

Groundwater Baseline Study

Groundwater Field Investigations:

- October 2016 to September 2017
- Drilled and installed monitoring wells
- Conducted tests to determine how fast and easily groundwater flows through the water-bearing soil and rock

Groundwater Results:

- Elevations ranged from 19 to 36 meters (above sea level) from October 2016 to September 2017.
- Groundwater levels fluctuated up to 2.5 meters between the wet and dry seasons.
- Flow generally mimics surface topography, with groundwater flowing away from hilltops and converging in main stream drainages
