized to identify conflict “hot-spots,” which may then be used as part of adaptive management to further mitigate conflicts between road users and wildlife (e.g., through increased signage, further driver education, and enforcement of speed limits as mentioned in 5.2.1).

Any encounter with wildlife (including observations or interactions) is also required to be reported and records kept. The radio will be used to alert other operators when there is wildlife in the area and to travel with caution. These records provide a basis for identifying locations of higher risk for wildlife-vehicle collisions, and for developing appropriate mitigation strategies for those areas. If a large number of wildlife (e.g., moose or goats) are present on or adjacent to the road, a reduced speed limit or temporary road closure may be instigated at the discretion of the Principal, Environment in consultation with the Mine Manager.

Performance monitoring to reduce wildlife-vehicle interactions includes the following:

- A reporting system for wildlife-vehicle interactions and wildlife-road structure interactions (e.g., moose regularly observed on a particular segment of the road).
- The reporting system allows personnel to raise concerns anonymously or report observed non-compliance.
- Location, species, date, and type of wildlife-vehicle interactions are reviewed annually to identify any areas with higher frequencies of interactions.
- Personnel are trained on reporting procedures for wildlife observations and interactions through the personnel education and training program (Section 5.1.6).
- Completion of an incident report form if an incident is observed or occurs and follow up by Health and Safety working with the environmental staff, for the safety of mine personnel and

wildlife. Incidents are reviewed and mitigation measures adapted as necessary to help reduce the incidence of wildlife-vehicle interactions (e.g., through increased signage, further driver education, enforcement of speed limits).

- Wildlife fatalities will be removed from the BJAR to minimize attracting wildlife to the road, thereby reducing the risk of conflicts between vehicles and wildlife, and injured wildlife will be reported to Pretivm environmental staff for further investigation. The Principal, Environment reports these observations to regulatory authorities, as appropriate.

6.1.3 Access Monitoring

As described in Section 5.1.3, the BJAR is managed through controlled access points to prevent its use for hunting and recreational activities. If unauthorized use, including hunting, is observed along the access road or anywhere within the Mine area, it will be reported immediately to security. The Principal, Environment will in turn report hunting activities involving the access road to provincial authorities.

6.1.4 Monitoring via Aircraft

Pilots are asked to report incidental observations of large mammals (e.g., goats, moose, grizzly bears, wolf packs) as part of the incidental wildlife reporting program.

6.1.5 Building and Waste Management Monitoring

Environmental staff monitor Mine infrastructure and waste handling and management, as follows:

- Visual inspections of the outside of Mine infrastructure, including underground components, for observations of wildlife interacting with buildings or evidence of use (e.g., bird nesting materials in vents, scratching or chewing of building materials, bat activities and evidence of roosting, evidence of digging beneath buildings or skirting) and adaptively managed if necessary (e.g., improve building skirting, install bird spikes to deter bird nesting).
- In the event that wildlife is accessing Mine infrastructure where BMPs to prevent access have already been implemented, a response plan to limit access by the wildlife species will be developed. This could involve measures such as improvements to building skirting or installation of deterrents (e.g., bird spikes), depending on the species accessing the infrastructure.
- Visual inspections of waste handling and management practices at camps (e.g., kitchen and domestic wastes) and waste storage facilities (i.e., incinerator and burn pits) check for compliance with the Waste Management Plan.
- If wastes or other wildlife attractants are found to be misdirected or mismanaged, the wastes/attractants are moved to an appropriate secure location as soon as possible to limit attraction of wildlife.
- If wildlife is observed attempting to access or are successful in accessing waste storage facilities, alternative methods to secure wastes and wildlife attractants will be evaluated and applied as appropriate.

Personnel are encouraged to report incidental observations of issues related to camps or waste management. Incidental observations are reported and recorded continuously. Any incidents

where wildlife have been observed to interact directly with waste or observations of habituated wildlife (particularly bears and wolverine) are reported to Pretivm environment staff who may notify appropriate regulatory agencies and authorities, if required. These instances may be evaluated by Pretivm environment staff and corrective measures implemented in consultation with the Ministry of Environment, BC Conservation Officer Service, as appropriate. If wildlife is required to be trapped and relocated, BC Ministry of Forests, Lands and Natural Resources Operations are contacted for direction and the required permits.

Visual inspections of the transmission line are conducted annually to evaluate the condition of design features installed to reduce bird interactions. Inspectors are also on alert for evidence of bird mortality during inspection.

6.1.6 Incidental Wildlife and Wildlife Incident Monitoring

Wildlife observations by environment staff and other mine personnel are recorded in a general wildlife log. Objectives for keeping this log include:

- recording wildlife occurrence and activity in the Mine area;
- identifying unexpected conflicts or potential conflicts posed by existing Mine facilities to wildlife; and
- identifying needs for adaptive management if a new risk to wildlife, people, equipment, or infrastructure is identified.

Personnel are educated about the need to report observations of wildlife species interacting with Mine facilities to Pretivm environmental staff. Those wildlife observations are also reported to security or dispatch, or an observation is noted on a Field Level Hazard Assessment card, which has a section for reporting wildlife observations and incidents. All employees are trained on the use of Field Level Hazard Assessment cards in the initial orientation and when wildlife is observed, the following information is requested to be recorded, if possible:

- location, date, and time;
- type of interaction (e.g., attraction, nesting);
- species, number of animals;
- behaviour (e.g., feeding, resting);
- condition (e.g., limping, wounded, salivating); and
- any damage to or interaction with mine property.

Wildlife in poor condition, that may be diseased, or appear injured, is reported to Pretivm environmental staff for further investigation. The Principal, Environment reports these observations to regulatory authorities, as appropriate.

Where incidental sightings are clustered and result in hazards to wildlife and or people or property, possible causes will be investigated by a qualified environmental professional with a view to understanding the cause(s) for any attraction and to identify mitigation.

6.1.7 Mountain Goat and Avalanche Monitoring

Avalanche control is required in areas where avalanches may reach the BJAR and pose a safety concern to Mine personnel. Avalanche control may be required in mountain goat UWR and other areas that support mountain goats. Details on mountain goat monitoring, as it relates to avalanche control measures conducted at the Mine, are provided in the Mountain Goat Management Plan (Appendix C). Actions described in Appendix C for avalanche and goat management will also be applied to wolverine. Wolverine observations and incidents will be recorded during monitoring.

6.2 POPULATION MONITORING

Population monitoring is carried out for moose and mountain goat to detect potential effects of mine-related activities on these species.

Loss or alteration of moose, mountain goat, and grizzly bear habitat (including applicable UWRs and WHAs) will be modeled once during operation to compare total loss to the amount predicted in the EAC application / Environmental Impact Statement.

6.2.1 Moose Monitoring

To support the recovery, conservation, and management of the Nass moose population, Pretivm entered into a Contribution Agreement with the Province (BC MF) to participate in the Nass Moose Management Program (NMMP), as per Condition 15 of Environmental Assessment Certificate #M15-01 (see Section 4.2 of this plan). This Contribution Agreement requires a financial contribution to the NMMP and may require review, preparation, comments, or participation in drafts plans, final plans, and reports regarding the NMMP. Implementation of the financial contributions set out in the Contribution Agreement and participation in activities conducted as part of the NMMP are outside the scope of the WMP.

Pretivm also conducts periodic monitoring of the regional population of moose in a sub-set of the survey units surveyed during baseline studies for the Mine. Surveys occur every 5 years following provincial Resource Standards Information Committee standards, with the survey units determined in consultation with BC Ministry of Environment and Climate Change Strategy (BC MECCS). Moose surveys were completed in the late winter of 2018 and will be completed again in 2023. Reports are filed for internal monitoring purposes and submitted to indigenous groups for review and comment.

6.2.2 Mountain Goat Monitoring

Pretivm conducts periodic monitoring of the regional population of mountain goat in a sub-set of the survey units surveyed during baseline studies for the Mine. Surveys occur every 5 years following provincial Resource Standards Information Committee standards, with survey units determined in consultation with BC MECCS. The Mountain Goat Management Plan is provided in Appendix C.

6.3 WORK PLANNING AND SCHEDULE

Management measures are implemented to avoid, eliminate, or minimize adverse effects on wildlife and wildlife habitat throughout the remaining mine phases. Table 6.3-1 summarizes the Mine phases to which the various wildlife management measures are applicable. Table 6.3-2 summarizes the frequency of monitoring.

Table 6.3-1. Management Activities for Wildlife and Associated Mine Phases

Management Activity	Operations	Closure/Temp. Closure	Post-closure
Vegetation Clearing Management	X		
Road and Traffic Management	X	X	
Access Management	X	X	
Aircraft Management	X	X	X
Building and Waste Management	X	X	
Personnel Education and Training	X	X	X

Table 6.3-2. Performance Monitoring Activities for Wildlife and Associated Mine Phases

Monitoring Activity	Operations	Closure/Temp. Closure	Post-closure
Vegetation Clearing Monitoring[1]	X		
Road and Traffic Monitoring	X	X	
Access Monitoring	X	X	
Aircraft Monitoring	X	X	
Building and Waste Monitoring	X	X	
Incidental Wildlife and Wildlife Incident Monitoring	X	X	X
Avalanche Control Monitoring (Goats)	X	X	
Population Monitoring (Goat and Moose)	X		

[1] Vegetation clearing monitoring will only occur if construction/clearing activities take place during sensitive timing window for the various wildlife VCs, as described in Table 5.1-1.

7 REPORTING AND RECORDING

7.1 REPORTING

7.1.1 Compliance Reporting

Compliance reporting is subject to Environmental Assessment Certificate and *Land Act* and *Mines Act* Permit conditions.

7.1.2 External / Internal Reporting

Internally, all personnel are to report wildlife observations made anywhere within the Mine area. Externally, Pretivm reports on WMP results annually summarizing, where pertinent, the monitoring methods and results, incidental observations, incidents, and adaptive mitigation measures.

7.1.3 Incident Reporting

Incident reporting includes vehicle collisions with wildlife, encounters with wildlife, aerial observations from pilots, and wildlife interactions with Mine infrastructure and waste handling systems. In addition, any mortality and/or encounters during vegetation clearing surveys, or other mortality events, are reported.

7.1.4 Monitoring Results

Pretivm maintains wildlife related records / data. Data is entered in a format and program that allows for comparison between years.

7.1.5 Continuous Improvement, Follow-up, and Adaptive Management

Mitigation measures are continuously improved by recording incidents involving wildlife and following up on these incidences and implementing adaptive management if current mitigation measures are ineffective. Some of these mitigation measures may include, reducing speed limits on certain sections of road where wildlife is frequently sighted, adapting our waste storage (animal proof bins, bins with hydraulic lids) if there are wildlife proximity concerns, changing our electric fence patterns around camp to deter bears, creating extra push ins to allow animals to exit roads, or education for workers.

7.1.6 Wildlife Advisory Committee

Pretivm chairs a Wildlife Advisory Committee to discuss the results of compliance and wildlife monitoring studies, and mitigation actions on the site on an annual basis. The committee comprises representatives from BC MECCS Tsetsaut/Ski km Lax Ha First Nation, Tahltan First Nations, Nisga'a Lisims Government, and Pretivm, with Pretivm to act as the chair of the committee. The membership and terms of reference for this committee were set at the first meeting. The timing of meetings follows submission of annual compliance and monitoring reports for review and discussion by the committee.

Wildlife Attractant Zero Tolerance Policy

WILDLIFE ATTRACTANT ZERO TOLERANCE POLICY

1. Purpose

The purpose of this Policy is to establish a zero-tolerance approach to improper disposal and allowing access to wildlife attractant infractions at the Brucejack mine site (i.e., including all camps, roads and associated infrastructure), and clarify what constitutes a wildlife attractant infraction.

2. Scope

This policy applies to all Newcrest employees as well as all contractors, suppliers, and visitors, working at or visiting Brucejack mine site and exploration sites.

3. Regulatory / Permit Requirements and Penalties

Newcrest has legally enforceable requirements under its Environmental Assessment (EA) Certificate (#M15-01) and Mines Act Permit (M-243) to implement its approved Wildlife Management and Waste Management Plans, including to prevent wildlife incidents involving attractants. The BC Wildlife Act also has provisions regarding wildlife attractants. Non-compliance can result in issuance of Warnings, Orders, Administrative Penalties (fines), or prosecution (listed in order of increasing enforcement magnitude). Fines issued under the Mines Act can be up to $500,000 per incident (per day). There is no maximum to the amount for a fine issued by BC Environmental Assessment Office Compliance and Enforcement. It is essential that the issue of wildlife attractants be fully addressed at the Brucejack mine site to prevent enforcement action beyond current Orders.

All personnel must adhere to proper waste handling procedures and other access prevention measures under the Waste Management Plan, to eliminate wildlife access to attractants. Internal disciplinary measures are needed as a tool to support full compliance.

4. Application

As per the Brucejack Disciplinary Policy, a Newcrest employee found to commit any "wildlife attractant infraction" will receive disciplinary action, up to and including termination, at the sole discretion of Brucejack mine site's General Manager, Mine Manager, Mine Superintendent or their designate (Newcrest Management). Any personnel working for a contractor, consultant, or supplier found to commit a "wildlife attractant infraction" while working, operating or visiting at Brucejack mine site, can have their site privileges revoked at the discretion of Newcrest Management.

5. Definitions

The following definitions apply to this Policy (adapted from the *BC Wildlife Act*):

"**wildlife attractant**" means food or food waste and their packaging, compost, or other waste or garbage that could attract dangerous wildlife, or, a carcass or part of a carcass of an animal, or fish, or other meat.

"**dangerous wildlife**" means a bear, cougar, coyote, wolf, fox, wolverine or pine marten, or any wildlife species deemed to be dangerous by Newcrest Management.

"**bear-resistant bin**" means a container of any size that is specifically designed to prevent access to a bear or other dangerous wildlife, as approved by the Brucejack Environmental Department.

"**food waste**" means any waste item that was previously used or associated with food or drink, including but not limited to, candy wrappers, cellophane or ziplock bags, food trays/boxes, drink boxes/cans, and fruit cores/peels.

6. Policy

Intentional or otherwise unintentional attracting of wildlife at Brucejack mine site such that the wildlife can access the attractant is considered an infraction, and is in direct violation of this Policy. Thus, a "wildlife attractant infraction" at Brucejack mine site includes, but not limited to, the following:

1) Intentionally feeding wildlife (e.g., feeding directly from hand to mouth, or knowingly leaving food or food waste outside accessible to the animal).
2) Baiting and/or beckoning wildlife using food or food waste to take a photo or to see the animal at closer range, even if the animal is not actually fed.
3) Disposing of coffee, juice or other fluid other than water outside of a fully enclosed building or in a designated bear-resistant bin.
4) Littering of food, food waste, or food packaging outside of a fully enclosed building or in a designated bear-resistant bin, where wildlife can access it.
5) Failing to place food or food waste in the appropriate receptacle (i.e., NOT in bins designated for metal, wire, heavy plastic, batteries, etc.), or failing to close the lid of the appropriate receptacle following waste placement.
6) Leaving food or food waste unattended within the room in all bunks and offices outside the main Brucejack Camp Complex. Food can be brought to the room or office but all remaining food and food waste, upon vacating that room for the work day, must be taken to the designated waste and recycling receptacles located at the entrance way to that bunk or office.

7) Failing to respond to, collect and properly dispose any spilled substance or item that can attract wildlife (e.g., coffee, juice, cigarette butt, chewing tobacco, antifreeze, hydrocarbon, coolant, etc.).
8) Failing to dispose of cigarette butts in a designated receptacle.
9) Leaving food, food waste, or food packaging in vehicles or equipment with one or more windows left open, or in an accessible location such as a pick-up truck box.
10) Leaving a door to a building ajar or open when not attended, including both personnel doors and bay doors on all buildings, or leaving a window open when not present in the room, thereby allowing access to wildlife. If ice build-up, a broken hinge or other obstruction is causing the door or window to remain ajar after repeated attempts to close it, rectify the issue immediately or contact Brucejack Maintenance for support, if required.
11) Leaving a fence gate open when not in active use for entering or exiting, including the electric fence gates at the Wildfire and Knipple Camps, and the Knipple Waste Facility gate.

WHAs designate habitats in which activities are managed to minimize their effect on the Identified Wildlife for which the area was established.
WAC	Wildlife Advisory Committee

1 PURPOSE

1.1 INTRODUCTION

This Mountain Goat Management Plan (MGMP) describes actions that are intended to mitigate potential effects on mountain goats during the Construction, Operations, Closure and Post-closure phases of the Brucejack Mine (the Mine), owned and operated by Pretium Resources Inc. (Pretium). It focuses on the management recommended for legislated Ungulate Winter Range (UWR), high quality summer habitat, unique areas (mineral licks; kidding areas), and areas of known persistent use within the wildlife Regional Study Area (RSA) particularly on the Mine footprint components and activities (Rescan 2013a). Unless otherwise indicated, measures described in the MGMP apply to all components for the life of the Mine. This plan is designed to be adaptive, effective, and achievable in both the short and long term, and will incorporate the activity details as they are developed with the Mine.

1.2 BACKGROUND INFORMATION

Mountain goat populations were surveyed in the RSA during the summers of 2010 and 2012, and the winters of 2011 and 2013, following provincial standards for aerial surveys standards (RIC 2002). These surveys reported 286 mountain goats in the RSA (Rescan 2013a). Furthermore, mountain goats were surveyed in 2017 following provincial standards for aerial survey standard during the summer and 298 goats were observed (ERM 2017). The mountain goat surveys in 2022 yielded detections of 325 goats in 84 groups from 12 survey unit (SU) areas (ERM 2023). Mountain goats were observed in all SUs including areas where no individuals were detected during the 2017 survey period (ERM 2023).

For winter habitat in the Brucejack area, aerial surveys indicate that, mountain goats prefer subalpine forest stands that provide a diverse range of arboreal and rooted plant forage adjacent to escape terrain. Tree and shrub cover on steep, rocky ledges offer thermal advantage during sunny weather (solar radiation) and during inclement stormy weather by providing cover from snow. Goats also prefer southerly aspects because snow accumulation tends to be lower and food can be found more readily (Wilson 2005). Natal and kidding habitats are generally smaller pockets of habitat located within and near winter ranges (Mountain Goat Management Team 2010, p. 11).

During summer, mountain goats move to higher elevations to exploit the newly emerged high-quality vegetation. Areas with abundant early seral stage vegetation (e.g., grasses and herbs) are preferred by mountain goats. Mountain goats also seek higher elevation habitat as it provides thermal relief during the warmest periods of summer. Mineral licks at various elevations receive annual use and are important for the local mountain goat population. They are used primarily during the summer to compensate for mineral deficiencies or imbalances in goats' diets (Ayotte, Parker, and Gillingham 2008).

The majority of goats recorded during baseline studies (Rescan 2013a) were observed in mid-elevation habitat generally below the treeline along the Bowser River and close to Bowser Lake in the winter, and in high-elevation habitat above the treeline near peaks associated with Sulphurets Creek, in the summer. These areas also have UWRs that were occupied by wintering goats in 2012. See maps in Appendix A.

The nearest occupied high quality mountain goat habitat to Mine infrastructure is beyond 3 km west of the Brucejack Mine Site on either side of Sulphurets Creek, well away from any mining activities. High quality mountain goat habitat was defined in the environmental assessment for the Mine as high, medium–high, and medium-rated habitat derived from habitat suitability modeling (Rescan 2013b). Baseline surveys indicated that the majority of goat observations occur in this high quality goat habitat (Rescan 2013a). Other areas of occupied high-quality mountain goat habitat within the Mine area include an area 1 km north of the Brucejack Access Road (BJAR) approximately mid-way between Knipple Lake and the Mine, and an area along the mountains north of Bowser Lake, beyond 3 km from the BJAR. Additionally, the nearest identified kidding habitat to Mine infrastructure is west of the Knipple Glacier, approximately 1 km away from the Knipple Glacier Access Road crossing. No mineral licks have been found near Mine infrastructure (see maps in Appendix A).

2 PERFORMANCE OBJECTIVES

The overall performance objectives of the MGMP are to:

- prevent disturbance and habitat loss to goats within designated and candidate UWR during the winter and within high-rated summer habitat during the kidding period;
- manage disturbance due to aircraft and helicopters through avoidance where possible and minimization where it cannot be avoided; and
- manage incidental mortality of mountain goats due to avalanche control procedures through pre-avalanche control surveys, herding of goats from avalanche paths, and delaying avalanche controls until goats clear the area.

This document provided direction for environmental managers mainly during the Construction phase of the Mine but also is applicable to the Operations, Closure and Post-closure phases. Mine-related activities of relevance to this MGMP include the construction of mining infrastructure, transmission line, camps and other early-stage facilities and activities associated with helicopter use, and avalanche control during all Mine phases.

3 SCOPE

The MGMP is applicable to Construction, Operations, Closure and Post-closure activities that require Mine-specific mitigation and monitoring. The MGMP provides the environmental personnel and construction crews with information that can be used to coordinate activities and avoid negative effects on mountain goats where possible and to mitigate effects where unavoidable. Site-specific mitigation and monitoring will be addressed through the following measures (Table 3-1):

1. Clearing Management for Mountain Goats (Section 5.1)
2. Aircraft and Helicopter Management for Mountain Goats (Section 5.2)
3. Avalanche Management for Mountain Goats (Section 5.3)

Table 3-1. Summary of Mitigation Measures Applicable to Mine Phases and Components

Mitigation Measure	Mine Phase	Mine Component
Clearing Management	Construction	Transmission Line
Aircraft and Helicopter Management	Construction; Operations	All Components
Avalanche Management	Construction; Operations; Closure	Mine Site, Access Road, Transmission Line

4 RELEVANT LEGISLATION, REGULATIONS, AND PERMITS

Mountain goats are protected legislatively by the provincial *Wildlife Act* (1996) and guidance for habitat management is provided by the provincial *Forest Regulation and Protection Act* (FRPA; 2002). Under the FRPA, areas that are important or critical to ungulates and sensitive wildlife may be designated as Ungulate Winter Ranges (UWRs) or Wildlife Habitat Areas (WHAs), and General Wildlife Measures (GWMs) may be used to manage forest and range practices for protection and conservation of the species (Mountain Goat Management Team 2010).

General Wildlife Measures established for UWRs and WHAs include regulations for primary forestry activity (defined under the Forest Planning and Practices Regulation to include tree clearing and access structure [road/trail] construction/maintenance), such as prohibiting road construction, timber harvesting or silviculture treatments within established buffers around UWR and/or WHA boundaries unless an exemption is provided. Schedule 1 - GWM order # U-6-002 identifies management measures and actions that can be carried out in the UWR in the Nass Timber Supply Area, Upper Portion of the Ningunsaw and Unuk watersheds within the Mine RSA.

The relevant best management practices that guided the development of this plan are summarized in the *Management Plan for the Mountain Goat in British Columbia* and *A Compendium of Wildlife Guidelines for Industrial Development Projects in the North Area, British Columbia* (Mountain Goat Management Team 2010; BC MFLNRO 2014). Procedures and protocols of the best management practices were incorporated in the clearing, aircraft and helicopter, and avalanche management actions for mountain goats in the following sections.

5 ENVIRONMENTAL PROTECTION AND MANAGEMENT

This section identifies the management and mitigation measures to facilitate protection of mountain goats as per the BC Mountain Goat Management team guidelines and GWM order #U-6-002 (Mountain Goat Management Team 2010). This includes consideration for clearing and pre-clearing surveys, and air-based activities. In addition, avalanche management is considered due to the potential of incidental mortality caused by avalanche control procedures.

5.1 CLEARING MANAGEMENT FOR MOUNTAIN GOATS

Most Construction Phase clearing for the Mine was completed between September 5 and November 1, 2015, within the timing window that is outside of periods identified as being sensitive for mountain goats. The southern-most section of the transmission line, as well as the preferred Bulk Emulsion Site are not within or in proximity to UWR habitat and were cleared in 2016 when it is snow-free. Clearing of the Knipple Transfer Area was also completed during autumn 2015, along with most of the clearing for the Bowser Aerodrome and camps, and locations where additional clearing was needed along the lower BJAR (km 0-58). Minor additional clearing for the Bowser Aerodrome and BJAR (mainly borrow locations) may be done later; however, these sites are not within or in proximity to UWR habitat. No clearing is needed at the Mine Site, as it is above treeline. Clearing management as described in the following section will therefore only be relevant in the unlikely event that additional clearing needs are identified for the Mine in the future.

Mitigation activities are determined by habitat type, season and the number of goats observed. If any winter clearing is planned in future, pre-clearing surveys will be conducted during winter when ground-based Mine activities are within 500 m of UWR habitat (Rescan 2013a, 2013b). If clearing is required within a UWR or within 500 m of UWR habitat during the sensitive period, an exemption permit application will be submitted by a Registered Professional Biologist. Work requiring helicopter or aircraft support will be conducted as described in Section 5.2, Aircraft and Helicopter Management.

All actions regarding mountain goat clearing management will be directed by qualified environmental personnel (either staff or consultant) with appropriate experience with ungulates in BC. The objective for surveys will be to conduct them as close to clearing as possible, with a maximum of 72 hours before clearing. The pre-clearing survey will survey for goats out to 2-3 km from the proposed clearing site, covering the area of mountainside defined by drainages unlikely to be crossed by goats. If a particular block of mountain side does not have goats, then the clearing teams are free to clear within 72 hours. If goats are found within 1.5 km of the clearing site: 1) a further pre-clearing survey will be conducted, 2) the site will be surveyed as the crews are being put out, or 3) the clearing schedule will be altered to clear that site later, following another pre-clearing survey. If the pre-clearing is conducted within 24 hours of clearing, and the area within 500 m of the clearing site is clear of goats, clearing can continue as planned. Vegetation clearing will be halted if goats are observed within 500 m of the clearing area during sensitive timing periods (i.e., winter – November 1 to June 14 for all goats, and

May 1 to July 15 for goats with kids) until animals are outside the recommended threshold distance of 500 m.

If goats with kids are observed, additional surveys will be conducted, and mitigation implemented. Note that kidding is assumed to occur at mid to high elevation generally up-slope during the winter or spring and goats are at high elevation during the summer or fall months. Table 5.1-1 summarizes the timing, habitat, triggers, and mitigation activities.

Table 5.1-1. Mitigation Activities for Mountain Goats during Vegetation Clearing

Timing	Habitat	Mitigation Activities
Winter (November 1 to April 30)	UWRs	The preferred option is to avoid activities within 500 m of UWR habitat during winter. If clearing is planned in these areas during winter, then conduct pre-clearing surveys and apply for an exemption permit. If goats are observed within a 500 m buffer of clearing, pause work until goats have moved outside of this buffer.
Summer (May 1 to July 15)	High-quality Summer Habitat – Kidding Areas	If goats with kids are observed between May 1 and July 15 within a 500 m buffer during clearing activities, pause work until goats have moved off. Avoid clearing activities within 2 km of confirmed natal/kidding areas. Pre-clearing surveys may also be conducted less than 72 hours prior to activity.
Spring/Fall (April to November	High-quality Summer Habitat – Mineral Licks	Avoid destruction of mineral licks. Minimize disturbance within 100 m of licks.
All Year	All Habitats	Vehicles accessing the Mine will be required to give the right of way to mountain goats observed on the road.

5.2 AIRCRAFT MANAGEMENT FOR MOUNTAIN GOATS

Mountain goats are potentially sensitive to noise and disturbance from development, particularly to helicopter disturbance, as well as other aircraft. Goats are vulnerable to disturbance during:

- winter (November 1 to April 30) in the low elevation forested areas that goats use during winter in designated UWRs; and
- kidding period (May 1 to July 15) in the high elevation alpine areas that goats use during kidding, summer, and fall.

The guidelines proposed by the province do not differentiate between types of helicopters. However, research and professional experience indicate that goats react at different distances to different types of aircraft. Goats typically react more strongly to larger, multi-rotor aircraft (e.g., Vertol, Chinook) that are louder than other helicopters, and larger helicopters with only two blades (e.g., Bell 205) that produce a distinct blade slap noise when descending (ERM unpublished data).

In contrast, goats typically react less strongly to smaller, multi-blade helicopters such as the Eurocopter A-star, which produces a "whine" rather than a blade slap sound. Choosing the appropriate helicopter should reduce the potential for disturbance to mountain goats at the site and allow the helicopters some small leeway in flying closer to goats if the circumstances require it (e.g., low ceiling).

During primary forest activities [i.e., clearing and access structure (road/trail) construction], mountain goat mitigation related to aircraft includes:

- As recommended by the province, maintaining 2 km horizontal setback from mountain goats where feasible and weather permitting. Also, maintaining 500 m vertical separation between helicopters and mountain goat habitat, weather permitting.
- Educating pilots as to the importance of avoiding and not flying towards mountain goats, particularly during important periods of the year such as kidding and winter.
- Disseminating established flight paths for camps and construction areas to all new pilots.

There is a general set of helicopter "behaviours" which, if followed, can significantly reduce the potential for mountain ungulates to be disturbed by helicopters. Goats typically have little defence against predators, except fleeing to escape terrain and they likely perceive helicopters as a predation risk. Thus, it is important to understand and have the helicopter "behave" in a way that does not startle or trigger this predation response.

General recommendations for pilots include:

- Avoid overflights of occupied goat habitat whenever possible (below suggested elevations of 500 m), including avoiding "flightseeing".
- If flying a helicopter that produces a heavy "blade slap" noise, avoid inducing this noise when overflying or adjacent to occupied goat habitat.
- If a pilot is aware that goats are on the opposite side of a ridge or mountain, avoid surprising goats by flying low over the ridge and suddenly appearing above them.
- Avoid triggering a goat's "chase response" by avoiding flying directly at goats. Helicopters flying tangentially to goats are perceived less as potential predators.
- Goats can become habituated to helicopters if the helicopters operate in a predictable and non-threatening manner. Wherever possible, use the same routes and elevations to and from camps and drills.
- Use topographic barriers to separate helicopters from mountain goats.
- Keep helicopters below mountain goats if feasible.
- Helicopters can drop off specialized work crews in goat habitat, but only when goats are not present within 500 m.

In the balance between operability and reducing disturbance to goats, for aircraft activities pilots are instructed to maintain the largest separation feasible from mountain goats. The ideal situation is

>2 km. In some cases, it may not be possible to maintain >2 km separation with goats given that certain valleys may be less than 2 km wide, and seasonal low clouds may force helicopters into the bottom of valleys. Pilots avoid flying within 500 m of goats, even if that means that certain valleys are unpassable on certain days with low cloud. Pilots minimize any flights in the range of 500-1,500 m, to those that are absolutely necessary. Pilots do not conduct crew "tours" near goats. There are allowances for different topographies given the fact that the average width of valleys in NW BC is 1.5-2.5 km wide. Flight paths that consider observed goat use and occupation of habitat within the RSA are provided in Appendix A. Air traffic is encouraged to use these paths to minimize disturbance during sensitive periods.

5.3 AVALANCHE MANAGEMENT FOR MOUNTAIN GOATS

5.3.1 Management Activities

Avalanche management is conducted in the winter during all Mine phases. Mountain goats occupy alpine areas with steep, rocky cliffs during the summer. During winter, mountain goats can occupy low elevation forested areas on southern slopes as well as habitat in or below areas prone to avalanches, including alpine areas above the BJAR, near Knipple Lake, and along the Knipple Glacier (Figure 5.3-1 and Appendix A). Avalanche management activities include management to avoid mortality or abandonment of habitats by mountain goats due to control induced avalanches.

Avalanche management procedures typically use helicopter deployment of explosives (Pretium 2018a, 2018b). This procedure requires the avalanche area to be clear and visible prior to deployment. However, Remote Avalanche Control System (RACS) concussive devices that are built into the start zone of avalanche tracks can be deployed during or after snow events and at night.

Mitigation activities to limit risks to mountain goats are primarily based on conducting surveys for goats prior to initiating avalanche control and pausing control activities until goats have cleared avalanche paths. Mitigation activities depend on the choice of avalanche control. Three methods of avalanche control are currently used for the Mine; each has an associated survey protocol to ensure the site is clear of people or wildlife prior to detonation. These include:

1. Hand-based blasting is conducted predominantly at the base of the avalanche path using case charges which consist of a high explosive suspended on a bamboo pole tripod and remotely detonated. These are placed on or slightly above the BJAR. Ski-touring and throwing hand charges may also be employed up slope from the road: prior to conducting hand-based blasting the crew conducts visual confirmation the site is clear of people or wildlife along avalanche path and start zone. If goats are present, blasting will be delayed until they have left the area. Air horns or other suitable sounding devices may be used to herd goats away to a safe distance before blasting begins. If this is required, then a General Wildlife Permit application will be submitted to BC MFLNRORD.
2. Helicopter-based blasting is conducted at the top of avalanche paths and most often to be used in spring to clean up sites. It includes dropping of explosive charges out of the helicopter to

initiate and avalanche from above: prior to conducting helicopter-based blasting, there is a detailed sweep of the slope to determine where best to place targets ensuring a thorough survey of the path and surrounding area for hazards and goats. If the area and area immediately adjacent (within 100 m) to the avalanche path is clear, blasting will proceed. If not, goats will be herded away to a safe distance before blasting begins if possible. If terrain and snow conditions preclude herding goats away from the area, blasting will be delayed until goats clear the area.

Figure 5.3-1
Location of RACS Units

Over the past four winters during which helicopter-based blasting has been conducted for avalanche control at the Mine and along the BJAR, no mountain goats have been observed within or in proximity to the avalanche control sites at the time control was being conducted. Pre-blast visual inspections have been conducted as part of standard procedure to ensure that the areas are clear of both personnel and wildlife, including mountain goats.

3. In-place RACS concussive devices, of which Pretium uses two different systems, were installed at three of the most problematic sites along the BJAR. These devices may be operated remotely during any weather and are used to initiate avalanches at the top of the path. During clear weather, a ground-based survey of the avalanche track is conducted from a safe location using a spotting scope or similar device. Site-specific details are described in Section 6.1.3. If goats are observed and safety is not compromised, then blasting will occur once mountain goats move out of the avalanche area. Air horns or other suitable sounding devices may be used to herd goats away to a safe distance before blasting begins. If blasting is planned during obscured conditions with low lying cloud or fog, heavy snowfall or wind events, pre-blast surveys may not be feasible.

As some approaches to mountain goat deterrence may be novel, all avalanche management activities considered will be documented and summarized in an annual report. The results of avalanche mitigation activities will be used in an adaptive management approach to inform future actions. Documentation will include:

- Survey methods and results;
- Any mitigation required – deferring the avalanche control or use of air horns; and
- Results of avalanche control.

Details of the avalanche control methodology were included in the Licence of Occupation applications submitted by Pretium to BC MFLNRORD, which were subsequently approved.

5.3.2 Risk to Mountain Goats from Avalanche Control Measures

This section evaluates the risk to mountain goats resulting from avalanche control measures at a site level using field data on the locations of proposed avalanche control measures, goat habitat, and goat occupancy collected during 2015. There are several avalanche zones identified along the BJAR and near the mine site. Avalanche control measures in all areas follow the mitigation and adaptive management approach described in Section 5.3.1.

Within each of the zones there are areas that are managed for avalanches; these include areas along the BJAR at 2 km, 30 km, 44 km, 56 km, 58 km, 59 km, and the area around the Brucejack Camp. While the event frequency and size of avalanches vary, of the areas requiring most consistent avalanche control, the areas at the Brucejack Camp, 56 km, and 2 km are not identified as key goat winter habitat, and goats were not observed at any of these locations during inventory (Rescan 2011). Slopes above

the BJAR at 30 km are near a UWR, however goats were not identified in this area during inventory. The UWR is at the top of the avalanche zone, and control measures are only expected to be associated with the lower slope above the road. Consequently, goats are not expected to occupy this area when avalanche control is required.

Risk to goats from avalanche control at the Brucejack Mine Site, 56 km, 30 km, and 2 km is considered very low. Directed monitoring for goats is not proposed for these sites beyond the scanning protocol that currently occurs for avalanche control using helicopter-based or hand-based blasting described in section 5.3.1. If, for exceptional circumstances, goats are observed within avalanche tracks planned for blasting, avalanche control will be halted until the goats have cleared the area. If required, noise will be used to herd goats out of the danger area as described in Section 5.3.1. The response of goats to noise will be documented (Section 5.3.1).

Avalanche control at 44 km and 58 km is the most likely to provide a risk to mountain goat. The 59 km site has also been assessed for risk to mountain goat. All three methods of control may potentially be used at these sites, however, the ground-based RACS represent the avalanche control of greatest consequence to goats in size of area, potential goat occupancy, and frequency of use. The RACS are remotely fired with a charge of compressed oxygen and propane, Gasex®, or 4 kg explosive charge dropped from Wyssen Towers to initiate an avalanche. The RACS used to manage avalanche hazards will be installed at three key locations along the Brucejack Access Road. The Gazex® is permanently fixed at the top of the avalanche paths at 44 km, while Wyssen Towers are installed at the top of avalanche paths at 58 km and 59 km (Figure 5.3-1). A monitoring plan has been identified for use with RACS avalanche control in these areas and it can be extended to include all methods of avalanche control at these problematic sites.

To evaluate the potential risk to mountain goats at these three sites from the installation of the RACS and other avalanche control systems, a field survey was carried out in May 2015 (June 17, 2015, Wildlife Trip Report). The survey was conducted, in part, to evaluate the likelihood that goats would occupy the areas slated for avalanche control. The risk to goats was evaluated based on the results of this survey combined with the information available from habitat suitability mapping, spatial distribution of habitat, and the anticipated goat use. Locations at 44 km and 58 km were identified as potentially supporting use, while goat winter use at km 59 is not anticipated. The risk to mountain goats from avalanche control at these three sites was qualitatively evaluated based on professional judgement of habitat suitability and potential occupancy during the winter. The habitat value, and therefore likelihood of habitat uses and risk to goats, was referenced to a local benchmark; the UWR unit on the north side of Bowser Lake which supports substantial goat numbers (12 observed in the winter 2011 survey at this location). This UWR is located at Anderson Mountain approximately 5 km away from the 10 km marker on the Brucejack Access Road, along Wildfire Creek, and is not expected to be disturbed by Mine-related activities.

The Gazex® RACS unit at 44 km is at the edge of a large UWR complex that has potential to support several goats. This avalanche control site is at the lower, south, and eastern edge of the complex, and while goats may occupy the site during winter, there is habitat of higher quality and greater connectivity north of the site. Within the UWR, goats were observed in May 2015 (waypoint 043,

Figure 5.3-1) up slope on the mountain within the UWR. Goats were observed in a favourable area of green vegetation near the large UWR polygon during the May 2015 reconnaissance. The 2011 winter ungulate surveys (Rescan 2011), did not detect goats in this area, but identified a total of 14 goats to the north and west of the 44 km UWR polygon unit. The RACS unit will affect a large area downslope from the UWR polygon unit (Plate 5.3-1). Considering the isolation of this unit at the periphery of a larger more suitable complex, the probability of it being occupied by goats during avalanche control is low and with monitoring, risk to goats is predicted as Low as well. The 44 km avalanche control area was checked for presence of mountain goats and other wildlife as part of standard pre-blast procedures during blasting that occurred over the past four winters; no mountain goats were observed within the blast areas.

Plate 5.3-1. Location of RACS unit exploders at 44 km site.

The first Wyssen RACS site is comprised of one tower located at 58 km at the southern end of the Knipple Glacier portion of the BJAR. One mountain goat was observed at this location during the May 2015 reconnaissance, and goats with kids had been recorded near this site in 2011 prior to July 1 as recorded in the July 14, 2011, Vegetation and Wildlife Critical Review trip report. No goats were observed during winter 2011 survey near this location (Rescan 2011) and the survey unit associated with the site only had one goat observed during the winter 2011 surveys. The habitat was assessed as high-quality winter habitat as it supports vegetation including conifer cover and shrubs adjacent to escape terrain. The area potentially affected by the RACS is at the lower elevation of the suitable habitat, where escape terrain is becoming fragmented, and connectivity to more contiguous habitat is reduced in winter (Figure 5.3-2). Considering the location at the edge of habitat and no documented winter use, it has a low probability of being occupied by goats during avalanche control, and risk to goats is predicted as Low with monitoring. As with the 44 km area, km 58 was also checked for mountain goat presence prior to blasting over the past four winters and no goats were observed within the avalanche zone.

The second Wyssen RACS site is comprised of 11 towers located between 59 and 60 km and was assessed as low-quality winter habitat for goats. This site is in area recently exposed as the Knipple Glacier receded and has virtually no vegetation cover that would provide winter forage to goats. Its value as escape terrain is also marginal as it is small and surrounded by more gently rolling topography (Figure 5.3-2), and only a small, low elevation area will be impacted by the RACS. No goats were observed near this site during the 2011 winter inventory (Rescan 2011) and only one goat was observed in survey unit (SU) 10. The probability of this site being used during winter by goats is very low and risk to goats is predicted as Very Low. No goats have been observed at this location during previous avalanche blasting activities.

Figure 5.3-2. Location of Wyssen Towers between Km 58 and 60 of the Brucejack Access Road

6 ENVIRONMENTAL MONITORING

6.1 PERFORMANCE MONITORING

6.1.1 Clearing Monitoring

Any additional pre-clearing surveys will be completed by consultants or environmental staff (preferably Registered Professional Biologists) with appropriate experience and/or training with mountain goats in BC. As described in Section 5.1 however, almost all planned clearing has been completed to date and any further clearing required in sensitive areas will occur between September 5 and November 1, outside of the sensitive periods for mountain goats.

Monitoring frequency may be triggered during vegetation clearing but not during normal operations thereafter. Monitoring will occur for clearing activities that will occur in winter (November 1 until April 30) within 500 m the mountain goat UWR. The objective for surveys will be to conduct them as close to clearing as possible, with a maximum of 72 hours before clearing. The pre-clearing survey will survey for goats out to 2-3 km from the proposed clearing site, covering the area of mountainside defined by drainages unlikely to be crossed by goats. If a particular block of mountain side does not have goats, then the clearing teams are free to clear within 72 hours. If goats are found within 1.5 km of the clearing site, then: 1) a further pre-clearing survey will be conducted, 2) the site will be surveyed as the crews are being put out, or 3) the clearing schedule will be altered to clear that site later, following another pre-clearing survey. If the pre-clearing is conducted within 24 hours of clearing, and the area within 500 m of the clearing site is clear of goats, then clearing can continue as planned.

Ground surveys may be used to supplement helicopter-based surveys if topography requires, and weather and work safety allows it. Flight scheduling for monitoring will be conducted by a Registered Professional Biologist with appropriate experience and/or training with mountain goats in BC.

6.1.2 Aircraft Monitoring

Pilots are asked to report incidental observations of goats as part of the incidental wildlife reporting program as discussed in the Wildlife Monitoring Plan (Pretium 2023). Employees who feel that pilots have flown too close to goats are encouraged to report this to Brucejack Logistics or environmental staff.

6.1.3 Avalanche Monitoring

Monitoring during avalanche control activities is conducted to minimize potential mountain goat mortality during avalanche control measures.

Avalanche control monitoring information collected include:

- Location;

- Date;
- Time;
- Personnel;
- Methods and results of pre-control surveys;
- Mitigation actions including;
  - all wildlife herding actions and other mitigative measures,
  - wildlife response,
  - subsequent rationale for decision regarding blasting (including decision not to trigger an avalanche);
- Any blasting activity undertaken; and
- Notes on results.

As listed above, the monitoring measures include visual surveys before avalanche control is initiated to the extent feasible, mitigation efforts and their effects, decision making, and avalanche control results. The avalanche control results include post-control surveys to evaluate if any goat mortality has occurred. The RACS units located at 44 km, 58 km and 59 km along the BJAR have been predicted as having a Low (44 km and 58 km) or Very Low (59 km) risk to goats. Surveys conducted in May 2015 identified varied risks at each location considering connectivity of habitat, habitat quality and spatial distribution of habitat and goats.

The site at 44 km includes a large area of slope that tails out over the BJAR and into the Bowser River. This control is initiated by six Gazex® RACS exploders. The initiation zone is in the low elevation portion of a UWR polygon that has been identified as potentially used by goats. When feasible – i.e., when avalanche control is to be conducted during clear weather conditions – spotting for mountain goats (and moose at the tail out) will be conducted from the ground with a spotting scope (or similar device) prior to detonation of exploders. Spotting will be conducted from 44.4 km. The observer will be in communication by radio and give the all clear when there are no goats within 100 m of the "Slasher" avalanche path

The site at 58 km includes a relatively short run and small area at the bottom of the slope that can be initiated by a Wyssen Tower RACS exploder. The site is expected to have a Low risk to goats and can be observed on the ground by a monitor with a spotting scope prior to detonation. Spotting for 58 km will be done from the causeway across the Bowser River, as there is no safe location with good visibility closer to the 58 km site. The observer will be in communication by radio and give the all clear when no goats are observed in openings within 500 m from the blast location.

The sites between 59 and 60 km include a large area of slope that tails out over the BJAR at several locations and is managed by 11 Wyssen Tower RACS exploders. The area is predicted to have a Very Low risk to goats as such no monitoring is proposed.

Monitoring for mortalities will occur as a check by environmental staff in the spring, with mortality evidenced by signs of goats or as signs of scavenging by predators or birds. Monitoring will be implemented if evidence of goat use is identified through the course of development.

6.2 WORK PLANNING AND SCHEDULE

The mitigation and management measures for mountain goats that will be implemented to eliminate or minimize adverse effects will occur throughout the various Mine phases.

7 REPORTING AND RECORDING

7.1 REPORTING

7.1.1 Compliance Reporting

Compliance reporting will be subject to EA Certificate conditions, and *Mines Act* permit conditions.

Compliance reporting for a wildlife permit used to herd mountain goats away from avalanche paths, if needed, will be reported separately to BC MFLNRORD as detailed in the permit.

The results of monitoring and mitigation are reported to the Wildlife Advisory Committee (WAC).

7.1.2 External/Internal Reporting

All personnel are encouraged to report wildlife observations made anywhere within the Mine. Information collected during monitoring activities, including incidental observations, is summarized in the daily wildlife monitoring log.

7.1.3 Incident Reporting

Incident reporting includes observations of mountain goats during pre-clearing surveys, mountain goat encounters with aircraft/helicopters not following appropriate mitigation measures, and wildlife interactions with avalanche mitigation actions. In addition, any mortality and/or encounters during vegetation clearing surveys, or other mortality events, are reported.

7.2 RECORD KEEPING/TRACKING

7.2.1 Monitoring Results

Information collected during monitoring activities includes the effort that the monitor has put into surveying (start and end times), as well as documenting information on goat observations including time of observation, physical condition, age, sex (if possible) and number of goats. Notes on behaviour and response to the activity will also be recorded, as will observations of other sensitive wildlife incidentally observed.

7.2.2 Continuous Improvement, Follow up, and Adaptive Management

Mitigation measures will continuously be improved by recording incidents involving mountain goats and following up on these incidences and implementing adaptive management when or if current mitigation measures are ineffective.

1 PURPOSE, SCOPE, AND PERFORMANCE OBJECTIVES

The purpose of the Soils Management Plan for the Brucejack Gold Mine is to outline soil and growth media salvage, stockpiling, and replacement approaches for the Mine Site Area only, under auspices of the *Mines Act* Permit M-243.

Following is a discussion of soil and overburden resources, as well as the soil salvage and management considerations for the Mine Site Area and the 19 km northernmost section of the Brucejack Transmission Line.

The scope of this Soils Management Plan includes only the area specified under the *Mines Act* Permit M-243: the Mine Site Area (i.e., Brucejack Mine Site, Lakeshore Drive Realignment, Lakeshore Drive, Valley of the Kings Bypass Road, NPAG Quarry Borrow Sources, and northern 19 km of Transmission Line extending from Pretivm's Mineral Claim #1026976 to the northern terminus of the line). All other areas (i.e., Knipple Transfer Area, Bowser Aerodrome, Bowser Camp, Wildfire Camp, southern 38 km of the Brucejack Transmission Line, explosive storage areas, communications towers, avalanche control systems, and meteorological stations) are covered under the Ancillary Infrastructure Decommissioning and Reclamation Plan.

2 RELEVANT LEGISLATION, REGULATIONS, AND EAC CONDITIONS

2.1 RELEVANT LEGISLATION AND REGULATIONS

This Plan follows the structure outlined by the British Columbia (BC) Ministry of Energy, Mines and Petroleum Resources (BC MEMPR) in its draft application guide for *Mines Act* and *Environmental Management Act* Permits (BC MEM 2013), and addresses the content requirements provided by both the BC MEM and BC Ministry of Environment & Climate Change Strategy (BC MECCS). As well, soils management will follow the Health, Safety and Reclamation Code for Mines in British Columbia (2017).

2.2 RELEVANT EAC CONDITIONS

Pretivm was granted an Environmental Assessment Certificate (#M15-01) on March 26, 2015 that included a series of conditions associated with the Certificate. This management plan is in support of Condition #2, in relation to a Reclamation and Closure Plan and Component Plan for Ancillary Infrastructure Decommissioning and Reclamation, presented within Schedule B of the Certificate and copied below.

> *Condition 2*
>
> *"The Holder must prepare the Construction, Operations, Closure and Post-Closure Component Plans identified in Appendix A in consultation with, and to the satisfaction of, RRAs.*
>
> *Component Plans, at minimum, must include the following information:*
>
> - *Purpose of Component Plan;*
> - *Performance objectives;*
> - *Effects mitigation measures;*
> - *Monitoring programs;*
> - *Monitoring schedules; and*
> - *Reporting requirements.*
>
> *The Holder must consult with the NLG, Tahltan and TSKLH on the content and implementation of Component Plans in accordance with the ACP set out in Condition 5.*
>
> *The Holder must implement Component Plans according to timelines set by RRAs. This can be no later than the commencement of Construction."*

2.3 Relevant Permit Conditions

The *Mines Act* Permit M-243 and associated Management Plans require that conditions in the *Mines Act* Permit M-243 be followed for soil salvage and storage as well as sediment and erosion control. Following mine closure the Reclamation Plan for the site requires landforms be appropriately prepared for long term maintenance-free configuration and have self-sustaining drainage control features and watercourses that do not allow soils to be remobilized into aquatic resources. Soils salvaged and stored are to be used for reclamation purposes where appropriate. At closure the Mine Site is to meet land use objectives of the permit, i.e. the landscape is to be returned to a matrix habitat that does not hamper movement of wildlife.

3 SOILS MANAGEMENT STRATEGY

This section describes the soil and growth media salvage, stockpiling, and replacement approaches for the Brucejack Mine Site Area and the Northern 19 km of the Transmission Line. Soils or growth media suitable for use in reclamation will be salvaged from Mine surface development areas, where feasible. The land capability of reclaimed areas will be affected by soil handling including salvage, storage, and spreading at reclamation, as well as site preparation for reclamation.

3.1 BRUCEJACK MINE SITE AREA

3.1.1 Soil Assessment

The Brucejack Mine Site Area is located in the high elevation, very cold Coastal Mountain-heather Alpine (undifferentiated; CMAun) Biogeoclimatic Ecosystem Classification (BEC) subzone. The surface disturbance (infrastructure footprints) area has been estimated at about 22 ha for the Brucejack Mine Site with a buffer and interdisturbance areas at the Mine Site estimated at 23.5 ha for a total of 45.5 ha. The greater Mine Site Area has been estimated at 62 ha and includes:

- Brucejack Mine Site;
- Lakeshore Drive realignment to the gravel borrow sources;
- existing Lakeshore Drive;
- existing Valley of the Kings bypass road (to glacier);
- NPAG Quarry; and
- gravel borrow sources.

Within this Mine Site Area, vehicle travel is kept to the main roads and pathways, and is discouraged outside of these areas. Vegetation is sparse, generally covering less than 20% of the Brucejack Mine Site and with little to no cover at the other facilities within the Mine Site Area. This sparseness is due to the occurrence of extensive bedrock, as well as the limited extent and poor quality of growth media, many of which do not meet the definition of soils and/or have elevated metals concentrations. Soils and growth media are poorly developed as a result of limited weathering of parent materials, and/or of poor quality due to the site's location primarily on a gossan (mineralized, oxidized rock on surface; Plate 3.1-1). There has also been historical disturbance of growth media within the Mine Site due to advanced mineral exploration activities.

Where soils are present, they are generally rated as poor due to the high coarse fragment content, lack of soil development, or shallowness over bedrock. Most material proposed for salvage at the Mine Site is unconsolidated overburden (subsoils), as the very limited soil that may have been present in some areas has been disturbed. The overburden comprises recently deposited/exposed morainal and residual (materials developed in-place) materials. Small areas of Fair to Good rated soil material may be present between rock outcrops in some areas. However, based on Canadian Council of Ministers

of the Environment guidelines, soil analysis indicates that the soils at the Mine Site have metal exceedances, including arsenic. Therefore, the soils at the Mine Site are considered to be generally unsuitable for use in reclamation.

Plate 3.1-1. Brucejack Mine Site located on a gossan.

3.1.2 Soil Salvage

The Mine Site Area is predominantly hummocky with rock outcrops and patchy, shallow, soil development in residual/colluvial and morainal materials, along with extensive disturbed areas (Figures 3.1-1 and 3.1-2; Polygons: 605, 609, 610, and 636). The Mine Site Area also contains a small area of near level sediments of fluvio-lacustrine and moraine fill (Polygon 608) near Brucejack Lake. However, polygon 608 is an area that was used for a waste rock and mineralized material storage facility until 1999 and remnants of that material remain, generally below the water table. As above, the plan is to not salvage unconsolidated overburden within the Mine Site area for reclamation purposes. Nonetheless, overburden has been excavated and stored, primarily from polygon 609. Limited chemical analyses conducted before construction began indicated the material is often PAG and is not be suitable for reclamation purposes (Lorax 2016; Appendix A). Further chemical analysis will be carried out and if the material is suitable for reclamation purposes, it will be excavated at Closure and used on-site for reclamation. Otherwise, this material will remain in place at Closure.

Rock outcrops dominate the NPAG Quarry site and along the Lakeshore Drive realignment. Cobbles and gravel also extend to surface at the gravel borrow sources. No growth media salvage is feasible at these sites.

3.2 TRANSMISSION LINE (NORTHERN 19 KM)

The Brucejack Transmission Line follows bedrock-dominated terrain. Towers and lines were installed by helicopter. Little surficial material was disturbed due to the small size of the tower footprints and use of helicopter support.

Any soils that were disturbed during construction will be seeded with a native seed mixture such as:

- alpine bluegrass (*Poa alpine*);
- spike trisetum (*Trisetum spicatum*); and
- blue wildrye (*Elymus glaucus*).

This seeding will provide a vegetative cover in the disturbed areas and reduce the potential for erosion.

Appendix A

Lorax Environmental Memo (February 18, 2016):
Characterization of Overburden at the Brucejack Mine Site

MEMORANDUM

To:	**Sylvia Van Zalingen, Max Holtby, Robin McCall (Pretivm)**	**Date: February 18, 2016**
From:	**Alison Shaw, Stephanie Simpson (Lorax)**	**Project #: A384-1**
Subject:	**Characterization of Overburden at the Brucejack Mine Site**	

A significant volume of overburden material (estimated at up to 60,000 m^3) will be excavated by the end of Construction and relocated within the Brucejack Mine Site in order to develop site infrastructure. Pretivm Resources Inc. (Pretivm) requested that Lorax Environmental Services Ltd. (Lorax) develop a sampling program to assess the geochemical characteristics of overburden and its suitability for use in reclamation, in accordance with requirements of *Mines Act* Permit M-243. Relevant conditions outlined in *Mines Act* Permit M-243 that pertain to management of overburden material include the following:

Section D(9)(a):

> *The Permittee shall salvage and stockpile topsoil, overburden and organic material, to the extent practical, for use in reclamation.*

Section D(3):

> *All materials with the potential to generate ML/ ARD shall be placed in a manner that minimizes the production and release of metals and contaminants to levels that assure protection of environmental quality.*

This memorandum provides an overview of the overburden at the Brucejack Mine Site; a description of the assessment methods employed for the 2015 characterization program; and a discussion of the static test results in the context of the regulatory requirements outlined above. The findings presented herein indicate that the overburden at the Mine Site is not suitable for reclamation purposes due to the low nutrient and organic matter contents; the elevated metal concentrations; and the potentially acid generating (PAG) characteristics of the material.

1. Overburden at the Brucejack Mine Site

1.1 Site Description

The Brucejack Mine Site is located predominantly on bedrock outcropping with pockets of sparse alpine vegetation covering less than 20% of the area (Photo 1-1). Located above the tree line in the Coastal Mountain-heather Alpine Biogeoclimatic Ecosystem Classification zone, the mine site has an elevation of approximately 1400 m above sea level and is surrounded by glaciers and ice fields to the west, south, and east. The mean annual temperature in this region

ranges from 0 ºC to 4 ºC. Snow, névé, and firn persist late into the year resulting in a short frost free period (Pretivm, 2015).

Vegetation development is limited by the availability and poor quality of growth media, and due to excessive snow pack, strong winds, and low temperatures in this region. When present, the distribution of Alpine Group species (*e.g*. small shrubs, lichen, mosses) is limited by growth media depth, drainage, and microclimate.

Photo 1-1: An aerial view of the Brucejack Mine Site and Brucejack Lake from the east.

The Canadian System of Soil Classification (1998) defines soi1 as:

> *'naturally occurring, unconsolidated minera1 or organic material at least 10 cm thick that occurs at the earth's surface and is capable of supporting plant growth. In this definition "naturally occurring" includes disturbance of the surface by activities of man such as cultivation and logging but not displaced materials such as grave1 dumps and mine spoils.'*

The baseline (pre-development) soils and reclamation assessment of the Brucejack Mine Site characterized the surficial materials (potential growth media) as poorly developed as a result of limited weathering of parent materials and disturbance related to mineral exploration activities (Pretivm, 2015). Most material originally proposed for salvage at the Mine Site is unconsolidated overburden (subsoils), comprised of recently exposed morainal and residual (developed in-place) materials. Where present, soils were generally rated as Poor due to the high coarse fragment content, or shallowness over bedrock (Pretivm, 2015). Baseline and reclamation assessments also noted that the Mine Site is located within a gossan, with mineralization to surface.

1.2 Previous Characterization Programs

Baseline studies were carried out to assess the characteristics of the Brucejack Gold Mine Project terrain and soils. Fifty soil samples were collected from 34 inspection sites within three defined sub-areas of the local study area (LSA): Brucejack Access Road, Brucejack Mine Site, and Brucejack Transmission Line (Pretivm, 2014). Soil inspections were carried out in the field and a range of parameters, including pH, carbon (C) content, texture, $CaCO_3$ equivalence, metal concentrations and cation exchange capacity (CEC), were analyzed to provide information on ecologically important characteristics relative to reclamation suitability and soil management. The results of this analysis indicated that soils at the Mine Site were generally considered to be unsuitable for use in reclamation due to the poor quality, low nutrient contents and elevated metal concentrations (As and Ni in particular). The detailed results for this study are presented in the 2012 Terrestrial Ecosystem Baseline Studies (Appendix 16-A in Pretivm, 2014).

A separate baseline study, carried out by BGC in August 2013, was completed to evaluate the ML/ARD characteristics of the Mine Site overburden. The study included 14 overburden samples from the surface layer around the Mine Site which were submitted for ABA and solid phase element determination by aqua regia digestion. Results from this program indicated that all 14 samples were PAG, and five samples had paste pH values < 6 (4.9 to 5.9).

Additional geochemical sampling was carried out at the Mine Site in July 2015, whereby 10 overburden samples were collected from two small pits in the vicinity of the proposed Contact Water Pond (CWP). The pits were developed through approximately 4 m of overburden, but were not developed to bedrock. In one of the pits, geotextile fabric was encountered, indicating that this area had previously been disturbed from the period of time in the mid to late 1980s when Newhawk Gold Mines Ltd. was undertaking mineral exploration at the site. All 10 samples were indicated to be PAG.

The extent of overburden at the Mine Site has been estimated from stratigraphy data collected during a drilling program carried out by BGC Engineering (BGC) between 2012 and 2014. The BGC program was comprised of forty boreholes and included a description of the overburden

material and the measured thicknesses. This data, along with a map showing borehole locations, is provided in Appendix A. This information was used to estimate the amount overburden that would be removed from the mine Site during construction and to provide guidance for recommended sample locations for the 2015 overburden program.

2. Assessment Methods for 2015 Mine Site Overburden Program

2.1 Rationale for Sample Frequency

As described above, pre-development site investigations suggested that excavation of up to 60,000 m^3 of overburden would be necessary within the Brucejack Mine Site during Construction. Given that the overburden material is weathered from predominantly PAG rock and that the existing overburden samples at the site are indicated to be PAG, a sampling frequency consistent with that recommended by the British Columbia Ministry of Energy and Mines (MEM) for preliminary assessment of rock (*i.e.,* 8 samples per < 100,000 metric tonnes) was applied to characterize the Mine Site overburden. Using the MEM standard, 60,000 m^3 equates to 108,000 metric tonnes (assuming a density of 1.8 g/cm^3) and a minimum of 16 sample locations.

To achieve the target sampling frequency, the Mine Site was divided into 16 quadrants with recommendations that at least one test pit be developed in each quadrant and two samples be collected from each location; one sample from the upper horizon (generally the upper 30 cm) and a second sample from the lower horizon. Quadrants superimposed entirely over Brucejack Lake or outside of the Mine Site boundary were omitted and additional sampling completed in the vicinity of the portal pad where the nature of the material was unknown.

A total of 28 overburden samples were collected from 17 test pits around the Mine Site in September 2015. Figure 2-1 shows the location of test pits for the 2015 sampling programs and surface sites for the 2013 program. A description of each overburden sample collected to date from the Brucejack Mine Site is provided in Appendix B.

2.2 Collection Methods

Test pits were developed either with the aid of an excavator or by hand using a large shovel. Sites accessible by an excavator had a trench cut down to the bedrock to expose the complete overburden profile in cross section. The depth from the surface of the overburden to bedrock was noted and the vertical profile documented. Once the profile had been documented, a 2 kg composite sample from the entire upper 30 cm was collected using a hand shovel and a second 2 kg composite sample was collected from the entire horizon below 30 cm to bedrock.

At each of the test pits developed for the 2015 sampling programs, the thickness of the overburden and depth to bedrock was recorded. Samples were only collected from locations

that had sufficient thickness of overburden, determined as 30 cm for the purpose of this evaluation. Sites that had less than 30 cm overburden were documented, but no sample was collected.

2.3 Quality Assurance and Quality Control

The quality assurance and quality control (QA/QC) program for the Brucejack Mine Site overburden assessment included one field duplicate sample per 10 samples collected to assess variability in PAG potential and soil content of the overburden over short distances. A total of four field duplicate samples were collected in 2015. The duplicate sample was achieved by collecting a second 2 kg composite sample in the same manner and from the exact same location as the original test sample.

Results for field duplicate samples are generally consistent with the original test sample, with the majority of parameters having a % difference ((test sample – duplicate) / duplicate * 100) of < 30. The largest variations are observed for insoluble S concentrations for the test and field duplicate samples. Of note is the variation in C content and NP for the duplicate of B00208469 (upper 30 cm at Site 3) and the variation in S content and AP for the duplicate of B00208479 (upper 30 cm at Site 14), indicating variation in NP and AP over short distances in overburden at the Mine Site. The QA/QC results are presented in Appendix C.

Figure 2-1: Map showing overburden sample locations at the Brucejack Mine Site.

2.4 Analytical Methods

2.4.1 Sample Preparation

All samples collected in 2015 were submitted to SGS Canada Inc. (SGS) in Burnaby BC for processing and analyses. The overburden samples were thoroughly homogenized then riffle split into two portions. One split from each sample was used for particle size analysis (PSA) and the other split for geochemical static testing. From the split reserved for static testing, 250 g of the "as received" material was split out from each sample for shake flask extraction (SFE) experiments and another 200 g was split out and pulverized to 80% passing of the 270 mesh (53 µm) for acid base accounting (ABA) and solid phase element determination. The remaining pulverized sample was used for organic matter (OM) and nutrient determination.

2.4.2 Particle Size Analysis

The 2015 overburden samples were submitted for PSA, including wet and dry sieve and fine fraction separation using the Malvern Mastersizer 2000.

2.4.3 Acid Base Accouting

All overburden samples were submitted to SGS for the full suite of ABA, including paste pH, sulphur (S) species and total and inorganic carbon (C). ABA compares the acid production (AP) and neutralization potential (NP) of a sample to provide an overall theoretical acid generation potential for the sample (*i.e.*, net potential ratio). The net potential ratio (NPR) is the ratio of AP to NP for a given sample. All waste rock, quarry rock, borrow materials, and tailings for the Brucejack Project are considered PAG if NP/AP is < 2.

2.4.4 Solid Phase Element Content

All overburden samples were submitted to SGS for solid phase element determination by aqua regia digestion. Total metals were conducted by digesting 0.500 g of sample in 5 mL of 3:1 HCl/HNO_3 (aqua regia) at 95ºC for 1.5 hours. The extract is then diluted to 25.0 mL and analyzed for metals by inductively coupled plasma mass spectrometry (ICP-MS). Solid-phase metals data are used to identify which metals are enriched in waste materials and could potentially leach from the test material.

2.4.5 Water Soluble Parameters

Shake flask extraction (SFE) experiments were conducted on the overburden samples to evaluate the water soluble parameters. Representative samples, comprising the full range of particle sizes, were subjected to 24-hour Nanopure water leach extraction tests at a 3:1 liquid to solid ratio.

2.4.6 Organic Matter and Nutrients

Pulverized sub-samples from the 2015 overburden program were sent to SGS Agri-Food Laboratories in Guelph, ON for quantitative soils analyses, including OM content and nutrient concentrations. The analyses included determination of:

- Al, B, Ca, Cu, Fe, K, Mg, Mn, P and Zn by Mehlich III method;
- OM by the modified Walkley Black digestion;
- Total phosphorus by the Olson method; and
- Total nitrogen by the Dumas method (Leco Nitrogen analyzer).

The Mehlich III method uses a NH_4NO_3, NH_4F and EDTA-H_4 extracting solution with inductively coupled plasma optical emission spectrometry (ICP-OES) finish. The Mehlich III method overestimates the amount of P available for plant uptake since it is a more aggressive extraction method carried out under lower pH conditions; therefore, P was also determined by the Olson method, which uses a 1N sodium bicarbonate ($NaHCO_3$) extracting solution and colourimetric finish to provide a more realistic estimation of the available P in the overburden samples.

Organic matter content was determined using a modified Walkley Black titration method with colourimetric finish. The method is based on the oxidation of OM by potassium dichromate ($K_2Cr_2O_7$) sulfuric acid mixture followed by back titration of the excessive dichromate by ferrous ammonium sulfate ($Fe(NH_4)_2(SO_4)_2 \cdot 6H_2O$). The method is modified by extensively heating the sample during oxidation to ensure complete digestion.

Nitrogen was quantified using a LECO Nitrogen analyzer whereby a sample of known mass is combusted at a high temperature (about 900°C) in the presence of oxygen.

3. Results

3.1 Grain Size Analysis

For the purpose of this characterization, soil describes particles <2 mm in diameter, which are responsible for the majority of water and nutrient holding capacity (Sheoran *et al.*, 2010). Conversely, particles >2 mm in diameter are classified as gravel, and are not optimal for plant growth because the larger pore space of coarse grained material cannot hold enough water or nutrients to sustain growth. Table 3-1 presents the particle size distribution of overburden samples collected during the 2015 sampling program. Figure 3-1 presents the soil fraction for Mine Site overburden samples according to depth. The laboratory reports for particle size distribution (PSD) analyses by sieving and laser diffraction techniques are presented in Appendix D.

The PSD results from sieve analyses (Appendix D-1) indicate that 19 out of the 28 samples analysed are dominated by soil-sized particles. Of these samples, 14 represent samples from the upper 30 cm of the overburden. Both the upper 30 cm and lower overburden samples at sites 3, 4, 9, 11, 12 and 15 have > 50% soil-sized particles, whereas this is only the case for the upper 30 cm samples at sites 2, 6, 8, 10, 13, 14 and 19. It is noteworthy that sites 2, 6, 8 and 19 have < 35 cm thickness of overburden overlying bedrock. Therefore, the PSD data indicates that soil-sized particles represent the majority of particles over the entire overburden profiles at sites 2, 3, 4 (along Brucejack Creek), 6, 8, 11, 12, 15 and 19.

The Malvern Mastersizer 2000 employs laser diffraction techniques which allows for differentiation between sand, silt and clay fractions. Results from the analyses are presented in Appendix D-2 and indicate that the majority of soil fractions can be classified as loamy sand or sandy loam, and to a smaller degree, sand. Of the soil fraction, sand comprises 52-98% of the samples and silt + clay comprises 2-48% of the samples (Table 3-1). The percentage of clay was less than 10% in all samples, inferring generally low cation exchange capacity and low capacity for nutrient retention. Available water storage capacity, based on texture classifications, suggest values ranging from 83-125 mm water/m soil, allowing for moderate to low available water to plants and good drainage (BCMAFF, 2002).

Figure 3-1: Soil percentage (%) in Mine Site overburden samples according to depth with the 50% level highlighted for reference.

Notes: *AWSC: Available Water Storage Capacity (BCMAFF, 2002; Water Conservation Factsheet); bold values represent samples with >50% soil percentage (< 2 mm) of PSD; samples were not collected at Site 1 and Site 16 due to extensive 'infill' at these locations (*i.e.*, no overburden present).

3.2 Acid-Base Accounting

Acid base accounting results for the overburden samples are provided in Table 3-2. For the overburden samples, AP was determined from sulphide S and NP from total inorganic C (TIC) to avoid overestimating AP and available NP. As outlined in *Mines Act* Permit M-243, an NPR < 2 indicates that a sample is PAG and must be placed in a manner that minimizes the production and release of metals and contaminants to levels that assure protection of environmental quality.

Total S content in the overburden samples ranges from below the detection limit (0.01%) to 3.44%, with sulphide S comprising the major portion of the total S content. The insoluble S content is likely in non-acid generating organic mineral phases. Neutralization potential derived from TIC is low, ranging from below detection (0.01%) to 1.6% (median of 0.12%).

Of the 52 overburden samples, 47 are PAG (NPR < 2). However, two of the five NPAG samples (OB-03 and OB-07 in Table 3-2) have paste pH < 5.5, indicating that the samples are slightly acidic.

Table 3-2:

Notes: AP (acid potential) is calculated from sulphide S and NP (neutralization potential) calculated from total inorganic carbon (TIC). NPR (net potential ratio) is the ratio of NP over AP.

3.3 Solid Phase Elements

Solid-phase metals data are used to identify which metals are enriched in materials. This information can be used in combination with ABA to establish the geochemical properties of a material. Table 3-3 presents select metal abundances obtained from aqua-regia digestion of the overburden samples. The degree of enrichment of an element over crustal abundance can be used as a general indicator of the metals that could be of potential concern (Price, 2009). However, solid-phase metal concentrations well above crustal abundance do not conclusively indicate that the metal will be leached at a high rate from the material. Rather, the rate of metal leaching is related to the metal's mineralogical association and the aqueous geochemistry of the infiltrating waters. The full set of solid phase element results is provided in Appendix E.

An indicator of significant solid-phase enrichment is assigned arbitrarily herein to be values greater than or equal to three times the crustal abundance. These values are indicated as shaded cells (light grey) in Table 3-3. Values indicated to be greater than or equal to ten times the crustal abundance are shaded in dark grey.

Table 3-3 indicates that silver (Ag), arsenic (As), mercury (Hg), sulphur (S), antimony (Sb), selenium (Se), and thallium (Tl) are present in elevated concentrations in overburden samples. Additionally, cadmium (Cd), copper (Cu), molybdenum (Mo) and lead (Pb) are elevated in some samples.

Also presented in Table 3-3 are the Canadian Council of Ministers of the Environment (CCME) Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health for industrial limits (CCME, 2007). Values that exceed the CCME guideline are indicated in bold italics in the table. Arsenic concentrations for all overburden samples are above the CCME guideline of 12 ppm As, with concentrations ranging from 21 ppm to 446 ppm As (median of 50.5 ppm As). One sample at Site 12 also has elevated Cu concentrations of 1790 ppm, exceeding the CCME guideline of 91 ppm Cu. With the exception of one Sb value and one Se value in surface samples collected during the 2013 program, all other parameters are below the CCME soil quality guideline.

Notes: 1. Italicized values in blue font indicate values measured below the detection limit;
2. ACA = average continental crust abundance values according to Price (1997); light shaded values are higher than 3x's the ACA and dark shaded values are higher than 10x's the ACA.
3. CCME = Canadian Soil Quality Guidelines for the Protection of Environmental and Human Health, Industrial limits (CCME, 2007); bold italic values are higher than the CCME guideline.

3.4 Water Soluble Extraction

Shake flask extraction tests provide a preliminary measure of the water-soluble constituents of a sample. The SFE results of select parameters for overburden samples collected at the Brucejack Mine Site are presented with Metal Mining Effluent Regulations (MMER) Maximum Authorized Monthly Mean Concentration (MMM) values (MMER, 2015) and BC Ministry of Environment (BCMOE) Water Quality Guidelines for the Protection of Aquatic Life for reference (Table 3-4). The full set of SFE results is provided in Appendix F.

The SFE leachate compositions from all overburden samples are below the MMER MMM values for water soluble species. However, sulphate and dissolved Ag, Al, As, Cd, Co, Cu, Mn, Se, Tl and Zn exceed the long-term (30-day) and/or short-term (maximum) BCMOE water quality guidelines in at least one overburden sample. Cadmium, in particular, is elevated in leachate from many of the overburden samples.

The CCME interim remediation criteria for soil recommends a pH range of 6 to 8 (CCME, 1991). In general, most plants prefer to grow in moderate rather than extreme pH environments, as soil nutrients are most available at a circumneutral pH; however, vegetation can be sustained in soil pH values ranging from 4 (very strongly acidic soils) to 10 (very strongly alkali soils) (BCMAFF, 2001). The SFE tests for the Brucejack overburden samples produced pH values ranging from 5.1 to 8.0 (median of 7.4), within the range of typical soil pH and consistent with recommended remediation criteria (CCME, 1991). The slightly lower pH values measured during SFE experiments compared to paste pH values from ABA analyses is likely due to the higher water to rock ratio used for the SFEs (3:1 versus 2:1).

Notes:
1. italicized values in blue font indicate values measured below the detection limit;
2. BC WQG = British Columbia water quality guidelines for the protection of aquatic life (BC MOE, 2006 and BC MOE, 2015); guidelines for Al, Cd and Fe are for dissolved species, all other guidelines are for total, shaded values are higher than the maximum value and bold italic values are higher than the 30-day criteria; NP = none proposed; NA = not applicable.
3. MMER MMM = Metal Mining Effluent Regulations, Maximum Authorized Monthly Mean Concentration (MMER, 2015).
4. Hardness dependent guidelines (Ag, Cd, Cu, Pb, Ni and Zn) were calculated based on the waster hardness in Brucejack Lake of 28 mg $CaCO_3$/L.

3.5 Organic Matter and Nutrients

Organic matter (OM) describes the fraction of soil that contains plant or animal tissues in various stages of decomposition (Cornell University, 2008). OM contributes to soil productivity in several ways, including (1) enhancing aggregate formation and stability, resulting in increased water-holding capacity; (2) increasing soil CEC and long-term nutrient supply; and (3) facilitating nutrient cycling through enhanced soil microbial activity. OM is also a major source of C, N, and available P and K in unfertilized soils (Sheoran *et al.*, 2010). In mineral soils, an OM content greater than 3%, which is equivalent to approximately 2% total organic C (TOC), generally indicates good fertility. Productive agricultural soils have been found to have OM content of between 3 and 6% (Cornell University, 2008).

Table 3-5 presents the results for OM and nutrients in the Mine Site overburden samples. The results indicate that overburden at the Mine Site contain OM ranging from 0.2 to 1.8%. With the exception of one sample (B00208478), all samples contain < 0.75% OM. Concentrations of OM are consistent with TOC values calculated from ABA data. Analysis of overburden samples for OM and nutrients were not limited to the soil fraction (< 2 mm), as is typical of most soil studies. As such, concentrations may be diluted by the gravel fraction of the overburden samples. However, even if all of the measured OM was assumed to be within the soil fraction of the overburden samples, only sample B00208478 would contain sufficient OM (3.0%) to be considered fertile.

Phosphorus (P) concentrations in all samples were low according to target indices for mineral soil (0-15 cm) in BC (BC Ministry of Agriculture, 2010). Concentrations were < 40 ppm, indicating that crops growing on such soil media would respond beneficially to additional P. Soil potassium (K) ranged from 214-448 ppm, constituting optimal (133-333 ppm) to high and excess (>334 ppm) K concentrations. Boron (B) is an essential micronutrient, but the concentration range between deficiency and toxicity to plants is relatively narrow. Background concentrations of 1 ppm are required for normal plant growth; however, at concentrations of 3 ppm, as observed in the overburden samples (mean B = 3.x), toxicity may occur for sensitive plants (Sylvis Environmental, 2008).

Nitrogen (N) concentrations in the Brucejack overburden samples range from 0.06 to 0.23% N. However, total N analysis measures N in all organic and inorganic forms and, therefore, is not necessarily representative of bio-available N (Horneck *et al.*, 2011). Approximately one to four percent of the total N is generally considered bio-available during a growing season, converting from organic N to inorganic N via microbial activity. Furthermore, N in soil is very water soluble and can be easily leached during a heavy precipitation event. Nitrogen is often the limiting nutrient (*i.e.*, nutrient in relatively short supply which is exhausted first and thus limits cellular growth) and soils which are intended to support vegetation are generally fertilized according to the nutrient needs of the target plant for growth.

Table 3-5:
Soil Analyses Results for Overburden Samples

Results of the OM and nutrient study indicate that the overburden at the Mine Site is deficient with respect to OM (and TOC), P and N, and contains excess K and B, potentially to toxic levels for sensitive plant species. Although amendment with chemical fertilization is possible to bolster the deficient nutrients, there is limited potential for long-term fertility due to slow OM buildup at this elevation and climate.

4. Discussion

The results presented herein are consistent with baseline and previous characterization studies carried out on overburden material at the Brucejack Mine Site. The main findings of the 2015 characterization program are outlined below:

- PSD analysis of overburden samples shows that the majority of particles fall within the soil size fraction and have a texture that indicates sufficient capacity for drainage and physical stability, but the data also suggests limited capacity for nutrient and water retention given the moderate to low proportion of clay and silt.
- ABA results indicate that overburden from the Brucejack Mine Site is predominantly PAG due to the generally low NP measured in test samples (median NP = 10 kg $CaCO_3$/t) coupled with variable AP (up to 10.5 kg $CaCO_3$/t).
- SFE analyses shows that sulphate and Ag, Al, As, Co, Cu, Mn, Se, Tl and Zn exceed the BCMOE water quality guidelines in at least one overburden sample; however, Cd is elevated in leachate from many of the overburden samples. Arsenic, in particular, is elevated in all overburden samples, with concentrations ranging from 21 ppm to 446 ppm As (median of 50.5 ppm As) and exceeding the CCME Industrial Limits Soil Quality Guidelines for the Protection of Environmental and Human Health of 12 ppm As.
- OM and nutrient contents of overburden samples are generally low, thereby considered to be limiting for plant growth. While nutrient deficiencies can be amended with chemical fertilization, there is limited potential for long-term fertility due to slow OM buildup at this elevation and climate.

Overall, the results of the overburden characterization program indicate that the material is not suitable for use in reclamation. It is recommended that once the overburden material is removed, that it be disposed of in a manner that will minimize ARD. It is understood that the final disposal location would require careful consideration to the following: the geotechnical stability of the proposed dumping location, the impact on TSS levels in Brucejack Lake, and any associated water quality issues.

5. Closing

We appreciate the opportunity to contribute to the ongoing development of the Brucejack Mine. Please contact Stephanie Simpson or Alison Shaw if you have any questions regarding the content of this memorandum.

Best regards,

Lorax Environmental Services Ltd.

Alison Shaw, Ph.D.
Senior Geochemist

Stephanie Simpson, M.Sc.
Environmental Geoscientist

Contact Water Pond Overburden Program										
B00208001	427058	6258708	CWP, TP1	0	2	> 3.75	*ND*	Jul-15	*ND*	30% cobble boulder subrounded clasts with minimal fine grained sand and abundant coarse clay.
B00208002	427058	6258709		0	2			Jul-15	*ND*	30% cobble boulder subrounded clasts with minimal fine grained sand and abundant coarse clay.
B00208003	427058	6258710		2	2.25			Jul-15	*ND*	horizon of oxidized and orange stained cobbles and gravel material with coarse clay. Filter cloth at ~ 2m
B00208004	427058	6258711		2	2.25			Jul-15	*ND*	horizon of oxidized and orange stained cobbles and gravel material with coarse clay. Filter cloth at ~ 2m
B00208005	427058	6258712		2.25	3.75			Jul-15	*ND*	gravel horizon with 30-50% >5cm cobbles and fine sand matrix, minimal clay.
B00208006	427058	6258713		2.25	3.75			Jul-15	*ND*	gravel horizon with 30-50% >5cm cobbles and fine sand matrix, minimal clay.
B00208007	427102	6258682	CWP, TP2	0	2	> 4.0	*ND*	Jul-15	*ND*	fine grained gravel with medium sand laminations throughout. Clasts were cobble boulder (5-50cm) in size and matrix was coarse clay to fine sand.
B00208008	427103	6258683		0	2			Jul-15	*ND*	fine grained gravel with medium sand laminations throughout. Clasts were cobble boulder (5-50cm) in size and matrix was coarse clay to fine sand.
B00208009	427104	6258684		2	4			Jul-15	*ND*	fine grained gravel with medium sand laminations throughout. Clasts were cobble boulder (5-50cm) in size and matrix was coarse clay to fine sand.
B00208010	427105	6258685		2	4			Jul-15	*ND*	fine grained gravel with medium sand laminations throughout. Clasts were cobble boulder (5-50cm) in size and matrix was coarse clay to fine sand.
2015 Mine Site Overburden Program										
B00208481	426532	6258868	Site 2	0	0.33	0.33	TSD	Sep-15	10yr 5/6	25% subangular rocks between 0.5-7cm across, surrounded by a matrix of loamy sand
B00208469	426645	6258867	Site 3	0	0.3	> 2.15	V12	Sep-15	7.5yr 6/2	Fine to medium grained sandy loam with subangular clasts up to 4cm across. Fine moss with <1cm long fibres in upper 10cm
B00208471	426645	6258867		0.3	2.15			Sep-15	7.5yr 6/2 (0.3-0.7m); interbedded 5yr 6/8 & 4/1 (0.7-1.2m); 7.5yr 5/2 (1.2-1.6m); 5yr 4/1 (1.6-2.15m)	Sandy loam with decreasing frequency of rock clasts down to 0.7m. Dark grey clay between 0.7-1.2m and 1.6-2.15m. Interbedded rusty layers of silty clay loam up to 8cm thick in upper clay layer. Coarse grained sand grading gradually to fine grained sand between 1.2-1.6m
B00208467	426751	6258929	Site 4	0	0.3	0.65	V12	Sep-15	7.5yr 5/0 (0-0.1m); 10yr 6/8 (0.1-0.22m); 7.5yr 4/2 (0.22-0.3m)	Grey clay with subangular clasts to 10cm, dry medium-coarse grained sand between 10-22cm followed by dark brown loam to 0.3m. Loam layer hosts ~2-3% roots up to 3mm thick
B00208468	426751	6258929		0.3	0.65			Sep-15	7.5yr 6/0 (0.3-0.41m); 7.5yr 4/4 (0.41-0.65m)	Grey clay to 41cm similar in composition to the upper 10cm, followed by dark red silt loam
B00208472	427000	6258813	Site 5	0	0.3	1.7	VSF	Sep-15	10yr 3/3	Sandy clay loam with angular, platy rock fragments up to 30cm wide. Most frags between 0.5-3cm.
B00208473	427000	6258813		0.3	1.7			Sep-15	10yr 3/3	Sandy clay loam with angular, platy rock fragments up to 30cm wide. Most frags between 0.5-3cm. Fine mossy fibres up to 1cm long seen occasionally
B00208477	426576	6258709	Site 6	0	0.34	0.34	TSD	Sep-15	7.5yr 6/4 (0-0.11m); 5yr 4/3 (0.11-0.19m); 5yr 5/3 (0.19-0.34m)	Medium grained loamy sand with pebbles and cobbles ranging from angular to rounded. Colour changes with depth but texture does not.
B00208451	426769	6258743	Site 7	0	0.3	0.74	V12	Sep-15	5yr 4/4	Uniform colour and silty loam texture. Platy weathered clasts of latite from 0.1-10cm wide. Less than 5% of clasts are beige, remainder are red-brown
B00208452	426769	6258743		0.3	0.74			Sep-15	5yr 4/4	Uniform colour and silty loam texture. Platy weathered clasts of latite from 0.1-10cm wide. Less than 5% of clasts are beige, remainder are red-brown
B00208478	426950	6258716	Site 8	0	0.35	0.35	VSF	Sep-15	10yr 4/3	Light grey-green moss covering moist silt loam. Subangular to subrounded cobbles up to 10cm wide.
B00208459	427108	6258692	Site 9	0	0.3	> 11.0	VSF	Sep-15	7.5yr 4/6	Clay loam with ~10% subangular rocks up to 15cm wide, uniform colour
B00208461	427108	6258692		0.3	2.38			Sep-15	7.5yr 4/4	Clay loam with ~20% subangular to subrounded rocks from 0.02-1.2m across (large boulder removed while digging test pit
B00208475	426627	6258610	Site 10	0	0.3	0.4	TSD	Sep-15	5yr 4/6	Fine clay with ~30-40% subangular clasts between 1-4cm across.
B00208476	426627	6258610		0.3	0.4			Sep-15	5yr 4/6	Fine clay with ~30-40% subangular clasts between 1-4cm across.
B00208453	426770	6258630	Site 11	0	0.3	1.04	V12	Sep-15	5yr 5/3	Fine grained loamy sand. Infrequent weathered rock fragments
B00208454	426770	6258630		0.3	1.04			Sep-15	5yr 4/4 (0.3-0.54m); 5yr 4/6 (0.54-1.04m)	Fine grained loam, grading to clay loam and back between 0.6-0.85m. Subangular rock fragments under 3cm are <10%.
B00208455	426792	6258561	Site 12	0	0.3	>1.47	V12	Sep-15	5yr 3/4	Fine grained loam with 20-30% subrounded to rounded cobbles up to 15cm across
B00208456	426792	6258561		0.3	1.47			Sep-15	5yr 3/4 (0.3-0.4m); 10yr 4/3 (0.4-1.0m); 10yr 3/2 (1.0-1.47m)	Fine to medium grained sand to loamy sand to 1m, subangular to rounded clasts ranging from 0.5-5cm wide. Below 1m is fine grained clay with cobbles up to 15cm wide
B00208465	426981	6258578	Site 13	0	0.3	1.15	VSF	Sep-15	5yr 4/3	Sandy loam with roots up to 3mm wide and 15cm long. Subrounded to rounded cobbles frequently seen.
B00208466	426981	6258578		0.3	1.15			Sep-15	5yr 4/3 (0.3-0.45m); 10yr 3/4 (0.45-1.15m)	Sandy loam with <1% roots up to 1mm wide. Rock fragments becoming more angular and generally below 10cm across
B00208479	427078	6258519	Site 14	0	0.33	0.33	VSF	Sep-15	10yr 5/3 (0-0.15m; 10yr 3/2 (0.15-0.33m)	Fine clay loam with <10% subangular to subrounded pebbles up to 3cm wide. Infrequent organics- moss fragments seen down to 0.2m depth
B00208457	427104	6258649	Site 15	0	0.3	> 11.0	VSF	Sep-15	5yr 4/4	Fine grained sandy loam with subangular to rounded rocks ranging from 1-30cm wide
B00208458	427104	6258649		0.3	2.3			Sep-15	5yr 4/4 (0.3-1.65m); 7.5yr 4/6 (1.65-2.3m)	Fine grained sandy loam to 1.65m, silty clay loam from 1.65-2.3m. Subrounded to subangular V12 and Vsf cobbles up to 50cm across
B00208464	426588	6258477	Site 17	0	0.37	0.37	VSF	Sep-15	5yr 4/4	Loamy sand with subangular platy Vsf fragments comprising 50% of the overburden. Fragments range from 0.5-10cm long
B00208462	426722	6258414	Site 18	0	0.3	1.45	VSF	Sep-15	7.5yr 5/4	Coarse grained sandy loam with 30% subrounded gravel and cobbles
B00208463	426722	6258414		0.3	1.45			Sep-15	7.5yr 5/4	Medium to coarse grained sandy loam with gravel and cobble frequency decreasing with depth
B00208474	427078	6258474	Site 19	0	0.35	0.35	V12	Sep-15	5yr 4/3	Silty clay with occasional moss fragments to 0.25m. Moisture seeping at bottom of pit

Notes: ND: No Data
bgs: below ground surface, the depths are approximate based on field photos provided by BGC
V12: Intermediate fragmental volcanics
VSF: Volcanic Sedimentary Facies
TSD: Pebbly volcanic litharenite to sandy pebble or cobble conglomerate (similar to the VSF).

Notes: 1. italicized values in blue font indicate values measured below the detection limit;
2. ACA = average continental crust abundance values according to Price (1997); highlighted values are higher than three times the ACA.

Appendix E. Solid Phase Element Results for Overburden Samples from Brucejack Mine Site

Notes: 1. italicized values in blue font indicate values measured below the detection limit;
2. ACA = continental crust abundance values according to Price (1997); highlighted values are higher than three times the ACA.

APPENDIX F: SHAKE FLASK EXTRACTION RESULTS FOR OVERBURDEN SAMPLES FROM MINE SITE

PRETIVM

GLOSSARY AND ABBREVIATIONS

Terminology used in this document is defined where it is first used. The following list will assist readers who may choose to review only portions of the document.

Cr	Chromium
CMP	Chromium Management Plan
Cr (III)	Trivalent chromium
Cr (VI)	Hexavalent chromium
CWP	Contact Water Pond
D-Cr	Dissolved chromium
FWAL	Freshwater Aquatic Life
T-Cr	Total chromium
SOP	Standard Operating Procedure
WTP	Water Treatment Plant

1 PURPOSE

The purpose of this Chromium Management Plan (CMP) is to provide guidance for Pretium Resources Inc. (Pretium) on how to avoid, minimize and otherwise mitigate the release of hexavalent chromium [Cr(VI)] to the receiving environment. Hexavalent Cr is expected to leach from paste backfill cement and to a lesser degree from shotcrete used during mining operations. This plan aims to: 1) document the potential risk to the environment; 2) describe the monitoring plan for ensuring that the environmental risks are minimized; and 3) outline a plan for identifying and implementing mitigation.

2 SCOPE

The CMP is intended to provide guidance for managing the release of hexavalent Cr from cement in the Brucejack Mine underground workings. It is focused on the generation and placement of cemented paste tailings as backfill in underground workings during the Operation phase of the Brucejack Mine. The proposed mitigation and monitoring for managing the release of hexavalent Cr is also applicable to the generation and use of shotcrete and grout in underground workings.

This Plan is intended to meet regulatory requirements related to Cr at the Brucejack Mine. Effluent Permit 107835 (PE-107835) issued under the provisions of the *Environmental Management Act* for the Brucejack Mine requires that British Columbia Freshwater Aquatic Life water quality guidelines be met at the outlet of Brucejack WRTSF (i.e., 9 µg/L for total trivalent Cr [Cr(III)] and 1 µg/L for total hexavalent Cr [Cr(IV)]). The permit stipulates that actions as outlined in this plan are required if any of the following occurs: 1) dissolved Cr (D-Cr) in water treatment plant (WTP) influent exceeds 10 µg/L, 2) total Cr (T-Cr) in WTP effluent exceeds 20 µg/L, or 3) D-Cr at Brucejack WRTSF outlet (BJ 3.10) exceeds 1 µg/L.

3 INTRODUCTION

In recent years, the release of hexavalent Cr from cement has been identified as a potential environmental concern (e.g., Tarik and Yanful, 2013). However, the potential risks associated with hexavalent Cr are not widely recognized in the context of cemented paste backfill, which is otherwise regarded as a best practice option for tailings disposal. There is little published information on the risks associated with Cr release from cemented paste backfill at mine sites, and best management practices are not yet widely disseminated. Consequently, Pretium has determined that the release of hexavalent Cr warrants careful evaluation and an adaptive management strategy, to incorporate relevant information as it becomes available, and to develop appropriate management practices for the Brucejack Mine.

Underground mine operations at the Brucejack Mine will result in the leaching of Cr from cement contained within paste backfill. Depending on the cement fabrication process, cement can contain up to 30 ppm of hexavalent Cr, which is the water-soluble form of Cr under circum-neutral pH conditions (Kronos ecochem, 2011). Additional leaching of hexavalent Cr may also occur in localized areas within the underground mine as a result of extensive use of shotcrete and/or grout.

While the WTP is expected to remove trivalent Cr, which will also be present, the WTP will not be effective at removing hexavalent Cr. Consequently, without some other form of mitigation, it is possible

that hexavalent Cr, originating from cement, could pass through the WTP, into Brucejack WRTSF, and ultimately into Brucejack Creek.

Significant work has been carried out by Pretium and its consultants to evaluate the potential risks associated with cement-derived Cr(VI) at the Brucejack Mine site. This work has included the following:

- Initiation of static and kinetic testwork on cement and paste materials to identify the source(s) and speciation of Cr;
- Assessment of the expected water treatment plant removal efficiency for various species of Cr;
- Research on Cr leaching behaviour and associated best management practices; and
- Assessment of potential environmental effects

The following sections summarize Cr sources and mitigation options, the results of experimental programs developed, the monitoring programs initiated and adaptive management measures that will be implemented to limit the concentration of hexavalent Cr in mine water. A preliminary framework for implementation of the Plan is also provided. This Plan will be routinely updated as relevant information becomes available and management practices are refined.

4 CHROMIUM SOURCES AND CONTROLS

4.1 OVERVIEW

Cement will be introduced into the underground workings at the Brucejack Mine in cemented paste backfill, shotcrete and grout. It is estimated that up to 50% of ore process tailings will be mixed into cemented paste, which will be deposited in mined-out underground workings. A total of up to 8.7 million tonnes of cemented paste backfill will be generated through life of mine. The paste backfill is expected to include approximately 3.9% cement, although some high-strength paste with cement content of 10%, and low strength paste with 2% cement, will also be generated. Shotcrete and grout are also used in the underground workings to stabilize the workings, and to plug drill holes to minimize the volume of groundwater entering the workings.

Cr is present in the raw materials used to make cement (e.g., fuels, refractory brick, grinding media), and may also be introduced in the manufacturing process from other materials including gypsum, pozzolans, ground granulated blast furnace slag, mineral components, cement kiln dust and set regulators (Hills & Johansen, 2007). Much of the Cr in these materials typically occurs as Cr(III), which is stable with low solubility and low reactivity (Hills & Johansen, 2007). While cemented paste backfill is generally an effective method for the stabilization of heavy metals including Cr (Wilk, 1997), some Cr(III) is typically oxidized to Cr(VI) in the cement kiln and the finish mill. Cr(VI) is unstable, and water soluble. Consequently, Cr(VI) is leached when cement is hydrated.

Based on discussions with potential cement suppliers, the commercial cement available in British Columbia typically contains 25-50 parts per million (ppm) Cr. Lafarge Canada, a supplier of cement for the Brucejack Project, has indicated that the typical Cr content in their cement is approximately 25

ppm, and that this originates from raw materials (Dalkie, M. Pers. Comm., 2015). No additional Cr is added in Lafarge's cement manufacturing process.

4.2 CHROMIUM AT BRUCEJACK MINE

4.2.1 Chromium in Mine Water

Predicted Cr concentrations of Brucejack mine water throughout the Operations phase have been estimated based on the results of humidity cell (HC) tests on paste backfill materials. Initial results from HC37, as described in Section 4.6.4.2 of the MA & EMA Permits Application, resulted in water quality predictions in the receiving environment that exceed the BC FWAL Cr(VI) guideline of 1 µg/L.

Paste samples used in the initial humidity cell tests (HC37) were prepared by Rheological Consulting Services Pty Ltd. (RCS) of Melbourne, Australia, for the purpose of evaluating the suitability of Brucejack tailings for generation of paste backfill. The cement used in the paste sample was Australian general purpose (GP) cement. The cement comprised 4 wt% (dry basis) of the tailings sample (RCS, 2013). The Cr content of the cement was not reported; however, Cr concentrations were determined for raw paste (i.e., tailings) (303 ppm Cr) and a cemented paste backfill sample (250 ppm Cr).

Humidity cell testing was undertaken using a crushed, composite sample of cemented paste backfill. The composite sample was found to have an inferred cement content of approximately 6% (by comparing the Ca content of uncemented and cemented paste, determined from aqua regia and Sobek NP analysis). The test involved placement of a crushed 1 kg sample of the cemented paste backfill sample in a short cylinder, rinsing of the sample with 0.5 L of water once a week, and analysis of the leachate for anions and metals. The results indicated that soluble Cr is readily leached out of the cemented paste backfill materials. The concentrations predicted in the underground workings and the receiving environment as presented in the 2015 MA & EMA Permits Application are based on these results, but scaled for grain size, permeability and temperature to take into account laboratory and experimental conditions. The concentration of Cr leached from cemented paste is anticipated to be mainly the water-soluble Cr(VI) species. The actual concentration of Cr(VI) in leachate from this humidity cell tests was not measured, but for the purpose of modeling it was assumed that all of the Cr released was in the hexavalent form.
